INVENTORY OF SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN SEED AND PLANT IN- TRODUCTION DURING THE PERIOD FROM APRIL 1 TO JUNE 30, 1922 (NO. 71; NOS. 54969 TO 55568).

INTRODUCTORY STATEMENT.

The migrations of cultivated plants are slow when compared with the spread of ideas or inventions, but it would surprise anyone who has not paid much attention to the subject to learn of the steady flow of new varieties which is going on from the old to the new countries. This inventory represents the stream which is reaching America through the carefully supervised Government channel.

As we look over the immigrants which have arrived during the last three months we are struck with the fact that most of those which are coming in will require a long period of acclimatization, and many of them will need to be bred with those varieties which we already have before they will prove their full value to the country. Just as the human immigrants who arrive at Ellis Island are amalgamating slowly but surely with those who came years ago, so these plant immigrants, many of them at least, will be known by the particular characters which they have contributed to the cultivated plants already here to which they are related; for, like all other living things, the cultivated plants on which we subsist are continually changing under the hands of the plant breeders and through the unconscious process of selection which is always going on.

The fact that these plants which are introduced need to be selected and bred simply emphasizes the lamentable circumstance that there are too few plant breeders in America and too little encouragement is given to those few to carry on this painstaking long-time work of breeding and selecting plants.

The general public has scarcely begun to realize the self-sacrifice and lifelong devotion to its study which the successful plant breeder must give to any plant before he brings about any permanent improvement in it or the ease with which years of effort may be wiped out in a single season of unfortunate occurrences. Neither has the public appreciated that the emoluments which come to the plant breeder are rarely sufficient to cover even the expenses of cultivation and the care which the plants have required, so that at the end of a life of devotion to this work the breeder often finds himself impoverished by the expenses of the upkeep of his collections. It is this condition more than any other which is retarding the development of our cultivated plants to-day, and it is a condition which should be remedied.

This inventory describes under Nos. 55031 to 55039 nine newly originated varieties of Finnish oats sent in from Helsingfors, some of which are reported to be improvements over the Guldregn variety, which is a standard in Finland, and others which are said to be particularly suited for cultivation on swampy land.

Sixty varieties of sorghum have been collected for Mr. Vinall, the sorghum specialist of the department, by the director of agriculture of the Sudan Government from all over the Anglo-Egyptian Sudan in the region tributary to Khartum (Nos. 55106 to 55165).

For the strawberry breeders the Irapuato variety (No. 54976) from the famous strawberry region of that name in Mexico will be of interest.

The search for varieties of corn which may furnish new characters to be incorporated into our American varieties has been extended to eastern Asia, and through our agricultural explorer, Mr. Rock, we have received from the slopes of Doi Chang Mountain, in upper Siam, a variety (No. 55045) which from time immemorial has been grown by the Miaos, those jungle natives who have long inhabited the high mountains of Siam and who are corn-eating people, despite the fact that all around them the Siamese and Chinese subsist on a diet of rice.

For the pear breeders and those particularly interested in the discovery of a better stock than the one we have for the cultivated pear Mr. Rock has secured seeds of *Pyrus pashia* (No. 54998) from the region of Kengtung, Burma, which, according to the information he could obtain, is used by the natives there as a stock for the sand pear. He has also sent in two new forms (Nos. 55497 and 55550) which he found cultivated near Talifu, in the Province of Yunnan.

Whether the sugar cane (No. 55501) which Mr. Rock found in cultivation in the dry arid region of Yunnan at 6,000 feet elevation will prove a shorter season variety than those we now have, only a trial will disclose.

Mr. Rock's discovery and introduction of the new species of cherry, *Prunus majestica* (Nos. 55417, 55476, 55498, and 55500), from this same region of Yunnan, where, he reports, it makes a tree 30 feet high on the exposed dry ridges 6,000 feet above sea level and produces its juicy bitter-fleshed fruits in great abundance in February and March, may mean the origination of cherries for our Southern States or it may mean a new stock for the cultivated cherry of the North which is more drought resistant than the mazzard or the mahaleb.

Whether one or other of these discoveries which Mr. Rock has made will, after the lapse of years, repay him in a measure for the months of hard work and discomfort and isolation which he has been through in his difficult journey into Yunnan from Siam over trails which have never been traveled before by botanists, or whether it will be the loveliness of his new flowering Cassia (No. 55049), which he discovered near Szemao and which in March he found covered with a mass of deep-pink flowers, time alone will show.

From peach seeds introduced several years ago from Valencia, Spain, there have originated at the Chico Plant Introduction Garden two new and, Mr. Morrow believes, particularly promising varieties of peaches for canning purposes (Nos. 55563 and 55564).

As a result of Mr. Popenoe's exploring work in Ecuador there have come in the seeds of two rather unusual varieties of potato from an altitude of 11,000 feet in the Ecuadorian Andes, in Carchi Province (Nos. 55557 and 55558).

From the new Republic of Czechoslovakia a collection of apple varieties (Nos. 55212 to 55232) has been received through the kindness of Josef Mazanek, but whether or not any of them will prove better than our commercial sorts will have to be determined. They are some of the noted sorts of that region.

The introduction of *Microcitrus inodora* from the Bellenden Ker Range of mountains of northern Queensland is of particular interest, inasmuch as this species, according to Doctor Swingle, the citrus specialist of the Bureau of Plant Industry, is the only one of the whole genus which bears fruit in its wild state of sufficiently good quality to make it of promise for cultivation without any improvement. We are especially indebted to C. T. White for the Russell River lime (No. 55447), as it is called in Queensland.

The matasano of Honduras, *Casimiroa tetrameria* (No. 55445), while not so hardy as its relative the white sapote, *C. edulis*, bears much larger fruit, and since it has shown its ability to grow well and fruit in southern Florida its wide dissemination there is considered a matter of importance.

In the category of secondary fruits of value to the housewife for preserves and for stewing appears to be the Indian jujube (*Ziziphus mauritiana*, No. 55485), bushes of which have borne heavily at Miami, Fla. Since in India there are cultivated forms of this fruit, which might be called a kind of southern crab apple, that seem to be superior, it has seemed important to get them.

Doctor Shantz during his explorations in South Africa was so impressed by the possibilities of the narras (*Acanthosicyos horrida*, No. 55486), a species of cucurbit which the Hottentots almost live upon during certain months of the year, that a new importation of the seeds has been made. This cucurbit, which forms spiny thickets in the Kalahari Desert, bears melonlike fruits, the seeds and flesh of which are keenly relished by the natives. If it can be established in our own southwestern deserts it may prove a very valuable acquisition.

The gum arabic of commerce constitutes a specialized industry in Arabia and the east coast of Africa, and although it is doubtful whether labor conditions would make it possible to develop the culture of the gum-yielding species of Acacias in our own deserts, their introduction for the trial seems worth making. Through the kindness of Mr. Massey, Government botanist of the Anglo-Egyptian Sudan, and of the director of the Wellcome Tropical Research Laboratories in Khartum, a collection of the best species has been made (Nos. 55419 to 55423).

The successful introduction by Mr. Rock of the true chaulmoogra-oil-producing species of tree has led to a search for all those other representatives of the Flacourtiaceæ from the seeds of which a similar oil is obtainable, with the result that from Sierra Leone we have secured *Oncoba echinata* (No. 55465), which Dr. F. B. Power assures us has been shown to bear seeds from the oily content of which the true chaulmoogric acid has been isolated. As this is a shrub

and not a forest tree its culture may be more easily accomplished than will be the culture of the Burmese and Siamese trees. Should this be the case the supply of this oil, which has proved so great a remedy for leprosy, may be more quickly insured. The seeds have been supplied by Mr. King-Church, the conservator of forests at Freetown, Sierra Leone, Africa.

In the Plant Introduction Garden at Miami one of the first introductions of the Guatemalan avocado was planted in 1906, and around it were planted other introductions, many of them belonging to the West Indian type. Mr. Simmonds has found this Collins variety a very good stock for our later introductions of Guatemalan avocados, and one of the first of these seedlings to come into bearing has yielded unusually good fruit and shows decided signs of being a hybrid. It has attracted the attention of the growers in Florida, and there has come a demand for it for orchard plantings. We have entered it as a new introduction (No. 55509), calling it the Collinson.

Although it is difficult to wean northerners from the vegetables of their childhood, the scarcity in the summer of green vegetables in the South has made those living there interested in getting forms which will give tender leafy material for greens throughout the hot months. The West Indian spinach (*Amaranthus viridis*, No. 55405) from Montserrat, which Mr. Thompson, of Antigua, assures us produces leaves the size of dessert plates and which throughout the recent severe drought on the island yielded greens twice a week for the table, may be one of these new and valuable summer vegetables.

Dr. Carlos Renson, of Salvador, the discoverer of a species of *Meibomia* which he states is very resistant to prolonged drought and is at the same time an excellent nitrogen gatherer, has sent in some seeds of this new cover crop (*Meibomia rensoni*, No. 55446) for trial, and it is to be hoped that it will do as well in other tropical regions as it does with him.

The wistaria has come to have so important a place in the ornamental horticulture of the temperate zone that we presume it is quite too much to hope that any of the wistarialike climbers will ever compete with it, although we must confess that *Petraea volubilis* as grown in Florida runs it a close second. Sir Hugh Dixson, of Abergeldie, New South Wales, has sent in seeds of *Millettia megasperma* (No. 55565), which bears sweet-scented wistarialike flower clusters of a darker hue than the Chinese wistaria and in his grounds has proved to be a most beautiful decorative vine.

The great similarity of the Atlantic coast of America to that of eastern and even parts of western China makes the trial of a large number of newly introduced species of ornamental perennials and flowering shrubs from Szechwan of unusual interest. Through the kindness of A. K. Bulley, of Neston, England, it is hoped to place in the hands of American amateurs a large collection of new and as yet unidentified species of *Anemone*, *Campanula*, *Caragana*, *Clematis*, *Delphinium*, *Deutzia*, *Euonymus*, *Fritillaria*, *Gentiana*, *Hemerocallis*, *Iris*, *Lilium*, *Lonicera*, *Rhododendron*, and others which have been gathered together by his collector, Dr. F. Kingdon Ward (Nos. 55253 to 55366).

The hibiscus in its various forms is one of the real glories of the Tropics, and through the work of breeding and selection of certain

American amateurs in Honolulu there have been brought into existence some superb varieties which are little known outside of the Hawaiian Islands. Through the kindness of Mrs. J. Rappe Myers, who has gathered together 54 varieties from her various friends, we are now in possession of an extensive collection of these superb forms and shall distribute them in the Tropics (Nos. 55057 to 55064 and 55166 to 55211).

To enrich the park collections of the country we have received from the firm of Vilmorin-Andrieux & Co. some of the rare flowering shrubs which Maurice L. Vilmorin gathered from various parts of the world into his arboretum (Nos. 55071 to 55098). Among them are rare species of *Berberis*, *Buddleia*, *Cotoneaster*, *Deutzia*, *Ligustrum delavayanum*, *Rosa omeiensis pteracantha*, and others.

The botanical determinations of seeds introduced have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared by Paul Russell, who has had general supervision of this inventory.

DAVID FAIRCHILD,
Agricultural Explorer in Charge.

OFFICE OF FOREIGN SEED AND PLANT INTRODUCTION,
Washington, D. C., February 10, 1923.

INVENTORY.¹

54969. MYRCIARIA CAULIFLORA (Mart.) Berg. Myrtaceæ.

Jaboticaba.

From Minas Geraes, Brazil. Seeds turned over to this office by the Federal Horticultural Board. Received May 11, 1922.

"The *jaboticaba* is one of the best indigenous fruits of southern Brazil, but like many of the others it has received little attention outside of its native home. Its habit of producing the fruit directly upon the trunk and larger limbs, together with the unusual beauty of its symmetrical and umbrageous head of pale-green foliage, make this a peculiarly striking tree. The tree reaches a height of 35 or 40 feet on rich soil, the leaves are narrowly oval, and the small white flowers are produced singly or in clusters on the bark of the trunk and limbs. The fruit is round, one-half to 1½ inches in diameter, maroon-purple in color, and with a rather thick, tough skin. The translucent juicy pulp, white or rose tinged, is of agreeable vinous flavor. These fruits are eaten fresh or as jelly. The tree would probably prove most suitable for our tropical dependencies, although perhaps it could be grown in favorable spots in southern California and southern Florida." (*Wilson Popenoe*.)

54970. PHLEUM PRATENSE L. Poaceæ.

Timothy.

From Calgary, Alberta, Canada. Seeds presented by G. M. Stewart, district inspector, seed branch, Department of Agriculture. Received May 31, 1922.

"Produced by a grower in one of our irrigated districts. This grower has been producing from one to two carloads of timothy seed yearly and has been using the one strain of seed all the time." (*Stewart*.)

Locally grown seed introduced for experiments in timothy breeding.

54971. VICIA ERVILIA (L.) Willd. Fabaceæ.

Vetch.

From Ariana, near Tunis, Africa. Seeds presented by F. Boeuf, chief, Botanical Service of Tunis. Received May 31, 1922.

Introduced for experiments in the use of vetches as forage crops.

54972. BRASSICA PEKINENSIS (Lour.) Gagn. Brassicaceæ.

Pai ts'ai.

From Min Hsien, Kansu, China. Seeds presented by Willis H. Ruhl. Received June 2, 1922.

A good variety of *Pai ts'ai* from Min Hsien, Kansu, China.

¹ It should be understood that the varietal names of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Seed and Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their identity fully established, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized American codes of nomenclature.

54973. HYLOCEREUS POLYRHIZUS (Weber) Britton and Rose. Cactaceæ.

From Guayaquil, Ecuador. Seeds presented by Dr. Frederic W. Goding, American consul general, Guayaquil. Received June 2, 1922.

"A triangular-stemmed cactus which is very abundant in the region about Guayaquil, where it may be seen climbing the trunks of various trees by means of aerial roots. It is also found in sandy places in the neighborhood of Riobamba, where it does not climb trees. The local name of this cactus is 'pitajaya.' The roundish fruits are 5 to 7 inches long, with a thin, strawberry-red skin inclosing a mass of reddish pulp containing many small black seeds. This pulp is of most delicious flavor, and from it is made a cooling drink, called locally 'refresco,' which is superior to any other I have ever tasted." (*Goding.*)

54974. VICIA FABA L. Fabaceæ.**Broad bean.**

From Granada, Spain. Seeds purchased from Don Juan Leyva, Granada, by Miss Ola Powell, States Relations Service, through Gaston Smith, American consul, Malaga, Spain. Received April 17, 1922.

"*Habas granadina.* A large, tender bean." (*Powell.*)

Introduced for experiments in the use of broad beans as forage.

54975. DIOSCOREA ESCULENTA (Lour.) Burkill. Dioscoreaceæ.**Lesser yam.**

From Mayaguez, Porto Rico. Tubers presented by T. B. McClelland, horticulturist, Porto Rico Agricultural Experiment Station. Received May 4, 1922.

Potato. A small-tubered variety from Africa, resembling the Irish potato and known in Porto Rico as the *Potato* yam. In some places it is considered among the best for home planting, and in a few city markets it brings good prices.

The vines of this variety are slender and round stemmed, with short, strong, sharp spines; there are two longer spines at the base of each leaf petiole. The leaves appear alternately. The edible tubers develop near the crown of the plant much the same as sweet potatoes. They are oval and vary up to 8 inches in length and 2½ inches in diameter. As they are small and not easily injured, these roots can usually be kept longer after being harvested than the large-rooted kinds. They are smooth, dark grayish brown, and at a distance of a few feet are likely to be mistaken for Irish potatoes. The skin is very thin and tough and may, after being broken, be pulled off in strips resembling thin pieces of cherry bark. The interior of the tuber is white, brittle, and firm and practically free from fiber when not allowed to remain too long in the soil; it is over 23 per cent starch. However, tubers which are left in the soil until late in the winter sometimes have a few long and rather strong, longitudinal fibers. When cooked the tubers are fine-grained, tender, and sweeter in flavor than most other varieties.

Since the small yams develop in the surface soil and are not hindered by a compact subsoil, the *Potato* variety thrives best in rich soil and better than most other varieties in clays. It yields poorly in sandy soil and in compact soils produces angular or flattened tubers.

From experiments made in planting at different distances apart it is believed that 3 by 3 feet will give the best results. The variety grows well on ridges or on level land where the drainage is good and the soil is loosened to a good depth. (Adapted from C. F. Kinman in *Bulletin* 27, *Porto Rico Agricultural Experiment Station*, p. 13.)

54976. FRAGARIA sp. Rosaceæ.**Strawberry.**

From Irapuato, Guanajuato, Mexico. Plants presented by Luis Kan, through Arthur Stockdale, Mexico City. Received May 8, 1922.

"Irapuato is famous throughout Mexico for its strawberries, which supply the markets of Mexico City and many other towns of the highlands. Terry's 'Mexico' says: 'The rich soil of the environing country is favorable to the

growth of strawberries (*fresas*) which are on sale throughout the year. A score or more of venders frequent the railway station and offer the berries in small baskets. The best berries are always carefully arranged on the top; the lower layers are apt to be small, if not decayed, which shows that the Mexicans are not far behind their northern brethren in the matter of preparing their wares for sale. The elevation of Irapuato is 5,800 feet, the climate rather cool, sub-tropical. I have not been able to learn the history of the Irapuato strawberry fields; probably the first plants were brought here by the Spaniards in relatively recent times and are of European derivation. Only one variety seems to be grown; this is a rather small berry of excellent flavor. It is introduced into the United States for study by our strawberry breeders and for possible use in producing new forms by crossing." (*Wilson Popenoe*.)

54977 and 54978. CERATONIA SILIQUA L. Cæsalpiniaceæ. Carob.

From Valencia, Spain. Pods presented by J. D. Wright. Received May 4, 1922. Quoted notes by Mr. Wright unless otherwise specified.

"Carob pods obtained from 'Masia de Mompo,' the estate of Sr. Pelegrin Contell, near Valencia, Spain, March 29, 1922."

54977. "*Matalafera*. Pods of this quality are borne by Sr. Contell's best trees, including his big tree 'El Capitan.'"

54978. "*Roches*. The pods of this variety are very sweet, but are not borne as abundantly as are those of the *Matalafera*."

54979. TRIFOLIUM REPENS L. Fabaceæ. White clover.

From Milan, Italy. Seeds purchased from Fratelli Ingegnoli. Received April 5, 1922.

"*Ladino giant white clover*. A forage plant of the first order, which will grow in any soil capable of being irrigated. It lives for several years if new seeds are sown occasionally. Four cuttings may be obtained, and it makes better hay than other forage plants; it is the best for fattening stock, and also tends to increase the production of milk." (*Fratelli Ingegnoli, Catalogue, 1922.*)

54980. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Florence, Italy. Seeds obtained through W. Roderick Dorsey, American consul. Received April 5, 1922.

"Medium red-clover seed produced in the vicinity of Bologna, Italy." (*Dorsey*.)

Introduced for experimental work by specialists of the Department of Agriculture.

54981. SOLANUM TUBEROSUM L. Solanaceæ. Potato.

From Cambridge, England. Tubers presented by Prof. R. H. Biffen, School of Agriculture. Received April 7, 1922.

"*Edgecote Purple*. This variety is introduced for the breeding experiments being conducted by J. W. Lesley at Mills College in California. It bears pollen quite freely, and while it is susceptible to the wart disease, it appears to be resistant to the mosaic and leaf-curl diseases. It is also known as the *Wiltshire* variety." (*William Stuart*.)

54982. NYMPHÆA sp. Nymphæaceæ. Water lily.

From Livingston, Guatemala. Plant purchased from Louis Bull, United Fruit Co., through Harry Johnson, Hynes, Calif. Received April 11, 1922.

"This grows in the quiet bays near Jocolo, Izabal, Guatemala, and in general habit is similar to the *gracilis* type. The leaves have sinuate margins and red purple lower surfaces. The white, sweet-scented, diurnal flowers are produced in abundance throughout the year." (*Johnson*.)

54983. DIOSCOREA ALATA L. Dioscoreaceæ.**Greater yam.**

From Trinidad, British West Indies. Tubers presented by Claude Connell, through J. B. Rorer, Board of Agriculture, Port of Spain. Received April 20, 1918, and grown at the Plant Introduction Garden, Brooksville, Fla. Numbered April, 1922.

"This is an unidentified variety of yam from a mixed collection of varieties recorded under S. P. I. No. 45990. The individual tubers of this yam are club-shaped to cylindrical, and thus far in Florida have not much exceeded 4 pounds in weight. They remain perfectly white when cooked and are mealy and of very delicate flavor." (R. A. Young.)

54984 to 54987.

From Honolulu, Hawaii. Presented by Dr. H. L. Lyon, in charge, Department of Botany and Forestry, Experiment Station of the Hawaiian Sugar-Planters' Association. Received April 7, 1922. Quoted notes by Doctor Lyon unless otherwise stated.

54984. CASSIA NODOSA Buch.-Ham. Cæsalpiniaceæ.

"Seeds collected in Honolulu."

Pink-and-white shower. This magnificent flowering tree is one of the most commonly cultivated ornamental plants in Honolulu, where it is much used for street planting. It is a moderate-sized deciduous tree, with long drooping branches and glossy leaves; during May and June it bears a profusion of beautiful, bright-pink, rose-scented flowers in dense clusters on long stalks. It is native from the eastern Himalayas to the Malay Islands and the Philippines. (Adapted from *Rock, Ornamental Trees of Hawaii*, p. 106.)

For previous introduction, see S. P. I. No. 52797.

54985. KLEINHOVIA HOSPITA L. Sterculiaceæ.

"Seeds collected in Honolulu."

A handsome tree 25 to 45 feet or more in height, native to southern India and the East Indies, with heart-shaped leaves about 4 inches long and wide. The flowering panicles are large and full and bear small rose-colored flowers; the inflated papery pods are about an inch long. The tree thrives well in low moist places and is quite suitable for planting along avenues, for which purpose it is used considerably in Calcutta. (Adapted from *Rock, Ornamental Trees of Hawaii*, p. 155.)

54986. PINANGA INSIGNIS Beccari. Phœnicaceæ.**Palm.**

"Seeds collected in the Philippines by F. X. Williams."

A rather small palm with a slender, smooth trunk about 6 inches in diameter, very graceful feathery leaves, and oval fruits 2 inches in length. The seeds are occasionally used as a substitute for betel nuts in preparing "bûyo," the mixture of leaves of *Piper betle*, lime, and betel nuts, which, when chewed, colors the saliva a characteristic red and is held to be a tonic and general stimulant. (Adapted from *Brown and Merrill, Philippine Palms and Palm Products*, pp. 20, 112, and 117.)

For previous introduction, see S. P. I. No. 37607.

54987. UVARIA sp. Annonaceæ.

"Seeds collected in the Philippines by F. X. Williams."

54988 to 54990.

From Matania el Saff, Egypt. Seeds presented by A. Bircher, director, Middle Egypt Botanic Station. Received April 7, 1922. Quoted notes by Mr. Bircher.

54988. BARYXYLUM AFRICANUM (Sond.) Pierre. Cæsalpiniaceæ.
(*Peltophorum africanum* Sond.)

"A handsome evergreen tree with feathery leaves and yellow flowers."

For previous introduction, see S. P. I. No. 50125.

54988 to 54990—Continued.**54989. DIOSPYROS sp.** Diospyraceæ.

Persimmon.

"This evergreen tree grows well in Egypt, bearing heavy crops of fruits the size of apples, with dark-brown, sweet flesh."

54990. VANGUERIA INFAUSTA Burchell. Rubiaceæ.

"A small tree with sessile woolly leaves and bearing clusters of fruits known as 'Mispel' in South Africa. It resembles *Vangueria edulis*, but is better adapted to a continental climate than the latter, which is a native of Madagascar."

A tree 6 to 7 feet high with dense cymes of greenish flowers and edible globular fruits about an inch in diameter, known as "wild medlars" to the colonists in South Africa. (Adapted from *Sim, Forest Flora of the Cape of Good Hope*, p. 243.)

54991. PYRACANTHA CRENULATA YUNNANENSIS Vilm. Malaceæ.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received April 7, 1922.

"A new variety received from Yunnan, China, by Maurice L. Vilmorin; it differs from the type in its greater vigor, longer spines, and less dentate leaves. The shrub attains a height of 1 to 3 meters (3 to 10 feet). As compared with the type, the fruits are a brighter coral red and are smaller but much more abundant; they hang on the shrub until January." (*Vilmorin-Andrieux & Co., 1920-1922 catalogue.*)

54992. CARICA PAPAYA L. Papayaceæ.

Papaya.

From Progreso, Yucatan, Mexico. Seeds presented by O. Gaylord Marsh, American consul. Received April 7, 1922.

"Dr. George F. Gaumer, an American scientist at Izamal, Yucatan, has furnished the following information regarding this variety of the papaya: 'The Maya name is *Chacalhaarput* and the English name *mammey* papaya, the latter name being derived from the fact that the edible part of the fruit is of the same color as that of the *mammey* [*Mammea americana* L.]. The fruit is from 10 to 12 inches long and 3 to 6 inches in diameter, with flesh of a very fine flavor. The milky juice of the unripe fruits contains a large amount of papain, an excellent digestive.'" (*Marsh.*)

For previous introduction, see S. P. I. No. 54330.

54993 and 54994. TRIFOLIUM REPENS L. Fabaceæ. White clover.

From Aarhus, Denmark. Seeds presented by S. Sørensen, agricultural attaché, Danish Legation, Washington, D. C. Received April 11, 1922. Quoted notes by Mr. Sørensen.

"Two samples of our best strains of white clover, sent to me by a seed dealer, Fr. Drejer, from Aarhus, Denmark."

54993. "Norso (No. 348)."**54994. "Stryno Hvidklöver** (No. 660)."**54995. PHASEOLUS LUNATUS L.** Fabaceæ.

Lima bean.

From Kengtung, Burma. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received April 4, 1922.

"(Kengtung, southeastern Shan States. February 1, 1922.) This variety is much cultivated; the green pods are eaten like string beans and the mature ones like Lima beans. These are greatly relished by the Shan people, as well as by Europeans. The seeds are planted in May; and mature pods are obtained in the cold season." (*Rock.*)

54996. FRAGARIA VESCA SEMPERFLORENS (Duch.) Seringe. Rosaceæ. Strawberry.

From Edinburgh, Scotland. Seeds presented by Prof. Isaac Bayley Balfour. Royal Botanic Garden. Received April 14, 1922.

This variety differs from the type in the greater size of all its parts, the fruit in particular, and especially in its habit of producing flowers and fruit continuously throughout the summer. In its red color and delicate flavor the fruit is quite similar to that of the type. (Adapted from *Robinson, The Vegetable Garden*, p. 673.)

54997. PYRUS sp. Malaceæ. Pear.

From Chefoo, China. Presented by A. Sugden. Received April 4, 1922.

Pear seeds from Chefoo, China, which are to be grown for use as stock plants for cultivated varieties of apples and pears.

54998. PYRUS PASHIA Buch.-Ham. Malaceæ. Pear.

From Kengtung, Burma. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received April 4, 1922.

"(No. 2253. Kengtung, Burma. February 6, 1922.) A large tree about 50 feet in height with a trunk about 2 feet in diameter, found in a bamboo grove on the plains of Kengtung two stages from the Chinese border, at an altitude of about 3,000 feet. The flowers of this variety are pure white without the pink center seen in those found on the slopes of Loi Mwe southeast of Kengtung, and the tree is an object of great beauty. The natives let the fruits get black on the tree, in which state they are sweet and are made into jam. The fruits of this variety are larger than usual. The native name is *Mai Kaw Ki Kai*. The sand pears of Yunnan are grafted on this species by the natives, according to a priest of the temple of Wat Ban Sao." (Rock.)

54999. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Jesi, Department of Marches, Italy. Seeds purchased through Francesco Archibugi, New York, N. Y. Received April 14, 1922.

Introduced for comparison with American-grown seed.

55000. ARALIA CACHEMIRICA Decaisne. Araliaceæ.

From Stockholm, Sweden. Seeds presented by Dr. Robert E. Fries, director, Botanic Garden. Received April 15, 1922.

This Himalayan species of *Aralia* is introduced for comparison and breeding experiments with the udo (*Aralia cordata*). It is a lax shrub, 5 to 10 feet in height, with elongated flower panicles a foot in length.

For previous introduction, see S. P. I. No. 52788.

55001. GIRARDINIA PALMATA Gaud. Urticaceæ.

From Sibpur, near Calcutta, India. Seeds presented by Lieut. Col. A. T. Gage, director, Royal Botanic Garden. Received April 15, 1922.

A tall, stout, erect, tufted plant, 4 to 6 feet in height, growing commonly in the temperate and subtropical regions of the Himalayas, where it ascends to 5,000 feet above the sea. It is generally known as the "Nilghiri nettle" and is of considerable importance in its native country because of the fiber obtained from its stalks. This fiber is very long, white, soft, and silky and is used for making fine fabrics and for mixing with wool. While the plant is described as an annual, it has proved, under cultivation, to be a perennial; the young shoots are cut down twice a year for their fiber. The leaves of this species are used as a vegetable among the hills of the Northwest Provinces. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 3, p. 500.)

55002. TRIFOLIUM PRATENSE L. Fabaceæ.**Red clover.**

From Riga, Russia. Purchased through John P. Hurley, American consul.
Received April 14, 1922.

"This seed originated in the former Province of Kurland, but was grown in the district of Doblen, about 40 miles southwest of Riga." (*Hurley.*)

Introduced for comparison with American-grown varieties.

55003. DIOSCOREA ALATA L. Dioscoreaceæ.**Greater yam.**

From Natal, Rio Grande do Norte, Brazil. Tubers presented by E. C. Green. Received April 12, 1922.

"These tubers weigh only a few ounces each and are presumably much below the average. The flesh darkens a little when cooked, but is mealy and of good flavor." (*R. A. Young.*)

55004 to 55024.

From Nishigahara, Tokyo, Japan. Seeds presented by H. Ando, director, Imperial Agricultural Experiment Station. Received April 15, 1922.

55004 to 55023. *ECHINOCHLOA CRUSGALLI EDULIS* Hitchc. Poaceæ.

Barnyard millet.

A collection of native varieties of barnyard millets introduced for cultural and breeding experiments.

55004. *Chonakubi.*55014. *Kinshu.*55005. *Chosen.*55015. *Kurohie.*55006. *Dango.*55016. *Manshu.*55007. *Esashi-shiro.*55017. *Mochi-hie.*55008. *Futagomochi.*55018. *Hanamaki-kuro.*55009. *Gamakashira.*55019. *Nigiri.*55010. *Hanamaki.*55020. *Numakunai.*55011. *Hida.*55021. *Otsu.*55012. *Hitokara.*55022. *Yamanome 1.*55013. *Kekanjo.*55023. *Yamanome 2.*55024. *PHLEUM PRATENSE L.* Poaceæ.**Timothy.**

"Timothy seeds produced in Hokkaido." (*Ando.*)

Locally grown timothy introduced for breeding investigations.

55025 and 55026.

From Los Banos, Philippine Islands. Seeds presented by J. E. Higgins, College of Agriculture. Received April 15, 1922.

55025. *CASSIA SIAMEA* Lam. Cæsalpiniaceæ.**Kassod tree.**

A medium-sized or sometimes a large tree with gray, nearly smooth bark and papery, glabrous leaflets. The small yellow flowers are borne in large pyramidal terminal panicles. The tree is probably native to Burma and is cultivated throughout India and many tropical countries for its hard heavy wood, which is very durable. The heartwood is dark brown to nearly black, in stripes of dark and light; it is used for mallets, walking sticks, for building, and for fuel. (Adapted from *Rock, Leguminous Plants of Hawaii*, p. 81.)

For previous introduction, see S. P. I. No. 54924.

55026. *CASSIA TIMORIENSIS* DC. Cæsalpiniaceæ.

A rather low tree with slender, downy branches, pale-green leaves up to 9 inches in length, bright-yellow flowers, and thin, glossy, flexible pods sometimes 6 inches long. The tree is distributed throughout the Malay Archipelago and the Philippines. (Adapted from *Hooker, Flora of British India*, vol. 2, p. 265.)

55027. PYRUS CALLERYANA Decaisne. Malaceæ.**Pear.**

From Nanking, China. Seeds purchased from J. L. Buck, acting dean, College of Agriculture, University of Nanking. Received April 15, 1922.

A wild pear from the mountains of western China, where it grows at altitudes of 1,000 to 1,500 meters (3,300 to 5,000 feet). This pear maintains a vigorous and healthy condition under the most trying situations and may prove to be a very valuable blight-resistant stock.

For previous introduction, see S. P. I. No. 49097.

55028. PASSIFLORA MALIFORMIS L. Passifloraceæ.

From Cartagena, Colombia. Seeds presented by H. C. Kluge. Received April 17, 1922.

"The flower of this vine is very beautiful, and the fruit is edible." (*Kluge.*)

55029. AELUROPUS REPENS (Desf.) Parl. Poaceæ.**Grass.**

From Algiers, Algeria. Seeds presented by Dr. L. Trabut, director, Service Botanique. Received April 17, 1922.

"Found at very salty places in the Sahara." (*Trabut.*)

A low, much-branched, rigid, perennial grass from the Mediterranean countries. It roots at the nodes and appears to be partial to sandy places, even close to salt water. (Adapted from *Muschler, Manual Flora of Egypt, vol. 1, p. 129.*)

55030. CITRUS sp. Rutaceæ.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received April 11, 1922.

"I have used this shaddock, which is the nonedible white variety, as a stock for 20 years and would be lost without it. For grapefruit it is inclined to gum rather more than the sour orange or rough lemon, but my 10-year-old tangerines, worked on this stock, have 2,500 fruits on some of the trees, and the fruits are fine grained and of good commercial size. The Washington Navel on this stock is also very prolific and bears a full crop every year, and I have had equal success with other round oranges like the King, Valencia, Pineapple, and Lue Gim Gong." (*Towns.*)

55031 to 55039. AVENA SATIVA L. Poaceæ.**Oats.**

From Helsingfors, Finland. Seeds presented by Leslie A. Davis, American consul, through E. G. Montgomery, United States Department of Commerce. Received April 15, 1922. Quoted notes by Mr. Davis.

55031. "*Esa* (0644). A white oat."

55032. "*Jalostettu maatiäis* (0144). This variety was obtained by crossing the Kuopio 091 variety with the Guldregn variety. Its kernel is very dark brown, resembling that of the native stock. It has simple requirements and grows here just as well as native stock. The panicle is large and beautiful. The straw is of average length, somewhat better than that of native stock, but not so strong as that of the Guldregn variety. It ripens at the same time as central Finnish native stock, but five days earlier than the Guldregn variety. During experiments of many years it has often given a better crop than the Guldregn variety and a considerably better one than native stocks, with which it has been compared."

55033. "*Kultasade* (*Guldregn*). This variety from southern Finland thrives in northern Finland only in high warm places."

55034. "*Nopsa* (0206). This is a cross between the Norbotten and Ligovo oat varieties. It has a large black chaffy kernel of which the hull forms a considerable percentage. The panicle is not thick and the stalk is strong. It is very early, ripening two weeks before the Guldregn oat. The crop is good, considering its early ripening, but

55031 to 55039—Continued.

it can not compete with later varieties, such as the Guldregn. It does not appear to thrive well in dry places, but it yields well in swampy lands. It is especially suitable for cultivation on swampy lands on account of its maturing so early and because of its strong stalks. This oat must be sown profusely, owing to the large size of its kernel."

55035. "*Osmo 1* (0537). This variety was obtained by crossing Kuopio 091 with the Guldregn variety. The kernel is full, dark brown, and of the size of the Guldregn. The panicle is straight and the straw strong. The straw is not quite so hard as that of the Guldregn, but stands up about as well. It is a little earlier than the first variety here mentioned. It ripens a week before the Guldregn, so that it can well be cultivated in central and northern Finland. It also grows well in swamps."

55036. "*Osmo 2*."

55037. "*Tuotto* (101). This variety comes from the foreign Clydesdale oat. It has a large, full kernel. The color of the kernel, however, is not satisfactory, since it is brownish gray. The panicle is not thick, but is stiff, and the stalk is somewhat short and strong. The *Tuotto* variety is a late one and ripens four or five days later than the Guldregn variety. It gives good crops and has given better ones than the Guldregn and Veikko varieties. It can be grown profitably only in southern Finland."

55038. "*Veikko* (052). This variety has descended in a direct line from the Piffelbacher variety. Its kernel is large, white, and full and has quite a thin hull. Its panicle is straight, and its stalk is strong and of average length. It ripens at the same time as the Guldregn and in experiments has sometimes given better and sometimes poorer crops than the latter, so that it may be considered of about the same value as the Guldregn. It requires perhaps a somewhat better quality of soil than the Guldregn."

55039. "*Voitto* (*Seger*). This variety from southern Finland thrives in northern Finland only in high warm places."

55040. *ERYTHRINA POEPPIGIANA* (Walp.) O. F. Cook. Fabaceæ.
(*E. micropteryx* Poepp.)

From Mayaguez, Porto Rico. Seeds presented by T. B. McClelland, horticulturist, Porto Rico Agricultural Experiment Station. Received April 17, 1922.

An ornamental red-flowered leguminous tree, 40 to 50 feet in height and covered with short, conical spines. It is a native of the lower Andes of Peru, but is cultivated as a shade tree on coffee plantations in Porto Rico, where it is known as *bucare* and also as *palo de boyo*. (Adapted from *Cook and Collins, Economic Plants of Porto Rico, Contributions from the National Herbarium*, vol. 8, p. 139.)

For previous introduction, see S. P. I. No. 43049.

55041. *SABINEA CARINALIS* Griseb. Fabaceæ.

From Dominica, British West Indies. Seeds presented by Joseph Jones, curator, Botanic Gardens. Received April 19, 1922.

"This tree is known locally as *Bois Charibe* and is one of the most showy of our native plants. It is a very fine flowering tree, and I have seen nothing in the Tropics to surpass it as a mass of color. If grown on fairly good land, it will not make a good show; but if planted on a dry, rocky hillside, where it will be scorched by the sun for a period of three or four months each year, it makes a marvelous display of flowers." (Jones.)

"Mr. Jones's description of the marvelous color of the *Bois Charibe* and of the rocky hillsides where it grew attracted my attention at once, and I planted a few young seedlings on a dry coral reef in front of my house at Coconut Grove, Fla. They have grown unusually well, and during the first week of

March last year one of them flowered. I have never seen a more beautiful scarlet flower, and Mr. Jones says he has seen nothing in the Tropics to surpass it as a mass of color. The chances seem good that in the *Bois Charibe* we have a small tree which is going to add splashes of red color to the landscapes of southern Florida and one which will thrive on the dry rocky ledges." (*David Fairchild*.)

For previous introduction, see S. P. I. No. 46026.

55042. COFFEA LAURENTII Wildem. Rubiaceæ.

Coffee.

(*C. robusta* Hort.)

From Kingston, Jamaica. Seeds presented by W. S. Goodman, acting superintendent, Hope Gardens. Received April 17, 1922.

This species, which is native to the Belgian Congo, is introduced for the use of specialists in the Department of Agriculture. It is commonly known as "robusta" coffee.

For previous introduction, see S. P. I. No. 51481.

55043 and 55044.

From Tangier, Morocco. Seeds presented by Jules Goffart, Société d'Horticulture. Received April 17, 1922.

55043. LIMONIUM BRASSICAEFOLIUM × IMBRICATUM. Plumbaginaceæ.

(*Statice brassicaefolium* × *imbricatum*.)

This is a hybrid between *Limonium brassicaefolium*, which has flowers with yellowish white corollas and smooth purple calyces, and *L. imbricatum*, which has flowers with yellowish white corollas and rather hairy calyces. Both of these species are shrubby plants about a foot and a half in height, with more or less velvety lobed leaves and winged branches, and both are natives of the Canary Islands.

55044. LIMONIUM FRUTICANS (Webb) Kuntze. Plumbaginaceæ.

(*Statice fruticans* Webb.)

An ornamental shrubby plant, native to the Canary Islands, with rigid, much-branched flower stalks about 2 feet in height, rising from a loose rosette of oval, crisply wrinkled leaves. It bears large flat clusters of bicolored flowers; the snowy white corollas and bright-violet calyces are made more vivid by the small red bracts and the bright-green wings of the flower stalks. (Adapted from *Flore des Serres et des Jardins de l'Europe*, vol. 4, p. 525.)

For previous introduction, see S. P. I. No. 51148.

55045. ZEA MAYS L. Poaceæ.

Corn.

From Doi Chang, Siam. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received April 4, 1922.

"(Doi Chang, near Chiangmai, Siam. January 10, 1922.) This corn was found at an altitude of 4,500 feet on Doi Chang, the Elephant Mountain; it was grown by the Miao tribe, a jungle people who inhabit the high mountains from northern Siam northward to the Province of Kweichow, China. They are a very primitive people of Chinese origin and do not eat rice but use corn exclusively." (*Rock*.)

55046. BOUEA OPPOSITIFOLIA (Roxb.) Meissn. Anacardiaceæ.

(*B. burmanica* Griffith.)

From Bangkok, Siam. Seeds presented by Y. S. Sanitwongse. Received May 4, 1922.

"The fruit of the *maprang* is of very inferior quality everywhere except at a certain locality north of Bangkok." (*Sanitwongse*.)

An evergreen tree of moderate height, with hard, gray wood which is very durable. It is a relative of the mango and is often cultivated for its edible fruits. It is native to Burma and the Andaman Islands. (Adapted from *Gamble, Manual of Indian Timbers*, p. 108.)

55047 and 55048. ZEA MAYS L. Poaceæ.**Corn.**

From Prague, Czechoslovakia. Seeds presented by Basil Benzin. Received April 19, 1922. Quoted notes by Mr. Benzin.

Native Czechoslovakian varieties of corn, introduced for cultural and breeding experiments.

55047. "*Bankutka*. A flint variety derived from dent corn by selection, 1917-1921, Levice, Czechoslovakia."

55048. "*Florentinka*. An extra early variety of flint corn, Levice, Czechoslovakia."

55049. CASSIA sp. Cæsalpiniaceæ.

From Szemao, Yunnan, China. Seed collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received May 4, 1922.

"(No. 2827. Szemao, Yunnan. March 11, 1922.) A deciduous tree 40 to 50 feet in height, found in the foothills of Szemao at an altitude of 5,000 feet. During March the tree is one mass of large, deep-pink flowers which are 2 inches wide and borne in short racemes all along the branches. It is a most striking tree and can be seen from quite a distance. It is very different from *Cassia nodosa*, which is evergreen, and from *C. bakeriana*, which occurs in northern Siam." (Rock.)

55050. ERANTHEMUM PURPUREUM Hort. Acanthaceæ.

From Manila, Philippine Islands. Cuttings presented by P. J. Wester, agricultural adviser, Bureau of Agriculture. Received April 19, 1922.

"A plant with variegated, mostly purplish foliage, grown on the Moro graves in Lanao. The flowers are whitish and inconspicuous. It could probably be used as a bedding plant as far north as Washington or possibly New York." (Wester.)

"No place of publication has been found. It may be *Odontonema nitidum* Kuntze. To be grown for identification." (H. C. Skeels.)

55051 and 55052.

From Cuzco, Peru. Seeds presented by Prof. Fortunato L. Herrera. Received April 17, 1922.

55051. CHENOPodium QUINOA Willd. Chenopodiaceæ.

Quinoa.

"One of the plants cultivated by the native inhabitants of the highlands of Peru and Bolivia is a species of *Chenopodium* (*C. quinoa*), and so far as foliage is concerned it is not very unlike our ordinary 'goosefoot' in general appearance. Its seeds, however, are white, or nearly so, and fully three times as large as those of *C. album*. In pre-Columbian times this plant was one of the main foods of the Indians, evidently ranking with the potato and corn in this respect. None of the Old World cereals being known before the discovery, it was only natural that the cultivation of this plant should have extended over a considerable area. In addition to Peru and Bolivia it was probably grown in some parts of Argentina and is known with certainty to have been cultivated in Chile; in fact, there even appears to have been an Araucanian or Mapuche name for it. Doubtless its cultivation at the present time is less extensive than formerly, due in part to the diminished Indian population and in part to an apparent ignorance or indifference on the part of the white population to its real merits as a food. At present it is probably most commonly grown on the Titicaca plateau. It is said to yield abundantly, though it does not seem to have occurred to anyone to measure the yield of a given area. In late April and May some of the fields are red with compact panicles, for this seems the only part of the plant visible from a short distance. Other fields have a greenish cast, there being two or possibly more varieties. On the island of Chiloe, southern Chile, the plant grows taller than any seen about Lake Titicaca, and the foliage is more abundant, though

55051 and 55052—Continued.

whether the latter condition is due to the difference in season or to the lower altitude and more abundant rainfall is uncertain. The grain is used by the Indians in the same manner as rice, being put in soups and made into porridge. It appeals to a North American primarily as a breakfast food and should rank with oatmeal and some of the better wheat preparations. It may be cooked and served in a manner similar to oatmeal, but it becomes even more appetizing if spread out in a tray about an inch deep after steaming and then browned in the oven." (W. F. Wight.)

For previous introduction, see S. P. I. No. 46658.

55052. *LUPINUS* sp. Fabaceæ. Lupine.

"*Tarhui*. The seeds are consumed in large quantities in this locality and are of great importance as a foodstuff, having been used since the time of the conquest." (Herrera.)

55053 to 55056.

From Chefoo, Shantung, China. Budwood presented by A. Sugden. Received April 17, 1922. Quoted notes by Mrs. Myers. Sugden.

55053. *MALUS* sp. Malaceæ. Crab apple.

"A white-fruited crab apple."

55054. *MALUS* sp. Malaceæ. Crab apple.

"A red-fruited crab apple."

55055. *PYRUS* sp. Malaceæ. Pear.

"A wild pear."

55056. *ZIZIPHUS JUJUBA* Mill. Rhamnaceæ. Jujube.
(*Z. sativa* Gaertn.)

"The dragon's-claw 'date.'"

An ornamental variety of the jujube with gnarled, twisted branches. It is said to be quite rare in China.

For previous introduction, see S. P. I. No. 22914.

55057 to 55064. *HIBISCUS* spp. Malvaceæ. Hibiscus.

From Honolulu, Hawaii. Seeds presented by Mrs. J. Rappe Myers. Received April 17, 1922. Quoted notes by Mrs. Myers.

"Collected in Honolulu, March 14, 1922."

55057. *HIBISCUS* sp.

"A very choice mixed collection."

55058. *HIBISCUS* sp.

"Apricot colored, single."

55059. *HIBISCUS* sp.

"Single, copper shade, very choice, from Gerrit P. Wilder's garden."

55060. *HIBISCUS* sp.

"A delicate straw-colored single variety from the Oahu Country Club."

55061. *HIBISCUS* sp.

"Single, creamy pink, shading to a very dark center."

55062. *HIBISCUS* sp.

"A beautiful, large, soft-pink single variety."

55057 to 55064—Continued.**55063. HIBISCUS sp.**

"A large single white variety from Robbins B. Anderson. This plant produced more and larger flowers than any other white variety on the island."

55064. HIBISCUS sp.

"A beautiful single yellow variety from the experiment station."

55065 to 55067.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received April 27, 1922.

55065. BASELLA RUBRA L. Basellaceæ.**Malabar nightshade.**

Common white variety. An East Indian plant with creeping stems up to 6 feet in length and oval or heart-shaped, fleshy green leaves. These leaves, which may be eaten like spinach, are abundantly produced throughout the summer, growing in greater profusion as the weather becomes warmer. The plant is cultivated as an annual, the seeds being sown in early spring and the seedlings planted out late in May. (Adapted from *Robinson, The Vegetable Garden*, p. 451.)

For previous introduction, see S. P. I. No. 2006.

The following grasses are introduced for forage-crop experiments:

55066. FESTUCA HETEROPHYLLA Lam. Poaceæ.**Fescue.**

"This European grass is used in mixtures for sterile or sandy soil, especially in mixtures for lawns; the stem blades are flat." (A. S. Hitchcock.)

55067. PHALARIS BULBOSA Jusl. Poaceæ.**Grass.**

A perennial tufted grass whose roots penetrate the soil to a depth of nearly 3 feet. It is a native of the Mediterranean countries, but is now cultivated in New South Wales, where it has been found to endure dry conditions remarkably well. It will stand a considerable amount of pasturing; it also makes excellent hay if cut as soon as the flower heads begin to appear. (Adapted from *Agricultural Gazette of New South Wales*, vol. 28, p. 715.)

For previous introduction, see S. P. I. No. 53241.

55068. MANISURIS EXALTATA (L. f.) Kuntze. Poaceæ.**Grass.**

(*Rottboellia exaltata* L. f.)

From Salisbury, Rhodesia. Seeds presented by H. G. Mundy, chief agriculturist and botanist, Department of Agriculture. Received April 24, 1922.

"*Kokoma grass*. This grass, which is a native of Rhodesia, is an extremely vigorous, free-seeding, leafy annual. It hardly withstands drought as well as Sudan grass, but gives a considerably larger yield of fodder. Owing to the freedom with which the seeds are shed it is inclined to volunteer very freely, and in rich, low-lying, arable land it may become a troublesome weed. The rather harsh, stringing hairs on the lower culms are an objection, but not a very serious one." (*Mundy*.)

For previous introduction, see S. P. I. No. 46983.

55069 and 55070. SOJA MAX (L.) Piper. Fabaceæ. Soy bean.

(*Glycine hispida* Maxim.)

From Omagari, Akita-Ken, Japan. Seeds presented by Isabura Nagai, director of substation, Rikuu Branch, Agricultural Experiment Station. Received April 29, 1922.

"It has been our experience that the smooth, or 'Hadaka,' varieties of soy beans from Japan do not shatter their seed nearly so easily as the hairy sorts." (*W. J. Morse*.)

"The pods of the first variety are smooth and of the second variety slightly hairy. Both varieties were grown at our experiment station." (*Nagai*.)

55069. Hadaka No. 3.

55070. Hadaka No. 260.

55071 to 55098.

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received April 17, 1922.

55071 to 55075. *BERBERIS* spp. Berberidaceæ.

Barberry.

55071. *BERBERIS AGGREGATA PRATTII* C. Schneid.

(Wilson No. 1300.)

A hardy shrub 6 to 10 feet in height, with slender, 3-parted spines, oval leaves, narrow panicles of yellow flowers, and egg-shaped salmon-red fruits about one-fourth of an inch in length. It is a native of western China and grows very freely under cultivation at Kew, England. (Adapted from *Curtis's Botanical Magazine*, pl. 8549.)

For previous introduction, see S. P. I. No. 44527.

55072. *BERBERIS DIELSIANA* Fedde.

"(Purdom No. 543.) A spreading, loosely branched, Chinese shrub often 10 feet high, with elliptic leaves that are whitish beneath. The beauty of the red fruits is accentuated by the bronze color of the leaves in the fall." (*Skeels*.)

For previous introduction, see S. P. I. No. 54066.

55073. *BERBERIS POIRETI* C. Schneid.

(Purdom No. 35.) Forma *weichangensis*. A form of the above species from Weichang, Chihli, China; it differs slightly from the type in the size of the bracts and in spine characters.

55074. *BERBERIS* sp.

(M. Vilmorin No. 4775.)

55075. *BERBERIS* sp.

(Wilson No. 135.)

55076. *BETULA MEDWEDIEWI* Regel. Betulaceæ.

Birch.

A lofty tree, native to Mount Somlia, Transcaucasia, where it is found in forest borders at an altitude of 6,800 feet. The papery, oval leaves, smooth and olive green on the upper surface, are paler below. (Adapted from *Gartenflora*, vol. 36, p. 383.)

For previous introduction, see S. P. I. No. 52933.

55077. *BUDDLEIA JAPONICA* Hemsl. Loganiaceæ.

A deciduous shrub 3 to 5 feet in height, sparsely branched and of an open habit. The very narrow dark-green leaves are up to 8 inches in length, and the pale-lilac flowers are densely crowded in terminal branched panicles. This shrub is a native of Japan and is rather striking in autumn with its long, dense, drooping panicles of fruit. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 272.)

55078. *CALLICARPA GIRALDIANA* Hesse. Verbenaceæ.

(Wilson No. 439.)

An ornamental shrub from western China, with membranous bright-green dentate leaves and many-flowered cymes of purple flowers followed by dense clusters of round violet-purple fruits. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 3, p. 366.)

For previous introduction, see S. P. I. No. 44076.

55079. *CASTANEA SATIVA* Mill. Fagaceæ.

Chestnut.

Variety *heterophylla*. A form with leaves of various shapes.

55080 to 55086. *COTONEASTER* spp. Malaceæ.

55080. *COTONEASTER ADPRESSA* Bois.

A dwarf *Cotoneaster* from China which does not exceed 10 inches in height, but forms a clump several feet in diameter, with the

55071 to 55098—Continued.

stems rooting easily where they touch the ground. It has solitary flowers with pink-tipped petals and bright-red fruits. (Adapted from *Vilmorin and Bois, Fruticetum Vilmorinianum*, p. 116.)

For previous introduction, see S. P. I. No. 27407.

55081. COTONEASTER MOUPINENSIS Franch.

The common cotoneaster in the thickets and margins of woods throughout western Szechwan at altitudes of 4,000 to 7,500 feet. It is 6 to 15 feet high, with white flowers and jet-black fruits. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, p. 163.)

For previous introduction, see S. P. I. No. 53688.

55082. COTONEASTER MULTIFLORA Bunge.

A deciduous shrub or small tree 10 to 12 feet high, with slender, arching branches, papery leaves, branched clusters of white flowers, and roundish red fruits. This elegant cotoneaster is native to the northwestern borders of China and makes a most charming appearance when the branches are wreathed with the abundant flowers in May and June. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 413.)

For previous introduction, see S. P. I. No. 40168.

55083. COTONEASTER SALICIFOLIA RUGOSA (E. Pritz.) Rehd. and Wils.

"A very handsome Chinese shrub having long pendulous branches covered with much-wrinkled lanceolate leaves which have the under-surface covered with down. The berries are small, globular, and bright scarlet. They are borne in clusters and combined with the autumn tints of the foliage produce a very pretty effect." (*Journal of the Royal Horticultural Society*, vol. 38, p. cclii.)

For previous introduction, see S. P. I. No. 53694.

55084. COTONEASTER sp.

Received as *Cotoneaster myrtiflora*, for which a place of publication has not been found.

55085. COTONEASTER sp.

(M. Vilmorin No. 4690.)

55086. COTONEASTER sp.

(M. Vilmorin No. 5015.)

55087. DEUTZIA SCHNEIDERIANA LAXIFLORA Rehder. Hydrangeaceæ.

(Wilson No. 767.)

A shrub about 6 feet in height from western China. The flowers, nearly half an inch in length, are borne in broadly pyramidal but rather loose clusters. (Adapted from *Gardeners' Chronicle of America*, vol. 24, p. 273.)

For previous introduction, see S. P. I. No. 52640.

55088. DEUTZIA sp. Hydrangeaceæ.

(M. Vilmorin No. 7264.)

55089. LIGUSTRUM DELAVAYANUM Har'ot. Oleaceæ.

Privet.

(Wilson No. 1290.)

This hardy shrub was first discovered by Abbé Delavay in the mountains of Yunnan, China. In habit it is prostrate-spreading, except for a few perfectly upright branches which rise from the center of the shrub to a height of about 10 feet. The shining dark-green foliage, which is remarkably persistent, reminds one of a myrtle and, with the

55071 to 55098—Continued.

white flowers and blue-black fruits, makes this plant a very attractive ornamental. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 2, p. 601, and from *Revue Horticole*, vol. 73, p. 495.)

For previous introduction, see S. P. I. No. 49677.

55090. *PRUNUS* sp. Amygdalaceæ.

Plum.

Received as *Prunus korolkowii*, for which a place of publication has not been found.

55091. *PYRACANTHA* sp. Malaceæ.

(M. Vilmorin No. 6257.)

55092. *RIBES MEYERI TURKESTANICUM* Jancz. Grossulariaceæ.

A shrub 3 to 4 feet in height, native to Turkestan, with blunt-pointed leaves, reddish purple flowers, and deep-purple, shiny, juicy fruits of no pronounced flavor. (Adapted from *E. Janczewski, Monographie des Groseilliers*, p. 297.)

For previous introduction, see S. P. I. No. 32761.

55093. *RIBES* sp. Grossulariaceæ.

(M. Vilmorin No. 7947.)

55094 and 55095. *ROSA OMEIENSIS PTERACANTHA* (Franch.) Rehd. and Wils. Rosaceæ.

Rose.

55094. A shrub 3 to 9 feet tall, with white flowers and red fruits having usually a shorter stalk than in the type. Very common on the wind-swept mountain sides of western Szechwan. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 2, p. 332.)

For previous introduction, see S. P. I. No. 53738.

55095. Variety *fructu rubra*. A bushy rose about 3 feet in height, with large oval prickles, small thickly set leaves, solitary single white flowers, and rather large red fruits. It is native to Yunnan, China. (Adapted from *Vilmorin and Bois, Fruticetum Vilmorinianum*, p. 99.)

55096. *SORBARIA ARBOREA SUBTOMENTOSA* Rehder. Rosaceæ.

A variety with the lower surfaces of the leaflets densely hairy; similar to the type, but with larger flowers. It is native to western Szechwan, China, where it forms a shrub up to 20 feet in height with rather small white flowers. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, p. 47.)

55097. *SORBARIA* sp. Rosaceæ.

Received as *Sorbaria pallasii grandiflora*, for which a place of publication has not been found.

55098. *VITIS DAVIDII* (Cart.) Foex. Vitaceæ.

Grape.

A luxuriant climber, native to central China, with the young shoots covered with spiny, somewhat-hooked bristles. The shining dark-green leaves are heart shaped, toothed, and up to 8 inches in width, and the fruits are said to be black, about two-thirds of an inch in diameter, and of pleasant flavor. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 2, p. 667, under *Vitis armata*.)

For previous introduction, see S. P. I. No. 41877.

55099. *GOSSYPIUM* sp. Malvaceæ.

Kidney cotton.

From Yeungkong, Kwangtung, China. Seeds presented by Dr. W. H. Dobson. Received April 18, 1922.

A kidney cotton with fiber of medium length.

55100 to 55104.

From Kisantu, Belgian Congo. Seeds presented by Père J. Gillet, S. J., Jardin d'Essais de Kisantu. Received April 29, 1922.

55100. *COFFEA* sp. Rubiaceæ.

Coffee.

"Coffee-hybrid Le Roy." (*Gillet.*)

55101. *MUSA ARNOLDIANA* Wildem. Musaceæ.

Banana.

The plant grows to a height of 12 to 15 feet without suckering, and the leaves are about 7 feet in length. The inflorescence is short and drooping, and the fruits are nearly 4 inches long. The plant is native to the Belgian Congo. (Adapted from *Fawcett, The Banana*, p. 278.)

55102. *PIMENTA OFFICINALIS* Lindl. Myrtaceæ.

Allspice.

A small tree, native to tropical America, whose dried, unripe berries constitute the allspice of commerce. It prefers a hot and rather dry climate, with alluvial, well-drained soil. Jamaica is the source of our supply of allspice at the present time.

For previous introduction, see S. P. I. No. 44824.

55103. *PSIDIUM* sp. Myrtaceæ.

"A small shrub." (*Gillet.*)

55104. *VOANDZEA SUBTERRANEA* (L.) Thouars. Fabaceæ.

A creeping annual leguminous plant which matures its fruits in the same manner as the peanut, whence its common name "groundnut." It is native to tropical Africa and is extensively grown in that continent, as well as in other tropical countries, for its edible seeds.

For previous introduction, see S. P. I. No. 54704.

55105. *GARCINIA TINCTORIA* (DC.) W. F. Wight. Clusiaceæ.
(*G. xanthochymus* Hook. f.)

From Honolulu, Hawaii. Seeds presented by Gerrit P. Wilder. Received April 4, 1922.

Introduced for testing as a stock for the mangosteen (*Garcinia mangostana* L.).

For previous introduction, see S. P. I. No. 40103.

55106 to 55165. *HOLCUS SORGHUM* L. Poaceæ.
(*Sorghum vulgare* Pers.)

Sorghum.

From Khartum, Anglo-Egyptian Sudan. Seeds presented by W. A. Davie, Director of Agriculture, Sudan Government, through H. N. Vinall, agronomist, Office of Forage-Crop Investigations, United States Department of Agriculture. Received April, 1922.

"Samples of local varieties collected by the Sudan Department of Agriculture throughout Anglo-Egyptian Sudan in the region tributary to Khartum." (*Vinall.*)

55166 to 55211. *HIBISCUS* spp. Malvaceæ.**Hibiscus.**

From Honolulu, Hawaii. Cuttings secured by Mrs. J. Rappe Myers, in Honolulu, and sent in by J. M. Westgate, agronomist in charge, Agricultural Experiment Station. Received March 27 and 30, 1922. Quoted notes by Mrs. Myers, unless otherwise stated.

The Chinese hibiscus is one of the most popular and useful decorative plants of tropical gardens and is cosmopolitan in its distribution. Probably in no other region, however, has so extensive a series of choice horticultural forms been brought together as in Hawaii. In most parts of the Tropics only two or three varieties are seen, usually the single scarlet and the double scarlet. In recent years some excellent sorts have been distributed by Florida nurserymen, yet it is felt that much more can and should be done to popularize the newer delicately colored varieties, and toward this end the following collection has been secured in Honolulu by Mrs. J. Rappe Myers. They should prove of real value in southern Florida and in Porto Rico, the Canal Zone, and the American Tropics generally.

"Most of these varieties are the productions of Gerrit P. Wilder."

55166 to 55192. "Collected March 11, 1922."

55166 to 55170. "Collected in Mrs. George Sherman's garden."

55166. *HIBISCUS SYRIACUS* L.

"(No. 1.) A lavender variety; originally from Japan."

55167. *HIBISCUS* sp.

saceæ. **Banana.**

From Honolulu, Hawaii. Shoots presented by Willis T. Pope, horticulturist, Hawaii Agricultural Experiment Station. Received April 10, 1922.

55246. (No. 4490.) *Chamaluco*. The plant is from 10 to 15 feet in height with medium-sized leaves; when grown in fertile soil the bunches of fruit are rather large. There are two types—one with green and the other with gray fruits. The greater part of these fruits are eaten cooked at the time when other varieties are ripe. (Adapted from *Bulletin 25, Departamento de Agricultura y Trabajo, Porto Rico, p. 19.*)

For previous introduction, see S. P. I. No. 19303.

55247. "(No. 4489.) *Ice Cream*. This banana is said to have been introduced into the Hawaiian Islands from the Malay region of Asia. It was first grown at the Hawaii Station, Honolulu, in 1900, offshoots having been obtained from William Chamberlain, of Honolulu.

"Description of the plant: A 1-year old clump grown from a single offshoot usually consists of 8 or 10 plants, varying from a size suitable for transplanting up to full-grown plants maturing fruit. The average height of the full-grown plant is about 20 feet. Each mature plant usually has 10 or 12 light-green leaves at one time. The trunk is light green with parts of the outer leaf sheaths varying from light green to dark brown. The light brown often has a slight tinge of pink. The leaf blades are shiny light green above with a frosty lighter green below, due to a powdery bloom which does not rub off easily. The young leaves often have the under side of the midrib tinged with pink. Small offshoots have leaves with both margin and midrib of a delicate pink. The bases of the petioles of the larger leaves have abrasionlike marks of brown to dark brown such as are not uncommon on older plants of several other varieties.

"Fruit: The bunch of the *Ice Cream* variety is medium in size, varying in weight from 30 to 60 pounds. In color it is strikingly different from most other yellow bananas. It has a whitish or bluish green color before maturity, which is due to the powdery bloom covering the entire fruit. This powdery bloom remains quite evident after the yellowing and full ripening of the fruit. The bananas usually ripen irregularly on the bunch. After ripening, the bananas very soon

55246 to 55252—Continued.

become soft and have a tendency to fall from the bunch. The hands of bananas are usually seven or eight in number and average about 14 bananas to the hand. Each fruit is from 5 to 7 inches in length and from 2 to 2½ inches in diameter, with a weight of 7 or 8 ounces. The skin of the ripe fruit is of medium thickness, and tender, and separates, leaving a portion of its inner lining on the pulp of the fruit when peeled. The pulp is rather spongy and white or creamy white in color, suggestive of ice cream, hence its name. The flavor is slightly tart and applelike." (Pope.)

55248. "(No. 4499.) *Iholena*. The plant is of low growth, perhaps about 9 feet to the top of the leaves as an average. The petioles are rather stout, light green with pink on the edges; leaves slightly bronze colored on the under surface when young. The bunch is rather small. The fruits are arranged loosely and stand out almost at right angles from the axis of the bunch. The skin of immature fruits is light green, turning to yellow before ripening. The form of the fruit is angular; when thoroughly ripe, beginning to turn black, it is regarded as one of the best of the native bananas for eating raw. It is also good for cooking. The flesh is pink." (J. E. Higgins, *Bulletin 7, Hawaii Agricultural Experiment Station*.)

For previous introduction, see S. P. I. No. 22064.

55249. "(No. 4731.) *Kona Maiamaule* or *Miamuli*, as it is sometimes called, is, I believe, the best cooking banana in these islands, and I believe it has commercial possibilities in a locality like Kona, where much good land may be had with sufficient rainfall, little wind, and rich soil overlying a most favorable underdrainage." (Pope.)

55250. "(No. 4497.) *Largo*. Introduced into Hawaii from Mexico. The plant is of medium height, and the fruits, borne in long-stemmed bunches, have buttery pinkish flesh of fair flavor." (J. E. Higgins, *Bulletin 7, Hawaii Agricultural Experiment Station*.)

55251. "(No. 4495.) *Porto Rico*. This variety was introduced from Porto Rico by the Hawaii station in 1904.

"Description of the plant: Average height about 25 feet. Mature trunks become about 10 or 12 inches in diameter at the base. Each trunk supports 10 or 12 green leaves about 12 feet long. The color of the trunk sheaths varies from a shade of pink to dark brown. The color of the leaves is dull green above and light green below, with abrasionlike markings at the base of the petioles where they begin to extend from the sheath.

"Description of the fruit: The bunch is small to medium in size, weighing 25 to 40 pounds, and usually consists of five or six hands. The banana is smooth with angle ridges not prominent, apex or blossom end somewhat beaked, and not well filled, even on bunches which show plump fruit from good culture. The skin is bright yellow and peels well when fruit is ripe. The flesh is light yellow and rather juicy, sweet, with a pleasant flavor somewhat like that of the apple. The fruit ripens uniformly and holds well on the bunch.

"The *Porto Rico* is a very desirable banana for growing in the home garden, as most of its qualities are such as are desired in a fresh fruit for home use." (Pope.)

55252. "(No. 4492.) *Red Cuban*. This is the proper name of the largest sized variety of the various red bananas; large both as to plant and fruit. A well-grown bunch has 8 to 10 hands and individual fingers of from 2 to 2½ inches in diameter. This is the red banana of commerce." (Goldsmith H. Williams, *Crescent City, Fla.*)

55253 to 55366.

From Neston, Cheshire, England. Seeds presented by A. K. Bulley. Received April 20, 1922. Quoted notes by Mr. Bulley, unless otherwise stated.

"Collected by Dr. F. Kingdon Ward in Szechwan, China."

55253. *ANDROSACE SPINULIFERA* (Franch.) Kunth. Primulaceæ.

"(No. 4042.) An erect plant with rose-pink flowers."

A hairy alpine plant with narrowly oval leaves and a scape up to 8 inches high bearing heads of purplish flowers. It is native to the mountains of central China. (Adapted from *Engler, Das Pflanzenreich*, vol. 22, p. 184.)

55254. *ANDROSACE* sp. Primulaceæ.

"(No. 4388.) Rose pink, darker eye."

55255. *ANEMONE RUPICOLA* Cambess. Ranunculaceæ.

"(No. 4276.)"

A robust Chinese anemone about a foot in height which produces an abundance of showy flowers that are pure white with the outer sepals rosy lilac. (Adapted from *The Garden*, vol. 79, p. 272.)

For previous introduction, see S. P. I. No. 38999.

55256. *CAMPANULA* sp. Campanulaceæ.

"(No. 4605.) A dwarf plant with violet flowers."

55257. *CAMPANULA* sp. Campanulaceæ.

"(No. 4805.) A plant with pale-blue flowers."

55258. *CARAGANA* sp. Fabaceæ.

"(No. 4147.) Flowers sulphur yellow."

55259. *CARDAMINE* sp. Brassicaceæ.

"(No. 4483.) Collected at 13,000 to 14,000 feet altitude. A plant growing a foot high with fragrant purple flowers."

55260. *CLEMATIS* sp. Ranunculaceæ.

"(No. 4585.) Purple flowers with silver stamens."

55261. *CLEMATIS* sp. Ranunculaceæ.

"(No. 4877.) Clusters of straw-yellow flowers."

55262. *CODONOPSIS* sp. Campanulaceæ.

"(No. 4446.) A plant 15 inches in height with purple flowers."

55263. *CODONOPSIS* sp. Campanulaceæ.

"(No. 4618.) Collected at 13,000 to 14,000 feet elevation. A plant 8 to 12 inches high with pale lavender-blue flowers."

55264. *CREMANTHODIUM* sp. Asteraceæ.

"(No. 4210.) A plant with nodding purple flowers."

55265. *CREMANTHODIUM* sp. Asteraceæ.

"(No. 4619.) Sulphur-colored flowers."

55266. *CREMANTHODIUM* sp. Asteraceæ.

"Nodding yellow flowers."

55267. *CREPIS* sp. Cichoriaceæ.

"Collected at 13,000 feet elevation."

55268. *CYNOGLOSSUM* sp. Boraginaceæ.

"(No. 4093.) A plant with deep-blue flowers."

55253 to 55366—Continued.

55269. DELPHINIUM sp. Ranunculaceæ.

Larkspur.

“(No. 4570.)”

55270. DEUTZIA sp. Hydrangeaceæ.

“(No. 4537.) A plant with white flowers.”

55271. DRABA sp. Brassicaceæ.

“(No. 4150.) Tufted golden yellow flowers.”

55272. EUONYMUS sp. Celastraceæ.

“(No. 4526.) A plant growing from 10 to 15 feet in height.”

55273. FRITILLARIA sp. Liliaceæ.

“(No. 4030.) Flowers dull yellowish green, spotted and speckled with chocolate.”

55274 to 55279. GENTIANA spp. Gentianaceæ.

55274. GENTIANA DETONSA Rottb.

“(No. 4757.)”

A gentian native to the cold regions of northeastern Asia, with a very short stem and oblong leaves arranged more or less in a basal rosette. The flowers, borne singly, are deep blue with the corolla lobes wavy at the tips. (Adapted from *Turczaninow, Flora Baicalensi-Dahurica*, No. 13, p. 322.)

55275. GENTIANA sp.

“(No. 4637.) Deep-blue flowers.”

55276. GENTIANA sp.

“(No. 4859.) Bright-blue flowers; plant more or less prostrate.”

55277. GENTIANA sp.

“(No. 4941.) Steel-blue flowers.”

55278. GENTIANA sp.

“(No. 4968.) Bright-violet flowers.”

55279. GENTIANA sp.

“(No. 4992.) Violet flowers.”

55280. HEDYCHUM sp. Zinziberaceæ.

“(No. 3792.) A plant growing 6,000 to 7,000 feet above A-lu-shih.”

55281. HEMEROCALLIS sp. Liliaceæ.

“(No. 4776.) A plant 8 to 12 inches in height with fawn-orange flowers.”

55282. INCARVILLEA sp. Bignoniaceæ.

“(No. 4197.) A tall plant with sulphur-yellow flowers.”

55283 to 55292. IRIS spp. Iridaceæ.

Iris.

55283. IRIS sp.

55284. IRIS sp.

“(No. 3791.)”

55285. IRIS sp.

“(No. 4025.) Deep-violet, almost black, flowers.”

55286. IRIS sp.

“(No. 4073.) A dwarf plant with violet flowers; collected at 13,000 to 14,000 feet elevation.”

55253 to 55366—Continued.

55287. IRIS sp.

“(No. 4101.) Lemon and black crests.”

55288. IRIS sp.

“(No. 4193.) Collected at 13,000 feet elevation.”

55289. IRIS sp.

“(No. 4243.) Violet fold markings on falls.”

55290. IRIS sp.

“(No. 4433.) Slate-blue flowers.”

55291. IRIS sp.

“(No. 4434.) Violet fold markings.”

55292. IRIS sp.

“(No. 5000a.) Collected at 9,000 to 10,000 feet elevation.”

55293 to 55295. LILIUM spp. Liliaceæ.

Lily.

55293. LILIUM sp.

“(No. 4074.) Solitary nodding canary-colored flowers.”

55294. LILIUM sp.

“(No. 4242.) Plant 3 to 4 feet high with pale-purple flowers.”

55295. LILIUM sp.

“(No. 4245.) Flowers brownish yellow with trumpets finely spotted over a white ground.”

55296. LONICERA sp. Caprifoliaceæ.

Honeysuckle.

“(No. 4134.) Large, scarlet, translucent fruits.”

55297. LONICERA sp. Caprifoliaceæ.

Honeysuckle.

“(No. 4192.) A plant 6 to 10 inches high with pale-purple flowers.”

55298. LYCHNIS sp. Silenaceæ.

“(No. 4236.) Very small white or pinkish flowers; calyx bladdery, pale green striped with chocolate.”

55299. LYCHNIS sp. Silenaceæ.

“(No. 4964.) A dwarf plant with pale purplish pink flowers.”

55300 to 55304. MECONOPSIS spp. Papaveraceæ.

55300. MECONOPSIS ACULEATA Royle.

“(No. 4171.)” A biennial Himalayan plant with hairy stems and rosettes of blunt-pointed leaves. The flowers, bright blue with golden yellow throats, are borne in spikelike racemes, the flowers opening from the top of the raceme downward. (Adapted from *The Garden*, vol. 75, p. 226.)

55301. MECONOPSIS PRIMULINA Prain.

“(No. 4008.)”

A plant found in stony places in the eastern Himalayas, at 12,000 to 14,000 feet altitude. The leaves are narrow and the flowers bright blue. (Adapted from *Annals of Botany*, vol. 20, p. 350.)

55302. MECONOPSIS PSEUDOINTEGRIFOLIA Prain.

“(No. 4169.)” A stemless hairy plant from southwest Tibet, China, with narrow leaves and 1-flowered scapes; the flowers are bright yellow and up to 3 inches in diameter. (Adapted from *Annals of Botany*, vol. 20, p. 353.)

For previous introduction, see S. P. I. No. 51750.

55253 to 55366—Continued.

55303. MECONOPSIS sp.

"(No. 4164.) A plant growing a foot high, with sky-blue flowers."

55304. MECONOPSIS sp.

"(No. 4640.) Violet flowers."

55305. OREOCHARIS sp. Gesneriaceæ.

"(No. 3995.) Yellow drooping flowers."

55306. PHLOMIS sp. Menthaceæ.

"(No. 4644.) Pale-pink flowers."

55307. PICEA sp. Pinaceæ.

Spruce.

"(No. 3954.) A graceful tree 50 feet in height, growing at 9,000 to 11,000 feet altitude."

55308 to 55351. PRIMULA spp. Primulaceæ.

Primrose.

55308. PRIMULA BELLA Franch.

"(No. 4082.) Violet or purple flowers."

In damp, sandy, mountain pasture land on the Mekong-Salwin Divide, western Yunnan, China, this attractive primrose was originally collected. It is little more than 2 inches in height, but bears beautiful pale-rose or deep bluish rose flowers with greenish white eyes, fairly fragrant. (Adapted from *Notes from the Royal Botanic Garden, Edinburgh*, vol. 4, p. 225.)

For previous introduction, see S. P. I. 48353.

55309. PRIMULA BLATTARIFORMIS Franch.

"(No. 4520.)"

A primrose from limestone regions in Yunnan, China; in general appearance it resembles the smooth mullein, *Verbascum blattaria*, hence its name. The leaves form a close rosette, and the lilac flowers are borne in spikelike racemes. (Adapted from *Journal of the Royal Horticultural Society*, vol. 39, p. 145.)

55310. PRIMULA BREVIFOLIA Forrest.

"(No. 4173.)"

From a rosette of bright-green, oblong leaves rises a purplish scape which ends in a cluster of a half dozen or more drooping flowers; each has a dark-purple calyx and a fringed, blue-purple corolla. The plant is native to Yunnan, China. (Adapted from *Gardeners' Chronicle*, 3d ser., vol. 57, p. 207.)

55311 and 55312. PRIMULA DRYADIFOLIA Franch.

A somewhat shrubby Chinese primrose with small leaves and large, drooping, rose-colored flowers with dark-purple bracts. (Adapted from *Journal of the Royal Horticultural Society*, vol. 39, p. 165.)

For previous introduction, see S. P. I. No. 48359.

55311. "(No. 4100.)"

55312. "(No. 4109.)"

55313 and 55314. PRIMULA MALVACEA Franch.

A primrose from the mountains of Yunnan, China, densely covered with short hairs, with bright-green leaves about 3 inches in length and thick scapes which bear two or three umbels of reddish flowers. (Adapted from *Engler, Das Pflanzenreich*, vol. 22, p. 26.)

55313. "(No. 4351.)"

55314. "(No. 4181.)"

55253 to 55366—Continued.

55315 to 55319. *PRIMULA MUSCARIOIDES* Hemsl.

A primrose with rather fleshy light-green leaves 4 or 5 inches in length. The scapes, twice as long as the leaves, bear the heads of deep purple-blue or almost violet flowers. The plant inhabits moist open places on the edges of forests in Yunnan, China. (Adapted from *Curtis's Botanical Magazine*, pl. 8168.)

55315. "(No. 4436.)" 55318. "(No. 4225.)"

55316. "(No. 4180.)" 55319. "(No. 4748.)"

55317. "(No. 4077.)"

55320 to 55332. *PRIMULA NIVALIS* Pall.

This species is found in every part of the world where primroses grow excepting South America; it varies considerably according to its geographic location. The rather thick, ribbon-shaped leaves are often coated with silver or golden meal, and the flowers, usually blue or purple but sometimes white, are borne in large clusters. (Adapted from the *Journal of the Royal Horticultural Society*, vol. 39, p. 160.)

For previous introduction, see S. P. I. No. 48369.

55320. "Deep Tyrian purple with an eye almost black."

55321 and 55322. "(No. 4055.)"

55323 and 55324. "(No. 4080.)"

55325. "(No. 4141.)"

55326 and 55327. "(No. 4176.)"

55328 to 55330. "(No. 4885.)"

55331. "(No. 4911.)"

55332. "(No. 5000 K.)"

55333 and 55334. *PRIMULA POISSONI* Franch.

"(No. 4024.)"

A stout, smooth Chinese primrose with rigid, leathery, oblong, pale-green leaves 2 or 3 inches long and a solitary flower stalk which bears one or more whorls of pink flowers. (Adapted from *Curtis's Botanical Magazine*, pl. 7216.)

55335 and 55336. *PRIMULA SECUNDIFLORA* Franch.

"(No. 4175.)"

This is one of the finest Chinese primroses; it is a native of the Likiang Mountains in northwestern Yunnan, China, where it ascends almost to snow level, 15,000 feet above the sea. On the lower plateaus, at 11,500 feet altitude, this plant forms dense colonies with scapes up to 14 inches in height. The fragrant flowers are a beautiful shade of deep crimson, faintly tinged with purple, and droop gracefully from the scapes. The calyxes are ruddy purple, marked with white lines along the margins. (Adapted from *Gardeners' Chronicle*, 3d ser., vol. 51, p. 281.)

For previous introduction, see S. P. I. No. 48375.

55337 and 55338. *PRIMULA SIKKIMENSIS* Hook.

A robust primrose from rather wet situations in the Himalayas at altitudes of 12,000 to 17,000 feet. It sends up strong flower stems a foot or two in height, which bear numerous bell-shaped pale-yellow fragrant flowers. This species is hardy in England. (Adapted from *Robinson, English Flower Garden*, p. 739.)

For previous introduction, see S. P. I. No. 48378.

55337. "(No. 4930.)"

55338. "(No. 4179.)"

55253 to 55366—Continued.

55339. PRIMULA SINOPURPUREA Balf. f.

“(No. 4181.)”

This is one of the most striking primroses of the *nivalis* group. It is native to Yunnan, China, and is a stout herbaceous plant usually about 4 inches high. The narrow leaves are thinly papery, with yellow mealy lower surfaces, and the stout scapes bear deep-violet flowers. (Adapted from *Curtis's Botanical Magazine*, pl. 8777.)

For previous introduction, see S. P. I. No. 48379.

55340. PRIMULA VINCIFLORA Franch.

“(No. 4172.)”

A rather tall Chinese primrose, sometimes over a foot in height, with beautiful flowers of a deep indigo-purple shade; the calyx tube is yellowish at the base. In its native home it grows in masses of 20 to 30 plants in one clump. (Adapted from *Gardeners' Chronicle*, 3d ser., vol. 46, p. 344.)

For previous introduction, see S. P. I. No. 48381.

55341. PRIMULA sp.

“(No. 3920.) Flowers pinkish crimson with a yellow eye.”

55342. PRIMULA sp.

“(No. 3951.) Orange-colored flowers.”

55343 and 55344. PRIMULA sp.

“(No. 5000 J.) A plant growing at 8,000 feet altitude, with purplish crimson flowers.”

55345. PRIMULA sp.

“(No. 4445.)”

55348. PRIMULA sp.

“(No. 4181.)”

55346. PRIMULA sp.

“(No. 4225.)”

55349. PRIMULA sp.

“(No. 4174.)”

55347. PRIMULA sp.

“(No. 4275.)”

55350. PRIMULA sp.

“(No. 4081.)”

55351. PRIMULA sp.

“A plant 8 to 10 inches high, growing at 9,000 to 10,000 feet altitude.”

55352. PYROLA sp. Pyrolaceæ.

“(No. 4262.) Cream-colored flowers.”

55353. RHEUM sp. Polygonaceæ.

“(No. 3794.)”

55354 to 55359. RHODODENDRON spp. Ericaceæ.

55354. RHODODENDRON sp.

55355. RHODODENDRON sp.

“(No. 4160.) A snowy white, dwarf alpine plant.”

55356. RHODODENDRON sp.

“(No. 4170.) Bell-shaped, lemon flowers.”

55357. RHODODENDRON sp.

“(No. 4177.) A plant 6 to 8 feet in height; flowers pink with dark spots.”

55253 to 55366—Continued.**55358. RHODODENDRON sp.**

“(No. 4456.) A bush 2 to 3 feet in height.”

55359. RHODODENDRON sp.

“(No. 4486.) A plant 5 feet in height.”

55360 to 55364. SAXIFRAGA spp. Saxifragaceæ.**55360. SAXIFRAGA sp.**

“A yellow variety found in woods.”

55361. SAXIFRAGA sp.**55362. SAXIFRAGA sp.**

“(No. 4628.) Orange-colored flowers; plant 6 to 9 inches in height.”

55363. SAXIFRAGA sp.

“(No. 4654.) Flowers yellow.”

55364. SAXIFRAGA sp.

“(No. 4905.) A plant 6 to 9 inches in height with chocolate-colored flowers.”

55365. SWERTIA sp. Gentianaceæ.

“(No. 4977.) A plant 2 to 4 inches high.”

55366. VERATRUM sp. Melanthiaceæ.

“(No. 4832.) An erect plant 12 to 15 inches in height with violet flowers.”

55367. CUCURBITA PEPO L. Cucurbitaceæ.**Squash.**

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received May 8, 1922.

The “Naples squash” has trailing stems, usually about 10 feet long, and dull-green leaves with grayish white veins and spots. The cylindrical fruit is up to 2 feet in length, with smooth dark-green skin which becomes yellow when the fruit is ripe. The orange-colored flesh is abundant and sweet. This variety is very productive, and the fruit is of excellent quality, keeps well, but ripens rather late. (Adapted from *Robinson, The Vegetable Garden*, p. 326.)

55368. TRIFOLIUM PRATENSE L. Fabaceæ.**Red clover.**

From Lodi, Italy. Seeds purchased from Consorzio Agrario Cooperativo Lodigiano, through William H. Stevenson, International Agricultural Institute, Rome, Italy. Received May 8, 1922.

Introduced for cultural experiments and comparison with American-grown varieties.

55369. CROTALARIA JUNCEA L. Fabaceæ.**Sunn hemp.**

From Honolulu, Hawaii. Seeds presented by J. M. Westgate, agronomist in charge, Agricultural Experiment Station. Received May 9, 1922.

Introduced for testing as a green manure, for which purpose it is used in India. It is, however, also used in that country as a fiber plant and as a catch crop.

For previous introduction, see S. P. I. No. 43502.

55370 and 55371. RUBUS spp. Rosaceæ.

From Sitka, Alaska. Plants and roots presented by C. C. Georgeson, agronomist in charge, Agricultural Experiment Station. Received May 17, 1922.

Introduced for cultural and breeding experiments.

55370. RUBUS CHAMAEMORUS L.**Cloudberry.**

The cloudberry is of circumpolar distribution, and the edible yellowish fruits are much prized by natives of the Arctic regions. The plant is creeping in habit and is frequently found in peat bogs.

For previous introduction, see S. P. I. No. 24379.

55371. RUBUS SPECTABILIS Pursh.**Salmon berry.**

The salmon berry is a native of northwestern North America from California to Alaska; it is a vigorous plant with canes 5 to 15 feet in length and large, conical, salmon-colored fruits.

For previous introduction, see S. P. I. No. 23452.

55372. LAPAGERIA ROSEA Ruiz and Pav. Liliaceæ.**Copihue.**

From Angol, Chile. Seeds purchased from F. L. Crouse, Instituto Agrícola Bunster, Angol. Received May 19, 1922.

"*Copihue*. This, the national flower of Chile, has been occasionally grown in northern greenhouses, where it creates a genuine sensation when in bloom. It is a climbing plant of slow growth, with slender, wiry stems and bright-crimson tubular flowers about 3 inches in length. In southern Chile huge bunches of these blossoms are brought to the railway stations and sold to passing travelers. The plant requires an acid soil." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 54621.

55373 and 55374. JUGLANS spp. Juglandaceæ.**Walnut.**

From Buenos Aires, Argentina. Nuts presented by D. S. Bullock, agricultural commissioner, Bureau of Markets and Crop Estimates. Received May 13, 1922. Quoted notes by Mr. Bullock.

55373. JUGLANS sp.

"From the eastern foothills of the Andes at Limoncito, Rio Blanco, or Iruya, Province of Salta. Collected in August, 1921, by A. G. Maddren."

55374. JUGLANS sp.

"From the Sierra de Lumbrera, a well-watered small mountain range just east of the Andes, in the Department of Metan, Province of Salta. The 'Nogal' trees grow along the small creeks at an altitude of 3,000 to 4,000 feet. Collected by D. S. Birkett."

55375 to 55398.

From Copenhagen, Denmark. Presented by Government Seed Control. Received May 11, 1922. Quoted notes by Dr. A. S. Hitchcock, of the United States Department of Agriculture.

The Danish Government, in cooperation with the seed growers of Denmark, is conducting extensive tests of commercial crops of value for cultivation there. These seeds are selections of some of their more promising varieties.

55375. ALÓPECURUS PRATENSIS L. Poaceæ.**Meadow foxtail.**

(No. 40.) "Meadow foxtail is sometimes used as a meadow grass in the eastern United States. It is recommended for mixtures on moist soil, being nutritious and producing early forage. It is an erect grass 2 to 3 feet tall."

55375 to 55398—Continued.

55376. *ANTHYLLIS VULNERARIA* L. Fabaceæ. Kidney vetch.
 (No. 32.) A perennial herb found throughout Europe, northern Africa, and Asia, which is grown for sheep fodder and is particularly recommended for lime soils. In Norway it is native as far north as 70°. (Adapted from *Von Mueller, Select Extra-Tropical Plants*, p. 48.)
55377. *ARRHENATHERUM ELATIUS* (L.) Mert. and Koch. Poaceæ.
 (*A. avenaceum* Beauv.)
 (No. 37.) "This is occasionally cultivated in humid regions in the United States as a meadow grass; it is a fairly satisfactory forage grass."
55378. *AVENA SATIVA* L. Poaceæ. Oats.
 (No. 49.)
- 55379 and 55380. *BETA VULGARIS* L. Chenopodiaceæ. Beet.
 55379. (No. 44.) 55380. (No. 45.) Sugar beet.
55381. *BRASSICA NAPUS* L. Brassicaceæ. Rape.
 (No. 47.)
55382. *DACTYLIS GLOMERATA* L. Poaceæ. Orchard grass.
 (No. 36.) "A well-known meadow and pasture grass, cultivated in the humid regions of the United States."
55383. *DAUCUS CAROTA* L. Apiaceæ. Carrot.
 (No. 46.)
55384. *FESTUCA DURIUSCULA* L. Poaceæ. Hard fescue.
 (No. 39.) "This grass, rare in America, is used in mixtures for lawns, especially for sterile or stony soil."
55385. *FESTUCA ELATIOR* L. Poaceæ. Meadow fescue.
 (No. 38.) "Meadow fescue is cultivated for hay and pasture in humid regions of the United States."
55386. *HORDEUM DISTICHON PALMELLA* Harlan. Poaceæ. Barley.
 (No. 50.)
55387. *LOLIUM MULTIFLORUM* Lam. Poaceæ. Italian rye-grass.
 (No. 35.)
55388. *LOTUS CORNICULATUS* L. Fabaceæ.
 (No. 31.) An excellent fodder, and considered a valuable element in meadows and pastures in Australia and Tasmania, where it is native. (Adapted from *Maiden, Useful Native Plants of Australia*, p. 134.)
 For previous introduction, see S. P. I. No. 48634.
55389. *MEDICAGO LUPULINA* L. Fabaceæ. Black medic.
 (No. 30.)
55390. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.
 (No. 29.)
55391. *NOTHOLCUS LANATUS* (L.) Nash. Poaceæ. Velvet grass.
 (*Holcus lanatus* L.)
 (No. 43.) "Velvet grass has value as a meadow grass on moist sandy or sterile soil where other grasses will not thrive. It is an erect grass 2 to 3 feet tall."
55392. *PHLEUM PRATENSE* L. Poaceæ. Timothy.
 (No. 33.)
55393. *POA PRATENSIS* L. Poaceæ. Kentucky bluegrass.
 (No. 42.)

55375 to 55398—Continued.**55394. POA TRIVIALIS L. Poaceæ. Rough-stalked meadow grass.**

(No. 41.) A grass with stems decumbent at the base. Not only the stems but also the leaves and sheaths are very rough. The panicle is 2 to 5 inches long.

55395. SECALE CEREALE L. Poaceæ. Rye.

(No. 48.)

55396. TRIFOLIUM HYBRIDUM L. Fabaceæ. Alsike clover.

(No. 28.)

55397. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

(No. 26.)

55398. TRIFOLIUM REPENS L. Fabaceæ. White clover.

(No. 27.)

55399 to 55404. CUCUMIS MELO L. Cucurbitaceæ. Muskmelon.

From Lucknow, United Provinces, India. Seeds presented by F. H. Johnson, superintendent, Government Horticultural Gardens. Received May 9, 1922.

Seeds of six distinct varieties of Kharbusa (melons).

55399. Chitta.**55400. Khurra.**

55401 and 55402. Safada. This is perhaps the finest of Indian melons and is grown in sandy loam along river banks. It is the size of a very large orange, flattened at both ends, and white inside and out. (Adapted from Watt, *Commercial Products of India*, p. 438.)

55401. Safada (big).**55402. Safada (Mandyaon).**

55403. Sarda. A fine variety cultivated in India, originally introduced from Kabul, Afghanistan, for the wealthy natives of the Punjab. The seeds of this melon are distinguished by their very large size. (Adapted from Macmillan, *Handbook of Tropical Gardening and Planting*, p. 156.)

55404. Mixed.**55405. AMARANTHUS VIRIDIS L. Amaranthaceæ.**

From Antigua, Leeward Islands. Seeds presented by Edwin A. Thompson, junior assistant, Imperial Department of Agriculture. Received May 16, 1922.

"I obtained this variety recently in Montserrat; the seeds were from locally grown plants of a special type of West Indian spinach, which is an undoubted acquisition. The plant becomes about 5 feet in height, and during its early growth the leaves are large, about the size of a dessert plate. During the recent extreme drought in Antigua I have been able to have a side dish of this vegetable at least twice a week." (*Thompson*.)

55406 and 55407. SOLANUM TUBEROSUM L. Solanaceæ. Potato.

From Galicia, Austria. Tubers purchased from Heinrich Dotkowski & Son. Received May 18, 1922.

55406. "Petronius." This variety is fairly vigorous in growth and the plants are large, compact, and healthy with strong erect medium green stems. The leaves are medium to large and rather dark green; the flowers are white, and pollen is produced rather freely. The tubers are light skinned, the eyes medium in number and depth. It is not a very productive variety, being chiefly valuable for breeding purposes." (*William Stuart*.)

For previous introduction, see S. P. I. No. 33487.

55407. Rubin.

55408 and 55409. RUBUS MACROCARPUS Benth. Rosaceæ. Colombian berry.

From Bogota, Colombia. Presented by W. O. Wolcott. Received May 10, 1922.

"Seeds of very large wild blackberries." (Wolcott.)

55410. GOSSYPITUM ANOMALUM Wawra. Malvaceæ. Cotton.

From Asmara, Eritrea, Africa. Seeds presented by the director, Eritrea Colonization Service. Received April 19, 1922.

"This cotton has a very short staple, but it is soft and shining like silk. It is used by native textile workers." (A. M. Tancredi, *Notizie e Studi sulla Colonia Eritrea*, p. 110.)

According to one authority this is the only truly wild cotton in Africa: it has been found in Angola and also in the Anglo-Egyptian Sudan. It forms a shrub 5 to 10 feet in height, with rough branches, reddish flowers, and oval capsules about an inch in length, much smaller than cultivated cotton. (Adapted from Oliver, *Flora of Tropical Africa*, vol. 1, p. 211.)

55411. AMERIMNON SISSOO (Roxb.) Kuntze. Fabaceæ. Sissu.
(*Dalbergia sissoo* Roxb.)

From Dehra Dun, United Provinces, India. Seeds presented by R. S. Hole, forest botanist. Received May 16, 1922.

A large deciduous tree native to tropical and subtropical regions of the lower Himalayas. It is highly esteemed for its very durable wood, which seasons well, does not warp or split, and is strong and elastic. The thin layer of sapwood is white, while the heartwood is brown, with darker longitudinal veins, and is very hard. (Adapted from Gamble, *Manual of Indian Timbers*, p. 124.)

55412. DIOSCOREA ALATA L. Dioscoreaceæ. Greater yam.

From India. Tuber presented by E. R. Sasscer, Federal Horticultural Board, United States Department of Agriculture. Obtained by L. M. Scott, inspector, Boston, Mass., from baggage on the steamship *City of Valencia*. Received April 19, 1922.

"*Purple Ceylon*. In India this yam is said to be called 'King of Yams.' The specimen received weighs about 13 ounces, is roughly spherical, and has deep-purple flesh, being similar in these respects to the *Purple Ceylon* previously received from Porto Rico (S. P. I. No. 54900). The flesh retains its color when cooked, is smooth in texture, and of very good flavor." (R. A. Young.)

55413. COIX LACRYMA-JOBI L. Poaceæ. Job's-tears.

From Muang Hai, southern Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received May 9, 1922.

"(No. 2485. February 17, 1922.) Collected along brooks near Muang Hai, southern Yunnan, at an altitude of 4,000 feet; may be of interest to cereal specialists." (Rock.)

For previous introduction, see S. P. I. No. 49516.

55414 to 55416. CITRUS spp. Rutaceæ.

From Shaowu, Fukien, China. Presented by Rev. J. E. Walker, Shaowu Mission of the American Board. Received May 16, 1922.

"Seeds from varieties equal to the best in Amoy, Fukien." (Walker.)

55414. CITRUS sp.

55416. CITRUS sp.

55415. CITRUS sp.

55417. PRUNUS MAJESTICA Koehne. Amygdalaceæ. Cherry.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received May 16, 1922.

"(No. 2884. Between Puerhfu and Mohei, Yunnan, March 18, 1922.) A tree 25 to 30 feet in height with ascending branches, growing on exposed dry ridges 6,000 feet or more in altitude. The cherries, which are borne in March, are oblong to ovoid, bright red, with scanty but juicy bitter flesh. The tree grows in company with *Pyrus yunnanensis*, *P. pashia*, *Larix* sp., and several other species of *Prunus* and *Malus* which are now in flower." (Rock.)

55418. PHASEOLUS SEMIERECTUS L. Fabaceæ.

From Gatun, Canal Zone. Seeds presented by J. A. Close. Received May 18, 1922.

"The long narrow pods are of a leguminous plant which I am trying out as a cover crop. I first noticed the dark-purple flowers, about the size and shape of sweet peas, along the railroad track at Gatun, but the plant did not grow well in the gravel. When planted in heavy clay mixed with charcoal, however, it developed wonderfully, and the vines formed a dense mat which allowed no other vegetation to grow under or through it. The plants grew about 3 feet high, and in the last month of the dry season the ground was covered with the decaying leaves. New plants have appeared a hundred feet from the old planting." (Close.)

55419 to 55423. ACACIA spp. Mimosaceæ.

From Khartum, Anglo-Egyptian Sudan. Seeds presented by E. E. Massey, Government botanist, Sudan Government Department of Agriculture, through Maj. R. G. Archibald, Wellcome Tropical Research Laboratories. Received May 15, 1922.

Introduced for experimental planting in the southwestern United States in connection with gum-arabic production.

55419. ACACIA ALBIDA Delile.

A low, much-branched tree with whitish bark, axillary spikes of white flowers, and flat, oblong pods. It is a native of tropical Africa and yields a gum similar to gum arabic. The leaves are eaten by goats, and the bark is used in curing leather. (Adapted from *Oliver, Flora of Tropical Africa*, vol. 2, p. 339, 1871, and *Kew Bulletin of Miscellaneous Information, Additional Series IX*, pt. 2, p. 288.)

For previous introduction, see S. P. I. No. 44922.

55420. ACACIA CATECHU (L. f.) Willd.

A moderate-sized tree with dark-brown, much-cracked bark, very finely pinnate leaves, spikes of white or pale-yellow flowers, and narrow dark-brown pods. It is found in most parts of India and Burma, sometimes becoming over 70 feet tall with a circumference of 8 or 9 feet. It yields a pale-yellow gum, with tears often an inch in diameter, which is a strong mucilage and a better substitute for gum arabic than the gum of *Acacia arabica*. This species is also the source of cutch, the resinous extract obtained by boiling down a decoction obtained from chips of the heartwood; from this extract a dull-red dye may be obtained.

The sapwood is yellowish white, and the heartwood, which is extremely hard, is either light or dark red. The wood is very durable, takes a fine polish, and is not attacked by white ants or shipworms. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 1, p. 27.)

For previous introduction, see S. P. I. No. 50711.

55421. ACACIA NUBICA Benth.

An umbrella-shaped shrub 4 to 5 feet high, with dark greenish bark, small leaflets, and rather large heads of fragrant yellowish flowers. It is native to Abyssinia and the western coast of Arabia. (Adapted from *Linnaea*, vol. 35, p. 337.)

55419 to 55423—Continued.

55422. ACACIA SPIROCARPA Hochst.

An umbrellalike tree 20 to 40 feet in height with snow-white heads of fragrant flowers and narrow, spirally twisted pods. It is quite common in dry, open, rocky places in Abyssinia at an altitude of about 4,500 feet. (Adapted from *Chiovenda, Osservazioni Botaniche nell'Abissinia*, p. 101.)

55423. ACACIA VERUGERA Schweinf.

This Abyssinian acacia forms a handsome tree 60 feet in height, with very long spines, light-green feathery foliage, and round heads of pale-yellow flowers. (Adapted from *Linnaea*, vol. 35, p. 340.)

For previous introduction, see S. P. I. No. 44924.

55424 to 55441.

From Harbin, northern Manchuria. Presented by B. W. Skvortzow. Received May 10, 1922. Quoted notes by Mr. Skvortzow.

A collection of seeds from northern Manchuria.

55424 and 55425. AMARANTHUS spp. Amaranthaceæ.

Introduced for testing as possible sources of leaf vegetables for diabetics.

55424. AMARANTHUS CAUDATUS L.

The young leaves of this plant are used like spinach.

55425. AMARANTHUS PANICULATUS L.

The seeds of this plant are much used by Mexican Indians for making sweetmeats; the seeds are first roasted, then mixed with sirup made of honey or of sugar and water, rolled into balls, and eaten like sugared pop corn. The seeds are also ground and cooked in small cakes known as *alegría*, these cakes being eaten in large quantities by the poorer classes. (Adapted from note of Mrs. Zelia Nuttall under S. P. I. No. 46310.)

For previous introduction, see S. P. I. No. 54407.

55426. CORIANDRUM SATIVUM L. Apiaceæ.

Coriander.

"A Chinese variety."

55427. FAGOPYRUM VULGARE Hill. Polygonaceæ.

Buckwheat.

A medium-sized variety with brownish gray seeds.

55428. HOLCUS SORGHUM L. Poaceæ.

Sorghum.

(*Sorghum vulgare* Pers.)

A reddish yellow variety with black hulls.

55429. ORYZA SATIVA L. Poaceæ.

Rice.

"Water rice."

55430 to 55432. PHASEOLUS ANGULARIS (Willd.) W. F. Wight. Fabaceæ.

Adzuki bean.

55430. Straw-colored variety.

55431. Small red variety.

55432. "From the Chinese market."

Large variety with mottled red and white seeds.

55433 and 55434. PHASEOLUS AUREUS Roxb. Fabaceæ.

Mung bean.

55433. Seeds dull grayish green.

55434. "From the Chinese market."

Seeds bright green.

55424 to 55441—Continued.**55435 and 55436. PHLEUM spp. Poaceæ.**

Introduced in connection with timothy-breeding experiments.

55435. PHLEUM ALPINUM L.

"Seeds of wild plants from the Ussuri district, Siberia."

55436. PHLEUM PRATENSE L.**Timothy.**

"From the Nicolsk-Ussurisk Agricultural Experiment Station."

Contains some *Phleum alpinum*.**55437 to 55441.**

Introduced for forage-crop experiments.

55437. SOJA MAX (L.) Piper. Fabaceæ.
(*Glycine hispida* Maxim.)**Soy bean.**

"Black soy beans."

55438 and 55439. VIGNA SESQUIPEDALIS (L.) Fruwirth. Fabaceæ.
Yard-Long bean.**55438. Black variety.****55439. Brown variety.****55440 and 55441. VIGNA SINENSIS (Torner) Savi. Fabaceæ.****Cowpea.****55440. Seeds mottled with straw color and light chocolate.****55441. "From the market."****55442 and 55443.**

From Foochow, China. Seeds presented by C. R. Kellogg. Received May 20, 1922.

55442. ALLIUM ODORUM L. Liliaceæ.**Onion.**In Japan this onion is cultivated for its leaves, which are eaten as greens; in the spring the leaves are borne luxuriantly by the old bulbs, becoming about a foot in length. (Adapted from *Useful Plants of Japan, Agricultural Society, Tokyo, p. 17.*)**55443. MELASTOMA REPENS Desr. Melastomataceæ.**"A low perennial shrub which bears beautiful roselike flowers all summer long. The flowers last only one day, but because of their great number the shrub is always well covered. The fruits are said to be eaten, but have the lack of flavor so common in Chinese fruits." (*J. B. Norton.*)

For previous introduction, see S. P. I. No. 48718.

55444. HIBISCUS ROSA-SINENSIS L. Malvaceæ.

From Manila, Philippine Islands. Cuttings presented by H. H. Boyle, Manila, through the Bureau of Agriculture. Received May 25, 1922.

White Gumamela. A white variety of the well-known and exceedingly variable Chinese hibiscus.**55445. CASIMIROA TETRAMERIA Millsp. Rutaceæ. Matasano.**

From Tegucigalpa, Honduras. Seeds presented by G. K. Donald, American consul. Received May 27, 1922.

A Central American tree about 30 feet in height, with pale warty branches, digitate leaves about 8 inches long, and axillary panicles of greenish flowers. The edible fruit, approximately the size of an orange, has a green skin with spiny protuberances sparsely scattered over the surface; the white or yellow flesh is sweet or slightly sour and incloses two or three large black seeds. (Adapted from *Field Museum of Natural History, Chicago, Publications, Botanical Series, vol. 1, p. 401.*)

This species has fruited in the Miami Plant Introduction Garden and its large attractive fruits prove it to be one worthy of serious study by Florida horticulturists.

For previous introduction, see S. P. I. No. 21030.

For illustrations of a white sapote and its fruits, see Plates I and II.

55446. MEIBOMIA RENSONI Painter. Fabaceæ.

From San Salvador, Salvador. Seeds presented by Dr. Carlos Renson, Director del Laboratorio Químico. Received May 23, 1922.

"These seeds gave a perfect germination in from 4 to 10 days." (Renson.)

The *barajillo* is a rapidly growing shrub, native to the Republic of El Salvador at altitudes ranging from 2,000 to 4,000 feet. Under favorable conditions it sometimes becomes a small tree about 18 feet high. The trifoliolate leaves are softly hairy and up to 3½ inches in length, and the small purplish flowers are borne in terminal racemes late in October. The roots of the *barajillo* are very large and penetrate deeply into the soil; the tubercles formed by the nitrogen-gathering bacteria are usually found only on the upper third of the root. All kinds of cattle are exceedingly fond of this plant; furthermore, it is capable of enduring prolonged drought and of thriving in very poor soil. (Adapted from *Revista de Agricultura Tropical, El Salvador*, vol. 1, p. 65.)

For illustrations of the *barajillo*, see Plates III and IV.

55447. MICROCITRUS INODORA (Baill.) Swingle. Rutaceæ.

(*Citrus inodorus* Baill.)

Russell River lime.

From Brisbane, Queensland. Seeds presented by C. T. White, Botanic Museum and Herbarium, Botanic Gardens. Received May 25, 1922.

In general appearance the Russell River lime resembles the orange, having the same dark-green foliage. The very small white flowers are odorless, and the oval or oblong ribbed fruits are about 2½ inches long, with pulp having a sharp but agreeable flavor. This tree is native to the Bellenden Ker Mountain region of northern Queensland and is the only species of the genus which yields fruits of sufficiently good quality to be of promise for culture even without any improvement by cross-breeding or selection. (Adapted from Swingle, *Journal of the Washington Academy of Sciences*, vol. 5, p. 577, and from Bailey, *Report of the Government Expedition to Bellenden Ker Range*, p. 34.)

55448 to 55450. CERATONIA SILIQUA L. Cæsalpiniaceæ. Carob.

From Jerusalem, Palestine. Cuttings presented by I. Wilkanski, Jewish Agricultural Experiment Station. Received May 25, 1922. Quoted notes by Mr. Wilkanski.

55448. "*Habathi*. This is poorer in quality than the other two varieties, but gives a larger crop."

55449. "*Sandalawi*. This is the best variety as far as quality is concerned."

55450. "*Schehabi*. This is quite mediocre both in quality and yield."

55451 to 55453. GOSSYPIUM spp. Malvaceæ.

Cotton.

From Bela Vista, Angola, Africa. Seeds presented by H. A. Neipp, American Mission. Received May 19, 1922. Quoted notes by Mr. Neipp.

55451. *GOSSYPIUM* sp.

"Collected in dry season at 5,400 feet altitude."

55452. *GOSSYPIUM* sp.

"Collected during the wet season at 5,400 feet altitude."

55453. *GOSSYPIUM* sp.

"Collected in Lobito, sea level."

ONE OF THE WHITE SAPOTES OF CENTRAL AMERICA. (CASIMIROA
TETRAMERIA MILLSP.; S. P. I. NO. 55445.)

The common white sapote (*Casimiroa edulis*) has been cultivated in California for many years. The species here shown, *C. tetrameria*, is of more recent introduction and has not yet become well known in this country. At Miami, Fla., it grows lustily and produces in great abundance its yellow-green fruits, whose pale yellow flesh is of very sweet flavor with a bitter tang. *Casimiroa tetrameria* can be distinguished from *C. edulis* by its more pubescent leaves. The fruits of the two species are almost identical in character. (Photographed by Edward Simmonds, Plant Introduction Garden, Miami, Fla., October, 1921; P27993FS.)

A RARE SPECIES OF WHITE SAPOTE. (CASIMIROA TETRAMERIA MILLSP.; S. P. I. No. 55445.)

When fully ripe, the fruits of this rare white sapote are very soft and delicate in texture and must be handled with care to avoid bruising. They are usually eaten out of the hand and are highly interesting because of the peculiar combination of sweet and bitter flavors which they possess. The tree can be grown in many parts of California and Florida. It resists severe frosts and requires less water than many other fruit trees. (Photographed by E. L. Crandall, Photographic Laboratory, May 24, 1921; P2689P.S.)

THE BARAJILLO, A NEW LEGUMINOUS SHRUB FROM SALVADOR. (MEIBOMIA RENSONI PAINTER; S. P. I. No. 55446.)

The use of leguminous plants as green cover crops and soil builders is becoming universal. The one here shown, *Meibomia renseni*, has recently been called to the attention of horticulturists by Dr. Carlos Renson, of San Salvador. Under favorable conditions of climate and soil it reaches 18 feet in height. Its purplish flowers are borne in terminal racemes. The large roots penetrate deeply into the soil. Like other leguminous plants, *M. renseni* gathers nitrogen from the air and stores it in nodules upon the smaller roots. (Photographed by Dr. Carlos Renson, San Salvador, Salvador.)

YOUNG BRANCHES OF THE BARAJILLO. (MEIBOMIA RENSONI PAINTER;
S. P. I. No. 55446.)

This new leguminous shrub from Salvador, in addition to serving as a green cover crop, is said to be an excellent forage for livestock. The plant thrives in poor soil and is said to resist drought admirably. It should be tried in tropical regions, where it may prove to be more valuable than the pigeon-pea, now used extensively as a cover crop and soil builder. (Photographed by Dr. Carlos Renson, San Salvador, Salvador.)

55454 and 55455. GARCINIA spp. Clusiaceæ.

From Santa Fe, Isle of Pines. Seeds presented by H. S. Jones. Received May 27, 1922.

Introduced for testing as a stock for the mangosteen (*Garcinia mangostana* L.).

55454. GARCINIA TINCTORIA (DC.) W. F. Wight.
(*G. xanthochymus* Hook. f.)

A medium-sized tree, native to southern Asia, with smooth, bright-yellow, strongly acid fruits the size of an orange.

For previous introduction, see S. P. I. No. 47358.

55455. GARCINIA sp.

Fruits yellow, about 2 inches in diameter.

55456 to 55462. SOLANUM TUBEROSUM L. Solanaceæ. Potato.

From Ibarra, Ecuador. Tubers presented by Sr. José Felix Tamayo. Received May 29, 1922.

"These varieties of *Chaucha* potatoes were grown near Ibarra, Ecuador. The *Chauchas* (Quichua, early) are a group of potatoes cultivated in the Ecuadorian highlands at altitudes between 8,000 and 12,000 feet. Commercially they are not very important, due to the fact that they do not keep as well as other varieties, but they are much cultivated for home use. The tubers are of good size; those of some varieties are of good quality, while others are rather inferior. The color, both of surface and flesh, is variable.

"The *Chauchas* mature in about five months from the time of planting, when cultivated at an elevation of 12,000 feet; other varieties require seven to eight months. As soon as the plants come into bloom the tubers are considered to be mature and are dug for eating. Unlike other varieties, which must be dug and then stored for a period before resowing, the *Chauchas* can be resown immediately after digging. The yield is fairly heavy, but not as great as that of some of the late-maturing varieties." (Wilson Popenoe.)

55456. (No. 1.)

55460. (No. 5.)

55457. (No. 2.)

55461. (No. 6.)

55458. (No. 3.)

55462. (No. 7.)

55459. (No. 4.)

55463. CUCURBITA PEPO L. Cucurbitaceæ. Squash.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received May 31, 1922.

Introduced in connection with experiments to determine the specific identity of our cultivated pumpkins and squashes.

Courge de Mirepoix. (Mirepoix Musk squash.) A variety cultivated in southern France, with a strong trailing stem, large erect leaves with rounded lobes, and pear-shaped, slightly ribbed fruits which are dark green, streaked with light green. The flesh is dark red, firm, and fragrant. (Adapted from Robinson, *The Vegetable Garden*, p. 327.)

55464. CERATONIA SILIQUA L. Cæsalpiniaceæ. Carob.

From Chasaki, Athens, Greece. Presented by P. O. Anagnostopoulos, director, Horticultural Station. Received May 27, 1922.

Cuttings of a variety of carob, grown near Athens, Greece. Obtained at the request of Dr. J. Eliot Coit, of Los Angeles, who has been in correspondence with Mr. Anagnostopoulos, and who believes that the variety may be a superior one for cultivation in California, where the carob is receiving serious attention.

55465. ONCOBA ECHINATA Oliver. Flacourtiaceæ.**Gorli.**

From Sierra Leone, Africa. Purchased from L. A. King-Church, conservator of forests, Freetown, Sierra Leone. Received June 1, 1922.

"The commercial sources of chaulmoogra oil and some closely related products which yield chaulmoogric and hydnocarpic acids have always been and still are the seeds of forest trees (*Taraktogenos kurzii*, *Hydnocarpus anthelminthica*, and *H. wightiana*, and possibly others) growing in the rain-forest regions of British India and Siam. It has, however, been observed by Goulding and Akers that the seeds of a West African shrub, *Oncoba echinata*, yield an oil which contains a large proportion of chaulmoogric acid.

"Through the explorations of J. F. Rock, of this office, seeds of the forest trees (*Taraktogenos kurzii*, *Hydnocarpus anthelminthica*, *H. wightiana*, and *H. castanea*) have been secured and plants obtained from them are now being grown in various countries. Inasmuch as these are all tall trees, considerable time would doubtless be required for the production of fruit. On account of this fact a search has been made for more rapidly maturing plants which yield chaulmoogric acid, and through the kindness of L. A. King-Church, conservator of forests of Sierra Leone, a considerable quantity of seeds of the *gorli* shrub (*Oncoba echinata*) has been secured.

"Since the investigations of Goulding and Akers (see Proceedings of the Chemical Society of London, vol. 29, No. 417, p. 197) of the Imperial Institute, have established the fact that *gorli* seeds yield 45.6 per cent of fat and that the mixed fatty acids obtained from this consist to the extent of 87.5 per cent of chaulmoogric acid, the importance of making an attempt to get the plant and cultivating it was pointed out by Dr. Frederick B. Power in his chapter in Mr. Rock's bulletin entitled: 'The Chaulmoogra Tree and Some Related Species,' p. 8 (U. S. Department of Agriculture Bulletin No. 1057).

"From the literature relating to the genus *Oncoba* it appears that it is composed of shrubs or small trees; that there are several species, all of them African, and that they bear fruits of considerable size. *Oncoba echinata*, for example, has fruits resembling in size and shape an unopened chestnut bur. That these shrubs are precocious is indicated by the fact that one species, *Oncoba routledgii*, flowered in England two years from seed. This won a certificate from the horticultural society on account of the conspicuous beauty of its large white flowers, which are 2 or 3 inches in diameter.

"Whether *Oncoba echinata* is especially particular as to its soil requirements remains to be determined, but, judging from the experience which we have had with other trees and shrubs from Natal and other portions of Africa, there would seem to be a fair chance that it might thrive even on the limestone soils of southern Florida." (David Fairchild.)

55466 and 55467. AVENA SATIVA L. Poaceæ.**Oats.**

From Cambridge, England. Seeds presented by Prof. R. H. Biffen, Cambridge School of Agriculture. Received May 24, 1922.

These two new hybrid varieties of *white winter* oats were originated at the Plant-Breeding Institute, Cambridge, England, and are introduced for the use of oat breeders in this country.

55466. A. 69.

55467. A. 147.

55468 and 55469.

From Oxtutzcab, Yucatan, Mexico. Seeds presented by Sr. Moises Vasquez Vega. Received May 29, 1922.

55468. *CARICA PAPAYA* L. Papayaceæ.**Papaya.**

"The fruits are very large, weighing from 17 to 22 pounds." (Vega.)

For previous introduction, see S. P. I. No. 52620.

55469. *JACARATIA MEXICANA* A. DC. Papayaceæ.

A relative of the papaya (*Carica papaya* L.), introduced for breeding experiments.

"A tree with a smooth, tapering trunk and many slender branches. The leaves are palmately seven parted and the fruits, about 6 inches

55468 and 55469—Continued.

long, are five winged, each wing terminating in an incurved spur at the base. These sweetish edible fruits are preserved with sugar. The tree is commonly called *bonete* or *papaya silvestre* and occurs in Yucatan and Chiapas, Mexico, and other parts of tropical America." (*W. E. Safford.*)

55470. AMYGDALUS PERSICA \times **COMMUNIS.** Amygdalaceæ. **Peach-almond hybrid.**

From Mexico, D. F., Mexico. Seeds presented by Prof. Juan Balme. Received June 1, 1922.

The peachmond, a supposed peach-almond hybrid, interesting to those engaged in breeding stone fruits.

55471. CHENOPodium QUINOA Willd. Chenopodiaceæ. **Quinoa.**

From Cuzco, Peru. Seeds presented by Dr. Alber A. Giesecke, Cuzco University. Received June 1, 1922.

For previous introduction and description, see S. P. I. No. 55051.

55472 to 55475. CAPSICUM ANNUUM L. Solanaceæ. **Red pepper.**

From Valencia, Spain. Seeds presented by Henry C. A. Damm, American consul. Received June 10, 1922.

55472. *Paprika* No. 1.

55473. *Paprika* No. 2.

55474. *Pimiento largo dulce de España.*

55475. *Pimiento Morron.*

For previous introduction, see S. P. I. No. 32370.

55476. PRUNUS MAJESTICA Koehne. Amygdalaceæ. **Cherry.**

From Kingtungting, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received June 2, 1922.

"(No. 2967. Manoh, Yunnan. March 30, 1922.) A large, handsome tree, 40 to 50 feet in height, with large green leaves and oblong, bright-red, bitter, fleshy fruits. It grows at altitudes of 6,000 feet on ridges with *Pyrus yunnanensis* and is very drought resistant, enduring drought for seven months or more. Also it can withstand the intense heat of April and the freezing temperatures of winter. It is a prolific bearer, but is useful only as a stock plant and as an ornamental." (*Rock.*)

55477. NAGEIA NAGI (Thunb.) Kuntze. Taxaceæ.
(*Podocarpus nagi* Pilger.)

From Okitsu, Shizuokaken, Japan. Seeds presented by T. Onda, director, Government Horticultural Experiment Station. Received June 2, 1922.

An evergreen subtropical tree 30 to 60 feet high, with very narrow, bluish green, sharp-pointed leaves about 3 inches long arranged in two rows on the branches. The fruit is a small, fleshy, purplish black drupe which emits a balsamlike fragrance when cut. In Japan, where this tree is native, the white, fine-grained wood is used for furniture and general building. Propagation is easily carried on by seeds, of which the tree produces an abundance. (Adapted from *Useful Plants of Japan, Agricultural Society, Tokyo, p. 145, and Revue Horticole, vol. 86, p. 77.*)

55478. SALPICHROA RHOMBOIDEA (Gill. and Hook.) Miers. Solanaceæ.

From Buenos Aires, Argentina. Seeds presented by Sr. Benito Carrasco, director, Botanic Garden. Received June 2, 1922.

Introduced for use in tomato-breeding experiments.

An ornamental relative of the tomato, with white flowers and edible, white, transparent berries which resemble the pineapple in flavor. Because of its attractive appearance and creeping habit it is very effective for covering bare places. (Adapted from *The Garden*, vol. 35, p. 367.)

55479. AVENA NUDA Hoejer. Poaceæ. Naked oats.

From Min Hsien, Kansu, China. Seeds presented by William H. Ruhl. Received June 2, 1922.

"This is the variety of huskless oats grown in the Province of Kansu." (*Ruhl.*)

55480. PHLEUM PRATENSE L. Poaceæ. Timothy.

From Sydney, New South Wales. Presented by George Valder, under-secretary and director, New South Wales Department of Agriculture. Received June 12, 1922.

Locally grown timothy seed introduced for cultural and comparison experiments.

55481. HIBISCUS CANNABINUS L. Malvaceæ.

From Pusa, Bengal, India. Seeds presented by A. Howard, Imperial economic botanist, through Robert S. Finlow, fiber expert to the Government of Bengal. Received June 3, 1922.

Introduced for trial as a fiber-producing plant.

A prickly stemmed plant 6 to 8 feet in height, cultivated throughout India for its fiber, which is used as a substitute for hemp. The fiber is soft, white, and silky and is considered by some authorities to be more durable than jute for coarse textiles. (Adapted from *C. R. Dodge, Useful Fiber Plants of the World*, p. 192.)

55482. DIOSCOREA CAYENENSIS Lam. Dioscoreaceæ.

From Guantanamo, Cuba. Tuber collected at Baltimore, Md., by C. E. Prince, inspector, Federal Horticultural Board. Received June 3, 1922.

"A yellow-fleshed yam having a somewhat bitter taste, but otherwise of very good quality. The vine is dark green and thorny." (*R. A. Young.*)

55483. LYCOPERSICON ESCULENTUM Mill. Solanaceæ. Tomato.

From Naples, Italy. Seeds presented by the Italian School of Agriculture at Portici, through Homer M. Byington, American consul. Received June 3, 1922.

"*King Humbert.* This belongs to the group of tomatoes used by the Italians for making tomato paste. The fruits are pear shaped. The vine is very vigorous and quite productive." (*D. N. Shoemaker.*)

Introduced for the use of specialists in tomato breeding.

55484. JUNIPERUS PROCERA Hochst. Pinaceæ. East African cedar.

From Jamaica Plain, Mass. Seeds presented by Prof. C. S. Sargent, Arnold Arboretum, Harvard University. Received June 3, 1922.

"This is probably the largest and handsomest juniper in the world. It is a native of the high mountains of eastern tropical Africa and should prove an extremely valuable tree in the mountains of the West Indies; it may grow in the southern United States." (*Sargent.*)

55485. ZIZIPHUS MAURITIANA Lam. Rhamnaceæ. Indian jujube.
(*Z. jujuba* Lam., not Mill.)

From Assam, India. Seeds presented by S. K. Mitra, economic botanist. Received June 5, 1922.

The Indian jujube is cultivated chiefly for its fruit, which varies in shape from more or less spherical in the wild or commoner kinds to oval or oblong in the cultivated kinds. The pulp is mealy and pleasantly sweetish; some of the cultivated varieties are very fine. The tree is found throughout India. (Adapted from *Brandis, Forest Flora of India*, p. 88.)

For previous introduction, see S. P. I. No. 41443.

For an illustration of this jujube, see Plate V.

55486. ACANTHOSICYOS HORRIDA Welw. Cucurbitaceæ.

From Pretoria, Union of South Africa. Seeds presented by Dr. I. B. Pole Evans, through Dr. H. L. Shantz, physiologist in charge of the Office of Plant Physiological and Fermentation Investigations. Received June 5, 1922.

"*Narras*. A remarkable cucurbitaceous plant which grows on the dunes of the Namib, where subterranean waters exist. Even when this water is at great depths this plant subsists. It forms thorny thickets on the sand hills of Southwest Africa and is adapted to a hot, dry climate, with little or no rainfall. The fruit is the size of an ostrich egg. Both the pulp and seeds are used as food by the natives. The fruits are produced in abundance, and for about four months of the year the more primitive Hottentots are said to survive with practically no other source of food or water. The fruits are eaten and water is secured from them. The seeds when ripe are plump and about the size of watermelon seeds.

"The plant is one which should be of great value to our Indians of the Southwest if once established on the sand dunes of Arizona and southern California. It is doubtful if any plant can be secured which seems offhand to give greater promise in that region than does this cucurbit." (*Shantz*.)

For previous introduction, see S. P. I. No. 31401.

55487. AMYGDALUS PERSICA L. Amygdalaceæ. Peach.
(*Prunus persica* Stokes.)

From Santa Ines, Chile. Plants presented by Sr. Salvador Izquierdo, Santiago, Chile. Received June 12, 1922.

"*Pomona Improved*. Sr. Izquierdo writes that this is an improved form of the variety *Pomona*, grown at his nursery at Santa Ines. Preserved fruits which he has sent us to show the character of the variety indicate that it is a fruit of unusually large size, deep yellow, clingstone, and of excellent quality for canning. It should be tried in California, where it may prove to have real value. Its season of ripening is not known." (*Wilson Popenoe*.)

55488. MEDICAGO SATIVA L. Fabaceæ.

From Loja, Ecuador. Seeds presented by Sr. Enrique Witt. Received June 15, 1922.

Locally grown seed introduced for experiments in alfalfa breeding.

55489. ILEX PARAGUARIENSIS St. Hil. Aquifoliaceæ. Yerba maté.

From Buenos Aires, Argentina. Presented by D. S. Bullock, agricultural commissioner, Bureau of Markets and Crop Estimates, United States Department of Agriculture. Received June 5, 1922.

"These seeds were harvested in April in the Territory of Misiones." (*Bullock*.)

A small, bushy, evergreen tree with serrate alternate leaves, native to Brazil and Paraguay and the neighboring countries. The leaves are roasted and ground to make the Paraguay tea of commerce, which is said to possess the good properties of tea and coffee without their injurious after effects.

For previous introduction, see S. P. I. No. 47309.

55490 and 55491. LENTILLA LENS (L.) W. F. Wight. Fabaceæ. Lentil.
(*Lens esculenta* Moench.)

From Malaga, Spain. Seeds presented by Sr. Luis Liro Ortiz, Ingeniero de la Sección Agronómica Málaga, through Gaston Smith, American consul. Received June 12, 1922.

55490. From Arevalo, Province of Avila.

55491. From the Province of Salamanca.

55492. DIOSCOREA ALATA L. Dioscoreaceæ. Greater yam.

From the Bahama Islands. Tuber collected at New York by Federal Horticultural Board inspectors. Received June 8, 1922.

"Tuber of an unidentified variety of the greater yam for testing in Florida and the Gulf region. The vine is four angled and prominently winged, with the margins of the wings purplish. The central part of the young leaf has purplish shading between the veins." (*R. A. Young.*)

55493. ILEX PARAGUARIENSIS St. Hil. Aquifoliaceæ. Yerba maté.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received June 7, 1922.

For previous introduction and description, see S. P. I. No. 55489.

55494. RUMEX TUBEROSUS L. Polygonaceæ. Sorrel.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received June 2, 1922.

"A very good sorrel from the Atlas region of Algeria." (*Trabut.*)

"The leaves are often used as a vegetable." (*Dragendorff, Die Heilpflanzen, p. 190.*)

55495. SEVERINIA BUXIFOLIA (Poir.) Ten. Rutaceæ.
(*Atalantia buxifolia* Oliver.)

From Buitenzorg, Java. Seeds presented by the director of the Botanic Garden. Received June 5, 1922.

A much-branched thorny shrub which is not uncommon in southern China and French Indo-China; it has oval, shiny green leaves, axillary clusters of small white flowers, and small berrylike fruits which become very dark red or nearly black. In Louisiana this handsome shrub has proved useful for hedges, especially the forms which have thorns 2 or 3 inches long; furthermore, it is easily propagated from cuttings. Experiments have shown that *Severinia* can withstand unusually large amounts of salt in the soil, and it may prove of interest for citrus fruits in regions having alkali in the soil or salty irrigation water. (Adapted from *Swingle, Journal of the Washington Academy of Sciences, vol. 6, p. 651.*)

55496. GARCINIA MANGOSTANA L. Clusiaceæ. Mangosteen.

From Peradeniya, Ceylon. Plants presented by Dr. F. A. Stockdale, Director of Agriculture for Ceylon, through Mrs. Arthur Curtis James. Received June 5, 1922.

"In the hope of establishing the mangosteen in our tropical dependencies, many importations of seeds and plants have been made during the last 20 years. Indeed, the office has made it a point never to miss an opportunity to secure new stock, whether in the form of a shipment of seeds by parcel post or a wardian case of young plants which some traveler returning from the East has generously volunteered to bring home. This lot of plants which Mrs. Arthur Curtis James secured from the Botanic Garden at Peradeniya, Ceylon, and which she has carefully brought with her on the deck of the yacht *Aloha*, was presented by Dr. F. A. Stockdale, Director of Agriculture for Ceylon." (*Wilson Popenoe.*)

For description of the mangosteen, see S. P. I. No. 51465.

A JUJUBE FOR MOIST TROPICAL REGIONS. (*ZIZIPHUS MAURITIANA* LAM.;
S. P. I. No. 55485.)

The Chinese jujube (*Ziziphus jujuba*) is being cultivated with great success in California and the Southwestern States. It is not successful, however, in southern Florida or in humid tropical regions generally. *Ziziphus mauritiana*, on the other hand, grows and fruits well at the Plant Introduction Garden, Miami, Fla., and will probably be suitable for cultivation in Porto Rico, Hawaii, and the Philippines. It is a small tree of attractive appearance, and its greenish yellow fruits, here illustrated in natural size, when stewed are scarcely distinguishable from the best northern plums. (Photographed by E. L. Crandall, Photographic Laboratory, February 7, 1922; P27245FS.)

BARBADOS RED, A GOOD VARIETY OF TROPICAL YAM. (*Dioscorea alata* L.;
S. P. I. No. 55561.)

This is a horticultural form of *Dioscorea alata*, technically known as the greater yam. It is widely grown in the West Indies and is closely related to the Dago haya, or Guam yam. It is, however, better than the latter in some respects. The tuber has a purple inner skin, and the firm flesh, mealy when cooked, is purplish and of good flavor. The yam replaces the potato in certain tropical regions and in its best varieties is fully equal to the latter; indeed, good yams properly cooked can hardly be distinguished from potatoes. (Photographed, natural size, by E. L. Crandall, Photographic Laboratory, June 23, 1922; F27585FS.)

55497 to 55499.

From Talifu, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received June 18, 1922. Quoted notes by Mr. Rock:

55497. *PYRUS* sp. Malaceæ.

Pear.

"(Talifu, Yunnan. April 18, 1922.) An edible pear about the size of a large apple; the flesh is light yellow, and the skin is thin, firm, and light citron colored with a red hue, hence the name *Wu pa li*, 'touched-by-the-fire' pear. The tree grows on the side of the lake opposite to Talifu."

55498. *PRUNUS MAJESTICA* Koehne. Amygdalaceæ.

Cherry.

"(No. 3066. Near Chukai, Yunnan. April 5, 1922.) A lovely tree with large serrate leaves; the branches were bent with their load of large, oblong, deep-red, cherrylike fruits. It is early fruiting, the fruits appearing in late February or early in March, and the tree seems to be absolutely free from insect or fungous pests. It occurs throughout the Black River Valley at altitudes of about 5,000 feet on mountain slopes, also near Szemao, where it is rare, and more commonly near Nanchien. The Chinese name is *Yin to* or *Yin tao*."

55499. *RUBUS ELLIPTICUS* J. E. Smith. Rosaceæ.
(*R. flavus* Buch.-Ham.)

Raspberry.

"(Nanchien, Yunnan. April 8, 1922.) A very stout shrub which, especially when young, is densely covered with long, red, almost hairlike spines. The flowers are white, and the deep-yellow, almost orange, very juicy acid fruits are collected by the hill tribes and brought to the markets; the fruits ripen earlier on the mountains than in the valley. The shrub is found at altitudes of 6,000 to 7,000 feet all the way up to Talifu; it grows on the high hills near Szemao, and I also came across it in Kengtung."

55500 and 55501.

From Nanchien, Yunnan, China. Cuttings collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received June 13, 1922. Quoted notes by Mr. Rock.

55500. *PRUNUS MAJESTICA* Koehne. Amygdalaceæ.

Cherry.

"(Szemao, Yunnan, March 18, 1922.) These seeds were sent to me at Talifu from the mountains near Szemao; they are said to be from the first wild edible cherries which came to the market."

55501. *SACCHARUM OFFICINARUM* L. Poaceæ.

Sugar cane.

"(Nanchien, Yunnan. April 27, 1922.) The cane is erect, tall, of a uniform reddish yellow color, and very juicy and sweet. It is cultivated throughout the central portion of Yunnan, south of Mengwa, and also near Puerhfu, in southern Yunnan; it is grown at an altitude of 5,000 to 6,000 feet and even higher. The region is very dry, and arid mountains form the slopes of the valleys."

55502. TRIFOLIUM PRATENSE L. Fabaceæ.

Red clover.

From Valence sur Rhone, France. Seeds purchased from Tezier Frères. Received June 17, 1922.

Medium red clover seed introduced for comparison and cultural experiments.

"This seed is from the 1921 harvest and was grown about 8 kilometers (about 5 miles) east of Valence." (*Tezier Frères*.)

55503. LYCOPERSICON ESCULENTUM Mill. Solanaceæ.

Tomato.

From Buenos Aires, Argentina. Seeds presented by D. S. Bullock, agricultural commissioner, Bureau of Markets and Crop Estimates, United States Department of Agriculture. Received June 15, 1922.

Perfección. Introduced for the use of specialists of this bureau who are engaged in tomato-breeding experiments.

55504. TELFAIRIA PEDATA (J. E. Smith) Hook. Cucurbitaceæ. Koume vine.

From Nairobi, Kenia, Africa. Seeds presented by A. Holm, director, Department of Agriculture. Received June 6, 1922.

"A perennial climber, indigenous to eastern Africa, which grows very luxuriantly in this colony. The kernels of the seeds are used by the natives both as a foodstuff and as a source of edible oil."

"The following analysis of the seeds has been published by Gilbert (see Sadebeck, *Die Kulturgewächse der Deutschen Kolonien und Ihre Erzeugnisse*, Jena, 1899, p. 245):

	Per cent.
Moisture-----	6.54
Ash-----	2.04
Oil-----	36.02
Protein-----	19.63
Woody fiber-----	7.30
Nitrogen-free extractive matter-----	28.45

"These seeds are flat, irregularly circular in shape, and about $1\frac{1}{4}$ to $1\frac{1}{2}$ inches in diameter. The single seeds average 4.9 grams in weight.

"The Imperial Institute of London has reported as follows:

"The seeds consist approximately of fibrous husk 11 per cent, shell 38 per cent, and kernel 51 per cent."

"The kernel yields 56.9 per cent of slightly reddish brown oil.

"The oil from seeds from Zanzibar gave the following analysis:

Specific gravity at 15° C-----	0.919
Acid value-----	2.6
Saponification-----	196
Iodin value-----	89

"This is a nondrying oil and has a pleasant, slightly sweet taste. It would be suitable for soap manufacture and also as an edible oil. The seed is used by Europeans in this colony both as a nut and as a flavoring for cakes.

"The reason that these seeds are not more used is due to the hardness of the shell and the difficulty of removing it, as well as to the intensely bitter, green skin which separates the kernel from the shell. If a method could be found of removing the tough fibrous husks and this bitter skin, it would appear that the seed would be of considerable commercial value, both for its edible oil and for the manufacture of soap, as well as for the resultant oil cake, which would probably make a good cattle feed. It would be impossible, however, to use the cake after pressing the unhusked seeds, on account of the skin mentioned above.

"A German syndicate of soap and candle manufacturers at Mannheim has investigated the possibilities of these seeds, but expressed the opinion that it would be inadvisable to place consignments of the seeds on the European market until a machine had been invented for rapidly and cheaply shelling them.

"These seeds grow very rapidly in any place which is not touched by frost. The pod containing the seeds is about a foot in diameter when ripe. The vine climbs over neighboring trees and requires no care." (*S. W. Eels, American consul, Nairobi, Kenia.*)

For previous introduction, see S. P. I. No. 52450.

55505 to 55508. RUBUS spp. Rosaceæ. Raspberry.

From Slough, England. Plants purchased from Charles Turner, The Royal Nurseries. Received June 2, 1922.

55505. RUBUS sp.

Carter's Prolific. A moderately vigorous variety with spiny canes about 3 feet high and very small leaves; it is a good cropper, and the berries are medium sized, deep red, and nearly round, firm, and of good flavor. (Adapted from *Journal of the Royal Horticultural Society*, vol. 47, p. 47.)

55506. RUBUS sp.

"Northumberland Fillbasket. Large, deep-red fruits of good flavor." (*Dicksons's 1921-22 Catalogue.*)

55505 to 55508—Continued.**55507. RUBUS sp.**

"*Perfection*. Very stout bright-crimson canes and large bright-red fruits of excellent flavor. A vigorous grower, thriving on light soils." (*George Bunyard's Catalogue*.)

55508. RUBUS sp.

"*The Guinea*. A new yellow variety of great excellence." (*Charles Turner's Catalogue*.)

For previous introduction, see S. P. I. No. 41976.

55509. PERSEA AMERICANA Mill. Lauraceæ.**Avocado.**

(*P. gratissima* Gaertn. f.)

Seedling now growing at the Plant Introduction Garden, Miami, Fla.

"*Collinson*. This is a seedling of the Collins Guatemalan avocado (S. P. I. No. 19080); it was planted at the new garden in 1915, endured well the frost of February, 1917, when the temperature went to 26° F., before a good crop of fruit in 1920 and 1921, and at this date (March 7, 1922) still has fruit on the tree. The tree is upright in habit, with large leaves which do not burn in the summer. This year the fruits are of better quality than before, the average weight being about 1½ pounds; color, green; seed, tight in the cavity; flavor, good." (*Edward Simmonds*.)

55510 to 55515. SOLANUM TUBEROSUM L. Solanaceæ. Potato.

From Sydney, New South Wales. Tubers presented by George Valder, undersecretary and director, New South Wales Department of Agriculture, through W. D. Kerle, Inspector of Agriculture. Received June 17, 1922.

These are old varieties of American origin which are being cultivated in New South Wales. They have been reintroduced from New South Wales for special studies by potato experts. William Stuart, of the Bureau of Plant Industry, has furnished the descriptive notes from old American catalogues.

55510. *Adirondack*. This variety is a hybrid with *White Peachblow*. It is distinguished from the latter in its upright habit and larger bright-green leaves. The red-skinned, almost perfectly spherical tubers are much clustered; the flesh is pure white. (Adapted from *Potato Catalogue of B. K. Bliss & Sons, 1881, p. 5*.)

55511. *Brownell's Beauty*. The foliage is deep green and very healthy; the tubers grow compactly in the hill and are easily dug, ripening in about three months from the time of planting. The tubers are medium to large, oval or somewhat flattened with the eyes few and nearly even with the surface; the skin is reddish or deep-flesh color; the flesh is white, fine-grained, and very delicate. For the table, when baked or boiled, they are equal to the best. (Adapted from *Potato Catalogue of R. K. Bliss & Sons, 1874, p. 4*.)

55512. "*Carmen No. 1*." (Synonym *Rural New York No. 1*.) This is a seedling from seedlings raised through several generations. It belongs to the Green Mountain group. The vines are large, strong, healthy, and well branched. The flowers are white and abundant, but rarely producing seeds. The abundant tubers are large, broadly roundish, with rather shallow eyes, creamy white skin, and white flesh of very fine quality." (*Stuart*.)

55513. *Manhattan*.

55514. *Manhattan Black*. This is a main-crop variety and may be called "Improved Compton's Surprise." The vines are vigorous, with dark-green foliage; the tubers are nearly round, with dark-purple skin and very solid white flesh of fine grain; in size medium to large. (Adapted from *Potato Catalogue of B. K. Bliss & Sons, 1880, p. 18*.)

55510 to 55515—Continued.

55515. *Queen of the Valley*. The vines are large and unusually vigorous, resisting disease well; the leaves are large, thick, and dark green. The very large tubers are long-flattened, but because of their large size are less suitable for table use than for feeding livestock. (Adapted from *Potato Catalogue of B. K. Bliss & Sons, 1881, p. 9.*)

55516. *FRAGARIA* sp. Rosaceæ.

Strawberry.

From Irapuato, Guanajuato, Mexico. Plants sent by Juan Lopez Comaremy, Irapuato, at the request of Arthur Stockdale, Mexico City. Received June 20, 1922.

For previous introduction and description, see S. P. I. No. 54976.

55517 to 55519. *MEDICAGO SATIVA* L. Fabaceæ.

Alfalfa.

From Lima, Peru. Seeds presented by Dr. W. E. Dunn, acting commercial attaché. Received May 10, 1922.

Peruvian alfalfa has proved of great value in certain parts of the United States. In the hope of securing new strains which may be superior in certain respects to any now grown in the United States, an effort is being made to obtain seed from as many different regions in Peru as possible. The following note is taken from H. L. Westover, *The Development of the Peruvian Alfalfa Industry in the United States*, Department Circular 93:

"As compared with common alfalfa, both the Peruvian and 'smooth Peruvian' alfalfas are more upright, less branched, and have fewer and somewhat coarser stems and smaller crowns. In thick stands, these differences are hardly noticeable. Most of the Peruvian introductions are also characterized by rapid growth, quick recovery after cutting, and in sections having a mild climate ability to make growth in cool weather after ordinary alfalfas have ceased growing. Under such conditions the former starts growth earlier in the spring and continues later in the fall, thereby giving more cuttings each season. The principal objection advanced in times past to these alfalfas is their tendency to become somewhat woody when allowed to stand beyond the flowering stage, but this difficulty is easily obviated by harvesting earlier.

"Lack of hardness will always confine the successful production of the true and smooth Peruvian alfalfas to the southern and southwestern portions of the United States, where the climatic conditions are comparatively mild. They can not be grown to advantage where the winter temperature falls below 10° F.

"At the present time most of the Peruvian and smooth Peruvian alfalfa in the United States is found in Arizona and California. It has also been grown to a limited extent in New Mexico, Texas, and the coastal regions of the South-eastern States. The results secured seem to indicate that in much of this region the common alfalfa could be replaced very profitably by Peruvian alfalfa."

55517. *Monsefu Norte*.55519. *Sierra Alta*.55518. *Quebrada de Tangas*.

55520 to 55547.

From Ariana, near Tunis, Africa. Seeds presented by F. Boeuf, chief, Botanical Service of Tunis. Received May 31, 1922.

55520 to 55524. *AVENA STERILIS* L. Poaceæ.

Oats.

55520. *Crème*.55523. *Noire*.55521. *Grise*.55524. *Rousse*.55522. *Hybride*.55525 to 55527. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceæ. Barley.55525. *Fourragère*.55527. *Commune J*.55526. *Commune A*.

55520 to 55547—Continued.

55528. *LOLIUM MULTIFLORUM* Lam. Poaceæ. Italian rye-grass.

"Italian rye-grass is used to a limited extent for meadow, pasture, and lawn and in the South is of some importance for winter forage" (A. S. Hitchcock.)

55529 to 55546. *TRITICUM DURUM* Desf. Poaceæ. Durum wheat.

55529. *Adjini.*

55538. *Mahmoudi AC 3.*

55530. *Agili.*

55539. *Mahoudi AP 5.*

55531. *Agiliblanc (No. 1).*

55540. *Medea.*

55532. *Agiliblanc (No. 2).*

55541. *Mekki 1.*

55533. *Aouedj.*

55542. *Mekki 2.*

55534. *Derbessi.*

55543. *Souri AC 60.*

55535. *Biskri.*

55544. *Souri AP 5.*

55536. *Hamira.*

55545. *Sbei 1.*

55537. *Jenah Rhetifah.*

55546. *Sbei 2.*

55547. *VICIA MICHAUXII* Spreng. Fabaceæ. Vetch.

Introduced for trial as green manure and as a forage plant.

A creeping or climbing annual vetch, native to Syria, with very narrow leaflets, light-yellow flowers, and hairy pods about an inch long. (Adapted from *Post, Flora of Syria, Palestine, and Sinai*, p. 288.)

55548. ORNITHOPUS SATIVUS Brot. Fabaceæ. **Serradella.**

From Hamburg, Germany. Seeds purchased from Ernst & Von Spreckelsen. Received June 20, 1922.

Introduced for testing as a winter forage crop in the South.

For previous introduction, see S. P. I. No. 39345.

55549. AMYGDALUS PERSICA L. Amygdalaceæ. **Peach.**

(*Prunus persica* Stokes.)

From Eastwood, New South Wales. Plants purchased from C. E. Vessey, Mount Tomah Nurseries, through H. R. Wright, Avondale, Auckland, New Zealand. Received June 20, 1922.

"*Goodman's Choice.* We have sent out a number of letters to friends who are in a position to know the behavior of this peach and its comparison with *Phillips Cling*. So far we have only two replies, one from Mr. Goodman, who states that this is easily the best-quality canning peach the canners have ever seen, and that growers in this State (Victoria) are putting in more acres of it than all other yellow clings put together.

"His catalogue description, quoted below, shows that it ripens about six weeks later than *Tuscan Cling*:

"Undoubtedly the greatest yellow-fleshed clingstone peach introduced for many years. The tree is a heavy bearer each season of medium-sized fruit that is admirable for canning. The skin has a red blush on the sunny side; the flesh is beautifully rich and translucent; the variety is remarkable for even crops and gradual ripening, which means so much when the picking campaign is in progress. The fruit ripens toward the end of February and, as the name indicates, represents my choice for canning."

"We know the behavior of the clings generally in this State, and we find that they have a great tendency to be uneven in shape. Our own nurseryman states that *Goodman's Choice* is one of the best late peaches that he has come across, but as we have no growers for canneries around there we can not give an authoritative report from that point of view ourselves." (Herbert J. Rumsey, Dundas, New South Wales.)

55550. PYRUS sp. Malaceæ.**Pear.**

From Talifu, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received June 27, 1922.

"(Talifu, May 4, 1922.) Seeds of a domesticated pear, from Haitung, on Lake Erh Hai, about 10 miles from Talifu." (Rock.)

55551. HORDEUM VULGARE PALLIDUM Seringe. Poaceæ. Barley.

From Valparaiso, Chile. Seeds purchased from S. Reid Thompson, American vice consul in charge. Received June 20, 1922.

"In Chile *Forjara* barley is cut twice for hay, and after that a third crop gives a good yield of grain. If this barley would give similar results in Oregon it would be of very great value." (F. C. Reimer, Oregon Agricultural College Experiment Station.)

55552 and 55553.

From Buitenzorg, Java. Seeds presented by the director, Botanic Garden, Buitenzorg. Received June 23, 1922.

55552. GARCINIA MANGOSTANA L. Clusiaceæ.**Mangosteen.****55553. RHEEDIA EDULIS (Seem.) Planch. and Triana. Clusiaceæ.**

"This is occasionally cultivated in Brazil under the name of *limão do matto* (wild lemon); it is a small, handsome tree with oblong glossy green leaves and elliptic yellow fruits 2 inches long. The white pulp is highly acid." (Wilson Popenoe.)

55554 and 55555.

From Barberton, Transvaal. Seeds presented by George Thorncroft. Received June 26, 1922.

55554. ANNONA SENEGALENSIS Pers. Annonaceæ.

A shrub or small tree, sometimes 20 feet in height, native to both eastern and western tropical Africa. The oval, blue-green leathery leaves are up to 5 inches in length, and the orange-yellow fruits, over an inch in diameter, contain an aromatic dark-red pulp which suggests that of the cherimoya of tropical America. (Adapted from Schweinfurth, *The Heart of Africa*, p. 222, and from Oliver, *Flora of Tropical Africa*, vol. I, p. 16.)

For previous introduction, see S. P. I. No. 49843.

55555. BOLUSANTHUS SPECIOSUS (Bolus) Harms. Fabaceæ.

(Lonchocarpus speciosus Bolus.)

A small, ornamental, leguminous tree from southeastern and southern Africa, with compound deciduous leaves and long racemes of violet flowers which have given the name "*Rhodesian wistaria*" to the tree in some districts. The hard, white, durable timber is used only for wheel spokes. The tree is subtropical in its requirements, grows best in good deep soil, and is propagated only by seeds. (Adapted from *The Garden*, vol. 78, p. 64.)

For previous introduction, see S. P. I. No. 21808.

55556. TRITICUM DURUM Desf. Poaceæ.**Durum wheat.**

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received June 23, 1922.

"(June 3, 1922.) Red wheat from Tlemcen, Algeria." (Trabut.)

55557 and 55558. SOLANUM TUBEROSUM L. Solanaceæ. Potato.

From Ibarra, Ecuador. Presented by Sr. Jose Felix Tamayo. Received June 27, 1922. Quoted notes by Wilson Popenoe.

Seeds of the following potatoes, obtained for the use of plant breeders. Tubers of these varieties have been previously introduced; see S. P. I. Nos. 53190 and 53193.

55557. "*Cueruda blanca* (white cueruda) potato, 1921 crop, from the hacienda La Rinconada, in the Province of Carchi, where it is cultivated at altitudes between 11,000 and 12,000 feet.

"This is the most important commercial potato of Carchi Province. At Ibarra, where it is one of the favorite varieties on the market, it is known as *pastuza*. It yields heavily, and the whitish brown, somewhat flattened, oval tubers are of good size and quality. The eyes are very shallow and not numerous."

For previous introduction, see S. P. I. No. 53193.

55558. "*Cueruda morada* (purple cueruda) potato, 1921 crop, from the hacienda La Rinconada, Province of Carchi, where it is cultivated at altitudes between 11,000 and 12,000 feet.

"Commercially one of the best and most important varieties in northern Ecuador, though it is not quite so extensively grown as *cueruda blanca*. The tubers are oval, flattened, purple in color, with whitish areas around the shallow eyes; they possess excellent keeping qualities."

For previous introduction, see S. P. I. No. 53190.

55559 to 55562. DIOSCOREA ALATA L. Dioscoreaceæ.**Greater yam.**

From Montserrat, British West Indies. Tubers presented by W. Robson, curator, Agricultural Experiment Station. Received June 21, 1922. Quoted notes by R. A. Young.

55559. "*West White*. This is a white-fleshed yam, firm but mealy when cooked, and of good flavor. The vine is green, with narrow reddish wings at the four angles. Leaves long-ovate, cordate, acuminate; sinus fairly wide, but deep."

55560. "*West Red*. The inner skin of this yam is deep purple, and the flesh is purplish, mottled with deeper purple; it is mealy when cooked, but rather lacking in flavor. The wings on the vine are prominent and maroon colored. Leaves opposite, broadly ovate, cordate, acuminate; veins maroon; sinus deep and narrow; petiole maroon at base and apex."

55561. "*Barbados Red*. The inner skin is purple, and the flesh is light purple with scattered fibers of deeper purple. The flesh is rather firm, but mealy when cooked and of very good flavor. The vine has prominent maroon wings at the angles. Leaves opposite, ovate-cordate, acuminate; veins maroon; sinus deep and narrow, petiole maroon at base and apex."

For an illustration of this yam, see Plate VI.

55562. "*Bottle-Necked Lisbon*. This is a white-fleshed yam, which, when cooked, is mealy and of good flavor. The vine is green, with very narrow reddish wings. Leaves on young plants alternate, sagittate, basal lobes pointed; sinus very broad."

55563. AMYGDALUS PERSICA L. Amygdalaceæ.**Peach.**

(*Prunus persica* Stokes.)

Seedling selected at the Plant Introduction Garden, Chico, Calif., from seed obtained through John R. Putnam, American consul at Valencia, Spain, under S. P. I. No. 43570.

"Fruit large, yellow, with red blush. Flesh golden yellow throughout, of excellent flavor; pit small, not deeply grooved. Weight about 9 ounces.

Ripens at the Chico Plant Introduction Garden about August 20. This variety is of exceptional value as a commercial canning peach. Remains firm when cooked, maintains its delicate flavor, and does not require a very heavy sirup." (*J. E. Morrow.*)

55564. AMYGDALUS PERSICA L. Amygdalaceæ.
(*Prunus persica* Stokes.)

Peach.

Seedlings selected at the Plant Introduction Garden, Chico, Calif., from seed obtained through John R. Putnam, American consul at Valencia, Spain, under S. P. I. No. 43571.

"Fruits a fine golden yellow with red blush; basin deep, suture distinct; pit very small and yellow, not coloring the flesh. Flesh firm and of fine flavor. Should prove excellent for canning and a good shipper. Average weight of fruits about 5 ounces. Ripens at the Chico Plant Introduction Garden about August 20." (*J. E. Morrow.*)

55565. MILLETTIA MEGASPERMA (F. Muell.) Benth. Fabaceæ.

From Abergeldie, New South Wales. Seeds presented by Sir Hugh Dixon, Summer Hill. Received June 23, 1922.

"This plant is quite unlike Chinese or Japanese varieties of wistaria. It has dark-green foliage and is a rank grower when established; mine is growing over a park railing 90 feet long, 4 feet wide, and 5 feet high and has to be kept within bounds on width and height. It is not particular as to soil, but I would not advise a heavy clay. The plant stands 8 to 10 degrees of frost without injury. The flowers are darker purple than those of the Chinese variety, sweet scented, and are borne in dense panicles. It is a very shy seeder, with seldom more than one seed in a pod but it strikes root freely when layered and also from cuttings. The root of a layer afterwards potted had the largest number of nodules I have ever seen on any leguminous plant. It is an exceedingly rare plant simply because its good qualities are not known." (*Dixon.*)

For previous introduction, see S. P. I. No. 50518.

55566. ILEX PARAGUARIENSIS St. Hil. Aquifoliaceæ. Yerba maté

From Asuncion, Paraguay. Seeds presented by C. Fiebrig, director, Botanical Garden. Received May 27, 1922.

A small evergreen tree, native to Paraguay and Brazil, whose leaves are roasted and ground to make the Paraguay tea or *maté* of commerce. This plant may prove suitable for Florida and California.

For previous introduction, see S. P. I. No. 55489.

55567 and 55568. DIOSCOREA spp. Dioscoreaceæ.

Yam.

From Ogbomosh, Nigeria, Africa. Tubers presented by Dr. George Green. Received June 23, 1922. Quoted notes by R. A. Young.

55567. DIOSCOREA CAYENENSIS Lam.

Yellow Guinea yam.

(Nos. 11, 12, and 14.) "Three tubers, apparently all of the same variety, from a mixed lot. The flesh is cream colored instead of yellow, as in the variety of this species previously received from West Indian sources, and is less bitter; the quality is good. The vine is dark shiny green and thorny, with alternate leaves."

55568. DIOSCOREA ROTUNDATA Poir.

White Guinea yam.

(No. 1.) "The specimen received is white fleshed, mealy, and of fair flavor when cooked. The vine is round stemmed, glaucous, and armed on the lower parts with short but strong recurved thorns. The leaves are opposite and on the lower parts of the main stem are modified into peculiar bracts, from the axils of which arise lateral branches. The variety appears to be different in quality from the one commonly grown in Porto Rico."

INVENTORY OF SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN SEED AND PLANT IN- TRODUCTION DURING THE PERIOD FROM JULY 1 TO SEPTEMBER 30, 1922 (NO. 72; NOS. 55569 TO 55813).

INTRODUCTORY STATEMENT.

The Chinese Province of Yunnan has in the past yielded many interesting ornamental plants to European collectors, but this inventory records the first time that an agricultural explorer from the Department of Agriculture has penetrated its mountain slopes and vast plains, where a climate similar to that of our Atlantic seaboard prevails.

While no such severe weather as that of the Dakotas ever visits this back country of China, it is a land of heavy frosts, and plants from its plains may be expected to do well in many parts of our Eastern States, while those from its wetter mountain slopes will doubtless find a congenial home in the Puget Sound region.

The plants which appear in this inventory represent a small fraction only of the great collections which the department's explorer, J. F. Rock, has gathered under conditions of living and travel which would daunt any but the real enthusiast. His travels have taken him over hundreds of miles of almost impassable mountain trails and roads through regions where Chinese bandits abound and have necessitated a constant association month after month with people who neither understand what he is doing nor care regarding his fate.

From the Likiang Snow Range, at an altitude of 11,000 feet, Mr. Rock sent six rare lilies, one of them *Lilium sutchuenense* (No. 55609), and five others as yet undetermined (Nos. 55610, 55730, and 55778 to 55780). From Likiang he forwarded seeds of a white-flowered ornamental bush (*Prinsepia utilis*; No. 55719), a fine climbing rose (No. 55721), and a wild species of cherry (No. 55720) that grows to 50 feet in height which he suggests may be used as a stock for the cultivated cherries. At Nguluke, in the Likiang Valley, 8,000 feet above sea level, Mr. Rock found a small, sour, red-fruited apricot (*Prunus armeniaca*; No. 55729) of deliciously fragrant aroma, which is used there for stewing and jam making, and in the foothills of Talifu he obtained seeds of the rare cherry (*P. majestica*; No. 55732) which grows into large trees and has a vigor suggesting its use as a stock or as an ornamental flowering tree. Seeds from large freestone peaches (*Amygdalus persica*; Nos. 55775 and 55776) borne by trees growing wild near Puerhfu and seeds of a large-fruited plum (*Prunus* sp.; No. 55783) from the same region are part of his shipments which have recently arrived.

H. R. Wright, of Auckland, New Zealand, to whom the department is indebted for many valuable collections of new fruit varieties, has sent his "Sunrise" (No. 55740), a very early variety of peach, and "Watts Early" (No. 55741), a peach worth testing in Florida because of the unusually short resting period which it requires. He also sent the Groverly Navel orange (*Citrus sinensis*; No. 55743), which is reported to be a large-sized variety with a habit for cropping which should make it worth a trial both in California and Florida.

G. Weidman Groff, of the Canton Christian College, has sent from South China a collection of trees, including the mu-oil tree (*Aleurites montana*; Nos. 55647 to 55650), some varieties of persimmon (*Diospyros kaki*; Nos. 55659 and 55660), an undetermined species of *Diospyros* (No. 55662), an interesting rare ornamental (*Millettia dielsiana*; No. 55663), two varieties of the carambola (*Averrhoa carambola*; Nos. 55651 and 55652), a fruit tree recently attracting attention in southern Florida, and a large promising ornamental tree from the Five Finger Mountains (*Nageia cupressina*; No. 55664).

F. A. McClure, also of the Canton Christian College, secured for the department during his recent exploration of the island of Hainan, off the coast of South China, several interesting plants (Nos. 55626 to 55632) and from Lokong in Kwantung seeds of 13 named varieties of *Prunus mume* (Nos. 55633 to 55645), from which some valuable strains of this lovely flowering tree may originate in this country.

Prof. C. S. Sargent, of the Arnold Arboretum, has favored the department with material from a new hardy Chinese shrub (*Prinsepia sinensis*; No. 55711) whose yellow flowers appear very early in the spring and entitle it to a place in every North Atlantic garden, even should its fruits not meet with an enthusiastic reception in America. The genus with its several species is worthy of the attention of American horticulturists.

The success which attended the introduction through this office many years ago of the hairy Peruvian alfalfa is a matter of history. Crops of it worth several million dollars are grown every year in southern California. Growers will watch with interest the introduction now of the so-called San Pedrana variety (*Medicago sativa*; No. 55724) from Peru which, according to Mr. Dunn, is cut every 45 days.

Although it is yet too soon to predict the ultimate fate of the lowland Guatemalan anona in southern Florida, its growth there has been so satisfactory that a large quantity of seed of this species (*Annona diversifolia*; No. 55709) has been imported from Tapachula.

The so-called subterranean clover of Australia (*Trifolium subterraneum*; No. 55707), which was introduced several years ago, has shown so much promise in the Southern States that a second importation of seeds has been necessary.

A beautiful Australian shade tree, *Viter littoralis*, grew 30 feet tall at Del Monte, Calif., years ago, but was cut down by a temperature of 17° F. A New Zealand species of this same genus (*V. lucens*; No. 55620) may prove hardier than its relative.

It seems strange that a magnificent tree in the mountain gorges of the great African continent should be in danger of becoming extinct, but such is the case. In fact, so fast are some of the wonderful forest trees of the globe disappearing that our grandchildren, even when they circle the world through the air, will not have the supreme pleasure which the Afrianders had, as, traveling at a snail's pace with ox teams across the veldt, they stood in the presence of the leafy giants of the Milanji cypress, whose crowns rose 140 feet above the earth. From Southern Rhodesia W. L. Thompson, of the American Board Mission, has sent the department seed of this wonderful tree (*Callitris whytei*; No. 55602) which survives now only in the gorges of that region not visited by forest fires, and it is hoped that these may grow and establish themselves in other regions.

G. H. Cave, the curator of the Lloyd Botanic Gardens at Darjiling, to whom in the past the department has been indebted for many courtesies, has sent a remarkable collection of seeds of Himalayan ornamental and economic trees and shrubs (Nos. 55669 to 55706). It includes one of the hill bamboos (*Cephalostachyum capitatum*; No. 55676); a yellow-flowered clematis (*C. grewiaeiflora*; No. 55677); a species of that small genus to which belongs the Japanese loquat (*Eriobotrya hookeriana*; No. 55679) with egg-shaped yellow fruits three-fourths of an inch long, possibly useful for breeders or as a stock; *Ilex insignis* (No. 55682), which has proved hardy in Ireland; a bright-flowered Indigofera (No. 55683); the famous pink-flowered Himalayan magnolia (*Magnolia compbellii*; No. 55688); three species of Michelia (Nos. 55689 to 55691), trees with magnolialike flowers and foliage, one of them the principal timber tree of the Darjiling Hills; the Himalayan spruce (*Picea smithiana*; No. 55694); and a Himalayan cherry (*Prunus napaulensis*; No. 55696) from an altitude of 10,000 feet.

Guarana is a paste that is much used by the natives of the Amazon Valley to make a beverage which contains caffein and, like cacao and coffee, is a stimulant. It is prepared from the grapelike fruits of a climbing shrub (*Paullinia cupana*; No. 55738), the culture of which in Brazil has been a lucrative industry. Seeds of this shrub have been presented by Doctor da Costa, of Rio de Janeiro.

The so-called kiffy of Sierra Leone is the roasted seed of a cucum-berlike plant (*Cucumeropsis mannii*; No. 55792) which is used as a condiment by the natives in the preparation of their remarkable dish known as dumboy.

Doctor Shirai, of Komaba, Japan, has presented plants of two distinct varieties of *Elaeagnus multiflora* (Nos. 55771 and 55772), the "Ogumi" and the "Togumi." As this species grows well on the Atlantic seaboard, these two large-fruited varieties will be wanted by those who have the ordinary small-fruited form.

Doctor Shantz has imported, in order to test again, the narras (*Acanthosicyos horrida*; No. 55763), a melonlike fruit which the Hottentots grow on the sand dunes of the Kalahari Desert and upon which they live for months.

The wild black cherry (*Prunus serotina*) has been determined to be botanically identical with the capulin of Central America and northwestern South America; but, whereas Americans have done nothing to improve this native cherry, our southern neighbors have

by selection evolved from their wild capulin or native cherry a large delicious fruit which is borne in clusters and is sold on their markets (Nos. 55764 and 55765).

Norman M. Ross, who has for many years tested the dwarf pea tree in his Forestry Station at Indian Head, Canada, recommends for wide distribution throughout the Northwest this handsome shrub (*Caragana pygmaea*; No. 55769) of Siberia and furnishes seeds for that purpose.

The "Toeban" (*Arachis hypogaea*; No. 55810), an early-maturing bunch strain of peanut which is resistant to the bacterial disease prevalent in Java caused by *Bacterium solanacearum*, will interest peanut growers in America; and Mr. Morrow's new peach (No. 55813) that originated as a sucker at the Chico garden from a stock which was used for the Tangutian almond (*Amygdalus tangutica*) proves to be a week later than the Elberta and of finer texture than that standard variety.

The botanical determinations of seeds introduced have been made and the nomenclature revised by H. C. Skeels; and the descriptive and botanical notes have been arranged by Paul Russell, who has had general supervision of this inventory.

DAVID FAIRCHILD,
Agricultural Explorer in Charge.

OFFICE OF FOREIGN SEED AND PLANT INTRODUCTION,
Washington, D. C., September 17, 1923.

INVENTORY.¹

55569 to 55572.

From Cuenca, Ecuador. Seeds presented by Dr. Federico Malo. Received July 24, 1922. Quoted notes by Doctor Malo.

55569 to 55571. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

"These are from the principal localities where alfalfa is produced; that which comes from the town of Guanando is considered especially good."

55569. "From Dr. José A. Avilez, town of Guano."

55570. "Purchased from Paula Iza, who brought it from Cuchibamba, near Ambato."

55571. "Obtained from Antonio Moyano and said to have been grown at Guanando."

55572. *TRIFOLIUM REPENS* L. Fabaceæ. White clover.

"This white-flowered clover from the vicinity of Burgay, near Biblian, is produced spontaneously; the stock are very fond of it."

55573 and 55574. *PHASEOLUS AUREUS* Roxb. Fabaceæ. Mung bean.

From Manila, Philippine Islands. Seeds presented by George S. Logan, through the Bureau of Foreign and Domestic Commerce, United States Department of Commerce. Received July 6, 1922.

These two varieties of the mung bean were originated at the Lamao Experiment Station. The mung bean is cultivated throughout southern Asia and the adjacent islands, where its seeds constitute a very important human food and its straw a valuable fodder.

55573. *Yellow mongo.*

55574. *Green mongo.*

55575 to 55578. *LYCOPERSICON ESCULENTUM* Mill. Solanaceæ. Tomato.

From Bogota, Colombia. Seeds presented by Q. U. Thompson. Received July 25, 1922.

These tomatoes are introduced from various places in Colombia in the hope of finding a strain which will prove immune to leaf-spot, a serious pest in this country.

55575. From Bogota.

55577. From Fusagasuga.

55576. From Girardot.

55578. From San Antonio de Tena.

¹It should be understood that the varietal names of fruits, vegetables, cereals, and other plants used in these inventories are those which the material bore when received by the Office of Foreign Seed and Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their identity fully established, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in these inventories will be subject to change with a view to bringing the forms of the names into harmony with recognized American codes of nomenclature.

55579. CYRTOSTACHYS LAKKA Beccari. Phenicaceæ.**Palm.**

From Singapore, Straits Settlements. Seeds presented by I. Henry Burkill, superintendent, Botanic Gardens. Received July 24, 1922.

A stately and elegant palm, native to the East Indies, with a slender spineless stem crowned by a cluster of boldly arched pinnate leaves 3 to 4 feet in length. It is distinguished by its red leaf sheaths. The fruits are elongate egg-shaped and about half an inch long. (Adapted from *Beccari, Annales du Jardin Botanique de Buitenzorg*, vol. 2, p. 141, and *Bailey, Standard Cyclopedia of Horticulture*, vol. 2, p. 947.)

J. F. Rock recommends this as a handsome ornamental plant, probably suitable for cultivation in southern Florida. It is doubtful whether it will withstand heavy frosts.

For previous introductions, see S. P. I. Nos. 49530 and 51870.

55580 to 55584.

From Canton, China. Plants presented by the Canton Christian College, through F. A. McClure. Received July 29, 1922. Quoted notes by Mr. McClure.

55580 and 55581. FORTUNELLA spp. Rutaceæ.**Kumquat.**

Introduced for department specialists engaged in citrus-breeding experiments.

55580. FORTUNELLA sp.

"(C. C. C. introduction No. 793.) Obtained from near a Chinese village (Sants'uen) in the island of Hainan, where it is found in a semicultivated state. The natives gather the fruits, which ripen in November, and eat them fresh or candy them. Some few of the fruits find their way to the markets, although they are not generally much in favor with the Chinese, owing to their acid taste. They have almost no seed, and in this respect are excellent for candying. The fruits are small, seldom attaining a size of more than an inch in diameter; the segments adhere to each other very firmly. The plants are never grafted, but are allowed to spring up from scattered seed."

55581. FORTUNELLA sp.

"(C. C. C. introduction No. 794.) Obtained from the wild in the Five Finger Mountains of the island of Hainan. I found the plant in flower in May. A few fruits at that time were brought to me by the natives. The flavor is rather sweeter than one would expect to find in wild fruits; these are not of commercial importance, as they are known only by the primitive tribes that inhabit the interior of the island. They gather the wild fruits and evidently consider them quite a delicacy, although they never take the trouble to plant the seeds near their houses. There is a slight prominence on the fruit at the stem end, which is characteristic."

55582 and 55583. PHYLLOSTACHYS spp. Poaceæ.**Bamboo.**

"These are grown for timber and also for food, the young shoots being eaten."

55582. PHYLLOSTACHYS sp.

"(C. C. C. observation No. 901.2.) *Tai t'au tim chuk*."

55583. PHYLLOSTACHYS sp.

"(C. C. C. observation No. 901.2.) *Ma chuk*."

55584. ZIZANIA sp. Poaceæ.**Wild rice.**

"(C. C. C. introduction No. 860.) *Kau sun*. This is grown by the Chinese in wet culture. The stock at the crown becomes infected with a smut, and the enlarged growth at that point is used as food. This product is very similar in appearance, texture, and flavor to the bamboo shoots and is prepared in the same manner."

55585. OXALIS TUBEROSA Molina. Oxalidaceæ.**Oca.**

From Tucuman, Argentina. Tubers presented by E. F. Schultz, horticulturist, Agricultural Experiment Station. Received July 31, 1922.

"A plant related to our common sheep sorrel, widely cultivated in Peru and Bolivia for the sake of its fleshy rootstocks, which are an important article of food. In some districts ocas are second only to potatoes, while in others ullucus (*Ullucus tuberosus* Caldas) are more important, or at least are sold more generally in the native markets. Ocas are eaten raw, as well as cooked, and are also frozen and dried. Ocas prepared in this last-mentioned way are called caya, a term corresponding to chuño, the name of the dried potatoes. Raw ocas, when first dug, have a distinctly acid taste, like sheep sorrel, but this is lost after the tubers have been exposed to the sun.

"The plant attains a height of 1 foot or more and has the general appearance of a large plant of sheep sorrel. The flowers are yellow, and the leaflets are folded at night or in wet weather, the same as the sheep sorrel.

"The varieties are numerous, though much fewer than in the case of the potato. Some are preferred for eating raw and others for the making of caya. The texture of the tubers is very tender and juicy. In form some are nearly cylindrical, while others are slender at the base and strongly thickened at the end. The colors vary from white or light pink through darker pinks or yellows to deep purplish red. The range of colors is much the same as in the ullucu, but no deep-yellow varieties were seen, nor any with spots, except that some have bands of deeper color across the eyes.

"In addition to the pleasing coloration, the surface of the tubers is smooth and clear, so that the general appearance is very attractive. The texture of the flesh is also very tender and crisp. If the taste should prove acceptable, ocas might become very popular for salads and pickles, if not for other purposes. The nature and habits of the plant indicate that it may be adapted to acid soils, which would be a distinct advantage in some parts of the United States." (*O. F. Cook.*)

For previous introductions, see S. P. I. Nos. 41168 to 41176.

55586. MEDICAGO SATIVA L. Fabaceæ.**Alfalfa.**

From Buenos Aires, Argentina. Seeds presented by D. S. Bullock, agricultural commissioner, Bureau of Agricultural Economics, United States Department of Agriculture. Received July 28, 1922.

Introduced for comparison and cultural experiments.

55587. PRUNUS SERRULATA Lindl. Amygdalaceæ.**Japanese flowering cherry.**

From Yokohama, Japan. Seeds purchased from the Yokohama Nursery Co. Received July 24, 1922.

Forma *lannesiana*. A variety of Japanese cherry known as *Mazakura* (synonym, *Dai Sakura*), used in Japan as a stock. Prof. Yugo Hoshino, of the Tohoku Imperial University at Sapporo, is quoted as follows in Hedrick's "Cherries of New York," p. 75: "In the northern part of Japan proper (main island) it is a common practice to graft European cherries on a special kind of Japanese cherry. This cherry has a peculiar character which fits it for propagation, namely, it roots very easily either from cuttings or by mound layering. It is grown by nurserymen only and is called *Dai Sakura*. It has a somewhat dwarfing influence on scions and hastens their fruiting age."

For previous introduction, see S. P. I. No. 38206.

55588. MICROCITRUS AUSTRALASICA (F. Muell.) Swingle. Rutaceæ.**Finger lime.**

From Dundas, New South Wales. Seeds presented by Herbert J. Rumsey. Received July 13, 1922.

"The finger lime is one of the most curious and interesting of the citrus fruits. The young plants have more or less horizontally arranged branchlets, with very short internodes and small oval young leaves, these much shorter than the stiff, erect spines. The flowers are small, and the fruits are long

and slender, 2½ to 4 inches long, with a loose pulp filled with a sour, rather strongly pungent juice. The shrub is native to the mountain scrubs of the coastal region of northern New South Wales and Queensland." (*W. T. Swingle.*)

"This relative of the citrus fruits has been used in creating several hybrids, chiefly with the Calomondin (*Citrus mitis*), a Philippine species (see S. P. I. Nos. 27724 to 27736); also with the Mexican lime and the common lemon. The fruits produced, as a rule, have resembled the finger lime more closely than the other parents, not being sufficiently juicy as compared with lemons or limes for economic use, and possessing a peculiar aromatic odor. Their use as citrus stocks and as hedge plants, particularly in the semiarid regions of the Southwest, seems worth a trial, and experiments along this line are under way." (*T. Ralph Robinson.*)

55589. FRAGARIA sp. Rosaceæ.

Strawberry.

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received July 26, 1922.

Introduced for experiments in strawberry breeding.

"This form is close to *Fragaria nilgerrensis*; it has the same foliage and the same small white fruits with darker seeds, but it is more vigorous, and the fruits might be considered as edible, whereas in the type their taste is unpleasant." (*Vilmorin-Andrieux & Co.*)

55590 and 55591. LYCOPERSICON ESCULENTUM Mill. Solanaceæ.

Tomato.

From Buenos Aires, Argentina. Presented by D. S. Bullock, agricultural commissioner, Bureau of Agricultural Economics, United States Department of Agriculture. Received July 26, 1922. Quoted notes by E. F. Schultz, Tucuman Experiment Station.

These tomatoes are introduced for the use of specialists in breeding blight-resistant varieties.

"The variety most extensively planted here in Tucuman, especially in the Lules region, is known under the name of *Parana*. It is generally regarded as the most blight-resistant variety, but my own experience has led me to the conclusion that it is not completely resistant, although there are always a number of plants which do not suffer at all when the rest of the plants have died from the disease."

55590. "Seeds of *Parana* from Lules, Tucuman."

55591. "Seeds from blight-resistant plants of *Parana*, grown at the Tucuman Experiment Station in 1921."

55592 and 55593. MUSA spp. Musaceæ.

Banana.

From Kisantu, Belgian Congo. Seeds presented by Père J. Gillet, S. J., Jardin d'Essais de Kisantu. Received July 27, 1922. Quoted notes by Père Gillet.

"These bananas are handsomer and probably more hardy than *Musa ensete*; they grow in the mountains of Ruanda at altitudes of 6,500 feet or more."

55592. *MUSA* sp.

"An undetermined variety with white nerves."

55593. *MUSA* sp.

"An undetermined variety with red nerves."

55594 to 55597. DIOSCOREA ALATA L. Dioscoreaceæ.

Greater yam.

From Holguin, Cuba. Tubers presented by Thomas R. Towns. Received July 24, 1922. Quoted notes by R. A. Young.

55594. *Pelua*. "A white-fleshed yam, comparatively small; tubers said to weigh 3 pounds each. Vine four angled, with narrow pale-maroon wings. Leaves broadly ovate, cordate, plain green."

55594 to 55597—Continued.

55595. *Frances*. "A white-fleshed yam; said to weigh up to 25 pounds or more in each hill. Vine four angled, with pale-maroon wings. Leaves alternate, broadly ovate, cordate, acuminate; sinus fairly deep and narrow."

55596. *Kohl-E-Patta*. "A white-fleshed yam whose tubers are said to weigh as much as 25 pounds to the hill."

55597. *Morado*. "This yam has purple inner skin and white flesh; it is said to weigh up to 25 pounds or more in each hill. The vine is four angled, with narrow maroon wings. Leaves broadly ovate, cordate, acuminate; sinus deep and narrow; petioles maroon at base and apex."

55598. *CLAUCENA LANSIUM* (Lour.) Skeels. Rutaceæ. *Wampi*. (*C. wampi* Oliver.)

From Honolulu, Hawaii. Seeds presented by Dr. H. L. Lyon, in charge, Department of Botany and Forestry, Experiment Station of the Hawaiian Sugar-Planters' Association. Received August 3, 1922.

The wampi is a very ornamental small tree, 18 to 20 feet in height; in the spring it bears small dense panicles of whitish sweet-scented flowers, and in midsummer appear the grapelike clusters of edible berries. The individual fruits are about the size of a large marble, with a rough, pale straw-yellow, orangelike rind covered with glands filled with green balsamic oil; the rather large seeds, one to three in number, are inclosed in colorless juicy pulp which has an agreeable aromatic acid flavor. The wampi is a native of South China, where the berries are highly esteemed, both as a dessert fruit and for preserves. Propagation is by seeds and layering. (Adapted from *Report of Hawaii Agricultural Experiment Station, 1914, p. 33.*)

For previous introduction and illustration, see S. P. I. No. 45328.

55599 to 55601.

From Richmond, Victoria. Seeds presented by F. H. Baker. Received July 29, 1922.

55599. *CASSIA LAEVIGATA* Willd. Cæsalpiniaceæ.

An erect shrubby ornamental cassia several feet in height, with axillary and terminal racemes of large yellow flowers and cylindrical leathery pods, 2 to 3 inches long, inflated when ripe. Native to Queensland and New South Wales. (Adapted from *Bentham, Flora Australiensis, vol. 2, p. 282.*)

For previous introduction, see S. P. I. No. 53851.

55600. *INDIGOFEA AUSTRALIS* Willd. Fabaceæ.

An attractive shrub 2 to 4 feet high, with erect branches, finely divided compound leaves, and dense racemes of very showy violet-red flowers. (Adapted from *Bentham, Flora Australiensis, vol. 2, p. 199.*)

For previous introduction, see S. P. I. No. 47152.

**55601. *KENNEDIA MONOPHYLLA* Vent. Fabaceæ.
(*Hardenbergia monophylla* Benth.)**

An ornamental Australian vine, with alternate smooth leaves and a profusion of blue flowers borne in stalked racemes. The long carrot-shaped somewhat woody root is called "sarsaparilla" by the natives and is used in infusion as a substitute for that root. (Adapted from *Lindley, Treasury of Botany, vol. 1, p. 569.*)

For previous introduction, see S. P. I. No. 51757.

**55602. *CALLITRIS WHYTEI* (Rendle) Engl. Pinaceæ.
(*Widdringtonia whytei* Rendle.)**

From Mount Silinda, Southern Rhodesia. Presented by W. L. Thompson, American Board Mission. Received July 24, 1922.

"Native cedar of this region. These seeds are from trees in our own grounds." (*Thompson.*)

The *Milanji cypress* was originally found at an altitude of 10,000 feet on Mount Milanji, in Nyasaland, by Alexander Whyte. It is a magnificent tree reaching a height of 140 feet, sometimes with a clear straight trunk for 90 feet and a diameter of $5\frac{1}{2}$ feet at 6 feet from the base. The pale reddish timber is of excellent quality and easily worked. The bark on old trees is of great thickness. These fine trees are rapidly disappearing before the forest fires, only those in damp gorges surviving. (Adapted from *Transactions of the Linnean Society*, 2d ser., vol. 4, p. 60, and *Gardener's Chronicle*, 3d ser., vol. 37, p. 18.)

For previous introduction, see S. P. I. No. 52807.

55603. PHLEUM PRATENSE L. Poaceæ. Timothy.

From Roskilde, Denmark. Presented by Danske Landboforeninger Frøforsyning. Received August 2, 1922.

Timothy seed produced locally for several seed generations; introduced for breeding experiments.

55604. PHLEUM PRATENSE L. Poaceæ. Timothy.

From Prague, Czechoslovakia. Presented by Basil Benzin. Received July 31, 1922.

Locally grown seed introduced for timothy breeding experiments.

55605 and 55606. RUMEX spp. Polygonaceæ.

From Okitsu, Japan. Seeds presented by T. Onda, director. Government Horticultural Experiment Station. Received August 2, 1922.

These sorrels, which are used as salad vegetables in Japan, are introduced for trial as food for diabetics.

55605. RUMEX ACETOSA L. Sorrel.

Suiba.

55606. RUMEX CRISPUS L. Curly dock.

Variety *japonicus*. *Gishi-gishi.*

55607. BOWENIA SPECTABILIS Hook. Cycadaceæ.

From Brisbane, Queensland. Seeds presented by C. T. White. Government botanist. Received August 1, 1922.

An Australian cycad with a short, thick, cylindrical stem which bears at the summit one or two large, very graceful, compound fernlike leaves. It makes a charming little ornamental and should thrive well in lath houses in Florida when given proper shade, a good supply of moisture, and soil rich in humus. (Adapted from *Curtis's Botanical Magazine*, pl. 5398, and *Bailey, Standard Cyclopedia of Horticulture*, vol. 1, p. 537.)

55608. PRUNUS TOMENTOSA ENDOTRICHA Koehne. Amygdalaceæ. Bush cherry.

From Jamaica Plain, Mass. Cuttings presented by Dr. C. S. Sargent, Arnold Arboretum. Received August 9, 1922.

A large spreading shrub or small tree with densely hairy branches, dark-green, toothed, sharp-pointed leaves about 3 inches long, solitary white flowers three-fourths of an inch across, and dark-red fruits about half an inch in diameter. The plant is found native in western Hupeh and northern Shensi, China. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, p. 225.)

55609 and 55610. LILIUM spp. Liliaceæ. Lily.

From Likiang, Yunnan, China. Bulbs collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received August 9, 1922. Quoted notes by Mr. Rock.

55609 to 55610—Continued.

55609. *LILIUM SUTCHUENENSE* Franch.

Lily.

"(No. 4402. Likiang, Yunnan. June 13, 1922.) A lily 3 to 4 feet in height, growing among limestone rocks and along brooks in scrub vegetation at an altitude of 10,000 to 11,000 feet on the Likiang Snow Range, near the Moso village of Nguluke. The flowers are borne at the apex of the stem in twos and threes and are very variable in color, ranging from orange-yellow to red and reddish brown, the inner part of the corolla being spotted purple."

55610. *LILIUM* sp.

Lily.

"(No. 4532. Likiang, Yunnan. June 17, 1922.) A plant 2 to 2½ feet high, growing among limestone crags in pine and fir forests at altitudes of 12,000 feet and higher. These bulbs were collected on the slopes of the Likiang Snow Range. The flowers, which are smaller than those of *Lilium sutchuenense*, are green and marked on the outside and inside with deep purplish spots. The lobes are much reflexed, making the perianth pitcher shaped. This species is not common, while *L. sutchuenense* is found more frequently."

55611 to 55615. *PHOENIX* spp. *Phœnicaceæ*.

Palm.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received July 25, 1922.

"These Phoenix hybrids are all small plants, developing shoots from the base, and are highly ornamental. They have proved quite hardy here, withstanding the severe frost of 1920 (20° or 21° F.), the lowest temperature since 1829." (*Proschowsky*.)

55611. *PHOENIX* sp.55614. *PHOENIX* sp.

(No. 1.)

(No. 4.)

55612. *PHOENIX* sp.55615. *PHOENIX* sp.

(No. 2.)

(No. 5.)

55613. *PHOENIX* sp.

(No. 3.)

55616. *PHLEUM PRATENSE* L. *Poaceæ*.

Timothy.

From Prague, Czechoslovakia. Presented by Basil Benzin. Received August 12, 1922.

Locally grown timothy seed introduced for the use of forage-crop specialists.

55617 and 55618.

From Aitutaki, Cook Islands. Tubers presented by W. T. Hewett. Received August 11, 1922. Quoted notes by R. A. Young.

55617. *COLOCASIA ESCULENTA* (L.) Schott. *Araceæ*.

Taro.

"*Taro-repo*. A taro with slightly pink buds."

55618. *XANTHOSOMA* sp. *Araceæ*.

Yautia.

"A white-fleshed yautia of good quality, received under the name 'taro-tarua.' The buds are very slightly tinged with pink."

55619 and 55620.

From Auckland, New Zealand. Seeds presented by Stanley G. Chambers, secretary, Auckland Acclimatisation Society. Received August 11, 1922.

55619. *RHOPALOSTYLIS SAPIDA* (Soland.) Wendl. and Drude. *Phœnicaceæ*.

Nikau.

An elegant palm from New Zealand; it is of peculiar interest because of its distribution, as it occurs farther south than any species of palm in either Australia or South America, being found at 38° 22' south lati-

55619 to 55620—Continued.

tude. The pinnate leaves, 4 to 6 feet in length, are borne on a trunk 6 to 12 feet high, and the very numerous flowers, occurring on a densely flowered, much-branched spadix, are pale pink. The young inflorescence is eaten by the natives of New Zealand. (Adapted from *Curtis's Botanical Magazine*, pl. 5139.)

For previous introduction, see S. P. I. No. 54298.

55620. VITEX LUCENS Kirk. Verbenaceæ.**Puriri.**

A fine tree, from 50 to 60 feet in height, native to New Zealand, but restricted to the northern part of North Island. It is often called the New Zealand oak on account of the strength and durability of its wood, which is not injured by damp or exposure and is therefore extremely valuable for shipbuilding purposes. The logs are often perforated with holes, the work of a soft-bodied grub which develops into the puriri moth. These holes do not affect the timber except that it sometimes has to be cut to disadvantage.

The handsome, bright glossy green leaves are three to five foliolate with leaflets 3 to 4 inches long. The pink or red 2-lipped flowers, produced more or less all the year round, are in axillary clusters of four to eight. The roots of the puriri never penetrate deeply into the ground, but lie near the surface, so the tree is easily blown over in a gale. (Adapted from *Laing and Blackwell, Plants of New Zealand*, p. 350.)

For previous introduction, see S. P. I. No. 47881.

55621. ILEX PARAGUARIENSIS St. Hil. Aquifoliaceæ. Yerba maté.

From Buenos Aires, Argentina. Plants presented by D. S. Bullock, agricultural commissioner, Bureau of Agricultural Economics, United States Department of Agriculture. Received August 9, 1922.

A small, bushy evergreen tree with alternate serrate leaves, native to Brazil and Paraguay and the neighboring countries. The leaves are roasted and ground to make the Paraguay tea of commerce, which is said to possess the desirable properties of tea and coffee without their injurious aftereffects.

For previous introduction, see S. P. I. No. 55489.

55622. DATURA LEICHHARDTII F. Muell. Solanaceæ.

From Brisbane, Queensland. Seeds presented by C. T. White, Government botanist. Received August 9, 1922.

Introduced for the use of geneticists working on the chromosome behavior of this genus.

A tall coarse herb with irregularly toothed oval leaves 3 to 4 inches long, pale yellowish white flowers about 3 inches in length, and very prickly globular capsules about an inch in diameter. The plant is native in northern Australia. (Adapted from *Bentham, Flora Australiensis*, vol. 4, p. 468.)

55623. PHELUM PRATENSE L. Poaceæ.**Timothy.**

From Christiania, Norway. Presented by Dr. N. Wille, director, Botanic Garden. Received August 8, 1922.

"This strain of timothy is from Lierfoss, Norway, where seed culture has been carried on for 20 years." (*Wille.*)

Locally grown seed introduced for timothy breeding experiments.

55624. CITRUS sp. Rutaceæ.

From Johannesburg, Transvaal. Seeds presented by Col. A. J. Bester. Received August 15, 1922.

"When I visited the great Symbabian ruins in central Africa in 1911 I discovered a new citrus fruit; I collected seeds and brought them back, and now the variety is distributed all over the Transvaal. The smooth-skinned fruits are much like a big lime in shape and the abundant fine-flavored juice is very sweet." (*Bester.*)

55625. PERSEA AMERICANA Mill. Lauraceae.**Avocado.***(P. gratissima Gaertn. f.)*

From Honolulu, Hawaii. Budwood presented by Gerrit P. Wilder. Received August 16, 1922.

Wilder. Grown by Gerrit P. Wilder at his residence in Honolulu, a seedling from the Guatemalan variety *McDonald* growing at 1402 Punahou Street, Honolulu. An account of the introduction of the *McDonald* from Guatemala is given in Bulletin 25, p. 43, Hawaii Agricultural Experiment Station, as follows:

"About 20 years ago Admiral Beardsley, leaving Guatemala for Hawaii, carried with him a number of avocados for consumption on the way. He saved two seeds, wrapping them in cotton wool and packing them in ice. Arriving in Honolulu, he gave one seed to Judge Wiedeman and the other to Mrs. E. K. Wilder. The former was planted at 1402 Punahou Street, now occupied by 'The McDonald,' and although both seeds grew, the 'McDonald' is far superior in quality and blooms earlier."

A formal description of the fruit of the *Wilder* variety is as follows:

Form nearly round; size large, average weight about 1 pound; stem thick, tough; apex broadly rounded; surface light olive green; flesh yellow, shading into light green near the skin and easily separated from the latter, oily, rich and nutty in flavor; season October to January in Honolulu.

The tree is vigorous, inclined to grow upward rather than to branch out, but can stand pruning. The variety is valuable as a late avocado.

An analysis of the fruit (analysis 1747, University of California, 1915) is as follows: Weight (in ounces)—fruit, 25.70; seed, 6.42; skin, 2.54; edible portion, 16.88. Analysis of edible portion (per cent)—protein, 1.31; fat, 15.87; ash, 0.86; carbohydrates, 5.15.

55626 to 55632.

From the island of Hainan, China. Seeds presented by the Canton Christian College, through F. A. McClure. Received August 14, 1922. Quoted notes by Mr. McClure.

Collected by Mr. McClure in April and May, 1922. The Canton Christian College introduction numbers are in parentheses.

55626. COMBRETUM sp. Combretaceae.

"(No. 853.) An ornamental shrub about 6 feet high, growing on open hillsides at an altitude of about 1,600 feet."

55627. DIOSPYROS sp. Diospyraceae.**Persimmon.**

"(No. 856.) A tree 40 to 50 feet high and 2 feet in diameter, growing near the Five Finger Mountains, at an altitude of 3,300 to 5,000 feet. The fruits are eaten by the natives."

55628. FICUS sp. Moraceae.**Fig.**

"(No. 847.) A small ornamental shrub up to 5 feet in height, collected in sandy soil at an altitude of 100 to 165 feet. The bright-red figs are edible."

55629. PANDANUS TECTORIUS Parkins. Pandanaceae.

"(No. 858.) This plant, which sometimes reaches a height of 10 or 12 feet if unmolested, is used extensively as a hedge plant in Hainan, chiefly below an altitude of 1,000 feet. The spherical fruits, about 8 inches in diameter, are bright orange-yellow when ripe."

55630. RUBUS sp. Rosaceae.

"(No. 848.) An edible wild berry found in sandy soil at an altitude of 100 to 165 feet."

55631. RUBUS sp. Rosaceae.

"(No. 849.) An edible wild berry found in clay loam on hillsides at an altitude of about 3,300 feet."

55626 to 55632—Continued.

55632. *CURCUMA ZEDOARIA* (Bergius) Roscoe. Zinziberaceæ.

"(No. 857.) Rhizomes of 'hak sam keung' (black-hearted ginger); the flowers are rich pink, and a dark purple in the center of the leaves, as well as in the rhizome, gives the plant its name. It is found most abundantly in sandy soil in thickets and along streams and is a very promising ornamental for semitropical regions"

55633 to 55645. *PRUNUS MUME* Sieb. and Zucc. Amygdalaceæ.

Japanese apricot.

From Lokong, Kwangtung, China. Seeds presented by the Canton Christian College, through F. A. McClure. Received August 14, 1922. The Canton Christian College observation numbers are in parentheses.

55633. (No. 601.5-B2) *Cha Ip mui*.55634. (No. 601.5-C) *Cha Ip mui*.55635. (No. 601.18) *Hak Lok Tsai mui*.55636. (No. 601.-E) *Hang mui*.55637. (No. 601.11-B) *Hank mui chie*.55638. (No. 601.7-C) *Hung mui*.55639. (No. 601.6-C-C) *Ngo Shu mui*.55640. (No. 601.19) *Sun Ngan Au mui*.55641. (No. 601.10-C) *Tai mui*.55642. (No. 601.20) *Tai Wang Wat mui*.55643. (No. 601.4-C2) *Tai Wat Tsing mui*.55644. (No. 601.4-D) *Tai Wat Tsing mui*.55645. (No. 601.8-C) *Wang Wat mui*.55646. *MEDICAGO SATIVA* L. Fabaceæ.

Alfalfa.

From Peking, China. Purchased from Dr. R. G. Mills. Received August 19, 1922.

Native-grown seeds introduced for alfalfa breeding experiments.

55647 to 55668.

From Canton, China. Seeds presented by G. Weidman Groff, general director, Canton Christian College. Received May 22, 1922. Numbered September, 1922. Quoted notes by F. A. McClure, of the Canton Christian College.

The Canton Christian College introduction numbers are in parentheses. Native names romanized from the Cantonese dialect.

55647 to 55650. *ALEURITES MONTANA* (Lour.) Wilson. Euphorbiaceæ.
Mu-oil tree.

"This is the *mu-yu shu* (literally, wood-oil tree) of southern China. It is less hardy than the tung-oil tree. *Aleurites fordii*, and 2-year-old specimens growing at Tallahassee, Fla., were killed by cold in February, 1917. The oil is practically identical with tung oil. The fruit differs from that of *A. fordii* in having an irregularly ridged surface when mature and the young leaves in being much more deeply lobed than those of that species." (R. A. Young.)

55647. "*Shek Lut*, or *Tung Yau Tsz*. Secured in the autumn of 1921 through Rev. F. Fritz, from Moilim, northeastern Kwangtung"

55648. "(No. 785.)"

55650. "(No. 789.)"

55649. "(No. 788.)"

For an illustration of the young tree, see Plate I.

A YOUNG SPECIMEN OF THE MU-YU SHU, OR MU-OIL TREE. (*ALEURITES MONTANA* (LOUR.) WILSON; S. P. I. NOS. 55647 TO 55650.)

Mu oil, yielded by the seeds of *Aleurites montana*, is practically identical in character with tung oil, obtained from *A. fordii* Hemsl. It is a valuable drying oil, used in the varnish, paint, and many other industries. The mu-oil tree is less resistant to frost than the tung-oil tree, and the specimen here shown, grown at the Live Oak Plantation, Tallahassee, Fla., was killed by the freeze of February, 1917. The leaves of young trees of this species are much more deeply lobed than those of the tung-oil tree (Photographed by R. A. Young, Tallahassee, Fla., August 11, 1916; P19856FS.)

THE CARAMBOLA, A FAVORITE FRUIT OF SOUTHERN CHINA. (AVERRHOA CARAMBOLA L.; S. P. I. Nos. 55651 AND 55652.)

The peculiar winged fruits of the carambola are highly acid in character and are eaten by the Chinese with fish, meats, and other foods. When fully ripe they are deep yellow and sweet enough to be eaten out of hand, though they are not greatly relished in this form. The tree can be grown successfully in southern Florida, but it is too tender for cultivation in other parts of the United States. (Photographed by Wilson Popenoe at Rio de Janeiro, Brazil, March 18, 1914; P15001FS.)

AN ATTRACTIVE RELATIVE OF THE MAGNOLIAS. (*MICHELIA EXCELSA* BLUME; S. P. I. No. 55690.)

As ornamental plants for the warmer portions of the United States the various species of magnolias have acquired great and well-deserved popularity, and it may be expected that *Michelia excelsa*, which belongs to the same family and whose handsome flowers are here shown, will some day be widely cultivated in the southernmost parts of this country. This tall tree is native in the temperate Himalayas of northeastern India at altitudes of about 5,000 feet. The large narrow leaves are silky brown beneath, and the beautiful white flowers are 4 to 5 inches across. (Photographed by J. F. Rock in northeastern India, in 1920; P22780FS.)

55647 to 55668—Continued.

55651 and 55652. *AVERRHOA CARAMBOLA* L. Oxalidaceæ. **Carambola.**

"Seeds from fruits purchased in the market at Canton by a Chinese student experienced in fruits. Both are cultivated by the natives."

55651. "(No. 651.) *Yeung To*. A sweet variety eaten out of hand."

55652. "(No. 652.) *Saam Nim*. A sour variety."

For an illustration of the fruit and foliage, see Plate II.

55653. *CALAMUS* sp. Phœnicaceæ.

Rattan.

(No. 659.) *Wong t'ong*. Collected in December, 1921, from the Five Finger Mountains, interior of Hainan. The long vinelike stems are gathered by natives, dried, and sold to Hakka traders, who export them from Hainan as one of the rattans of commerce."

55654. *CASTANOPSIS* sp. Fagaceæ.

"(No. 664.) *Kwai lan yui* (Cantonese). Collected near Hongmatsuen, a Loi village in the interior of Hainan. The nuts are used by the natives as food."

55655. *CHAENOMELES* sp. Malaceæ.

"(No. 650.) *Sz chuen muk kwa*. Purchased in February, 1922, on the street in Canton. The fruit is used by the Chinese in making a rice wine; it makes good jelly and has been tried successfully here at the Canton Christian College."

55656. *COIX LACRYMA-JOBI* L. Poaceæ.

Job's-tears.

"(No. 685.) *I mai*. Collected in December, 1921, on the island of Hainan. According to my Chinese assistant, a species of this genus is used by the people of Shinhing, West River, Kwangtung, as fish food, and a famous brand of soft-boned fish is the result."

55657 and 55658. *COLOCASIA ESCULENTA* (L.) Schott. Araceæ. **Taro.**

"Tubers from the Canton market in September, 1921, and grown in the Canton Christian College gardens for one season."

55657. "(No. 780.) *Hung Nga oo* (red sprouted)."

55658. "(No. 782.) *Paak oo* (white)."

55659 to 55662. *DIOSPYROS* spp. Diospyraceæ.

55659 and 55660. *DIOSPYROS KAKI* L. f.

Kaki.

"*Sai Paat tsz*. Obtained in September, 1921, by a Chinese student of fruits from Lohkongtung, Kwangtung."

55659. "(No. 652.)"

55660. "(No. 654.)"

55661. *DIOSPYROS LOTUS* L.

"(No. 655.) *Kaau tsai*. Obtained in Lohkongtung, Kwangtung. A wild species, the pulp of which is used in Canton to make a kind of waterproofing material."

55662. *DIOSPYROS* sp.

Persimmon.

"(No. 695.) *Tsz*. Collected from the Five Finger Mountains of the interior of Hainan, near the Loi village of Yiktsokmaau."

55663. *MILLETTIA DIELSIANA* Harms. Fabaceæ.

"(No. 662.) Collected by F. A. McClure, October 25, near Notia, island of Hainan. This promising ornamental is a shrub in the open, but becomes vinelike when grown in the shade of tall trees. The fruits are the shape and color of oranges and about 2 to 3 centimeters in diameter."

55647 to 55668—Continued.

55664. *NAGEIA CUPRESSINA* (R. Br.) F. Muell. *Taxaceæ*.
(*Podocarpus javanicus* Merr.)

"(No. 666.) *Yat poon tsung* (Cantonese). Collected in the Five Finger Mountains, interior of Hainan, in December, 1921. A large tree, becoming 50 meters (164 feet) in height and 2 meters (6½ feet) in diameter. It is a promising ornamental and possibly a timber tree."

For previous introduction, see S. P. I. No. 49546.

55665. *PHOENIX* sp. *Phenicææ*. Palm.

"(No. 663.) A tree resembling the date palm, with edible fruit. Seeds collected near Noda, island of Hainan, November, 1921."

55666. *RUBUS FIMBRILIFERUS* Focke. *Rosaceæ*.

"(No. 657.) *She p'aau lak*. Collected in December, 1921, on open grassy hillsides near Yiktsokmaau, interior of Hainan."

A species of *Rubus* native to southern China, especially the vicinity of Hongkong; the oval heart-shaped densely hairy leaves are about 4 inches long. The flowers and the red hemispherical fruits appear in the axils of the lower branches. (Adapted from Focke, *Bibliotheca Botanica*, vol. 72, p. 80.)

- 55667 and 55668. *SACCHARUM* spp. *Poaceæ*. Grass.

55667. *SACCHARUM ARUNDINACEUM* Retz.

"(No. 644.) A very tall, promising ornamental grass, collected near Namfung, Hainan, in December, 1921."

55668. *SACCHARUM SPONTANEUM* L.

"(No. 690.) A promising ornamental grass collected in November, 1921, near Noda, Hainan."

55669 to 55706.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received August 2, 1922.

55669. *ACER CAMPBELLII* Hook. f. and Thoms. *Aceraceæ*. Maple.

One of the principal maples of the northeastern Himalayas, where it grows at an altitude of 7,000 feet or more. The beautiful green leaves with their red stalks make this tree decidedly ornamental. The grayish white moderately hard wood is used for planking and cabinet work. (Adapted from Watt, *Dictionary of the Economic Products of India*, vol. 1, p. 69.)

For previous introduction, see S. P. I. No. 47629.

55670. *ALNUS NEPALENSIS* D. Don. *Betulaceæ*. Alder.

The Nepal alder is a tall, sparsely branched, rapid-growing deciduous tree found in many places along streams in the temperate Himalayas. The leaves are oval or oblong, and the irregular winged nuts ripen in March. The bark is used for dyeing and tanning, and the rather soft, reddish white wood is used for making boxes. (Adapted from Watt, *Dictionary of the Economic Products of India*, vol. 1, p. 176.)

For previous introduction, see S. P. I. No. 50714.

- 55671 to 55673. *BERBERIS* spp. *Berberidaceæ*. Barberry.

55671. *BERBERIS INSIGNIS* Hook. f. and Thoms.

A beautiful hollylike bush of erect habit, with very few spines and large shining evergreen leaves 3 to 7 inches in length. The golden yellow flowers are borne in clusters of about 15 and are followed by ovoid black berries. Native to the eastern Himalayas. (Adapted from Hooker, *Flora of British India*, vol. 1, p. 111.)

For previous introduction, see S. P. I. No. 47645.

55669 to 55706—Continued.

55672. *BERBERIS NAPAULENSIS* (DC.) Spreng.

An erect shrub, 3 to 20 feet high, native to the temperate Himalayas at altitudes of 4,000 to 8,000 feet. It is leafy only near the top, the leaves being 6 to 18 inches in length, with leathery leaflets. The flowers are borne in erect dense-flowered racemes, and the bitter, violet fruits are about half an inch in diameter. (Adapted from *Hooker, Flora of British India, vol. 1, p. 109.*)

For previous introduction, see S. P. I. No. 50715.

55673. *BERBERIS WALLICHIANA* DC.

An evergreen barberry found in forests of the temperate Himalayas at altitudes of 8,000 to 10,000 feet. The leaves are narrow and the flowers, which are borne many in a cluster, are followed by oval or oblong shining black-purple berries. (Adapted from *Hooker, Flora of British India, vol. 1, p. 110.*)

55674. *BUCKLANDIA POPULNEA* R. Br. Hamamelidaceæ.

A large evergreen tree, up to 80 feet in height, native to the eastern Himalayas at altitudes of 3,000 to 8,000 feet. The wood is grayish brown, close grained, and durable and is very much used in Darjiling for planking and for doors and window frames. (Adapted from *Watt, Dictionary of the Economic Products of India, vol. 1, p. 545.*)

For previous introduction, see S. P. I. No. 47649.

55675. *BUDDLEIA COLVILEI* Hook. f. Loganiaceæ.

A shrub or small tree 15 to 20 feet high from the vicinity of Sikkim, India, where it is found at altitudes of 9,000 to 12,000 feet. The oblong toothed leaves are about 6 inches long and the crimson flowers, an inch in length, are borne in large loose terminal clusters. (Adapted from *Hooker, Flora of British India, vol. 4, p. 81.*)

55676. *CEPHALOSTACHYUM CAPITATUM* Munro. Poaceæ. Bamboo.

A bamboo from the hills of Sikkim, India, which develops strong, slender, yellow stems up to 30 feet in height. These stems are used by the natives for bows and arrows, and the leaves are considered good fodder. (Adapted from *Gamble, Manual of Indian Timbers, p. 429.*)

55677. *CLEMATIS GREWIAEFLORA* DC. Ranunculaceæ.

A large woody climber with densely hairy, deeply 5-lobed leaflets and many-flowered panicles of hairy, tawny yellow flowers, with oblong sepals $1\frac{1}{2}$ inches long. The plant is native to the lower temperate and sub-tropical Himalayas at altitudes of 3,000 to 5,000 feet. (Adapted from *Johnson's Gardener's Dictionary, p. 230*, and *Hooker, Flora of British India, vol. 1, p. 6.*)

For previous introduction, see S. P. I. No. 33765.

55678. *CRACCA CANDIDA* (DC.) Kuntze. Fabaceæ.
(*Tephrosia candida* DC.)

A low shrub with slender velvety branches, smooth green leaves 6 to 9 inches long, with gray-silky lower surfaces, and copious terminal and lateral racemes of reddish or white flowers. The shrub is native to the more tropical of the Himalayas, ascending to 5,000 feet altitude. (Adapted from *Hooker, Flora of British India, vol. 2, p. 111.*)

For previous introduction, see S. P. I. No. 50363.

55679. *ERIOBOTRYA HOOKERIANA* Decaisne. Malaceæ.

A small stout-branched tree with thick leathery oblong sharply toothed leaves up to a foot in length, large panicles of small white flowers, and egg-shaped yellow fruits about three-fourths of an inch long. It is a native of the eastern Himalayas at altitudes of 6,500 to 8,000 feet. (Adapted from *Hooker, Flora of British India, vol. 2, p. 371.*)

For previous introduction, see S. P. I. No. 50717.

55669 to 55706—Continued.

55680. *ERYTHRINA ARBORESCENS* Roxb. Fabaceæ.

When covered with its bright-scarlet flowers this small tree is very attractive and is often planted as an ornamental, as in the streets of Darjiling. There are but few prickles on its branches, and the thin greenish leaves are often a foot in width. The strongly curved pods are about an inch wide and 6 to 9 inches long. The tree is found native in the central and eastern Himalayas at altitudes ranging up to 7,000 feet. (Adapted from *Hooker, Flora of British India*, vol. 12, p. 190, and *Gamble, Manual of Indian Timbers*, p. 122.)

For previous introduction, see S. P. I. No. 47680.

55681. *HYDRANGÆA ROBUSTA* Hook. f. and Thoms. Hydrangeaceæ.

A very stout, nearly erect hydrangea from Sikkim, India. The short-stemmed oval leaves are coarsely toothed and the flowers, with white sepals, blue petals, and stamens, are borne in rather loose, spreading corymbs with red pedicels. (Adapted from *Curtis's Botanical Magazine*, pl. 5038.)

For previous introduction, see S. P. I. No. 50367.

55682. *ILEX INSIGNIS* Hook. f. Aquifoliaceæ.

Holly.

An attractive holly from the Sikkim Himalayas, where it grows at an altitude of 7,000 feet. It forms a small tree or shrub with thick-grooved branches which are purplish when young. The leathery dark-green leaves are pinnately lobed, with the lobes spine tipped and alternately raised and depressed, so that there appears to be a double row of spiny lobes on each side. This holly has proved hardy in Ireland. (Adapted from *Gardeners' Chronicle*, 2d ser., vol. 14, p. 292.)

For previous introduction, see S. P. I. No. 47698.

55683. *INDIGOFERA DOSUA TOMENTOSA* Baker. Fabaceæ.

Indigo.

A low shrubby plant with densely hairy branches and dull-green compound leaves 6 to 9 inches in length, each leaf consisting of 40 to 50 leaflets: the bright-red flowers are borne in long racemes. This attractive species is found in temperate regions of the Himalayas at altitudes of 1,000 to 5,000 feet. (Adapted from *Hooker, Flora of British India*, vol. 2, p. 152.)

For previous introduction, see S. P. I. No. 50369.

55684. *JASMINUM DISPERMUM* Wall. Oleaceæ.

Jasmine.

A climbing shrub common in temperate regions of the Himalayas at altitudes of 2,000 to 8,000 feet. It bears very numerous white flowers in axillary cymes and terminal panicles, sometimes a hundred. (Adapted from *Hooker, Flora of British India*, vol. 3, p. 602.)

55685. *LAUROCERASUS ACUMINATA* (Wall.) Roemer. Amygdalaceæ.(*Prunus acuminata* Hook. f.)

Laurel cherry.

A slender-branched tree 30 to 40 feet in height, with flat narrow leaves up to 7 inches long and many-flowered racemes of yellowish white flowers. The fruit is a small oval drupe. The tree is found in the central and eastern Himalayas at altitudes ranging from 5,000 to 7,000 feet. (Adapted from *Hooker, Flora of British India*, vol. 2, p. 317.)

For previous introduction, see S. P. I. No. 47705.

55686. *LEYCESTERIA BELLIANA* W. W. Smith. Caprifoliaceæ.

A small graceful shrub with opposite, membranous, lance-shaped leaves, and sessile, two to four flowered spikes of rosy white flowers. It is native in the Sikkim Himalayas, near the Nepal border, at an altitude of 10,000 feet: it should prove hardy in England. (Adapted from *Transactions and Proceedings of the Botanical Society of Edinburgh*, vol. 24, p. 173.)

55669 to 55706—Continued.

55687. *LIGUSTRUM CONFUSUM* Decaisne. Oleaceæ.

This relative of our common privet is a small tree, sometimes 40 feet in height, and is native to the mountains of northeastern India at altitudes of 3,000 to 5,000 feet. The narrow leathery leaves are sometimes as much as 3½ inches long, and the small white flowers are borne in dense panicles. (Adapted from *Hooker, Flora of British India*, vol. 3, p. 616.)

For previous introduction, see S. P. I. No. 49640.

55688. *MAGNOLIA CAMPBELLII* Hook. f. and Thoms. Magnoliaceæ.

A beautiful deciduous magnolia from the Himalayas, where it ascends to 8,000 feet altitude. It reaches a height of 80 feet, has very dark bark, large elliptical dark-green leaves, and white to purple flowers 10 inches in diameter. This magnolia has flowered freely in southern France and Italy. (Adapted from *Curtis's Botanical Magazine*, pl. 6793.)

For previous introduction, see S. P. I. Nos. 47714 to 47718.

55689 to 55691. *MICHELIA* spp. Magnoliaceæ.55689. *MICHELIA CATHCARTII* Hook. f. and Thoms.

A lofty tree with magnolialike foliage and terminal white flowers about an inch in diameter. It is native in the temperate forests of the Sikkim Himalayas, where the moderately hard, dark-brown heartwood is used for planking and for making tea boxes. (Adapted from *Gamble, Manual of Indian Timbers*, p. 6, and *Hooker, Flora of British India*, vol. 1, p. 42.)

For previous introduction, see S. P. I. No. 47730.

55690. *MICHELIA EXCELSA* Blume.

In the temperate regions of the Himalayas, where this tree is native, it is known as the "white magnolia" and is the principal timber tree of the Darjiling Hills. The oblong leaves have silky brown lower surfaces, and the solitary white flowers are 4 or 5 inches in diameter. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 5, p. 243, and *Hooker, Flora of British India*, vol. 1, p. 43.)

For previous introduction, see S. P. I. No. 49642.

For an illustration of the flowers of this tree, see Plate III.

55691. *MICHELIA LANUGINOSA* Wall.

A tall tree with narrow leaves having white, woolly lower surfaces and solitary white flowers 3 to 4 inches across. Although it is spring flowering in most places in northeastern India, where it is native, in Sikkim it is said to form a large bush which flowers in autumn. (Adapted from *Hooker, Flora of British India*, vol. 1, p. 43.)

For previous introduction, see S. P. I. No. 46089.

55692. *MORUS LAEVIGATA* Wall. Moraceæ.

Mulberry.

An India mulberry which occurs wild and cultivated, though not common, in the lower Himalayas, where it forms a medium-sized tree with oval leaves up to 7 inches in length. In early spring appear the long-cylindrical, yellowish white or pale-purple fruits; these are edible, although of a rather insipid sweet flavor. (Adapted from *Atkinson, Notes on the Economic Products of the Northwestern Provinces*, pt. 5, p. 83.)

55693. *PASPALUM CONJUGATUM* Berg. Poaceæ.

Grass.

A creeping perennial grass with the flowering branches sometimes as much as 3 feet tall. Originally from Dutch Guiana, this species is found in moist places in the Tropics of both hemispheres and forms extensive and close mats. (Adapted from *Contributions from the National Herbarium*, vol. 18, p. 318.)

For previous introduction, see S. P. I. No. 51189.

55669 to 55706—Continued.

55694. *PICEA SMITHIANA* (Wall.) Boiss. Pinaceæ. Spruce.
(*P. morinda* Link.)

The Himalayan spruce is a lofty tree found in the mountains of northwestern India at altitudes of 7,000 to 11,000 feet; the terminal, drooping pale-green cones are 4 to 6 inches long. The stiff, sharp, spirally arranged green leaves are crowded into hanging, taillike twigs when young. The wood is extensively used for rough furniture and planking. (Adapted from Watt, *Dictionary of the Economic Products of India*, vol. 1, p. 4.)

For previous introduction, see S. P. I. No. 47754.

55695. *PIERIS FORMOSA* (Wall.) D. Don. Ericaceæ.

A beautiful evergreen Himalayan shrub with leathery finely toothed leaves and large terminal branching clusters of porcelain-white flowers. It has proved hardy in Cornwall, England. (Adapted from *Gardeners' Chronicle*, ser. 2, vol. 25, p. 568.)

55696. *PRUNUS NAPAULENSIS* (Seringe) Steud. Amygdalaceæ.

A small tree with narrow acuminate leaves, 4 to 6 inches long, and axillary racemes of white flowers. The drupes are about twice the size of a large pea and acid in flavor. This tree is a native of the temperate Himalayas at altitudes of 4,000 to 10,000 feet. (Adapted from *Flora and Sylva*, vol. 3, p. 34.)

For previous introduction, see S. P. I. No. 47767.

- 55697 to 55701. *RHODODENDRON* spp. ,Ericaceæ.

55697. *RHODODENDRON ARBOREUM* J. E. Smith.

This Himalayan rhododendron is variable both in its foliage and in the color of its flowers. In one form the leaves are silvery on the lower surface, while in another they are covered with a brownish red down. The bell-shaped flowers, borne in dense trusses, vary from deep crimson to pure white. The tree sometimes reaches a height of 35 feet, with a trunk 4 feet in circumference. (Adapted from *Flora and Sylva*, vol. 3, p. 34.)

For previous introduction, see S. P. I. No. 47771.

55698. *RHODODENDRON CILIATUM* Hook. f.

A Himalayan rhododendron, of somewhat dwarfed habit, bearing many small loose trusses of pinkish white flowers less than 3 inches wide. It rarely exceeds 6 feet in height. (Adapted from *Flora and Sylva*, vol. 3, p. 35.)

For previous introduction, see S. P. I. No. 47772.

55699. *RHODODENDRON DALHOUSIAE* Hook. f.

This is said to be the finest rhododendron from northeastern India, chiefly because of the great size and beauty of the fragrant flowers, which resemble those of a large lily. It is a straggling shrub, 6 to 8 feet high, with smooth dark-green leaves. The flowers, which occur in terminal clusters of three to five, are nearly 5 inches across. (Adapted from *Curtis's Botanical Magazine*, pl. 4718.)

For previous introduction, see S. P. I. No. 47773.

55700. *RHODODENDRON FALCONERI* Hook. f.

This shrub or tree, which sometimes attains a height of 30 feet, is a native of northeastern India. The large deep-green leaves, sometimes a foot long, and the whitish, densely clustered flowers make it a very fine ornamental. (Adapted from *Curtis's Botanical Magazine*, pl. 4924.)

For previous introduction, see S. P. I. No. 47774.

55669 to 55706—Continued.**55701. RHODODENDRON MADDENI** Hook. f.

An ornamental Himalayan shrub 6 to 8 feet high. The dark-green leaves are from 4 to 7 inches long, with deep-red petioles. The large, delicate, fragrant flowers, white tinged with rose, are borne in threes at the ends of the branches. (Adapted from *Curtis's Botanical Magazine*, pl. 4805.)

For previous introduction, see S. P. I. No. 47776.

55702 and 55703. SAURAUJA spp. Dilleniaceæ.**55702. SAURAUJA FASCICULATA** Wall.

A bush or small tree about 20 feet in height, native to the eastern subtropical regions of the Himalayas at altitudes of 2,000 to 4,000 feet. The long narrow leaves are quite hairy, especially beneath, and the flowers, which are first white, then pink, are borne in red-branched cymes. (Adapted from *Hooker, Flora of British India*, vol. 1, p. 287.)

55703. SAURAUJA NAPAULENSIS DC.

A moderate-sized tree with the youngest branches, leaf stems, and midribs covered with rough brown hairs; the narrow, strongly toothed leaves are up to 15 inches in length, the pink flowers are borne in many-flowered panicles, and the edible green fruits have a sweet mealy pulp. The tree is native in the temperate Himalayas at altitudes of 5,000 to 7,000 feet. (Adapted from *Hooker, Flora of British India*, vol. 1, p. 286.)

For previous introduction, see S. P. I. No. 47784.

55704. SKIMMIA LAUREOLA (DC.) Sieb. and Zucc. Rutaceæ.

An evergreen, strongly aromatic shrub, found throughout the temperate Himalayas at altitudes ranging from 6,000 to 10,000 feet. The white flowers are crowded into terminal panicles, and the red, fleshy, oval fruits are about three-fourths of an inch in length. The timber is used to make hoe and ax handles. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 6, pt. 3, p. 244, and *Hooker, Flora of British India*, vol. 1, p. 499.)

For previous introduction, see S. P. I. No. 47795.

55705. SPIRÆA MICRANTHA Hook. f. Rosaceæ.

A very attractive shrub of rather lax habit, found in the eastern temperate Himalayas at altitudes of 5,800 to 10,000 feet. The narrowly ovate doubly toothed leaves are sometimes 7 inches long, and the small pale-pink flowers are borne in very long spreading panicles. (Adapted from *Hooker, Flora of British India*, vol. 2, p. 325.)

For previous introduction, see S. P. I. No. 47802.

55706. TRACHYCARPUS MARTIANUS (Wall.) Wendl. Phœnicaceæ. Palm.

A slender-trunked fan-leaved palm from temperate regions of the Himalayas, where it grows to a height of 20 to 50 feet. The unarmad trunk bears at its summit a crown of rigid leathery roundish leaves 4 or 5 feet in diameter which are cut about halfway down into narrow 2-lobed segments. The yellow flowers, followed by blue fruits, are borne on a nodding spadix about a foot in length. (Adapted from *Hooker, Flora of British India*, vol. 6, p. 436.)

For previous introduction, see S. P. I. No. 53471.

55707. TRIFOLIUM SUBTERRANEUM L. Fabaceæ.**Subterranean clover.**

From Melbourne, Victoria. Seeds purchased from F. H. Brunning & Co. Received August 18, 1922.

"Experiments carried on by the United States Department of Agriculture and by State experiment stations in cooperation with this department during the years 1921 and 1922 have established the fact that this clover will survive the winter as far north as Knoxville, Tenn. At this station, as well as several others, the plants from fall seeding made some growth in the fall, held their own during the winter, and made a rapid and heavy growth early in the spring of 1922. This clover made a strong growth on sandy land at McNeill, Miss.; in this case finely ground bone meal had been used as fertilizer. Preliminary trials have been encouraging, and the department is making further tests." (A. J. Pieters.)

For previous introduction, see S. P. I. No. 51212.

55708. *PTEROCARPUS* sp. Fabaceæ.

From Buenos Aires, Argentina. Seeds presented by D. S. Bullock, agricultural commissioner, Bureau of Agricultural Economics, United States Department of Agriculture. Received August 17, 1922.

"(From Cierras de Vilgo, Independencia, Province of La Rioja, Argentina.) Indian name *chica*, which means 'chew forever' or 'chew always.' The seeds are eaten toasted by the Indians." (Bullock.)

55709. *ANNONA DIVERSIFOLIA* Safford. Annonaceæ. Ilama.

From Tapachula, Chiapas, Mexico. Seeds purchased through R. O. Stevenson. British vice consulate. Received August 19, 1922.

"The ilama may be termed the cherimoya of the lowlands. The cherimoya does not succeed in the Tropics unless grown at elevations of 4,000 to 6,000 feet, where the climate is cool. The ilama, on the other hand, belongs to the lowlands, but is strikingly similar in character to a good cherimoya. It is a valuable recruit and one which can not be too strongly recommended for cultivation throughout the Tropics." (Wilson Popenoe.)

For previous introduction, see S. P. I. No. 51404.

55710. *LOTUS ULIGINOSUS* Schkuhr. Fabaceæ.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received August 19, 1922.

A pasture plant of considerable agricultural importance, rather extensively used in New Zealand, from 10 to 15 tons of seed being sown annually. This plant prefers a wet or swampy habitat. It sold in December, 1918, at about a dollar per pound. It is saved for seed mainly in the Auckland Province, but prior to the war the greater portion was imported, mainly from Germany. This seed was exported from the latter country under the name of *Lotus villosus* or *L. uliginosus*, which are the European trade names for the *L. major* of the New Zealand seed trade. *L. major* is very variable with regard to certain characters, such as hairiness, and in consequence several botanical names have been given to the plant. There are apparently a good many different strains, but whether these breed true from seed and are good agricultural species or whether they are due either to the habitat in which they are growing or to fertilization has not yet been ascertained. (Adapted from *The New Zealand Journal of Agriculture*, vol. 17, p. 347.)

Received as *L. villosus*, which is now referred to *L. uliginosus*.

For previous introduction, see S. P. I. No. 48635.

55711. *PRINSEPIA SINENSIS* Oliver. Amygdalaceæ.

From Jamaica Plain, Mass. Seeds presented by Dr. C. S. Sargent, Arnold Arboretum. Received August 25, 1922.

"*Prinsepia sinensis* is a species which has been comparatively unknown to horticulturists until recent times. It is quite distinct from the Himalayan *P. utilis*, which yields a cooking oil common in India, but is closely similar to *P. uniflora*, which has been introduced by this office several times. Like *P. uniflora* it is a Chinese ornamental shrub with gray or whitish bark and small gray spines. But while *P. uniflora* has white flowers, dark-purple fruits, and thick linear-lanceolate leaves, *P. sinensis* is distinguished by yellow

flowers, deep-red fruits, and thin ovate-lanceolate leaves. The shrub is said to be somewhat hardier than *P. uniflora*. The plant is of striking habit, and the clusters of large bright-yellow flowers must make it a brilliant sight on its native Mongolian hills from Mukden to the Yaboo. It is early blooming, but at the Arnold Arboretum it bears only a few fruits." (*D. C. Peattie.*)

55712. DIOSCOREA ALATA L. Dioscoreaceæ. Greater yam.

From Bridgetown, Barbados, British West Indies. Tubers presented by John R. Bovell, Director of Agriculture. Received July 7, 1922.

"*Barbados Red.* The tuber has a purple inner skin, with white flesh usually tinged or mottled with purple. The vine is four angled, with rather prominent maroon wings. The leaves are opposite, broadly ovate, cordate, acuminate; veins maroon; sinus deep and narrow; petioles maroon at base and apex. In the cooked yam the purple color is pale, and the flesh is mealy and of good flavor. The tubers often weigh several pounds each and are usually somewhat cylindrical. This is a standard variety in the West Indies and should be a good market yam for this country." (*R. A. Young.*)

55713. PHYLLOSTACHYS sp. Poaceæ. Bamboo.

From Tangsi, Chekiang, China. Plants collected in 1907 by the late Frank N. Meyer, Agricultural Explorer of the United States Department of Agriculture. Received June, 1908. Now numbered for convenience in distribution.

"A small-growing variety not over 10 feet in height, forming dense clumps. The small wiry stems make excellent plant stakes and small fishing rods. It is quite hardy, withstanding freezing temperatures." (*Peter Bisset.*)

Originally introduced under S. P. I. No. 23233 (Meyer's No. 301), but as it does not agree at all with Meyer's note it is necessary to renumber it.

55714. HORDEUM VULGARE PALLIDUM Seringe. Poaceæ. Barley.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received July 8, 1922.

"*Trabut.* A very hardy variety selected from the barleys of North Africa." (*Trabut.*)

55715 to 55717.

From Jamaica Plain, Mass. Presented by Dr. C. S. Sargent, Arnold Arboretum. Received July 5, 1922.

Seeds of the following varieties of the Japanese flowering cherry (*Prunus serrulata* Lindl.) are to be grown for trial as stocks for edible-fruited cherries.

55715. PRUNUS SERRULATA PUBESCENS Wilson. Amygdalaceæ.

A tree up to 55 feet in height, with a trunk sometimes 7 feet in circumference and leaves with pale-green lower surfaces. The white or pink single flowers are usually about four-fifths of an inch in diameter. This variety, known as *Kasumi sakura*, has the widest distribution of any of the Japanese cherries and flowers about two weeks later than *Prunus serrulata spontanea*, from which variety it differs chiefly in the slight hairiness of the leaves. (Adapted from *Wilson, Cherries of Japan*, p. 31.)

For previous introduction, see S. P. I. No. 45709.

55716. PRUNUS SERRULATA SACHALINENSIS (Schmidt) Makino. Amygdalaceæ. Sargent's cherry.
(*P. sargentii* Rehder.)

This variety, the *Yama sakura* of northern Japan, is very similar to *Prunus serrulata pubescens*, except that the leaves are not hairy, and the flowers, which are pink or rose colored, rarely white, are usually a little more than an inch in diameter. It is the handsomest of all the wild cherries of eastern Asia and is the parent of several of the finest double-flowered Japanese cherries. (Adapted from *Wilson, Cherries of Japan*, p. 35.)

For previous introduction, see S. P. I. No. 46533.

55715 to 55717—Continued.

55717. *PRUNUS SERRULATA SPONTANEA* (Maxim.) Wilson. Amygdalaceæ.

In Japan this variety is a common wild tree in the woods and thickets from Kagoshima in the south to the Nikko region in the north, where it forms a tree over 75 feet in height with a trunk 15 feet in circumference. In habit and color of flowers this variety agrees closely with the northern *Prunus serrulata sachalinensis*; the flowers are white or pink and a little less than an inch in diameter. It is the *Yama sakura* of southern and central Japan. (Adapted from Wilson, *Cherries of Japan*, p. 28.)

For previous introduction, see S. P. I. No. 41577.

55718 to 55721.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received July 3, 1922. Quoted notes by Mr. Rock.

55718. *BERBERIS DICTYOPHYLLA* Franch. Berberidaceæ. **Barberry.**

“(No. 3388. May 15, 1922.) A fine yellow-flowered, somewhat spiny shrub which grows on limestone soil in the Likiang Mountains at an altitude of 12,000 feet. The fruits are a brilliant red, and the shrub would make an excellent ornamental.”

For previous introduction, see S. P. I. No. 49056.

55719. *PRINSEPIA UTILIS* Royle. Amygdalaceæ.

“(No. 3281. Lashihpa. May 10, 1922.) A spiny shrub of great ornamental value, which grows north of Talifu on limestone soil at altitudes of 8,000 to 10,000 feet. In December and January the pendent branches bear a great profusion of white flowers. A cooking oil is expressed from the seeds, which are gathered by the Chinese and native tribes.”

For previous introduction, see S. P. I. No. 42623.

55720. *PRUNUS* sp. Amygdalaceæ. **Cherry.**

“(No. 3256. May 9, 1922.) A wild cherry which forms a large spreading tree 50 feet high with a trunk up to 2 feet in diameter; it grows at 8,500 feet altitude in forests beyond Chinhoh. It should be a fine tree for stock purposes; it bears large numbers of small yellow fruits.”

55721. *ROSA* sp. Rosaceæ. **Rose.**

“(No. 3238. Lashihpa. May 10, 1922.) A fine climbing rose which grows in great profusion at 8,000 feet altitude near Likiang. It is a prolific bloomer, bearing large corymbs of flowers which are at first yellow, but become white when fully opened.”

For an illustration of this rose, see Plate IV.

55722. *TRIFOLIUM PRATENSE* L. Fabaceæ. **Red clover.**

From London, England. Seeds presented by Walter S. Tower, American commercial attaché, London, through the Bureau of Foreign and Domestic Commerce, United States Department of Commerce. Received July 3, 1922.

Introduced for department agrostologists.

55723. *MAGNOLIA CAMPBELLII* Hook. f. and Thoms. Magnoliaceæ.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received July 3, 1922.

A beautiful deciduous magnolia from the Himalayas, where it ascends to 8,000 feet above sea level. It reaches a height of 80 feet, has very dark bark,

A NEW WILD ROSE FROM SOUTHWESTERN CHINA. (*Rosa* sp.; S. P. I. No. 55721.)

This beautiful climbing rose was discovered by J. F. Rock on a high plateau in the cooler portion of the Himalayas in southwestern China at 8,000 feet altitude. The flowers, at first yellow, but later becoming a delicate creamy white, are single and are borne in large clusters. (Photographed by J. F. Rock on the Lashipa Plain, Yunnan, China, May 11, 1922; F30247FS.)

A NEW HYBRID PEAR. (*PYRUS SEROTINA* × *COMMUNIS*: S. P. I. No. 55835.)

The Van Fleet pear, a hybrid produced by the late Dr. Walter Van Fleet at Little Silver, N. J., merits the serious attention of fruit growers because the tree appears to be resistant to fire-blight and at the same time the fruit is excellent for cooking and preserving. The pear is medium to large, with golden-yellow skin and sweet whitish flesh. The tree is vigorous, with large, thick, glossy leaves. No trace of blight has appeared in the two original trees which have been growing for 10 years at the Plant Introduction Garden, Chico, Calif. (Photographed by E. L. Crandall, September 12, 1922; P27943FS.)

large elliptical dark-green leaves, and white to purple flowers 10 inches in diameter. This magnolia has flowered freely in southern France and Italy. (Adapted from *Curtis's Botanical Magazine*, vol. 111, pl. 6793.)

For previous introduction, see S. P. I. No. 47718.

55724. MEDICAGO SATIVA L. Fabaceæ.

Alfalfa.

From Lima, Peru. Seeds presented by W. E. Dunn, acting commercial attaché, through the Department of Commerce, Washington, D. C. Received July 3, 1922.

"This Peruvian alfalfa is known as 'San Pedrana.' Sr. Carlos Alvarez Calderón, who obtained the sample for us, says that it was grown in the coast region and may be harvested every 45 days throughout the year, whereas from the ordinary variety 'del país' only about six cuts per year can be obtained." (*Dunn*.)

Peruvian alfalfa has proved of great value in certain parts of the United States. In the hope of originating new strains which may be superior in certain respects to any now grown in this country, an effort is being made to obtain seed from as many different regions in Peru as possible. The following note is adapted from H. L. Westover, in "The Development of the Peruvian Alfalfa Industry in the United States," United States Department of Agriculture Circular 93:

As compared with common alfalfa, both types of Peruvian alfalfa are more upright, less branched, and have fewer and somewhat coarser stems and smaller crowns. In thick stands, these differences are hardly noticeable. Most of the Peruvian introductions are also characterized by rapid growth, quick recovery after cutting, and in sections having a mild climate ability to make growth in cool weather after ordinary alfalfas have ceased growing. Under such conditions the Peruvian alfalfas start growth earlier in the spring and continue later in the fall, thereby giving more cuttings each season. The principal objection advanced in times past to these alfalfas is their tendency to become somewhat woody when allowed to stand beyond the flowering stage, but this difficulty is easily obviated by earlier harvesting. Lack of hardness will always confine the successful production of the true and smooth Peruvian alfalfas to the southern and southwestern portions of the United States, where the climatic conditions are comparatively mild. They can not be grown to advantage where the winter temperature falls below 10° F. At the present time most of the Peruvian and smooth Peruvian alfalfa in the United States is found in Arizona and California. It has also been grown to a limited extent in New Mexico, Texas, and the coastal regions of the Southeastern States. The results seem to indicate that in much of this region the common alfalfa could be replaced very profitably by the Peruvian varieties.

55725. PRUNUS ARMENIACA L. Amygdalaceæ.

Apricot.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received July 3, 1922.

"A native apricot known as *louz*; the tree is very productive and the fruit excellent. This tree is cultivated at M'Sila, a subarid region." (*Trabut*.)

55726. FRAGARIA ROSEIFLORA Boulay. Rosaceæ.

Strawberry.

From Chenebourg, near Geneva, Switzerland. Seeds purchased from H. Correvon, Floraire Nursery. Received July 11, 1922.

Introduced for experiments in strawberry breeding.

This is very closely allied to *Fragaria vesca*, from which it is distinguished by its round, uniformly pink petals and its roundish depressed fruits. It is found wild on the slopes of the Vosges Mountains in Alsace. (Adapted from *Bulletin de la Société de France*, vol. 18, p. 92.)

55727. CERATONIA SILIQUA L. Cæsalpiniaceæ.

Carob.

From Bari, Italy. Budwood presented by Dr. E. Pantanelli, director, Agricultural Experiment Station. Received July 7, 1922.

"*Améle*. This is considered the best variety of carob cultivated in this province (Bari); it may be the kind with large sweet pods which has been reported to you from this region." (*Pantanelli*.)

55728. GARCINIA MANGOSTANA L. Clusiaceæ. Mangosteen.

From Peradeniya, Ceylon. Seeds purchased through H. F. McMillan, Botanic Garden, Peradeniya. Received August 31, 1922.

Introduced for the purpose of establishing the mangosteen in our tropical dependencies.

"This delicious fruit is about the size of a mandarin orange, round and slightly flattened at each end, with a thick, smooth, rich red-purple rind, which, when cut, exposes the white segments lying loose in the cups. The cut surface of the rind is a most delicate pink. The separate segments are whitish and covered with a delicate network of fibers. The texture of the pulp resembles that of the plum, and the flavor is indescribably delicious." (*David Fairchild*.)

For previous introduction, see S. P. I. No. 55496.

55729. PRUNUS ARMENIACA L. Amygdalaceæ. Apricot.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received August 26, 1922.

"(Nguluke, Likiang Valley. June 25, 1922.) The trees are 45 feet or more high and found in this region at altitudes of 8,000 to 9,200 feet. They are apparently free from disease and should make good stock plants. The small, sour, rich-red fruits are deliciously fragrant and are excellent for jam or for stewing." (*Rock*.)

55730. LILIUM sp. Liliaceæ. Lily.

From Likiang, Yunnan, China. Bulbs collected by J. F. Rock. Received August 30, 1922.

"(No. 4756. Nguluke, near Likiang. June 27, 1922.) This may be a variety of *Lilium sutchuenense*. The plant, which grows on the Likiang Range at an altitude of 11,000 feet, is about 4 feet tall, with linear-lanceolate leaves and large brightly colored reddish yellow flowers spotted with a rich purple." (*Rock*.)

55731. ORYZA SATIVA L. Poaceæ. Rice.

From Szemao, Yunnan, China. Seeds collected by J. F. Rock. Received August 30, 1922.

"(Szemao, Yunnan. March 11, 1922.) A bright-red rice of fine grade, called *tzu no mi* by the Chinese and sold in Szemao." (*Rock*.)

55732. PRUNUS MAJESTICA Koehne. Amygdalaceæ. Cherry.

From Talifu, Yunnan, China. Seeds collected by J. F. Rock. Received August 30, 1922.

"(No. 3174. Talifu, Yunnan. April 25, 1922.) A fine large tree, 60 to 70 feet in height, of *Prunus pseudo-cerasus* type, found in the foothills of Talifu at altitudes of 6,700 to 7,000 feet. The tree from which these seeds were collected had three trunks clothed with a smooth, shining, bronze-colored bark with horizontal bands speckled with white. Each trunk was over a foot in diameter, the branches were stout and erect, the foliage dark green, and the fruits small, oblong, reddish, and cherrylike in appearance." (*Rock*.)

55733. CARICA PAPAYA L. Papayaceæ. Papaya.

From Bangkok, Siam. Seeds presented by Lao Leng Hui, clerk, American Legation. Received September 1, 1922.

A mixed collection of papayas from Bangkok, Siam, for trial in southern Florida. The Siamese papayas are recommended by the Hon. W. P. Hunt,

former American Minister to Siam, as of unusually good quality and free from the objectionable odor which characterizes those of many other countries.

55734. PHLEUM PRATENSE L. Poaceæ.

Timothy.

From Budapest, Hungary. Presented by the Hungarian Seed Culture Co. Received August 29, 1922.

Locally grown seed introduced for timothy breeding experiments.

55735. MYRICA RUBRA Sieb. and Zucc. Myricaceæ.

Yang mae.

From Yokohama, Japan. Seeds purchased from the Yokohama Nursery Co. Received August 31, 1922.

"The beautiful dark-purple fruits are the size of crab apples and can be eaten out of hand or made into compotes and pies. There is great variation in the habit and productivity of the trees and also in the color, size, and taste of the fruits. The trees are evergreen and thrive best on well-drained rocky terraces. The localities that will best suit them in the United States will probably be the southern sections of the Gulf Coast States and the milder parts of California. Chinese name *yang mae*." (Frank N. Meyer.)

For previous introduction, see S. P. I. No. 53982.

55736. PERSEA AMERICANA Mill. Lauraceæ.

Avocado.

(*P. gratissima* Gaertn. f.)

From Laguna, Guatemala. Budwood collected by Wilson Popenoe, Agricultural Explorer of the United States Department of Agriculture. Received October, 1916. Numbered September, 1922.

This variety was not distributed along with others introduced from Guatemala in 1916-17, as no buds were saved at Washington, and only one was successfully established at Miami, where several budsticks of the original shipment were sent. For a year or more the variety was considered to be lost. When it came into bearing, less than two years after the original buds were top-worked on an old tree of the West Indian race at the Miami Plant Introduction Garden, the variety was seen to be sufficiently meritorious to justify a wider trial. In habit and character of growth it is excellent; the branches are strong, not drooping, and the growth vigorous. The fruits, which ripen at Miami in late winter and early spring, are slender pyriform, about 18 ounces in weight, dark green, with the surface somewhat rough; the skin is thick and woody and the flesh cream yellow, smooth, and free from fiber, of rich flavor and excellent quality. The seed is rather small and tight in the cavity.

The original note on this variety is as follows:

"(No. 41. Laguna, Guatemala. October 2, 1916.) Avocado No. 2. *Itzamna*. A fruit of good size, having a very small seed and flesh of good quality and ripening very early in the season. The tree does not seem to be a very heavy bearer, but it is in such condition that it is difficult to say what its behavior may be under more favorable culture.

"The parent tree is growing among coffee bushes in the finca of Don Miguel Soto, a few hundred yards from the northern shore of Lake Amatitlan, at an altitude of 3,900 feet. The soil is a heavy black loam, rich and moist. The tree is about 25 feet high, with a trunk 1 foot in diameter and a rather scanty top. The amount of fruit which it is ripening this year (1916) is not great, but the crop may be considered a fair one.

"Following is a description of the fruit:

"Form oblong-pyriform, not necked; size above medium, weight 14 to 16 ounces, length $5\frac{1}{4}$ inches, greatest breadth $3\frac{1}{4}$ inches; base rounded, with the stem insertion nearly central; stem moderately stout, .5 inches long; apex rounded; surface pebbled, light green to yellowish green, with fairly numerous yellowish dots; skin slightly less than one-sixteenth of an inch thick at base of fruit, more than one-sixteenth of an inch thick at apex, separating readily from the flesh, brittle, and granular in texture; flesh pale cream, greenish near the skin, firm, with very slight fiber markings toward the base of the fruit; flavor nutty; quality very good; seed very small, ovate-conic in form. $1\frac{1}{4}$ inches long, $1\frac{1}{2}$ inches thick, with both seed coats adhering closely and tight in the cavity.

"The fruit reaches maturity by the end of September at Lake Amatitlan and is then picked for market, but the quality would doubtless be much better if it were left on the tree some time longer. In excessively wet weather the fruits fall as soon as they are mature. With less soil moisture they hang on longer." (*Wilson Popenoe*.)

55737. *TABEBUIA PENTAPHYLLA* (L.) Hemsl. Bignoniaceæ.

From St. Croix, Virgin Islands. Seeds presented by J. B. Thompson, agronomist in charge, Agricultural Experiment Station. Received August 25, 1922.

This tree is native in the West Indies and Central America and is often cultivated as an ornamental.

"The *matiliscuate* is a handsome flowering tree found in north-central Guatemala, especially in the Valley of Salama, and commonly growing near small streams. I have seen it at altitudes of 2,000 to 3,500 feet. The tree is about 35 feet high at maturity, with a spreading crown, deciduous during the latter part of the dry season (January to March), and producing large clusters of pink flowers which make the tree a mass of color visible for some distance. Its flowering season is from January to March, and the seeds, which are produced in long slender pods, ripen in May and June.

"As an ornamental tree for cultivation in southern Florida and possibly also in California, the *matiliscuate* seems well worthy of trial. The only defect of this plant is the habit of dropping its leaves during the dry months of the year. If it flowers in the same months in Florida as in Guatemala, it should be a valuable addition to the flowering trees of that region. It thrives on heavy but rocky land and does not seem to require a large supply of water." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 44998.

55738. *PAULLINIA CUPANA* Kunth. Sapindaceæ. **Guarana.**

From Rio de Janeiro, Brazil. Seeds presented by Dr. J. Simão da Costa, through Dr. W. L. Schurz, commercial attaché of the American Embassy. Received September 6, 1922.

A stout, bushy vine found wild in Venezuela and northwestern Brazil and also cultivated in the latter country for the sake of the grapelike fruits, from which is obtained the product known as guarana. This, in the form of a black paste, has received considerable attention in the pharmaceutical world in recent years as a natural source of caffeine.

The following analysis shows the composition of guarana:

	Per cent.		Per cent.
Caffeine.....	5.388	Starch.....	9.350
Essential oil.....	2.950	Glucose.....	.777
Resin.....	7.800	Pectic acid, malic acid, dextrin,	
Coloring matter.....	1.570	etc.....	7.470
Saponin.....	.060	Vegetable fiber.....	49.125
Guarana-tannic acid.....	5.902	Water.....	7.650
Pyro-guarana acid.....	2.750		

Owing to the fact that guarana is so rich in caffeine, a small dose enables a man to endure extraordinary hardship, and taken sparingly it is said to be excellent for intestinal trouble.

The Maube district in Para, Brazil, produces about 25 tons of guarana paste annually, and the cultivation of the plant has recently been begun in the States of Goyaz and Rio de Janeiro. A number of new and successful pharmaceutical compounds contain this product. (Adapted from *Bulletin of the Pan American Union*, vol. 51, p. 268.)

55739 to 55747.

From Avondale, Auckland, New Zealand. Budwood and trees presented by H. R. Wright. Received September 13, 1922. Quoted notes by Mr. Wright.

55739 to 55747—Continued.

55739 to 55742. *AMYGDALUS PERSICA* L. Amygdalaceæ. **Peach.**
(*Prunus persica* Stokes.)

55739. "Dormant buds of *Kings Seedling*. A white-fleshed clingstone variety, with the skin uniformly of a beautiful red."

55740. "Dormant buds of *Sunrise*. One of the earliest varieties, of high color and superb quality. The tree is sturdy, close jointed, and a good cropper."

55741. "Dormant buds of *Watts Early*. A variety that might be suitable for Florida because of its short resting period. It starts its growth nearly a month before any other variety; consequently should not be planted in districts subject to late frosts. The ripening season is extra early."

55742. "*White Cling*. Tree belonging to a variety found growing near a native hut in the Coromandel district. It is said to bear heavy crops of fine-flavored, very juicy fruits."

55743. *CITRUS SINENSIS* (L.) Osbeck. Rutaceæ. **Orange.**

"*Groverly Navel*. Trees of a Queensland variety with fruits of large size. This variety is an enormous cropper and well worth a trial."

55744. *MALUS SIEBOLDII* (Regel) Rehder. Malaceæ.

"Selected trees which are aphid resistant, but not suitable as stock plants, lacking affinity. They are essentially ornamentals, having very pretty foliage and being very handsome while in fruit."

55745 to 55747. *PRUNUS SALICINA* × *CERASIFERA*. Amygdalaceæ.
Hybrid plum.

55745. "Dormant buds of *Ford's Early* (?)."

55746. "Dormant buds of *Ford's Early*. A hybrid plum which is early ripening and a good cropper."

55747. "Dormant buds of *Norris Early*. Said to be a hybrid plum."

55748 to 55750.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received September 12, 1922.

55748. *INDIGOFERA DOSUA TOMENTOSA* Baker. Fabaceæ. **Indigo.**

For previous introduction and description, see S. P. I. No. 55683.

55749. *MIMOSA RUBICAILIS* L'Am. Mimosaceæ.

A large, straggling, prickly shrub found throughout the greater part of India, ascending to 5,000 feet in the western Himalayas. The leaves, seeds, pods, and powdered roots are used by the natives medicinally. It is said to make a very satisfactory hedge plant. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 5, p. 249.)

For previous introduction, see S. P. I. No. 47734.

55750. *NICOTIANA SYLVESTRIS* Speg. Solanaceæ. **Tobacco.**

An ornamental tobacco from Argentina which has the double merit of large handsome leaves and a free-flowering habit. Its white sweet-scented flowers are very attractive, but should be shaded from the direct rays of the midday sun. (Adapted from *The Gardeners' Magazine*, vol. 52, p. 48.)

For previous introduction, see S. P. I. No. 42344.

55751 to 55753.

From Mili, Szechwan, China. Tubers and bulbs obtained by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received September 12, 1922.

55751 to 55753—Continued.**55751 and 55752.** *LILIUM* spp. Liliaceæ.

Lily.

55751. *LILIUM* sp.

"(July, 1922.) A tall plant with purplish white flowers borne in twos or threes; collected in the mountains."

55752. *LILIUM* sp.

"(No. 5054. July 12, 1922.) A rather rare species with pink flowers speckled with purple, found in the mountains at an altitude of 12,000 feet."

55753. (Undetermined.)

"(No. 5053. July, 1922.) Tubers collected in the mountains."

55754. HYPERICUM CANARIENSE L. Hypericaceæ.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received September 15, 1922.

"A small graceful tree with drooping branches, which will grow on the driest and poorest of soils. The wood is the strongest I have ever seen: it is almost impossible to drive a nail into it. The boys here use its thin straight stems as net handles, all other kinds of wood breaking under the strain of pushing the net through the water. I should think that such remarkably strong wood which can be produced on such poor soil would have a practical value." (*Proschowsky*.)

For previous introduction, see S. P. I. No. 47581.

55755. RUBUS sp. Rosaceæ.**Blackberry.**

From San Jose, Costa Rica. Seeds collected by Edward Goucher, Plant Propagator, Bureau of Plant Industry. Received September 14, 1922.

"The fruits of this species of *Rubus* were collected at Paraiso, near San Jose, Costa Rica. The plants grew along the roadside and were from 6 to 8 feet in height. The fruits, which were produced in abundance, were about 1 inch in length and very firm in texture, but of poor flavor." (*Goucher*.)

55756 to 55761.

From Yunnan, China. Collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received September 11, 1922. Quoted notes by Mr. Rock.

55756. *LILIUM* sp. Liliaceæ.

Lily.

"(No. 4931. Likiang. July 7, 1922.) Bulbs of a beautiful lily with thick, oval, alternate leaves which are far apart. The single terminal flower has rich pink reflexed petals spotted with dark purple. This rare plant grows on the edge of pine forests of the Likiang Snow Range at an altitude of 12,000 feet. This may be only a variety of *Lilium duchartrei*, but it is a decidedly handsome plant."

55757 to 55761. *PRUNUS* spp. Amygdalaceæ.

Seeds of the following wild cherries and plums:

55757. *PRUNUS* sp.**Cherry.**

"(Likiang. July 6, 1922.) A smaller tree than the following [No. 4858, S. P. I. No. 55758]; the fruits also are smaller, globose, and dark red. It grows in the Likiang Snow Range at an altitude of 12,000 feet. The tree is apparently free from any disease."

55758. *PRUNUS* sp.**Cherry.**

"(No. 4858. Likiang. July 6, 1922.) A fine looking cherry tree, 35 to 40 feet in height, which grows at an altitude of 12,000 feet among limestone boulders on the edge of alpine meadows on the

55756 to 55761—Continued.

Likiang Snow Range. The foliage is dark green, and the orange-red, oval-pointed, sour fruits are much sought after by birds and hence difficult to collect."

55759. PRUNUS sp.

Plum.

"(Szemao. July, 1922.) A plum tree of fine shape, 40 to 50 feet in height, growing in the mountains at an altitude of 5,000 feet or more. The small yellow fruits, about the size of an olive, are not very sour; the flesh is scanty but quite tasty."

55760. PRUNUS sp.

Plum.

"(Szemao. July, 1922.) A plum tree growing in the mountains at an altitude of 5,000 feet."

55761. PRUNUS sp.

Plum.

"(Szemao. July, 1922.) A plum tree, 30 to 35 feet in height, growing in the mountains at an altitude of 5,000 feet or more. The fruit, somewhat larger than an olive, is yellow, hard, and sour. Owing to its freedom from disease and prolific bearing, this species, as well as the two preceding ones, should be suitable for stocks."

55762. GARCINIA MANGOSTANA L. Clusiaceæ.

Mangosteen.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received September 6, 1922.

For previous introduction and description, see S. P. I. No. 55728.

55763. ACANTHOSICYOS HORRIDA Welw. Cucurbitaceæ.

From Louws Creek, Eastern Transvaal, Union of South Africa. Seeds presented by E. B. Edwards. Received September 14, 1922.

"*Narras*. A remarkable cucurbitaceous plant which grows on the dunes of the Namib, where subterranean waters exist. The plant subsists even when this water is at great depths. It forms thorny thickets on the sand hills of Southwest Africa and is adapted to a hot, dry climate, with little or no rainfall. The fruit is the size of an ostrich egg. Both the pulp and seeds are used as food by the natives. The fruits are produced in abundance, and for about four months of the year the more primitive Hottentots are said to survive with practically no other source of food or water. The fruits are eaten and water is obtained from them. The seeds when ripe are plump, about the size of watermelon seeds.

"The plant is one which should be of great value to our Indians of the Southwest if once established on the sand dunes of Arizona and southern California. It is doubtful whether any plant can be obtained which seems offhand to give greater promise in that region than does this cucurbit." (*H. L. Shantz*.)

For previous introduction, see S. P. I. No. 55486.

55764 and 55765. PRUNUS SEROTINA Ehrh. Amygdalaceæ.

Capulin.

From the city of Guatemala, Guatemala. Seeds presented by Sr. Jorge Garcia Salas, Director General of Agriculture. Received August 17, 1922.

"In Guatemala this tree is found throughout the highlands generally, sometimes as a semicultivated plant, sometimes as a wild species, or at least having the appearance of one. Its zone of cultivation lies between 4,000 and 9,000 feet. The Kiche Indians who live near Quezaltenango know the fruit as 'tup' and distinguish two varieties—the 'ek-i-tup' (red tup) and the 'sak-i-tup' (white tup), the latter having fruits of much lighter color than the former. The presence of a name for this fruit in the Kiche language argues an ancient cultivation in the Guatemalan highlands.

"The capulin is used in the same manner as the northern cherry—for eating out of hand, for preserving, for jams, etc. In those countries where good varieties grow it is popular among all classes of people.

"There is considerable difference in flavor of the fruits from different trees of a given region where this species grows, some of the fruits being disagreeably bitter, while others are sweet, pleasant, and altogether delicious. It is these latter which must be sought out and propagated if the possibilities of the capulin are to be fully realized and if it is to become eventually, as we confidently believe it will, a popular fruit throughout the subtropical regions of the entire world." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 41328.

55764. "A bitter cherry from cool regions of Chimaltenango." (*Garcia Salas*.)

55765. "A sweet cherry from cool regions of San Martin Jilotepeque." (*Garcia Salas*.)

55766 to 55768. *CUCUMIS* spp. Cucurbitaceæ.

From Burringbar, New South Wales. Seeds presented by B. Harrison. Received September 14, 1922. Quoted notes by Mr. Harrison.

55766. *CUCUMIS MELO* L.

Muskmelon.

"Seeds of the Australian casaba which I believe originally came from India. It is a most prolific plant, bearing cream-colored fruit about the size of a cucumber. It is sometimes called the 'apple melon' and is quite popular here, being very palatable when eaten with sugar or made up into pies. It is hardy, prolific, early, and should thrive well throughout the United States."

For previous introduction, see S. P. I. No. 46029.

55767 and 55768. *CUCUMIS SATIVUS* L.

Cucumber.

55767. "*Mammoth*. This cucumber grows to a very large size, almost as large as a medium-sized vegetable marrow, and keeps well. The flesh is very firm, crisp, and sweet."

For previous introduction, see S. P. I. No. 48156.

55768. "*Harrison's Giant*. Grows to a length of 3 feet and is well flavored. This variety has been evolved through careful selection and cultivation."

55769. *CARAGANA PYGMAEA* (L.) DC. Fabaceæ. **Dwarf pea tree.**

From Indian Head, Saskatchewan, Canada. Seeds presented by Norman M. Ross, Forestry Branch, Nursery Station, Indian Head. Received September 15, 1922.

A handsome shrub with small leaves and yellow flowers, which grows spontaneously in hilly places in the southern provinces of Russia, and in great abundance in the region south of Lake Baikal. In cultivation it rarely exceeds 4 feet, but in its wild state it is often 6 feet high with a stem 2 inches thick. The bright-yellow shoots when old are long and flexible and are made into flyflaps. The shoots are much tougher than those of any of our cultivated osiers and are better suited for tying. The hard dull-brown wood is streaked with red and is well adapted for veneering. (Adapted from *Edward's Botanical Register*, vol. 12, p. 1021.)

For previous introduction, see S. P. I. No. 52698.

55770. *LILIUM* sp. Liliaceæ.

Lily.

From Mili, Szechwan, China. Bulbs collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received September 15, 1922.

"(No. 5051. Mili. July 10, 1922.) A lily related to *Lilium duchartrei*, with large racemes of white flowers: the petals are reflexed and sprinkled with purple. The bulbs were collected in southwestern Szechwan, in the mountains of the Lama Kingdom." (*Rock*.)

55771 to 55774.

From Komaba, Tokyo, Japan. Seeds presented by Prof. M. Shirai, Botanical Institute, College of Agriculture, Komaba. Received September 19, 1922.

55771 and 55772. ELAEAGNUS MULTIFLORA Thunb. Elæagnaceæ. Gumi.

A very attractive white-flowered Japanese shrub about 6 feet in height. The lower surface of the oval leaves is silvery white and the dull-red oval fruits, about an inch in length, are much relished for their brisk tart flavor, being excellent for preserves. (Adapted from *The Florists' Exchange*, vol. 38, p. 185.)

55771. Ogumi.

55772. Togumi.

55773 and 55774. RUBUS spp. Rosaceæ.

These native Japanese species of *Rubus* are introduced for breeding experiments.

55773. RUBUS INCISUS Thunb.

An erect shrubby species with purplish stems, few spines, heart-shaped leaves, and solitary axillary white flowers. (Adapted from *Thunberg, Flora Japonica*, p. 216.)

**55774. RUBUS MICROPHYLLUS L. f.
(*R. palmatus* Thunb.)**

A much-branched shrub with slender climbing branches, scattered recurved prickles, roundish five or six lobed bright-green leaves, solitary axillary pure-white flowers, and yellow juicy fruits nearly an inch in diameter. (Adapted from *Curtis's Botanical Magazine*, pl. 7801.)

55775 to 55787.

From China. Collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received September 21, 1922. Quoted notes by Mr. Rock.

**55775 and 55776. AMYGDALUS PERSICA L. Amygdalaceæ. Peach.
(*Prunus persica* Stokes.)**

55775. "(Near Puerhfu, Yunnan. July, 1922.) Seeds of a tree 40 feet in height, which is a prolific bearer. The fruits are unusually fine, although small; they are juicy and of a delicious strawberry-like flavor, freestone, and with a strawberry-red surface."

55776. "(Puerhfu, Yunnan. July 10, 1922.) Seeds from large trees growing wild in the mountains 30 li [about 8 miles] from Puerhfu at an altitude of 5,000 feet. The fruits are large, freestone, quite juicy, and of good flavor."

55777. ARISAEMA sp. Araceæ.

"(No. 5053. Mili, Szechwan. July 12, 1922.) Tubers of an aroid of great beauty collected in the mountains. The large spathe is white, with a tinge of pale green toward the apex."

55778 to 55780. LILIUM spp. Liliaceæ.

Lily.

55778. LILIUM sp.

"(Likiang, Yunnan. July, 1922.) Bulbs of a lily with red stems, dark-green leaves, and yellowish red flowers; the reflexed petals are spotted with purple. This lily was found on the western slope of the Likiang Snow Range at an altitude of 14,000 feet."

55779. LILIUM sp.

"(Likiang, Yunnan. July 20, 1922.) Bulbs of a small lily with single white flowers; found on the Likiang Snow Range at an altitude of 14,000 feet."

55775 and 55787—Continued.**55780. LILIUM sp.**

"(Likiang, Yunnan. July, 1922.) Bulbs of a lily with red stems and thick, fleshy, light-green leaves, collected on the eastern slope of the Likiang Snow Range at an altitude of 14,000 feet. The yellowish green flowers are marked with purple stripes."

55781 to 55784. PRUNUS spp. Amygdalaceæ.**55781. PRUNUS TOMENTOSA Thunb.****Bush cherry.**

"(Likiang, Yunnan. July 18, 1922.) Seeds of a shrubby cherry which grows on the Yunnan-Szechwan border about five days' journey north of Likiang in the scrub forests near Fengkow, not far from the Yangtze River, at an altitude of 11,000 feet. The plant is 8 to 10 feet high, with a gray pubescence, branching from the base and forming a large round bush. It is a most prolific bearer, and in the latter part of July is loaded with the oval orange-yellow cherries of a sweetish sour flavor."

55782. PRUNUS sp.**Cherry.**

"(No. 5052. Mili, Szechwan. July 10, 1922.) Seeds of a fine spreading tree 35 to 40 feet in height, collected in the mountains at an altitude of 12,000 feet. The small oval red fruits have very small seeds. The tree should make a good stock plant."

55783. PRUNUS sp.**Plum.**

"(Near Puerhfu, Yunnan. July, 1922.) Seeds of a fine tree which bears bright-yellow, very juicy fruits of a mild, sweet flavor, the size of a small apple. This species could doubtless be improved."

55784. PRUNUS sp.**Plum.**

"(Near Puerhfu, Yunnan. July, 1922.) Seeds of a tree 35 to 40 feet high, with bright-yellow, slightly bitter fruits the size of a small walnut."

55785 to 55787. RUBUS spp. Rosaceæ.**Raspberry.****55785. RUBUS sp.**

"(Likiang, Yunnan. July, 1922.) Seeds of a rambling shrub collected on the Likiang Snow Range at an altitude of 15,000 feet in exposed situations covered with snow in winter and early spring. The entire plant is woolly white and slightly spiny, and the leaves are snow white beneath. The fruits, the size of a thimble, have a sweet, delicious flavor, and the individual drupelets are large and transparent."

55786. RUBUS sp.

"(Likiang. July 20, 1922.) Seeds of a climbing shrub, with leaves silvery beneath and green above, growing on the Likiang Snow Range at an altitude of 13,000 feet. The orange-red berries have a sweet subacid flavor and attractive color."

55787. RUBUS sp.

"(Likiang. July 20, 1922.) Seeds of a shrub 5 to 6 feet high, collected on the slopes of the Likiang Snow Range at an altitude of 13,000 feet. The small leaves are green on both sides, and the scarlet berries are sweet and very palatable."

55788. RUBUS GLAUCUS Benth. Rosaceæ.**Andes berry.**

From Guatemala. Seeds presented by B. M. Young, Morgan City, La.
Received September 25, 1922.

"The Andes berry occurs as a wild plant from Mexico to Ecuador. It is a vigorous raspberry-like plant, bearing maroon-colored fruits which resemble Logan blackberries in flavor, but are sweeter. It can probably be culti-

vated on the Pacific coast and in the Gulf States. A full description of the plant, its cultivation, and uses may be found in the *Journal of Heredity*, vol. 12, pp. 387-393, November, 1921." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 52734.

55789. RHEUM RHAPONTICUM L. Polygonaceæ. Rhubarb.

From Ottawa, Canada. Crowns presented by Prof. T. F. Ritchie, Department of Horticulture, Central Experimental Farm. Received September 28, 1922.

"A new variety of rhubarb of very fine quality; it has a slender purplish stalk." (*W. A. Orton*.)

55790. CALLIANDRA TERGEMINA (L.) Benth. Mimosaceæ.

From Dominica, British West Indies. Seeds presented by Joseph Jones, curator, Botanic Gardens, Dominica. Received September 22, 1922.

"Seeds of a small native tree known locally as *bois ravine*; it makes a good hedge plant and is very pleasing when in flower." (*Jones*.)

A beautiful leguminous shrub of the habit of the mimosas, but thornless, with compound leaves composed of six leaflets arranged characteristically in two groups of three each. The long purple filaments of the dense axillary flower heads make this shrub a very pleasing ornamental. (Adapted from *Plumier, Plantarum Americanarum, ed. Burmann, pl. 10*.)

55791. OSYRIS ALBA L. Santalaceæ.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received September 23, 1922.

"This is a small evergreen bush which is very ornamental when loaded with its red fruits. It grows in very dry poor soil." (*Proschowsky*.)

A small upright shrub 3 feet high, widely distributed throughout the Mediterranean region. It has stiff, narrow, yellowish green leaves, small axillary greenish yellow flowers, and small red fruits. The roots and fruit possess astringent properties. (Adapted from *Schneider, Illustriertes Handbuch der Laubholzkunde, vol. 1, p. 247*.)

55792 to 55795.

From Freetown, Sierra Leone, West Africa. Seeds presented by Prof. William N. Martin, Albert Academy, Freetown. Received September 25, 1922.

55792. CUCUMEROPSIS MANNII Naud. Cucurbitaceæ. Kiffy.

A cucurbitaceous yellow-flowered climbing vine from tropical Africa.

"The gourdlike fruits, about the size and shape of a goose egg, are produced on vines like that of the ordinary gourd. The seeds when parched and ground produce a delicious condiment, and kiffy seed is an important ingredient in the popular Liberian dish called dumboy. The flavor of the parched seed is similar to that of the parched seeds of *Sesamum indicum*, which are used in the same manner by the natives of Liberia. The seeds are obtained by macerating the fruits in water and washing them free from the pulp. This plant probably would mature its fruits only in the extreme southern United States." (*G. N. Collins*.)

For previous introduction, see S. P. I. No. 31365.

55793 and 55794. HOLCUS SORGHUM L. Poaceæ. Sorghum. (*Sorghum vulgare* Pers.)

55793. *Cush Cush*. Seeds yellow.

55794. *Cush Cush*. Seeds red.

55795. ORYZA SATIVA L. Poaceæ. Rice.

"Temne rice, the sweetest in Sierra Leone." (*Martin*.)

55796. GUILIELMA UTILIS Oerst. Phœnicaceæ.
(*Bactris utilis* Benth. and Hook.)

Pejibaye.

From San Jose, Costa Rica. Plants purchased through Oton Jimenez. Received September 15, 1922.

A shipment of plants of the pejibaye. For an extended account of this interesting food palm, see the Journal of Heredity, vol. 12, pp. 154-166, April, 1921.

For previous introduction and description, see S. P. I. No. 54776.

55797 to 55804.

From Harbin, Manchuria. Seeds presented by G. C. Hanson, American consul, Harbin. Received September 25, 1922. Quoted notes by Mr. Hanson.

"The following collection of farm products grown in the Provinces of Heilungchiang and Kirin, Manchuria, was prepared for a world's farm exhibit to be held in Lagrange, Ind., in October, 1922. The seeds are all of the 1921-22 crop."

55797. CANNABIS SATIVA L. Moraceæ.

Hemp.

"A variety of hemp grown at Anda."

For previous introduction, see S. P. I. No. 44712.

55798. FAGOPYRUM VULGARE Hill. Polygonaceæ.
(*F. esculentum* Moench.)

Buckwheat.

"Buckwheat from Anda."

55799. HOLCUS SORGHUM L. Poaceæ.
(*Sorghum vulgare* Pers.)

Sorghum.

"Kaoliang from Tzitzikar."

55800. LINUM USITATISSIMUM L. Linaceæ.

Flax.

"Siberian linseed from the Ussurisk Railway district."

55801. PANICUM MILLACEUM L. Poaceæ.

Proso.

"Red millet from Tzitzikar."

55802. SOJA MAX (L.) Piper. Fabaceæ.
(*Glycine hispida* Maxim.)

Soy bean.

"North Manchurian soy beans: average quality from the River Sungari district."

55803. TRITICUM AESTIVUM L. Poaceæ.
(*T. vulgare* Vill.)

Common wheat.

"Manchurian wheat; 124/125 Zolotnika natural weight; from Anda."

55804. ZEA MAYS L. Poaceæ.

Corn.

"A yellow variety of maize from Anda."

55805. PYRUS SEROTINA × COMMUNIS. Malaceæ. Van Fleet pear.

Trees grown at the Plant Introduction Garden, Chico, Calif., under P. I. G. No. 6583. Numbered September, 1922.

"A hybrid pear raised by the late Dr. Walter Van Fleet at Little Silver, N. J., and presented to the Plant Introduction Garden in 1909. Promising as a blight-resistant cooking and preserving pear for sections where fire-blight is destructive.

"Origin, Little Silver, N. J. A hybrid probably between Golden Russet, an oriental pear, and one or more of the *communis* types. Medium to large, roundish, obovate; skin golden, covered with numerous small round dots; stalk long, stout; cavity around stalk quite shallow or none at all; basin at the calyx end more or less abrupt, deep, russet; flesh whitish, sweet, slightly subacid, granular; core medium; seeds few, large; not gritty.

"A handsome golden colored pear which when properly ripened makes a fine baking and preserving fruit. The trees are strong and vigorous with large,

thick, glossy leaves. The two original trees have been grown at Chico for more than 10 years and no trace of blight has appeared. J. E. Morrow, superintendent of the Chico garden, who has watched this pear carefully for a number of years, says that it is a splendid cooking pear and that after being cooked it tastes something like pineapple. He further says that, owing to its extreme vigor, size, hardness, immunity to blight, and heavy cropping qualities, he believes the pear has much promise. He regards it as much better than Kieffer or LeConte and is of the opinion that it should be thoroughly tested, especially in the Southern States." (B. T. Galloway.)

For an illustration of this fruit, see Plate V.

55806. PHLEUM PRATENSE L. Poaceæ. Timothy.

From Sydney, New South Wales. Seeds presented by George Valder, Department of Agriculture. Received September 29, 1922.

Locally grown timothy introduced for comparison and cultural experiments.

For previous introduction, see S. P. I. No. 55480.

55807. GUILIELMA UTILIS Oerst. Phœnicicæ. Pejibaye.
(*Bactris utilis* Benth. and Hook.)

From San Jose, Costa Rica. Seeds collected by Edward Goucher, Plant Propagator, Bureau of Plant Industry. Received September 19, 1922.

For previous introduction and description, see S. P. I. No. 55796.

55808 to 55811.

From Buitenzorg, Java. Seeds presented through Carl Hartley. Received September 23, 1922. Quoted notes by Mr. Hartley.

55808 to 55810. ARACHIS HYPOGAEA L. Fabacæ. Peanut.

Presented by the Java Department of Agriculture.

"All of these peanuts mature in 100 days, or, according to the natives, in three months."

55808. "(No. 24 M.) *Broel*. This is a dominantly 3-seeded red-skinned peanut from East Java. It is moderately wilt resistant."

55809. "(No. 74.) *Paarse Holle*. This variety is named for its dark-red seed skin. It is mostly two seeded with some 3-seeded pods and is moderately wilt resistant."

55810. "(No. 71.) *Toeban*. This is grown by the Selectietuin here as their most productive strain. Unlike some of the kinds named 'Toeban' in other places, it has a white seed skin. Of the early-maturing strains, with one exception, it is the most resistant to the locally prevalent wilt, *Bacterium solanacearum*. It is of the bunch type, easily handled and harvested.

55811. CASTANOPSIS ARGENTEA (Blume) A. DC. Fagacæ. Chestnut.

"(April, 1922.) An edible chestnut obtained from the head forester at Palembang, Sumatra."

An evergreen tree 50 to 60 feet high, with narrow, thin leaves 5 to 7 inches long, and very spiny dense clusters of burs; each bur is about 2 inches wide and contains normally a single nut an inch in diameter. (Adapted from *Hooker, Flora of British India*, vol. 5, p. 621.)

For previous introduction, see S. P. I. No. 52533.

55812. MANGIFERA ALTISSIMA Blanco. Anacardiæ.

From Manila, Philippine Islands. Budwood presented by Sr. Adn. Hernandez, director, Bureau of Agriculture. Received September 6, 1922.

A Philippine relative of the mango, which is found wild from northern Luzon to southern Mindanao, where it forms a large tree, sometimes reaching a height of 116 feet. The tree is not cultivated, although the mangolike, smooth, green or yellowish fruits, 2 to 3 inches long, are used for making pickles. The

leaves are long, narrow, and pointed at both ends, and the small, fragrant, white flowers are borne in large numbers in branched clusters. (Adapted from *W. H. Brown, Wild Food Plants of the Philippines, p. 94.*)

55813. AMYGDALUS PERSICA L. Amygdalaceæ.
(*Prunus persica* Stokes.)

Peach.

From the Plant Introduction Garden, Chico, Calif. A sucker from the stock plant on which was budded *Amygdalus tangutica*, S. P. I. No. 41709. Numbered September, 1922, for convenience in distribution.

"This tree has matured a very good crop of exceptionally fine freestone peaches. The fruit is yellow with red cheeks, in shape slightly flattened at the ends and bulging in the center, in size about 3 inches in diameter and 2½ inches long. The basin is wide and shallow, the suture rather indistinct. The flesh is yellow, very juicy, of extra fine quality, and very red at the pit, which is rather large, rough, and deeply corrugated. Average weight about 6½ ounces. A number of persons who have sampled this peach have pronounced it superb. It compares favorably with *Late Crawford* and is about a week later than *Elberta*. It is not as coarse in texture as the latter." (*J. E. Morrow.*)

INVENTORY OF SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN SEED AND PLANT IN- TRODUCTION DURING THE PERIOD FROM OCTO- BER 1 TO DECEMBER 31, 1922 (NO. 73; NOS. 55814 TO 56144)

INTRODUCTORY STATEMENT

To many it may not be apparent why the Province of Yunnan, which borders Tibet on China's western boundary, is a particularly likely place to search for plants for introduction into America.

Mr. Rock, our agricultural explorer, who has been collecting in this region now for nearly three years, shows by his notes and specimens in what way Yunnan plants are likely to be valuable to American horticulture.

The vast mountain area, in which he has been exploring, where snow-clad peaks 12,000 to 20,000 feet high rise from almost sub-tropical valleys and gorges thousands of feet deep have been channeled by the largest and longest rivers in Asia (the Mekong and the Yangtze) in their break through the mountains which bound the Tibetan table-land, furnishes a home for thousands of interesting plants which some day will enrich our horticulture.

It is true that other exploring botanists, like Forrest and Kingdon Ward, have visited it, but this is the first time that an American explorer, with the needs of our farms and gardens in mind, has hunted for plants which can be grown in American dooryards and has entered western China by its back door, so to speak, which is Bhamo, on the border of Burma.

Mr. Rock's itinerary, like that of Frank Meyer, will be given in detail in a later number of this series. It suffices for him to locate the region where he collected the plants in this inventory. This centers chiefly around Likiang and the Likiang Snow Range. Many of the plants were found in localities where the thermometer goes below 32° F. and heavy snowfalls occur. High tropical altitudes and temperate-region latitudes correspond, but only roughly so, for it has come to be well recognized that high alpine plants are accommodated to conditions which do not prevail at many places at sea level in the Temperate Zone. The heavy and continuous blanket of snow which characterizes many mountain regions makes it possible for many rather tender plants, such as the potato, for example, to live in the ground over winter. To illustrate, in the higher altitudes of the Rockies on its western slopes and also as far north as Cape Breton Island, Nova Scotia, potato tubers often remain unfrozen in the soil because the soil is blanketed with snow before freezing weather occurs, whereas otherwise they would be frozen in

the ground nearly every year as far south as the Carolinas. Then, too, there must be taken into consideration the length of day, the atmospheric pressure which affects the amount of oxygen and carbon dioxid in the air, and the effect which high mountain atmosphere has upon the actinic rays of the sun. In other words, it should never be forgotten that these plants are essentially cosmic machines run by the sun's energy and that in no two places on the globe do identical atmospheric conditions prevail.

Twenty-five years of experience has taught those of us who have been establishing new plants in America to be very cautious in predicting where plants will thrive, for no one can foresee except in a general way the degree of accommodation which any new plant will exhibit. The only way to find out is to test it, and Mr. Rock has sent in large quantities of seeds for trial.

Exploring alone in any country has its shady side, but in Yunnan, where the explorer may at any time meet bands of roving bandits and be subjected to the barbarities which only savages know how to inflict, Mr. Rock has had to meet conditions which have been almost unbearable.

This fact should be borne in mind by those to whom in the years to come these plants are sent for trial, and their value should be measured in terms of the dangers and hardships which they have occasioned. That Mr. Rock has been able to hold out and keep moving to America a stream of seeds and cuttings is the wonder of his friends.

One of the reasons for Mr. Rock's expedition to Yunnan was to discover what species of chestnuts grow there and secure their seeds. In this quest he has been successful.

On the summit of the Salwin Ridge, southwestern Yunnan, Mr. Rock found dense forests of a large species of chestnut (*Castanea* sp.; No. 56080) which grows to be 100 feet tall and 5 feet in diameter and bears sweet edible nuts the size of chinquapins. It is an excellent timber tree, ratoons freely from the stump, and no evidence of any disease was found upon it. Four days' journey west of Talifu he found a small forest species, only 60 feet tall (*Castanea* sp.; No. 56119), also with small nuts; and a tall species near Tali Lake which bore deliciously sweet nuts (*Castanea* sp.; No. 55984). Whether out of these species or others which he has collected will come one which will solve the chestnut problem is a question which will require years to answer. At any rate the first step—that of getting together the Asiatic chestnuts—has been taken.

From the discovery by Mr. Rock of numerous distinct species of wild apples growing in the mountains far removed from civilization, it would appear that western Yunnan is the region from which to get southern forms of this fruit with which to build up by hybridization an apple for our Southern States which now lie below the apple belt. This collection includes fruits varying from the size of cherries to those of large-sized crab apples. Some are trees 40 feet high, growing in hot, dry, rocky locations where little else besides the Yunnan pine grows, and others have long drooping branches. None of these has as yet been determined botanically.

Wild as well as cultivated peaches also occur in western Yunnan, and Mr. Rock reports there a clingstone white-fleshed peach

(*Amygdalus persica*; No. 55929) $3\frac{1}{2}$ to 4 inches in diameter, which he found growing wild in the Likiang Valley, and other trees 40 to 50 feet tall with fruits tasting like cherries (Nos. 55885 and 55888).

Among the numerous wild species of *Prunus* are plums with fruits the size of walnuts (*Prunus* sp.; No. 55824), a lemon-yellow form from regions subjected to extreme drought and intense heat from October to June (No. 55901), and small-fruited forms, from 12,000 feet altitude on the slopes of Satseto in pure limestone soils, which may prove of value for stocks.

Mr. Rock has collected species of *Rubus* bearing delicious orange-red berries from 12,000 to 13,000 feet altitude (Nos. 55891, 55892, and 55904) and others from the shade of the spruce forest with fruits orange-red and translucent and an inch in diameter (No. 55892), crimson-stemmed drooping-branched ornamental forms (No. 55893), and still others which are spineless (No. 56114).

Mr. Rock has sent in a wild grape (*Vitis* sp.; No. 55953) which he found covering rosebushes there. It is a prolific bearer and its dull-purple berries are very sweet, which is not usually the case with wild species of *Vitis*. He has sent nuts from a wild walnut tree 50 feet tall and with a spread of branches of 100 feet (*Juglans regia*; No. 55989); a tree hazelnut (*Corylus* sp.; No. 55987) which grows to be 60 to 80 feet tall and has handsome, very large leaves and large edible nuts; various as yet unidentified species of persimmon (*Diospyros* spp.; Nos. 56132 to 56134); the rare *Catalpa duclouxii* (No. 55931) which makes a tree 70 to 80 feet tall and 4 feet in diameter and produces hard durable timber suitable for building purposes that may contribute to the development of a superior hybrid catalpa for forest purposes. In the way of ornamental shrubs, lilies, and other ornamental plants the region has already become noted in England. Mr. Rock has sent seeds of a honeysuckle (*Lonicera* sp.; No. 55897); the rare *Osteomeles schwerinae* (No. 55992) with its dull-purple fruits which are sweet and edible; gorgeous primroses (*Primula* spp.); an edible-fruited viburnum (*Viburnum* sp.; No. 55950); an ornamental currant (*Ribes* sp.; No. 55890); the wild peony (*Paeonia delavayi*; Nos. 55898, 55937, 55994); and a striking new ornamental tree (*Cornus* sp.; No. 55955).

In addition to Mr. Rock's collections there have been received from various correspondents throughout the world a wild plum from Beirut (*Prunus ursina*; No. 55872) for trial as a stock in southern California; Goodman's Choice peach (*Amygdalus persica*; No. 55831), a great success in Australia, which if it succeeds in America as it has there might easily add millions to the California peach-canning industry; a new mango (*Mangifera indica*; No. 55839) from Gerrit P. Wilder, of Honolulu, which turns yellow while hard and keeps well for two weeks; 39 varieties of beardless spring wheat (*Triticum aestivum*; Nos. 55842 to 55870) originated by two noted plant breeders of New South Wales, J. P. Shelton and J. T. Pridham, of Sydney. Some of these varieties are said to produce better flour than the noted Hard Federation wheat, which is also of Australian origin.

Dr. P. J. S. Cramer, of the Java Department of Agriculture, presents two interesting varieties of sugar cane (*Saccharum officinarum*; Nos. 55829 and 55830) from the Sugar Experiment Sta-

tion at Pasoeroean, Java, one of which instead of producing sugar produces only starch in its stems and one whose flower heads are so hypertrophied as to be used as a vegetable by the Javanese.

The botanical determinations of seeds introduced have been made and the nomenclature determined by H. C. Skeels, and the descriptive notes have been prepared by Paul Russell, who has had general supervision of this inventory.

DAVID FAIRCHILD,
Agricultural Explorer in Charge.

OFFICE OF FOREIGN SEED AND PLANT INTRODUCTION,
Washington, D. C., December 21, 1923.

INVENTORY¹

55814. *OLEA EUROPAEA* L. Oleaceæ.

Olive.

From Nice, France. Cuttings presented by Dr. A. Robertson Proschowsky.
Received November 25, 1922.

Variety *Arbéquina*. This is a favorite among the Catalan nurserymen in the Province of Lerida, Spain, where it represents 92 per cent of the olives planted. It appears to be the one most resistant to the rather frequent drops in temperature on the Urgel Plain. The production is very high in the irrigated sections every year and every two years in the other sections. In habit the tree is spreading, with the secondary branches reflexed. In this region the olive trees are pruned every two years and often every year, with a special rejuvenating pruning every 10 or 12 years, in order to keep down the size of the trees and make easier the hand picking of the fruit. (Adapted from *Revue de Botanique Appliquée*, vol. 2, p. 26.)

55815. *DENDROCALAMUS SIKKIMENSIS* Gamble. Poaceæ. Bamboo.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received November 1, 1922.

"Seeds of the largest bamboo of these forests, collected at an altitude of 2,000 feet." (Cave.)

A beautiful tufted bamboo native to Sikkim, India, where the dark-green culms reach a height of 60 feet or more and a diameter of 5 to 7 inches. The species is easily distinguished by its large reddish brown globular flower heads and densely velvety stem sheath. The long narrow leaves are said to be poisonous, and from the stems are made the "chungas," or native buckets, used for carrying water and milk and for churning. (Adapted from *Annals of the Royal Botanic Garden, Calcutta*, vol. 7, p. 82.)

For previous introduction, see S. P. I. No. 54450.

55816. *VOANDZEIA SUBTERRANEA* (L.) Thouars. Fabaceæ.

From Ebolowa, Cameroon, West Africa. Seeds presented by Fred Hope.
Received November 2, 1922.

A creeping annual leguminous plant which matures its fruits in the same manner as the peanut, whence its common name "groundnut." It is native to tropical Africa and is extensively grown in that continent, as well as in other tropical countries, for its edible seeds.

For previous introduction, see S. P. I. No. 55104.

55817 to 55819.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received October 4, 1922. Quoted notes by Mr. Rock.

¹ It should be understood that the varietal names of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Seed and Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their identity fully established, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized American codes of nomenclature.

55817 to 55819—Continued.

55817. *MALUS* sp. Malaceæ.

Apple.

"(Likiang. July, 1922.) A tree 40 feet high, found wild and semi-cultivated in the vicinity of Likiang. The handsome fruits, about 2 inches in diameter, are bright crimson with just a touch of yellow. The flesh is firm, not mealy, with an acid-sweet flavor. A delicious bright-red jelly is made by boiling the fruits whole, in the skin, 2 parts of apples to 1 part of water; the juice is strained and boiled with sugar, 3 parts of sugar to 5 parts of juice."

55818. *PRUNUS* sp. Amygdalaceæ.

Plum.

"(Near Szemao. July, 1922.) A large tree, 40 feet or more in height, collected 30 li (9 miles) from Szemao, at 5,000 feet altitude. The red fruits are the size of walnuts, with loose, rather sour flesh. This should be good as a stock plant."

55819. *PRUNUS* sp. Amygdalaceæ.

Plum.

"(Near Szemao. July, 1922.) A large tree 45 feet high, found in the mountains at an altitude of 6,000 feet. The dark-red fruits, the size of large walnuts, have hard flesh with a sour insipid flavor. This tree was free from disease and should make a good stock plant."

55820 to 55826.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received October 9, 1922. Quoted notes by Mr. Rock.

55820. *COTONEASTER* sp. Malaceæ.

"(No. 5749. August, 1922.) A very ornamental shrub 8 to 10 feet high, growing in open scrubland among limestone boulders at altitudes of 9,000 to 10,000 feet on the Likiang Snow Range. The leaves are densely packed along the stems; the pinkish flowers are numerous, as are also the scarlet and yellow fruits, the latter resembling miniature apples."

55821. *COTONEASTER* sp. Malaceæ.

"(No. 5781. August, 1922.) A prostrate shrub, growing on pure limestone rocks on the Likiang Snow Range at altitudes of 8,000 to 10,000 feet. It has small dark-green glossy leathery leaves, pinkish white flowers, and rich-red fruits and would make a splendid shrub for rockeries."

55822. *PRUNUS* sp. Amygdalaceæ.

Cherry.

"(August, 1922.) A tree 35 to 40 feet high, growing among limestone boulders at an altitude of 10,000 feet. It is a fine shapely tree, with glossy leathery foliage, racemes of white flowers, and dark-red glossy fruits the size of a pea.

"The temperature at the village of Nguluke, in the Likiang Plain, drops to below zero Fahrenheit in the winter, and a fall of 22 inches of snow in December is not uncommon."

55823. *PRUNUS* sp. Amygdalaceæ.

Cherry.

"(August, 1922.) A shapely tree, which grows at an altitude of 10,000 feet among limestone boulders on the Likiang Snow Range. It has long drooping racemes of cream-colored flowers and small yellowish green fruits which are sour when ripe."

55824. *PRUNUS* sp. Amygdalaceæ.

Plum.

"(August, 1922.) A very hardy plum tree 35 to 40 feet high, growing semiwild in the vicinity of Likiang, at altitudes of 8,500 to 9,000 feet. The bright-red, perfectly round fruits are the size of large walnuts, clingstone, with yellow sweetish sour flesh which makes excellent jelly and jam."

55820 to 55826—Continued.**55825. RUBUS BIFLORUS** Buch.-Ham. Rosaceæ.

"(July, 1922.) A rambling shrub, collected on the Likiang Snow Range at altitudes of 11,000 to 12,000 feet. The large leaves have woolly lower surfaces, the large calyx is foliaceous, and the subacid yellow fruits are the size of a thimble."

55826. RUBUS sp. Rosaceæ.

"(No. 5359. July, 1922.) A vigorous rambling shrub, collected at an altitude of 12,000 feet on the Likiang Snow Range. It has red spiny stems, leaves with white lower surfaces, pinkish purple flowers, and small dark-red fruits of a delicious sweet flavor."

55827. CASTANEA SATIVA Mill. Fagaceæ. **European chestnut.**

From Morristown, N. J. Nuts presented by Dr. C. S. Sargent, Arnold Arboretum, Jamaica Plain, Mass. Received October 27, 1922.

From a tree grown on T. H. Symington's place.

Introduced for department specialists engaged in chestnut-breeding experiments.

55828. CUCUMIS SATIVUS L. Cucurbitaceæ. **Cucumber.**

From Burringbar, New South Wales. Seeds presented by B. Harrison. Received October 11, 1922.

"Harrison's Long. A cucumber 2 to 3 feet long, with tender, crisp, and palatable flesh. This variety is the result of careful selection and cultivation." (Harrison.)

55829 and 55830. SACCHARUM OFFICINARUM L. Poaceæ. **Sugar cane.**

From Pasoeroean, Java. Cuttings presented by J. Kuyper, assistant director, Sugar Experiment Station, Pasoeroean, at the request of Dr. P. J. S. Cramer, Director of the General Experiment Station, Buitenzorg. Received October 13, 1922. Quoted notes by Doctor Cramer.

55829. "*Teboe glonggong*. A variety with starch instead of sugar in its stems; this appears to be a botanically interesting variation."

55830. "*Teboe troeboeg*. A variety with hypertrophied flowers, used here as a vegetable."

55831. AMYGDALUS PERSICA L. Amygdalaceæ. **Peach.**
(*Prunus persica* Stokes.)

From Eastwood, near Sydney, New South Wales. Trees purchased from C. E. Vessey, Mount Tomah Nurseries. Received at the Plant Introduction Garden, Chico, Calif., September, 1922. Numbered October, 1922.

Goodman's Choice.

The following notes concerning the merits of this peach have been received from nurserymen in Australia:

From Herbert J. Rumsey, Dundas, New South Wales, June 13, 1922: "We have sent out a number of letters to friends who are in a position to know the behavior of this peach and its comparison with *Phillips's Cling* [at present the standard canning variety in California]. We have had a reply from Mr. Goodman, who states that this is easily the best quality canning peach the canners have ever seen and that growers in that State (Victoria) are putting in more acres of it than of all other yellow clings together.

"His catalog description, quoted below, shows that it ripens about six weeks later than *Tuscan Cling*:

"Undoubtedly the greatest yellow-fleshed clingstone peach introduced for many years. The tree is a heavy bearer each season of medium-sized fruits that are admirable for canning. The skin has a red blush on the sunny side;

the flesh is beautifully rich and translucent; the variety is remarkable for even crops and gradual ripening, which means so much when the picking campaign is in progress. The peaches ripen toward the end of February and, as the name indicates, represent my choice for canning."

"We know the behavior of the clings generally in this State, and we find that they have a great tendency to be uneven in shape. Our own nurseryman states that *Goodman's Choice* is one of the best late peaches that he has come across, but as we have no growers for canneries around there we can not give an authoritative report from that point of view ourselves."

From G. W. Peart, manager for C. J. Goodman, Bairnsdale, Victoria, June 14, 1922: "The flesh of this peach is wonderfully rich for canning purposes, and the processed product is just as superior to other varieties in appearance as it is in taste. In quality it is superior to *Phillips Cling*. Canners in this State declare that they can obtain more dozens of high-grade quality canned peaches from a ton of *Goodman's Choice* than from any other variety. This means that canners pay higher prices for *Goodman's Choice*. The variety is a regular cropper and has never failed to set a good crop in 12 years except once when a record late frost ruined all the stone fruits in the district. Unlike *Phillips Cling*, all the fruits on the tree come up to first-class cannery requirements." In another letter, dated June 30, 1922, Mr. Peart says further: "This peach originated about 18 years ago in one of our canning peach orchards at Mossiface, Victoria. After careful testing, the late Charles J. Goodman planted 3,000 trees in 1910, and we commenced to sell trees in 1915. To-day I am selling more trees of this variety than of any other clingstone peach. Z. Akers, Shepparton Fruit Preserving Co., Shepparton, Victoria, has a block of 6-year-old *Goodman's Choice*, and he claims to have harvested an average crop of 3½ bushels of fruit per tree when the trees were just 4 years old."

From E. Meeking, Senior Fruit Inspector, Melbourne, Victoria, June 14, 1922: "The *Goodman's Choice* variety of peach is considered, in the opinion of those competent to judge, the best canning peach which has yet been produced. It is a good cropper, produces uniform fruits, is of excellent color and texture, and its flavor is considered superior to that of any other canning peach yet produced."

From L. J. Wicks, Highbury, South Australia, July 13, 1922: "As a canning fruit *Goodman's Choice* is certainly O. K. The texture is just right; it makes a rather pale sirup which, however, is remarkably clear."

55832 and 55833.

From Buitenzorg, Java. Seeds presented by Carl Hartley. Received October 11, 1922. Quoted notes by Mr. Hartley.

55832. CITRUS NOBILIS DELICIOSA (Ten.) Swingle. Rutaceæ.

Mandarin orange.

"A rather large, very loose-skinned mandarin orange grown in the highlands of western Java under the name *Djeroek Garoet*. The fruits from which these seeds were taken were juicy and of excellent flavor."

55833. RUBUS FRAXINIFOLIUS Poir. Rosaceæ.

"Collected at an altitude of about 3,500 feet on the Salak in western Java. The bush is often 2 meters high and very slightly thorny. The conical strawberry-red fruit, 2.5 centimeters long and 2 centimeters wide at the base, is inclined to be hollow and deficient in pulp, but it is not acid and the flavor is fairly good. The species may prove valuable in breeding work."

For previous introduction, see S. P. I. No. 31096.

55834. DIOSCOREA sp. Dioscoreaceæ.

Yam.

From China or Japan. Tuber presented by E. R. Sasscer, Federal Horticultural Board. Secured by an inspector of the California State Department of Agriculture. Received October 2, 1922.

"Tuber long, slender, dark skinned, white fleshed, rather small. When cooked the flesh is firm, but fairly mealy and of very good flavor." (R. A. Young.)

55835 and 55836. AMYGDALUS PERSICA L. Amygdalaceæ.

(Prunus persica Stokes.)

Peach.

From the Plant Introduction Garden, Chico, Calif. Seedling trees numbered October, 1922, for convenience in distribution. Quoted notes by J. E. Morrow.

A shipment of seeds of the peach variety *Tardio Amarillo* was received from southern Spain in November, 1916, and given S. P. I. No. 43570. As is well known, peach varieties do not come true to seed, and the two trees described below are promising seedlings from this shipment.

55835. "Tree No. 6, Test Nursery. Fruits $2\frac{1}{2}$ by $2\frac{1}{4}$ inches; average weight 4 ounces; color golden with a faint-red blush; basin deep and narrow, slight depression at suture; flesh yellow; pit yellow. Season September 5 to September 15, later than last year. This is a good canning clingstone peach and a heavy bearer."

55836. "Tree No. 8, Test Nursery. Fruits 2 by $2\frac{3}{4}$ inches; average weight 4 ounces; basin deep, narrow; suture only a thin line; flesh deep yellow; pit small, yellow; flesh of good texture and flavor. This peach should be propagated for canning purposes. It is of smaller size than last season and later in ripening."

55837. PHLEUM PRATENSE L. Poaceæ.**Timothy.**

From Kelburn, Wellington, New Zealand. Presented by E. Bruce Levy, biology section, Department of Agriculture, New Zealand. Received October 16, 1922.

"This seed, secured directly from the grower, represents a strain of timothy which has been grown in one district for 22 years." (Levy.)

Locally grown seed introduced for department specialists engaged in timothy-breeding investigations.

55838. TRIFOLIUM PRATENSE L. Fabaceæ.**Red clover.**

From Glavica, Dalmatia, Yugoslavia. Presented by the Knin Agricultural School, Glavica. Received October 14, 1922.

Seeds consisting of a mixture of "North" and "Composite" varieties, harvested in 1921 in Zetva, and obtained from a seed firm in Laibach, Slovenia, Yugoslavia.

Locally grown red-clover seed introduced for cultural and comparison tests.

55839. MANGIFERA INDICA L. Anacardiaceæ.**Mango.**

From Honolulu, Hawaii. Plant presented by Gerrit P. Wilder, through Willis T. Pope, horticulturist, Hawaii Agricultural Experiment Station. Received October 18, 1922.

"Wootton. The original was produced from seed of the mango known as No. 7, originally from Jamaica, and is growing on the property of J. L. Horner, Makiki St., Honolulu.

"A formal description of the fruit is as follows: In size it is medium to large; shape roundish; slightly flattened on the sides, no apex point evident; weight about 10 ounces; color when ripe a shade between orange-yellow and yellow-orange, with tinges of pink and red at the stem end and pale-yellow dots all over the surface; skin medium thin, tough, peeling qualities fair, very pleasing fragrance; flesh rich apricot yellow, very good texture; flavor excellent, juicy, sweet-acid; seed medium to small for size of fruit.

"An important characteristic of this variety is that while still solid it has a very beautiful color as if ripe, making it a very desirable marketing form. It is one of the very best of this seedling class of mangos. In moderate temperatures it will remain in good condition as ripe fruit for two weeks." (Wilder.)

55840. ACTINIDIA CHINENSIS Planch. Dilleniaceæ. Yang-tao.

Plants raised from seed secured from D. W. Coolidge, Pasadena, Calif. Numbered October, 1922, for convenience in distribution.

Plants of this large-fruited seedling have been propagated at the Plant Introduction Garden at Chico, Calif., under P. I. G. No. 19420 and at Bell, Md., under P. I. G. No. 1846.

"The *yang-tao*, an ornamental deciduous climber native to Szechwan, China, has attracted considerable attention because of the high quality of its fruits. The leaves have a plushlike texture and an unusual dark-green color, and their large size and regular spacing add to the beauty of the vine. The flowers are buff yellow to white, fragrant, often $1\frac{1}{2}$ inches across, and are produced in great abundance. The ovoid to globose russet-brown villous fruits are about 2 inches long. The flesh is green, of most excellent flavor, resembling that of a gooseberry, but tempered with a flavor peculiarly its own. The fruit is good when eaten fresh and also makes very fine jam and sauce." (*David Fairchild*.)

For previous introduction, see S. P. I. No. 54400.

55841. LYCOPERSICON ESCULENTUM Mill. Solanaceæ. Tomato.

From Montevideo, Uruguay. Seeds presented by Luis Guillot, Dirección de Paseos Públicos. Received October 18, 1922.

Introduced from tropical America in the hope of securing a strain immune to tomato leaf-spot.

55842 to 55870. TRITICUM AESTIVUM L. Poaceæ. Common wheat.
(*T. vulgare* Vill.)

From Sydney, New South Wales. Presented by J. P. Shelton, plant breeder, Department of Agriculture, Sydney. Received October 17, 1922. Quoted notes by Mr. Shelton.

"The varieties listed below are all beardless spring wheats, white grained, with medium to strong flour qualities, and all give commercial yields in some districts. Those marked 'strong flour' should give a flour of better bread-making qualities than those marked 'Hard Federation.'"

55842 to 55855. "(A) Varieties lately bred in New South Wales by J. T. Pridham, but not yet in general cultivation."

55842. *Aussie*.

55843. *Baldknob*.

55844. *Early Bird*. (Very early.)

55845. *Forelock*. (Bearded.)

55846. *Ghurka*. (Strong flour. Very early.)

55847. *Riverina*. (Early.)

55848. Selection 13 (C1) from Hard Federation. (Strong flour.)

55849. Selection 19 (C1) from Hard Federation. (Strong flour.)

55850. Selection 69 (A6) from Hard Federation.

55851. *Stamina*. (Strong flour. Early.)

55852. *Wagga* No. 49.

55853. *Wagga* No. 54. (Early.)

55854. *Wandilla*.

55855. *Waratah*. (Early.)

55856 to 55860. "(B) Varieties in general cultivation in New South Wales and Victoria."

55856. *Canberra*. (Very early and prolific.)

For previous introduction, see S. P. I. No. 42109.

55842 to 55870—Continued.**55857.** *Gallipoli.***55858.** *Gresley.***55859.** *Improved Steinwedel.***55860.** *Minister.* (Strong flour and late.)**55861 to 55868.** "(C) Varieties lately fixed in West Australia; some from crosses made in New South Wales."**55861.** *Carrabin.* (Strong flour.)**55862.** *Cuballing.***55863.** *Dindiloa.* (Strong flour.)**55864.** *Gerralying.* (Strong flour.)**55865.** *Merredin.***55866.** *Nabawa.***55867.** *Nangeenan.***55868.** *Narrogin.* (Strong flour.)**55869 and 55870.** "(D) Varieties for a hot climate with summer rainfall."**55869.** *Boureng.***55870.** *Bunge.*

For previous introduction, see S. P. I. No. 47380.

55871. PEUMUS BOLDUS Molina. Monimiaceæ.

From Santiago, Chile. Seeds presented by Salvador Izquierdo. Received October 13, 1922.

"*Boldo.* A small tree esteemed in Chile for its ornamental and medicinal value. The dried leaves are exported to Europe, where they are employed in diseases of the liver. An infusion of the flowers is also used medicinally. The fruits are eaten but are not of great value.

"The tree is dioecious and very aromatic in all its parts. It has opposite, rough, short-petioled, ovate leaves; the flowers, borne in small axillary racemes, are followed by fruits the size of our northern haws." (*Wilson Popenoe.*)

For previous introduction, see S. P. I. No. 54639.

55872. PRUNUS URSINA Kotschy. Amygdalaceæ.**Plum.**

From Beirut, Syria. Seeds presented by Alfred E. Day, American University of Beirut. Received October 14, 1922.

"A wild plum. The fruits of this particular tree are decidedly larger and sweeter than usual; they are about $1\frac{1}{4}$ inches in diameter and yellow with pink cheeks." (*Day.*)

55873. COTONEASTER HEBEPHYLLA Diels. Malaceæ.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received October 18, 1922.

"(Likiang, August, 1922.) A deciduous shrub 10 to 18 feet in height, growing in limestone soil at an altitude of 10,000 to 11,000 feet on the Likiang Snow Range. It has long rambling branches, white flowers, and dark-carmine fruits and is quite ornamental." (*Rock.*)

55874 to 55884.

From Petrograd, Russia. Seeds presented by Prof. N. I. Vavilov, director, Russian Bureau of Applied Botany of the Agricultural Scientific Committee, through D. N. Borodin. Received October 19, 1922. Quoted notes by Mr. Borodin.

"The numbers refer to the inventory book of the Russian Bureau of Applied Botany."

55874 to 55877. PISUM ARVENSE L. Fabaceæ. Field pea.

55874. "Vavilov's 'Mahor,' No. 193. 1921. From Varg'on Goont, Pamir."

55875. "Vavilov's 'Mahor,' No. 194. 1921. From Sengi, Pamir."

55876. "Vavilov's 'Mushung,' No. 190. From Chil-Dare-Darviz, Pamir."

55877. "Vavilov's 'Mushung,' No. 195. From Kooliab, Pamir."

55878 to 55880. PISUM SATIVUM L. Fabaceæ. Garden pea.

55878. "Pissarev's B/11, No. 317. From Irkutsk Government, Siberia."

55879. "Pissarev's No. 318. From Ust-Uda, Irkutsk Government, Siberia."

55880. "Pissarev's 'Tulunsky Hybrid,' No. 316. From Tulun, Siberia."

The fact that the following are without ligules is noted as being of interest to botanists, such forms being rare in this country:

55881. SECALE CEREALE L. Poaceæ. Rye.

"Vavilov's rye, grown in Russia in 1921. From Pamir."

55882 to 55884. TRITICUM AESTIVUM L. Poaceæ. Common wheat.
(*T. vulgare* Vill.)

55882. "Vavilov's wheat, No. 96. From Pamir."

55883. "Vavilov's wheat, No. 648. From Pamir."

55884. "Vavilov's wheat, No. 1569. From Pamir."

55885 to 55893.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received October 21, 1922. Quoted notes by Mr. Rock.

55885 to 55888. AMYGDALUS PERSICA L. Amygdalaceæ. Peach.
(*Prunus persica* Stokes.)

55885. "(Puerhfu. August, 1922.) A large tree growing wild in the mountains at an altitude of 5,000 feet. The fruits are a beautiful red, clingstone, with juicy, rather strong-flavored flesh resembling that of a cherry."

55886. "(Puerhfu. August, 1922.) A large tree 50 feet in height, growing wild in the mountains at an altitude of 5,500 feet. The fruits are of fairly good size, yellow with a red cheek, clingstone, with yellow, very juicy flesh of excellent flavor."

55887. "(Likiang. August, 1922.) A large vigorous tree growing at an altitude of 8,500 feet. The large fruits, 2½ inches in diameter, are red and yellow on the surface, with firm snow-white, quite tasteless flesh. This should be a good stock plant."

55888. "(Puerhfu. August, 1922.) A large tree, 40 to 50 feet high, growing wild in the mountains. The fruits are the size of small apples, pure white outside, clingstone, with snow-white, very juicy flesh resembling that of a cherry."

55885 to 55893—Continued.**55889. MALUS sp. Malaceæ.****Apple.**

"(Likiang. August 15, 1922.) A large vigorous tree growing wild and semicultivated. The fruits, the size of walnuts, are bright crimson with a touch of yellow on one side, with acid-sweet, very palatable flesh, are excellent for jam or jelly and also quite ornamental."

55890. RIBES sp. Grossulariaceæ.

"(No. 5833. Likang. August 16, 1922.) A shrub 6 to 15 feet in height, growing in alpine meadows at an altitude of 12,000 feet, where it is 5 or 6 feet high; also in fir forests, where it reaches a height of 15 feet. It is a beautiful plant with pendent branches loaded with flowers in early May. In the latter part of August the fruits appear; these are yellowish red berries the size of a pea, with an acid-sweet flavor."

55891 to 55893. RUBUS spp. Rosaceæ.**Raspberry.****55891. RUBUS sp.**

"(Likiang. August 15, 1922.) A shrub 4 feet high, growing in protected gulches on the Likang Snow Range at an altitude of 12,000 feet. It bears delicious orange-red berries and may be only a form of the following [S. P. I. No. 55892]."

55892. RUBUS sp.

"(Likiang. August 15, 1922.) A shrub 4 feet high, growing on the Likang Snow Range at an altitude of 13,000 feet in the shade of *Larix thibetica* and also in fir and spruce forests. The large orange-red translucent berries, an inch in diameter, are very juicy and of delicious flavor. This is certainly worthy of cultivation."

55893. RUBUS sp.

"(Likiang. August, 1922.) A shrub growing in sheltered ravines on the Likang Snow Range at an altitude of 11,000 to 12,000 feet. It has crimson-stemmed drooping branches and trifoliate leaves, with the lower surfaces slightly pruinose or silvery. The fruits, somewhat smaller than those of the preceding species, are obconical, darker red, and faintly pubescent."

55894 and 55895.

From Hongkong, China. Seeds presented by H. Green, superintendent, Botanical and Forestry Department. Received October 21, 1922.

55894. GARCINIA OBLONGIFOLIA Champ. Clusiaceæ.

A tree native to Hongkong, China, which is a relative of the mangosteen. It has narrow short-stalked leaves, terminal yellow flowers, and smooth fruits the size of a small apple. (Adapted from *Bentham, Flora Hongkongensis*, p. 25.)

"This species has just come into bearing in one of our greenhouses, and we find the fruit to be of very good quality for eating out of hand. The flavor suggests that of the mangosteen." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 36497.

55895. UVARIA CALAMISTRATA Hance. Annonaceæ.

"A native fruit which grows wild here and is erroneously called by the natives 'Hill Lai Chi.'" (*Green*.)

A climbing plant, native to Hongkong, with rather thick oblong leaves, clustered yellowish flowers, and elliptical fruits about a third of an inch in length. (Adapted from *Journal of Botany*, vol. 20, p. 77.)

55896 to 55905.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received October 25, 1922. Quoted notes by Mr. Rock.

55896. *COTONEASTER PANNOSA* Franch. Malaceæ.

"(No. 5818. August 20, 1922.) A very ornamental shrub 10 feet high, growing among limestone boulders in fir forests and alpine meadows on the Likiang Snow Range at altitudes of 9,000 to 12,000 feet. The flowers are whitish pink and the ovate fruits purplish black."

For previous introduction, see S. P. I. No. 40169.

55897. *LONICERA* sp. Caprifoliaceæ.

Honeysuckle.

"(No. 6058. August 25, 1922.) A shrub or small tree 20 feet in height, with a trunk a foot in diameter, which grows in limestone soil in the foothills near Likiang at altitudes of 9,000 to 10,000 feet. The flowers, which appear in early spring, are a deep orange-yellow, with a paler lower lip, and the small round fruits are tomato red."

55898. *PAEONIA DELAVAYI* Franch. Ranunculaceæ.

Peony.

"(No. 6059. August 25, 1922.) A very attractive, vigorous shrub 4 feet high, growing on steep slopes among limestone boulders and in alpine meadows at altitudes of 10,000 to 13,000 feet on the Likiang Snow Range. The deep-crimson flowers are 3 inches in diameter."

55899. *PRIMULA SINOPURPUREA* Balf. f. Primulaceæ.

Primrose.

"(No. 5783. August 25, 1922.) A very charming robust plant 3 feet in height, growing in acid soil in boggy meadows at an altitude of 14,000 feet on the Likiang Snow Range. The leaves are golden yellow beneath, and the large umbels of rich-purple flowers appear in April and early May. When in flower this plant is very striking."

For previous introduction, see S. P. I. No. 55339.

For an illustration of this Chinese primrose, see Plate I.

55900. *PRIMULA VINCIFLORA* Franch. Primulaceæ.

Primrose.

"(No. 5782. August 25, 1922.) One of the finest primulas found on the Likiang Snow Range. It grows in company with the preceding, *P. sinopurpurea* [S. P. I. No. 55899], in similar situations, though not nearly so common, for it does not seed readily. The deep indigo-blue flowers are an inch and a half across and, like the preceding, appear quite early."

For previous introduction, see S. P. I. No. 55340.

55901. *PRUNUS* sp. Amygdalaceæ.

Plum.

"(No. 6056. August 25, 1922.) A wild plum tree 20 to 25 feet high, of spreading habit, found in limestone soil on the eastern side of the Likiang Plain, opposite the Snow Range, at an altitude of 10,500 feet. It bears perfectly round fruits an inch in diameter, lemon yellow, opaque, with firm sour flesh which is somewhat sweet when absolutely mature. The tree is very healthy and an abundant fruiter and should make a good stock plant where hardiness is desired. The locality where it was collected is subject to drought from October to June, when the heat is intense, and snow falls in the winter."

For an illustration of this Asiatic plum, see Plate II.

55902. *RIBES GLACIALE* Wall. Grossulariaceæ.

"(August 21, 1922.) A shrub 15 feet high, growing in alpine meadows at an altitude of 12,000 to 15,000 feet on the Likiang Snow Range. The flowers, which vary from cream colored to red, and the red oval berries make this shrub decidedly ornamental."

55903. *RUBUS* sp. Rosaceæ.

Raspberry.

"(No. 5834. August 16, 1922.) A raspberry with large rich-green leaflets, collected on the Likiang Snow Range at an altitude of 11,000

A HANDSOME CHINESE PRIMROSE (*PRIMULA SINOPURPUREA* BALF. F.; S. P. I. No. 55899)

Because of its vigor and free-flowering habit in the high mountains of western China, where it is native, this primrose seems likely to be more satisfactory in cultivation than other members of the "nivalis" section of the genus, to which this species belongs. It was found by J. F. Rock in boggy meadows on the Likiang Snow Range in northern Yunnan at an altitude of 12,000 feet. The plant grows to a height of about 3 feet, and the flower stalks and lower surfaces of the thick dark-green leaves are covered with golden meal. In May the rich rosy purple, fragrant flowers, each about an inch in diameter, are produced in clusters of 6 to 12 or more. (Photographed by J. F. Rock, Yunnan, China, May, 1922; P30216FS)

A DROUGHT-RESISTANT ASIATIC PLUM (PRUNUS SP.: S. P. I. No. 55901)

A hardy wild plum which is drought and heat resistant deserves trial as a stock for regions in the United States where dry hot summers combine with cold winters to make the growing of stone fruits very difficult. This species was discovered in limestone soil on the Likiang Snow Range, Yunnan, China, at an altitude of 10,500 feet, where it grows as a spreading tree 20 to 25 feet high. It bears a large number of round lemon-yellow fruits an inch in diameter. Its native region is subject at times to intense heat and drought, and snow falls in the winter. (Photographed by J. F. Rock, September 1, 1922; P30289FS)

55896 to 55905—Continued.

feet. The yellow fruits the size of a thimble have a delicious flavor. The plant thrives in limestone soil."

55904. RUBUS sp. Rosaceæ.

"(No. 6057. August 24, 1922.) One of the finest species of *Rubus* on the Likiang Snow Range, where it grows at an altitude of 13,000 feet in forests of *Larix thibetica*. The orange-yellow fruits are larger than any of the cultivated species of *Rubus* and are rich in color, juice, and flavor."

55905. ROSA sp. Rosaceæ.**Rose.**

"(No. 5835. August 20, 1922.) A shrub 10 feet high, growing in meadows on the Likiang Snow Range at altitudes of 12,000 to 15,000 feet. It is a very ornamental plant, with red stems and red, curved, beadlike fruits. There are innumerable varieties, the flowers varying in color from creamy white to red."

55906. CITRULLUS VULGARIS Schrad. Cucurbitaceæ. Watermelon.

From Palm City, Camaguey, Cuba. Seeds presented by Rudolph Russ. Received October 28, 1922.

Watermelon seeds introduced from Cuba for experimental purposes by department horticulturists.

55907. LEYCESTERIA GLAUCOPHYLLA (Hook f. and Thoms.) C. B. Clarke. Caprifoliaceæ.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received October 23, 1922.

A slender plant, closely allied to the honeysuckles, with pale-green leaves and bearing in the early winter a profusion of pink flowers in short axillary spikes. It is native to the subtropical Himalayas at an altitude of 5,000 feet. (Adapted from *Gardeners' Chronicle*, 1858, p. 700.)

55908 to 55910.

From Darjiling, India. Seeds secured from G. H. Cave, curator, Lloyd Botanic Garden, by H. J. Elwes, Colesborn, Cheltenham, England, and presented by J. N. Rose, United States National Museum, Washington, D. C. Received October 20, 1922.

55908. OSBECKIA CRINITA Benth. Melastomaceæ.

A much-branched shrub 4 to 8 feet high, with small, narrow bristly leaves and large purple or pure-white flowers borne in terminal clusters. This plant is abundant at altitudes of 4,000 to 8,500 feet in the mountains of Sikkim and Bhutan, India. (Adapted from *Hooker, Flora of British India*, vol. 2, p. 517.)

55909. PIERIS FORMOSA (Wall.) D. Don. Ericaceæ.

A Himalayan bush, 15 to 20 feet in height, which bears large terminal clusters of white flowers resembling those of the lily of the valley. The glossy green foliage persists throughout the winter, making a very effective background for the flowers. (Adapted from *The Garden*, vol. 79, p. 111.)

55910. SYMPLOCOS GLOMERATA King. Symplocaceæ.

A shrub or small tree becoming 10 feet high, with narrow leathery leaves 6 inches long and axillary clusters of small white flowers. This shrub is rather common in the hills of Sikkim and Bhutan, India, at altitudes of 1,000 to 8,000 feet. (Adapted from *Hooker, Flora of British India*, vol. 3, p. 577.)

55911 to 55913. DAVIDIA spp. Cornaceæ.

From Kew, England. Presented by Dr. A. W. Hill, director, Royal Botanic Gardens, Kew. Received November 2, 1922.

55911. DAVIDIA INVOLUCRATA Baill.

Budwood of a handsome tree from western China, where it reaches a height of 60 to 70 feet; in habit and foliage it resembles a linden. The bright-green oval leaves, 3 to 6 inches long, are sharply toothed and slender stalked, and the globular heads of small flowers, borne on slender nodding stalks about 2 inches long, appear in May and are made unusually striking because of the two or three large white bracts. These bracts are of unequal size, the largest being from 4 to 7 inches long and 2 to 4 inches broad. (Adapted from *Horticulture*, vol. 10, p. 433.)

For previous introduction, see S. P. I. No. 49668.

55912 and 55913. DAVIDIA INVOLUCRATA VILMORINIANA (Dode) Hemsl.

This variety does not show any difference in flower characters from the preceding, but the leaves are smooth, and it may not prove as hardy as the typical form. (Adapted from *Horticulture*, vol. 10, p. 433.)

For previous introduction, see S. P. I. No. 52936.

55912. Seeds.**55913. Budwood.****55914. BERTHOLLETIA NOBILIS Miers. Lecythidaceæ. Brazil nut.**

From Santa Cruz de la Sierra, Bolivia. Seeds presented by Juan S. Bowles. Received November 1, 1922.

"The Brazil nut has never been successfully cultivated in any part of the United States, so far as known to us, and is probably too tropical in its requirements for even the mildest wintered sections of Florida and California. It may be possible to grow it in Porto Rico, the Canal Zone, parts of Hawaii, and the Philippines. Seeds received in past years have usually come from northern South America, where are found the principal centers of production. These seeds from Bolivia may yield trees which will be slightly less exacting in their requirements than those from regions nearer the Equator." (*Wilson Popenoe*.)

55915 to 55919. AMYGDALUS PERSICA L. Amygdalaceæ. Peach.
(*Prunus persica* Stokes.)

From Angol, Chile. Plants presented by the Instituto Agrícola Bunster, Angol. Received November 7, 1922.

"In the orchards of central Chile are cultivated numerous peach varieties of local origin. Most of them are clingstones, for this type is more popular in that country, apparently, than the freestone. Some of them are of large size and fine quality. In fact, they compare very favorably with the best peaches of other countries.

"The peach growers of California are interested in securing the best available clingstone varieties for the production of fruit to be used for canning and preserving. To this end an effort is being made by this office to secure interesting sorts from all parts of the world. The Chilean varieties are worth a careful trial. The following descriptive notes are adapted from the nursery catalogue of the Instituto Agrícola Bunster." (*Wilson Popenoe*.)

55915. Blanquillo de Mayo. A very late, productive variety, with medium-sized fruits: excellent for preserves.

55916. De Vino. A very good clingstone variety whose season is in March. The fruits are very large, with very dark-red flesh.

55917. Monstruoso amarillo de Pina del Mar. A freestone variety which ripens in February. The very large fruits are of excellent quality.

55918. O'Higgins. A clingstone variety which ripens in March. The large fruits are a clear yellow.

55919. Pavia blanco. The large fruits are of good quality and are excellent for preserves or for drying. Season, February and March.

55920. PLOCAMA PENDULA Ait. Rubiaceæ.

From Orotava, Canary Islands. Seeds presented by Juan S. Bolinaga. Received November 10, 1922.

"A species of low-growing shrub found on the slopes of the arid hillsides in the Canary Islands. It has a most beautiful weeping habit, giving the plants the appearance of tiny weeping willows not over $2\frac{1}{2}$ to 3 feet high. This would be very beautiful as a cover for dry hillsides overlooking the sea. It has already been brought into cultivation and will probably withstand severe drought." (*David Fairchild.*)

For previous introduction, see S. P. I. No. 21611.

55921. POSOQUERIA LATIFOLIA (Rudge) Roem. and Schult. Rubiaceæ.

From Ancon, Canal Zone. Seeds presented by James Zetek. Received November 14, 1922.

"The very conspicuous white flowers of this rubiaceous plant have a sweet perfume somewhat like that of the orange jessamine (*Chalcas exotica* Millsp.)." (*Zetek.*)

A shrub, sometimes 25 feet high, native to the forests of northern Bahia, Brazil, where it grows in dry sandy soil with but little water. It flowers in February, and its succulent fruits, which ripen in July, are sold in the native markets for making marmalade and jelly. The greatest value of the shrub, however, lies in the finely grooved rigid branches, which are highly prized for walking sticks. These are exported to England under the name of "Brazilian oak." (*Adapted from Kew Bulletin of Miscellaneous Information. 1904, p. 9.*)

A handsome plant, worthy of general trial in tropical regions.

55922. CUCUMIS MELO L. Cucurbitaceæ. Muskmelon.

From Angol, Chile. Seeds presented by the Instituto Agrícola Buuster. Angol. Received November 13, 1922.

"The melons of Chile, which ripen during the months of February, March, and April, are famous for their delicate flavor and remarkable keeping quality. Recently a number of them have been shipped from Valparaiso to New York, reaching the latter market in good condition. This seed is to be tested in our Southwestern States." (*Wilson Popenoe.*)

55923. PUNICA GRANATUM L. Punicaceæ. Pomegranate.

From Tangier, Morocco. Seeds presented by Jules Goffart. Received November 14, 1922.

"A variety of pomegranate with white flowers and fruits, which I found in Reunion. In flavor the fruit is slightly more acid than most varieties. When in flower and in fruit the tree is very ornamental." (*Goffart.*)

For previous introduction, see S. P. I. No. 40856.

55924. DIOSCOREA PENTAPHYLLA L. Dioscoreaceæ. Yam.

From Aulnay sous Bois, France. Tubers presented by Prof. R. de Noter, École d'Acclimatation de Recherches Agricoles. Received December 7, 1922.

Variety *Hortorum*.

"*Igname ronde de Chine* (round yam of China). The tubers made the first season, from plants grown from 'eyes' dug and replanted, weigh $1\frac{1}{2}$ kg. each; the second year the tuber may weigh 4 to 5 kg. The plant requires light sandy clay or, better, calcareous, richly fertilized soil. The tubers are gathered at the first frost and stored in the cellar. Two years' storage does not injure but improves the tubers. This yam is an excellent vegetable of delicate flavor and makes delicious fritters, cakes, and soufflés. The leaves, after the harvest, are used as cattle feed." (*De Noter.*)

For previous introduction, see S. P. I. No. 52867.

55925. CITRUS GRANDIS (L.) Osbeck. Rutaceæ. Pummelo.
(*C. decumana* Murr.)

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, Department of Agriculture, Buitenzorg. Received November 17, 1922.

"A red-fleshed pummelo of fair quality and well-developed color." (Cramer.)

For previous introduction, see S. P. I. No. 46336.

55926 to 55955.

From Yunnan, China. Collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received November 2, 1922. Quoted notes by Mr. Rock.

55926. ALEURITES sp. Euphorbiaceæ.

"(No. 6163. August 10, 1922.) Seeds of a tree 10 to 15 feet high, which grows wild on the lower slopes of the mountains of the Yangpi Valley, at an altitude of 6 600 feet. It is called *Tung-yu shu* by the natives; oil is obtained from the seeds and used for making oilcloth and also for burning."

55927 to 55929. AMYGDALUS PERSICA L. Amygdalaceæ. Peach.
(*Prunus persica* Stokes.)

55927. "(August 10, 1922.) Seeds of a half-wild peach growing near Yangpi, two days from Talifu. The tree is old, with large trunks; the large reddish and green fruits, 4 inches in diameter, are free-stone, with firm, sweet, white flesh which becomes red near the seed."

55928. "(Yangpi. August 10, 1922.) Seeds of a half-wild peach growing near a temple. The fruits are 1½ to 2 inches in diameter, clingstone, very juicy and sweet."

55929. "(August 20, 1922.) Seeds of one of the largest fruited peaches I know of, found growing wild in the Likiang Valley. The pointed fruits are 3½ to 4 inches in diameter, clingstone, with firm white flesh of fair flavor."

55930. CASTANEA MOLLISSIMA Blume. Fagaceæ. Chestnut.

"(No. 6165. Yangpi. August, 1922.) Seeds of a tree about 40 feet high which grows along the lower western slopes of the Tsangshan Range of the Yangpi Mountains. The trunk is about 2 feet in diameter, and the long narrow leaves are sharply serrate."

55931. CATALPA DUCLOUXII Dode. Bignoniaceæ.

"(No. 3097. Near Nguluke. September 8, 1922.) Cuttings of a tree 70 to 80 feet high, with a diameter of 4 feet or more, growing at an altitude of 9,400 feet in the Likiang Valley. At this altitude the trees do not bear seed. It is a very handsome tree, bearing in early spring large clusters of pinkish purple flowers. The hard, durable wood is very valuable and is used for building purposes."

55932. CRATAEGUS PINNATIFIDA Bunge. Malaceæ. Hawthorn.

"(No. 6166. Yangpi. August 10, 1922.) Seeds of a shrub 5 feet high, found at an altitude of 6,000 to 7,000 feet on the lower slopes of the mountains of the Yangpi Valley. The edible fruits are boiled with sugar and candied like jujubes. Native name 'Shan li ko' (mountain pear fruit)."

55933. HEMEROCALLIS FORRESTII Diels. Liliaceæ.

"(Nos. 3841 and 4546. August 27, 1922.) Seeds of a very handsome plant about 2 feet high, growing with *Incarvillea grandiflora brevipes* on the Likiang Snow Range at an altitude of 11,000 feet. It has a thick rootstock, narrow lanceolate leaves, and deep golden orange tubular flowers 2 to 3 inches long borne in many-flowered spikes. It flowers only in very early spring and is suited only for pure limestone soil.

55926 to 55955—Continued.

55934. *INCARVILLEA GRANDIFLORA BREVIPES* Sprague. Bignoniaceæ.

"(Nos. 4127, 4128, 6122. August 27, 1922.) Seeds of a gorgeous perennial, a foot or more in height, found growing at an altitude of 9,000 to 11,000 feet on the Likiang Snow Range. It has a thick stout rootstock, a large rosette of rich-green leaves, and flowers 3 inches wide. These flowers, which appear in March and April, have a long yellow calyx tube and a corolla which is a rich reddish purple or vermillion. This plant, one of the most striking of early spring, grows in snow-white magnesium-limestone soil."

For an illustration of this variety, see Plate III.

55935. *LILIUM TIGRINUM* Ker. Liliaceæ.

Tiger lily.

"(Nos. 4889 and 5357. September 7, 1922.) Bulbs of an orange-flowered lily cultivated by the Mosos in Likiang for the bulbs, which are eaten as a vegetable; only the outer scales are sold, the inner part being kept for planting. This lily grows wild along watercourses in the Likiang Plain at an altitude of 9,000 feet. The numerous large flowers, orange with purple, are very attractive."

55936. *MELIOSMA CUNEIFOLIA* Franch. Sabiaceæ.

"(Nos. 4410, 4721, 6136. September 3, 1922.) Seeds of a beautiful flowering shrub or small tree 12 feet high, found growing at an altitude of 9,000 to 10,000 feet along watercourses on the northern end of the Likiang Snow Range, usually among limestone boulders. In habit it resembles the weeping willow, with drooping branches bearing on their apices large pyramidal clusters of cream-colored flowers. During June and July this shrub is an object of great beauty."

55937. *PAEONIA DELAVAYI* Franch. Ranunculaceæ.

Peony.

"(No. 6059. September 3, 1922.) Seeds of a very attractive vigorous shrub 4 feet high, growing in rather dry situations north of Likiang among limestone boulders at an altitude of 9,800 feet. The deep-crimson flowers are 3 inches in diameter."

For previous introduction, see S. P. I. No. 55898.

55938. *PAPYRIUS* sp. Moraceæ.

"(No. 6162. Langkung. August 16, 1922.) Seeds of a shrub or small tree 10 feet high, which grows along streams at an altitude of 7,000 feet."

This genus includes the well-known paper mulberry.

55939. *POLYGALA ARILLATA* Buch.-Ham. Polygalaceæ.

"(No. 6167. Yangpi. August 10, 1922.) Seeds of an ornamental shrub 3 to 4 feet high, found growing on the lower mountain slopes at an altitude of 7,000 feet. The bright-yellow flowers are borne in long spikes, and the seed pods are small."

For previous introduction, see S. P. I. No. 49646.

55940. *PRUNUS* sp. Amygdalaceæ.

Cherry.

"(September 8, 1922.) Seeds of a cherry tree 25 to 30 feet in height with a trunk 8 to 10 inches in diameter, which grows in the main gorge leading to the snow-capped peak Satseto (altitude 21,000 feet), among pure limestone rocks, at an altitude of 12,000 feet. The water in the stream bed of this gorge is like milk because of the limestone soil; in the winter the gorge is filled with ice.

"The leaves of this tree are flaccid and bluish green. The long-stemmed bright-red ovoid-oblong cherries appear very late, in September, and are borne singly in the axils of the leaves; the juicy, bitter, bright-red flesh is not firm, and the stone is small. This would probably make a good stock plant for alkaline regions."

55941. *PRUNUS* sp. Amygdalaceæ.

Plum.

"(No. 6117. August 26, 1922.) Seeds of a wild plum tree about 20 feet high, which grows along banks of streams in the Likiang Plain at

55926 to 55955—Continued.

an altitude of 9,500 to 10,000 feet. The round lemon-yellow fruits are about an inch in diameter. The tree is a prolific bearer and grows in alkaline soil."

55942 to 55946. *ROSA* spp. Rosaceae.

Rosa.

55942. *ROSA* sp.

"(Nos. 6125, 6127, 6128, 6129, 6130. August 30, 1922.) Seeds of a mixture of a number of closely related forms found in the limestone meadows of Saba, Likiang Snow Range, at an altitude of 11,000 feet. They are all shrubs 8 to 10 feet in height."

55943. *ROSA* sp.

"(No. 6121. August 28, 1922.) Seeds of a shrub 12 to 15 feet high, with long rambling branches, found along watercourses on the north end of the Likiang Plain at an altitude of 9,000 to 10,000 feet. It bears a large number of white flowers, which are followed by small ovoid orange fruits. When in bloom this shrub is a very striking object."

55944. *ROSA* sp.

"(No. 6126. August 30, 1922.) Seeds of a shrub 8 to 10 feet high, which grows in a limestone meadow called Saba, in the Likiang Snow Range, at an altitude of 11,000 feet. The flowers are either cream colored or red and the smooth fruits a dull red-brown."

55945. *ROSA* sp.

"(No. 6435. September 7, 1922.) Seeds of a lovely slender spineless shrub 8 to 10 feet in height, which grows in a deep gorge leading up to the main peak of the Likiang Snow Range, at an altitude of 6,000 feet, among spruce and fir forests and rhododendrons. The soil is usually much impregnated with lime. The shrub is very ornamental both in flower and in fruit. The single flowers are a deep rose red, and the yellow and scarlet shining fruits are long pear shaped."

55946. *ROSA* sp.

"(No. 6436. September 7, 1922.) Seeds of a slender, very attractive shrub which grows with the preceding No. 6435 [S. P. I. No. 55945] in the limestone gorge leading to the main peak of the Likiang Snow Range, at an altitude of 11,500 to 12,000 feet. The stems and branches are red and spineless except on the young shoots. The flowers are cream colored, and the crimson to carmine fruits are covered with a few soft bristles, are pear shaped, and about an inch in length."

55947. *SCILLA* sp. Liliaceae.

"(No. 6169. Kiuhlo. August, 1922.) Bulbs of a liliaceous plant found growing at an altitude of 7,000 feet. It bears spikes of small rich-purple flowers."

55948 and 55949. *VACCINIUM* spp. Vacciniaceae.

55948. *VACCINIUM DELAVAYI* Franch.

"(No. 6168. August 20, 1922.) Seeds of a very compact hardy shrub which grows on the Tsangshan Range at an altitude of about 8,000 to 9,000 feet. The edible berries, the size of small peas, are purplish black."

55949. *VACCINIUM* sp.

"(No. 6437. September, 1922.) Seeds of a shrub 2 feet high, which is very common from the Black River Valley to this locality (Likiang Snow Range), where it grows under pine trees. The flowers are a beautiful pink, and the edible dark-purple fruits, about the size of peas, are quite sweet."

A SHOWY ALPINE PLANT FROM WESTERN CHINA (*INCARVILLEA GRANDIFLORA* BREVIPES SPRAGUE; S. P. I. No. 55934)

For many years the typical form of this relative of our trumpet vine has been known to horticulturists, but the variety here shown was discovered only a few years ago in western China, whence it was sent to Europe. It is a rather small perennial, a foot or two in height, and differs from the type in having large brilliant-red flowers with canary-yellow markings in the throat, as well as in having more compact flower clusters. The plant illustrated was growing in pure limestone drift on the lower slopes of the Likiang Snow Range, Yunnan, China, at an altitude of 10,500 feet. (Photographed by J. F. Rock, June 2, 1922; P30260FE)

A CHESTNUT FROM THE MOUNTAINS OF SOUTHWESTERN CHINA CAS-
TANEA SP.: S. P. I. No. 56380

55926 to 55955—Continued.

55950 to 55952. *VIBURNUM* spp. Caprifoliaceæ.55950. *VIBURNUM* sp.

"(No. 6061. September 7, 1922.) Seeds of a shrub 5 to 8 feet high, which is the most common *Viburnum* on the Likiang Plain; it grows almost everywhere, but especially along streams among limestone boulders and on the lower slopes of the Likiang Snow Range at an altitude of about 10,000 feet. In early spring appear the cymes of white flowers, followed by the drooping clusters of rich red-crimson fruits. These fruits are quite acid, but are used for jams and jellies, giving the jelly a rich-red color. When in fruit the plant is very ornamental; the fruits, which ripen after the first frost, remain firm for two months."

55951. *VIBURNUM* sp.

"(No. 6160. Talifu. August 20, 1922.) Seeds of an ornamental shrub 5 to 6 feet high, with drooping branches, which grows at an altitude of 10,000 feet on the Tsangshan Range. The flowers are white to cream colored and the fruits black when ripe."

55952. *VIBURNUM* sp.

"(No. 6161. Ningai. August 10, 1922.) Seeds of an ornamental shrub 4 feet high, found growing on limestone rocks. The flowers are white with a pinkish tinge, and the fruits are black."

55953. *VITIS* sp. Vitaceæ.

Grape.

"(No. 6286. September 7, 1922.) Seeds of a very hardy wild grape found covering rosebushes along streams among limestone boulders in the northern end of the Likiang Snow Range at an altitude of 10,000 feet. The leaves are small, thick, and deeply three lobed. The vine is a prolific bearer. The small dull-purple fruits, a little larger than peas, with large seeds, are borne in racemes 3 to 4 inches long and are very sweet, with no acid taste."

55954. (Undetermined.)

"(No. 6164. August 10, 1922.) Seeds of a tree 30 to 40 feet high, with a trunk 3 to 4 feet in diameter, which grows in deep gulches in the Yangpi Mountains, near Talifu, at an altitude of 10,000 feet. The leaves and fruit resemble those of a *Ziziphus*."

55955. *CORNUS* sp. Cornaceæ.

"(September 3, 1922.) Seeds of an ornamental tree about 25 feet high, which grows in the Peshwe Valley, north of the Likiang Plain, at an altitude of 10,000 feet. The leaves are bright green above, white beneath, and the cream-colored flowers are in large cymes. The fruits are purplish black and very ornamental."

55956 to 55963.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received November 4, 1922. Quoted notes by Mr. Rock.

55956. *LONICERA XEROCALYX* Diels. Caprifoliaceæ.

Honeysuckle.

"(No. 5939. August 27, 1922.) A rare shrub 15 to 20 feet high, which grows at an altitude of 12,000 feet on an alpine meadow known to the Mosos as 'Ma hoang pa tze' (leech meadow). The shrub has horizontal branches, narrow leaves of a rich green, and large rich golden yellow flowers, which appear in May and June. It is an exceedingly handsome species. The small fruits are a tomato red."

55957. *MECONOPSIS INTEGRIFOLIA* (Maxim.) Franch. Papaveraceæ.

"(Nos. 3358, 3385, 6114. August 27, 1922.) A fine alpine plant 2 feet or more in height, found rather commonly at an altitude of 14,000

as the plant grows older, usually set at a rather acute angle; leaves 2 to 4 inches long, light green above, grayish beneath, one edge serrate, the other smooth; sheaths deciduous, marked with purplish spots and blotches.

"A handsome ornamental form, fairly hardy, and grown generally in public gardens throughout the world. This was one of the earliest introduced forms in California and is found there in many gardens. It is said to be quite drought resistant and with a little protection will survive the winters as far north as Washington, D. C." (*B. T. Galloway*.)

55976. *ZEA MAYS* L. Poaceæ.

Corn.

From Buenos Aires, Argentina. Presented by D. S. Bullock, Agricultural Commissioner, Bureau of Agricultural Economics. Received November 28, 1922.

"From Entre Rios, Argentina." (*Bullock*.)

Maíz amargo (bitter corn). A variety of corn said to have been introduced into Argentina from Hungary in 1902, since which date it has become quite popular in some parts of northern Argentina because of its resistance to the attacks of locusts. A characteristic of this variety which distinguishes it from other varieties is its tendency to stool or produce side shoots. Unless planted close, each plant will produce under favorable conditions from 4 to 10 of these shoots. The leaves are often over 3 feet long and sometimes 4 inches wide and the stalks from 6 to 10 feet tall. There are two forms noted in Entre Rios, one with grayish white kernels and one with yellow kernels, the latter having longer ears than the former. Because of the numerous intergradations, however, it is very difficult to obtain typical ears of either form. The growing season of *maíz amargo* is long, sometimes as long as nine months. In Entre Rios it is sown in November. (Adapted from *Report No. 76, D. S. Bullock, Agricultural Commissioner*.)

55977. *ARACHIS HYPOGAEA* L. Fabaceæ.

Peanut.

From Sydney, New South Wales. Seeds presented by G. W. Valder, under-secretary and director, Department of Agriculture. Received November 28, 1922.

"These seeds were originally sent from the United States under the name 'Mammoth.' The Chinese claim that this variety is too large for their purpose." (*Valder*.)

Introduced for the use of specialists in the Department of Agriculture.

55978. *EUGENIA DOMBEYI* (Spreng.) Skeels. Myrtaceæ.

(*E. brasiliensis* Lam.)

Grumichama.

From Hilo, Hawaii. Seeds presented by Bro. Matthias Newell. Received October 23, 1922.

"The grumichama is found both wild and cultivated in southern Brazil, particularly in the States of Parana and Santa Catharina. Elsewhere, with the exception of Hawaii, it is scarcely known.

"The tree, which grows to the same size as the orange, is shapely and attractive in appearance, with ovate-elliptic, glossy deep-green leaves 2 to 3 inches long. The small white flowers are followed by pendent fruits, round or slightly flattened, the size of a cherry and deep crimson in color. The persistent green sepals which crown the apex are a distinguishing characteristic. The skin is thin and delicate, the flesh soft, melting, of a mild subacid flavor suggesting that of a Bigarreau cherry. The seeds are round or hemispherical when one or two in number; sometimes there are three or more, in which case the size is reduced and they are angular.

"The rapidity with which the fruits develop is surprising; within a month from the time of flowering they have reached maturity and are falling to the ground. Father Tavares states that all the trees do not ripen their crops at the same time, some blooming later than others and thus extending the fruiting season from November to February (in Brazil). Three varieties are distinguished by him, one with dark-red flesh, another with vermilion, and the third with white. All three are said to be equally good in quality. The fruit is usually eaten fresh, but may also be used to make jams and preserves.

"The grumichama (sometimes *grumizama*, to conform to old Portuguese orthography) has recently been planted in California and Florida. In the latter State it has withstood a temperature of 26° F. without injury, which indicates that it is subtropical, rather than strictly tropical, in character. It prefers a deep sandy loam, but succeeds in Florida on shallow sandy soils. Vaughan MacCaughy says: 'In the Hawaiian Islands it is usually about 20 feet high. It requires considerable moisture for its best development, as do all the Eugenias in our flora: the largest crops are borne by plants at the lower levels, up to 300 feet * * * flowering and fruiting continue from July until December, the main crop coming in the fall * * *. The first plants in Hawaii were probably introduced by the Spaniard Don Francisco de Paula Marin, who came to the islands in 1791.' The grumichama is sometimes listed as *Eugenia brasiliensis* Lam. *Stenocalyx brasiliensis* Berg. is another synonym. "Seedlings are said to commence fruiting when 4 or 5 years old. They grow rather slowly. No one appears to have budded or grafted the species as yet. For its value as an ornamental plant, as well as for its pleasant fruit, the grumichama deserves cultivation throughout the Tropics and Subtropics." (Wilson Popenoe.)

For previous introduction, see S. P. I. No. 54777.

55979 to 55981. MYRCIARIA spp. Myrtaceæ.

From Rio de Janeiro, Brazil. Seeds presented by P. H. Rolfs, director, Escola Superior de Agricultura e Veterinária, Vicosa, Minas Geraes, Brazil. Received December 21, 1922.

55979. MYRCIARIA sp.

Jaboticaba.

The jaboticaba (*Myrciaria cauliflora*) is doing very well in Florida, and these seeds are introduced for testing in that State.

55980. MYRCIARIA sp.

Jaboticatuba.

"The fruits of this variety are much larger than those of the ordinary jaboticaba." (Rolfs.)

55981. MYRCIARIA sp.

Jaboticaba.

The jaboticaba (*Myrciaria cauliflora*), one of the commonest and most popular fruits of the vicinity of Rio de Janeiro, Brazil, now appears to be thriving in southern Florida, and these seeds are introduced for cultural experiments in that State.

55982. GUILIELMA UTILIS Oerst. Phœnicaceæ.

Pejibaye.

(*Bactris utilis* Benth. and Hook.)

From Limon, Costa Rica. Seeds presented by C. P. Chittenden, manager, United Fruit Co. Received November 16, 1922.

"A red-striped variety of pejibaye of very good eating quality." (Chittenden.)

For previous introduction and description, see S. P. I. No. 55807.

55983 to 55992.

From Yunnan, China. Collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received November, 1922. Quoted notes by Mr. Rock.

55983. CASTANEA sp. Fagaceæ.

Chestnut.

"(No. 6256. Yangpi. September 19, 1922.) Seeds of a tall tree 40 feet or more in height, with a trunk 2 feet in diameter, found wild on the southwestern slopes of the Tsangshan Range at altitudes of 8,000 to 9,000 feet. The nuts, very sweet and of delicious flavor, are numerous in the burs, and the strong healthy trees are prolific bearers."

55983 to 55992—Continued.

55984. *CASTANEA* sp. Fagaceæ. Chestnut.

"(No. 6256a. September, 1922.) Seeds of tall trees found wild in the valleys of the Haitung Range, east of the Tali Lake, at an altitude of 8,000 feet. The nuts are larger than those from the mountains near Yangpi, but both are very sweet and delicious in flavor."

55985. *CHAENOMELES* sp. Malaceæ. Chinese quince.

"(Talifu. September 19, 1922.) Seeds of a quince, called in Chinese *Mu kua*, cultivated around Talifu. The tree is 50 to 80 feet tall, with a large trunk. The very aromatic fruits, rich yellow with a reddish tinge, have very firm, hard, yellow flesh."

55986. *COLOCASIA ESCULENTA* (L.) Schott. Araceæ. Dasheen.

"(Talifu. September 22, 1922.) Tubers of a Chinese vegetable called *Yee-tao*, sold in the Talifu market. The plant is grown in dry ground, like corn or wheat, and not flooded. The tubers grow in great numbers around the base of the stem; they are white and mealy and eaten boiled, like potatoes. The flower stalk is about 2 feet long, of a pinkish mauve color, with a slender spathe of the same color, and with cream-colored flowers; the whole is eaten as a vegetable, either fried or boiled."

55987. *CORYLUS* sp. Betulaceæ. Hazelnut.

"(No. 3292. Nguluke. September 11, 1922.) Seeds of a tree 60 to 80 feet in height, with trunks 2 to 3 feet in diameter, found at altitudes of 9,500 to 10,000 feet among limestone boulders near springs at the foot of the Likiang Snow Range. The tree is handsome, with very large leaves, and bears large edible nuts.

55988. *CRATAEGUS PINNATIFIDA* Bunge. Malaceæ. Hawthorn.

"(Talifu. September 20, 1922.) Seeds of a shrub 6 to 8 feet high, obtained from fruits sold in the Talifu market, where they are strung on fiber. These small applelike fruits mature in September. They have large seeds and rather sour flesh and are candied like jujubes. Chinese name *Shan li ko*."

For previous introduction, see S. P. I. No. 55932.

55989. *JUGLANS REGIA* L. Juglandaceæ. Walnut.

"(Yangpi. September, 1922.) Seeds of wild walnut trees 40 to 50 feet in height, with a spread of nearly a hundred feet, found in the mountains at an altitude of 8,000 feet. The nuts are large, thin shelled, and sweet."

For previous introduction, see S. P. I. No. 54790.

55990. *MALUS* sp. Malaceæ. Apple.

"(No. 6558. Chienchuan. September 15, 1922.) Seeds of a wild apple, tree 20 feet high, with stiff spreading branches, found in a dry, hot, rocky location in the Chienchuan Valley north of Talifu. The fruits are a little larger than a pea, glossy as if varnished, bright red on one side and yellow on the other."

55991. *MECONOPSIS INTEGRIFOLIA* (Maxim.) Franch. Papaveraceæ.

"(Likiang. September, 1922.)"

For previous introduction and description, see S. P. I. No. 55957.

55992. *OSTEOMELES SCHWERINAE* C. Schneid. Malaceæ.

"(No. 6554. Langchiung. September 16, 1922.) Seeds of an ornamental, spreading shrub 2 to 3 feet high, found in the Langchiung Mountains at an altitude of 7,500 feet and common in the arid regions north and south of Talifu. It differs considerably from the Pacific species, *Osteomeles anthyllidifolia*; the flowers are pinkish white and very fragrant, and the sweet edible fruits are uniformly dull purple."

For previous introduction, see S. P. I. No. 40033.

55993. FRAXINUS MICRANTHA Lingelsh. Oleaceæ.**Ash.**

From Dehra Dun, India. Seeds presented by R. S. Hole, forest botanist. Received December 21, 1922.

A Himalayan ash with large leathery leaves about 9 inches long and lax terminal panicles of minute flowers. It is very similar to another Himalayan species, *Fraxinus floribunda*, from which it differs in leaf characters and in having a looser panicle. (Adapted from Engler, *Botanische Jahrbücher*, vol. 40, p. 217.)

55994 to 56018.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received November 21, 1922. Quoted notes by Mr. Rock.

55994. PÆONIA DELAVAYI Franch. Ranunculaceæ.**Peony.**

"(Nguluke. September 12, 1922.)"

For previous introduction and description, see S. P. I. No. 55898.

55995. PRIMULA BULLEYANA Forrest. Primulaceæ.**Primrose.**

"(Heshwe. September, 1922.) Seeds of a very attractive primula collected three days' journey north of Likiang at an altitude of 9,000 to 11,000 feet. It is not a bog-loving plant but grows in pine forests."

55996. PYRACANTHA sp. Malaceæ.**Fire thorn.**

"(Likiang. September 11, 1922.) Seeds of a shapely shrub 10 to 15 feet in height, which grows along stream beds in limestone soil throughout the Likiang Plain. It is common all along the road from Talifu to Likiang, and even south of Likiang. When in flower it is very ornamental, but it is especially attractive when loaded with its bright-scarlet fruits from August until winter."

55997. PYRACANTHA sp. Malaceæ.**Fire thorn.**

"(No. 6527. September 14, 1922.) Seeds of a dense shrub 6 to 8 feet in height, which grows with *Prinsepia utilis* in arid situations in the valley beyond Lashipa, two days' journey south of Likiang. It has bright-yellow berries instead of the scarlet fruits which are so common."

55998 to 56016. PYRUS spp. Malaceæ.**Pear.**

"All these wild pears, of which I am sending seeds, are used as stock plants; they are not planted, but are so numerous that the Chinese simply cut them down and bud them. The best pears come from the region between Tienwei, Talifu, and Haitung."

55998. PYRUS sp.

"(No. 6503. Lashipa. September 13 and 14, 1922.) A very hardy pear tree 15 to 20 feet high, found on the Lashipa Plain, one day's travel south of Likiang, at an altitude of 10,000 feet. It has very tough branches, small, oval-oblong, crenate, acute leaves, and bears large numbers of fruits which are the size of small marbles, yellow, acrid, and unpalatable. The tree is generally used by the natives as a stock plant. Wherever the tree grows wild they cut the trunk down to 2 feet from the ground and bud cultivated varieties of pears on it. The tree is exceedingly hardy and drought resistant and also can withstand being inundated."

55999. PYRUS sp.

"(No. 6508. Likiang. September 13, 1922.) A tree 20 feet tall, which is wild all over the region north of Talifu; collected near the village of Luchu on the southwest end of the Likiang Plain. The leaves are oblong, dark green with red veins and petioles, glossy above, acute or rounded at the base and apex. The fruits are the size of marbles, yellowish brown and spotted, acrid, and unpalatable. This tree had a cultivated variety budded on it; the lower branches were loaded with the wild fruit, and the main trunk had an unripe pear of the cultivated variety."

55994 to 56018—Continued.

56000. *PYRUS* sp.

"(No. 6509. September 13, 1922.) A wild pear tree 20 feet high, found on the Likiang Plain near the village of Lasadje. The leaves do not have red veins and petioles, and the fruits, which are smaller than a marble, are yellow, spotted, acrid, but perfectly black and sweet when ripe. This is a very good stock plant."

56001. *PYRUS* sp.

"(No. 6511. Lashipa. September 13, 1922.) A wild pear tree 15 to 20 feet high, from dry hillsides at an altitude of 9,000 feet, where it grows with *Pinus sinensis*. The leaves are small, oval-elliptical, with long stems. The small, yellowish brown fruits are the size of marbles."

56002. *PYRUS* sp.

"(No. 6539. September 15, 1922.) A wild pear tree 25 to 30 feet high, found in the hot valley of Nankaochai near Chienchuan Valley, two and one-half days' journey south of Likiang, at an altitude of 7,000 feet. It has long spreading whiplike branches and very numerous brownish yellow fruits the size of marbles, which are black when fully ripe."

56003. *PYRUS* sp.

"(No. 6553. September 15, 1922.) A wild pear tree 40 feet in height, found in arid regions in the mountains west of Tengchuan, two days' journey north of Talifu, at an altitude of 6,500 to 7,000 feet. The branches are long and mostly horizontal. The fruits are much larger than those of the other wild pears, with a rich yellowish brown skin and firm butter-yellow flesh which is acrid and unpalatable, though juicy. This species is quite rare: I have seen only two trees."

56004. *PYRUS* sp.

"(No. 6555. September 15, 1922.) A tree 40 feet high with rambling and ascending branches, found in a dry region of yellow clay or loam on a hillside beyond Tienwei, three days' journey south of Likiang. This species is very rare, only one tree being seen, and is quite distinct from the other wild pears. The long-stemmed solitary fruits, smaller than a coffee berry, were few in number, oblong, and uniformly crimson."

56005. *PYRUS* sp.

"(No. 6556. September 16, 1922.) A wild pear tree 15 to 20 feet high, of very graceful habit and spineless, found in the Langchiung Valley near the Erhyin River, two days' journey north of Talifu. The leaves are bright green on both sides, and the bright yellowish brown fruits, larger than a marble, are juicy but acrid. The Chinese use this as a stock plant."

56006. *PYRUS* sp.

"(No. 6557. Langchiung Valley. September 16, 1922.) A wild pear tree 25 feet high, spineless, with dark-green, crenate, elliptic leaves and round, russet-brown, juicy, acrid fruits the size of small marbles and similar to those of No. 6556 [S. P. I. No. 56005]. The tree is a prolific bearer and is used here as a stock plant."

56007. *PYRUS* sp.

"(No. 6559. September 15, 1922.) A wild pear tree 25 to 30 feet high, with a stout trunk and stiff, spreading branches, found in the dry mountain range south of Chienchuan, three days' journey north of Talifu. The numerous fruits are about half an inch in diameter, greenish brown with lighter spots. A good stock plant."

The following are seeds of domesticated varieties.

56008. *PYRUS* sp.

"(Talifu. September 20, 1922.)"

55994 to 56018—Continued.

56009. PYRUS sp.

“(Haitung, east of Tali Lake. September, 1922.)”

56010. PYRUS sp.

“(Haitung. September, 1922.)”

56011. PYRUS sp.

“(Haitung. September 19, 1922.)”

56012. PYRUS sp.

“(Talifu. September 20, 1922.)”

56013. PYRUS sp.

“(Tienwei. September 15, 1922.)”

56014. PYRUS sp.

“(Tienwei. September 15, 1922.)”

56015. PYRUS sp.

“(Tienwei. September 15, 1922.)”

56016. PYRUS sp.

“(Tienwei. September 15, 1922.)”

56017. ROSA sp. Rosaceæ.

Rose.

“(No. 6504. September 14, 1922.) Seeds of a spreading shrub or climber with huge rambling branches, 25 feet high with a spread of 30 feet or more, found growing wild, with *Rosa banksiae*, all over the Lashipa Plain, one day's trip south of Likiang. The flowers when first opened are yellow, becoming cream colored and the size of a half dollar. The orange-red fruits are borne in large ample panicles. The shrub is very ornamental in flower and in fruit.”

56018. STYRAX LANGKONGENSIS W. W. Smith. Styracaceæ.

“(No. 3198. Langchiung. September 18, 1922.) Seeds of an ornamental shrub 1 to 2 feet tall, which grows in the arid region between Langchiung and Shapi, at an altitude of 7,500 feet. The flowers are large, white, and drooping, with rich reddish brown calyxes.”

56019. PRIMULA CHRYSOPA Balf. f. and Forrest. Primulaceæ.

Primrose.

From Ness, Neston, England. Seeds presented by A. K. Bulley. Received November 22, 1922.

“Come over and see *Primula chrysopa* next spring. It's a thing to say your prayers to.” (Bulley.)

A tufted perennial marsh-loving primrose from the Province of Yunnan, China, where it grows in moist stony alpine meadows. It has oblong, bright-green, somewhat fleshy, long-stemmed leaves and very attractive fragrant flowers borne in two to four flowered umbels on the summit of the slender scape. The calyx is green or purplish and the oblique corolla pale lilac with a golden eye. The entire plant is more or less covered with a white mealy powder. (Adapted from *Transactions of the Botanical Society of Edinburgh*, vol. 27, p. 277.)

56020. GUILIELMA UTILIS Oerst. Phoenicaceæ.

Pejibaye.

(Bactric utilis Benth. and Hook.)

From San Jose, Costa Rica. Seeds purchased through Otón Jiménez. Received December 19, 1922.

A shipment of seeds of the pejibaye. For an extended account of this interesting food palm, see the *Journal of Heredity*, vol. 12, pp. 154-166, April, 1921.

For previous introduction, see S. P. I. No. 55982.

56021. ESCALLONIA PHILIPPIANA (Engler) Masters. Escalloniaceæ.

From Exeter, England. Plants purchased from Robert Veitch & Son, The Royal Nursery. Received November 25, 1922.

This ornamental shrub, native to Chile, is the hardiest of all the Escallonias, and unlike the other species is deciduous. It forms a spreading shrub with gracefully arching branches and has small dark-green leaves which serve admirably as a background for the pretty star-shaped white flowers. (Adapted from *Gardening Illustrated*, vol. 38, p. 501.)

**56022. WARSZEWICZIA COCCINEA (Vahl) Klotzsch. Rubiaceæ.
Scarlet plume.**

From Gamboa, Canal Zone. Seeds presented by F. Marti. Received November 28, 1922.

"This is a remarkable ornamental tree; I first saw it on the banks of Gatun Lake at Rio Suelo. At a distance its racemes, over 2 feet long, with their brilliant-scarlet enlarged sepals, produced a startling splash of color against the dark-green foliage. The color is as vividly scarlet as the autumn colors of the sour gum, the sorrel tree, or some species of Japanese maple. The colored 'leaves' are in reality enlarged sepals. Only one flower in each cluster of flowers on the raceme has an enlarged sepal. Though the flowers themselves are not over a quarter of an inch in diameter, the enlarged sepals are often $2\frac{1}{2}$ inches long. The fact that this tree blooms in summer, the wet season, whereas most of the showy flowering trees of the Tropics bloom in the dry season, would seem to make this an unusually valuable ornamental tree for tropical regions. It is certainly worthy of a place in every collection of tropical trees." (*David Fairchild*.)

For previous introduction, see S. P. I. No. 54297.

**56023. FRAGARIA CHILOENSIS (L.) Duchesne. Rosaceæ.
Chilean strawberry.**

From Guayaquil, Ecuador. Seeds presented by Dr. F. W. Goding, American consul general. Received December 7, 1922.

"These seeds were obtained at Guachi, near Ambato. While the fruit of the Chilean strawberry is inferior in flavor to that of our best cultivated strawberries, it is remarkable for its excellent shipping and keeping qualities; and it seems that varieties might be produced by selection which would merit cultivation on a commercial scale.

"The berry is much used for canning and preserving. It is also eaten fresh. It is a curious circumstance that this species of strawberry, whose fruits are commonly an inch to an inch and a half long, should be called *frutilla* (little fruit) in Chile, Peru, and Ecuador, while the much smaller fruit of *Fragaria vesca*, rarely over one-half an inch long, is termed *fresa*, or strawberry. This last-named species is cultivated commercially at Quillota, Chile, whence the fruit, which ripens earlier than that of *F. chilensis*, is sent to the markets of Santiago.

"As far as I can ascertain by careful examination of the plants and fruits, the *frutillas* of Chile, Peru, and Ecuador are the same species. Neither in Peru nor in Chile, however, do the plants bear all through the year as they do on the sandy plains near Ambato, Ecuador. I imagine the difference in climatic conditions is the cause of this; on the Equator there are no well-defined seasons, and the plants remain active throughout the year, while in Chile the seasons are fairly well defined and vegetative activity ceases during a part of each year, as with us. The ripening season of *F. chilensis* in the highlands of southern Peru and central Chile seems to extend, approximately, from the latter part of October to January." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 54630.

56024. CORNUS OFFICINALIS Sieb. and Zucc. Cornaceæ.

From Rochester, N. Y. Seeds presented by John Dunbar, Assistant Superintendent of Parks. Received December 8, 1922.

"This resembles *Cornus mas* when in flower, but the fruits ripen in October and November and are quite handsome." (*Dunbar*.)

This species, which is very closely allied to *C. mas*, is native to Chosen and is occasionally seen in cultivation. Like *C. mas*, it has yellow flowers and red fruits, but differs in having conspicuous patches of dense, rust-colored down on the lower surfaces of the leaves and also is somewhat coarser in habit.

56025. CUCURBITA MOSCHATA Duchesne. Cucurbitaceæ. Squash.

From Libia, North Africa. Seeds presented by Dr. E. O. Fenzi. Received December 8, 1922.

"Seeds of a local variety which weighs about 50 kilos (110 pounds). It is very popular with the natives, and with good reason, for the flesh is more intensely colored, sweeter, and of better flavor than any other variety I can remember having seen either in Italy or California." (*Fenzi*.)

56026. ORYZA SATIVA L. Poaceæ. Rice.

From Samarlkota, India. Seeds presented by Dr. R. H. Forbes, Kulikoro, French West Africa. Received June 13, 1922. Numbered December, 1922.

"Rice from Samarlkota, Madras Presidency, India." (*Forbes*.)

Introduced for department specialists engaged in rice-breeding experiments.

56027. RICINUS COMMUNIS L. Euphorbiaceæ. Castor-bean.

From Albion, Brisbane, Queensland. Seeds presented by W. Ewart, secretary, Queensland Acclimatisation Society. Received December 8, 1922.

"*Bowen Hills*. This variety was raised from seeds obtained by the Queensland Acclimatisation Society from Bowen Hills and grown at Lawnton, Queensland, where it is considered the best of 60 varieties there cultivated. The plant is a vigorous grower, forms numerous large seed heads, and is remarkably free from disease and insect pests." (*Ewart*.)

56028. DAVIDSONIA PRURIENS F. Muell. Cunoniaceæ.

From Sydney, New South Wales. Seeds presented by J. H. Maiden, director and Government botanist, Botanic Gardens, Sydney, at the request of C. T. White, Government botanist, Brisbane. Received November 14, 1922.

Variety *jerseyana*. This variety differs from the northern Queensland form in being smaller in all its parts.

The northern form is a tree 30 or 40 feet high, of graceful erect habit, with drooping compound leaves 18 inches or more long; the terminal leaflet is often a foot in length. The reddish flowers are in clusters a foot or more long, and the fruit is an oval juicy drupelike berry the size of a goose egg, covered with a thin coating of irritating hairs; these, however, are easily removed by rubbing with a rough cloth, and then is exposed the smooth plumlike skin of the fruit. The soft, fleshy, rich-purple pulp, sharply acid in flavor, incloses a few small flat seeds. This fruit, which ripens in July in Queensland, is largely used by the settlers for making into jam and jelly. (Adapted from *Queensland Agricultural Journal*, vol. 2, p. 471, and *Bailey, Queensland Flora*, pt. 2, p. 538.)

56029. PHLEUM PRATENSE L. Poaceæ. Timothy.

From Ayr, Ayrshire, Scotland. Seeds purchased from McGill & Smith. Received December 8, 1922.

Locally grown seed introduced for department specialists engaged in timothy-breeding investigations.

56030. CUCUMIS SATIVUS L. Cucurbitaceæ. Cucumber.

From Balavaini, Marovo Lagoon, Solomon Islands. Seeds presented by H. T. Fairbrother. Received December 18, 1922.

"Seeds of our native cucumber, which is far ahead of any other I have ever tasted. It is of medium size, with a smooth skin and an incomparable flavor." (*Fairbrother*.)

56031. CHRYSOPHYLLUM MAGALISMONTANA Sond. Sapotaceæ.

From Pretoria, Transvaal. Seeds presented by I. D. Pole Evans, chief, Division of Botany. Received December 18, 1922.

An ornamental evergreen shrub or small tree which is common on stony outcrops in the Transvaal on frostless ridges at an altitude of 6,000 feet near Johannesburg and also in the "Middle Veld" at altitudes below 4,000 feet. The fruits, up to an inch in diameter, are agreeably acidulous and most refreshing in hot weather; they are used by the white colonists for making preserves and jelly. The natives call the tree *Stam-vruchte*, because the flowers and fruits are borne on very short stalks on the stem and main branches. The tree tolerates great heat and drought. (Adapted from note of J. Burtt Davy under S. P. I. No. 19384.)

For previous introduction, see S. P. I. No. 19384.

56032 to 56057. TRITICUM AESTIVUM L. Poaceæ.

(*T. vulgare* Vill.)

Common wheat.

From Tulun, Irkutsk, Russia. Seeds presented by Victor Pissareff, director of the Agricultural Experiment Station. Received December 9, 1922.

"These varieties of winter wheat have endured the winter at Tulun, which is considered beyond the northern limit of wheat growing." (*Pissareff*.)

56058 and 56059. CITRUS spp. Rutaceæ.

From Swatow, China. Plants presented by Rev. A. H. Page. Received December 21, 1922. Quoted notes by Mr. Page.

"These fruits, among the very best of the citrus fruits of China, grow chiefly in the low delta region crossed by the Tropic of Cancer, where there is a slight frost perhaps once in 10 years, during the period when the trees are dormant."

56058. *CITRUS NOBILIS DELICIOSA* (Ten.) Swingle. Mandarin orange.

"A tangerine which is as large and fully as sweet as the navel orange."

For previous introduction, see S. P. I. No. 45938.

56059. *CITRUS* sp.

"The 'soft orange,' which, like the tangerine, is easily peeled when thoroughly ripe. It will keep a long time without ice and becomes very sweet. It is only of medium size."

56060 to 56063. RIBES spp. Grossulariaceæ.

From Elstree, Herts, England. Presented by Hon. Vicary Gibbs. Received December 18, 1922.

56060. *RIBES HENRI* Franch.

Plant. An unarmed evergreen shrub, about 3 feet high, native to the vicinity of Szechwan in Hupeh, China. The oval dark-green leaves are

56060 to 56063—Continued.

up to 4 inches in length, and the small oval-oblong berries are crowned by the persistent calyx. This species bears considerable resemblance to *Ribes laurifolium* Jancz. (Adapted from *Bulletin Mensuel de la Société Linnéenne Paris, new series*, No. 9, p. 87, and *Gardeners' Chronicle*, 3d ser., vol. 71, p. 213.)

56061. RIBES LAURIFOLIUM Jancz.

Plant. A very attractive flowering currant first discovered in Szechwan, western China, at an altitude of 7,000 feet, where it grows as an evergreen unarmed shrub up to 6 feet in height; not common. The rich-green oval leaves are coarsely toothed and up to 5 inches in length. The greenish yellow flowers are borne in pendent clusters over 2 inches long, appearing in February and March. (Adapted from *The Garden*, vol. 79, p. 171.)

56062. RIBES LONGERACEMOSUM Franch.

Cuttings. "This species, found in the mountains of western China, bears large black fruits of good flavor, in racemes a foot and a half long." (*E. H. Wilson, Naturalist in Western China*, vol. 2, p. 31.)

For previous introduction, see S. P. I. No. 40459.

56063. RIBES MAXIMOWICZII Batal.

Cuttings. A deciduous shrub 6 to 9 feet high, first found by the Russian traveler Potanin, in Kansu, in 1885, but introduced into England several years later from western China. The leaves, in threes or fives, are 2 to 5 inches wide, glossy green above and pale downy beneath. The flowers, borne in long slender clusters in May, are made conspicuous by the dull lurid-red calyxes. The fruits, which are thickly covered with stiff glandular bristles, are, according to E. H. Wilson, sometimes orange and sometimes red, possibly at different stages of development. (Adapted from *Gardeners' Chronicle*, 3d ser., vol. 59, p. 273.)

For previous introduction, see S. P. I. No. 40410.

56064 to 56066. SACCHARUM OFFICINARUM L. Poaceæ.**Sugar cane.**

From Fajardo, Porto Rico. Seeds presented by R. A. Veve, Experiment Station, Fajardo Sugar Co. Received December 28, 1922. Quoted notes by Mr. Veve.

"These three varieties are very good in our district, and their seed germinates very well. Although all three of them are susceptible to mosaic disease, they are more resistant than the native varieties *Cristalina* and *Rayada*, which are here considered as standards."

56064. D109.

For previous introduction, see S. P. I. No. 49262.

56065. D433.

For previous introduction, see S. P. I. No. 49264.

56066. F. C. 306. "This is a local variety, a seedling of D433."**56067. PANGIUM EDULE Reinw. Flacourtiaceæ.****Pangi.**

From Manila, Philippine Islands. Seeds presented by A. Hernandez, director, Bureau of Agriculture. Received December 13, 1922.

"Seeds of pangi (*Pangium edule*) obtained from the barrio of Panagan, municipality of Lagonoy, Camarines Sur. Pangi seeds yield about 50 per cent of pitjoeng or samaun oil having the following constants (see Bureau of Forestry, Manila, Philippine Islands, Bulletin No. 20, p. 159) :

Specific gravity	0.937
Saponification value	178-183
Iodin value	89.94
Titer test of fatty acids	44.4"

—(Hernandez.)

"I have just eaten this fruit for the first time; it is quite similar to the *marang* (*Artocarpus odoratissima* Blanco) in flavor, being very sweet and rich. The flesh is rather scant and the seeds large, but some day we may discover a seedless one and then we shall have a real feast. The fruit is so large that one (seedless) would be enough for three to five people." (*P. J. Wester.*)

A Philippine tree which reaches a height of 25 meters (82 feet), with very large, smooth, pointed leaves and yellowish green flowers. The oval brown fruit is over 6 inches long and contains several seeds imbedded in a yellowish, edible pulp. The fresh seeds are poisonous, but steeping in water makes them edible. (Adapted from *Brown, Wild Food Plants of the Philippines*, p. 126.)

56068. DENDROCALAMUS SIKKIMENSIS Gamble. Poaceæ. Bamboo.

From Sibpur, near Calcutta, India. Seeds presented by C. C. Calder, curator, Royal Botanic Garden. Received December 11, 1922.

"This bamboo flowered profusely this year in the Darjiling District." (*Calder.*)

For previous introduction and description, see S. P. I. No. 55815.

56069 and 56070.

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, Director of the General Experiment Station. Received December 18, 1922.

56069. CITRUS MEDICA L. Rutaceæ.

Citron.

Seeds of a peculiar citron with papayalike fruits from Java.

56070. GARCINIA MANGOSTANA L. Clusiaceæ.

Mangosteen.

These seeds are introduced from Java in the hope of establishing the mangosteen in our tropical dependencies.

For previous introduction and description, see S. P. I. No. 55496.

56071. DIOSCOREA ALATA L. Dioscoreaceæ.

Greater yam.

From Fort Pierce, Fla. Tubers presented by C. S. Steele. Received December 28, 1922.

"This yam is a strain selected from the Hawaiian purple-skinned yam, S. P. I. No. 46768. The purple layer, just beneath the outer skin, was very thin and sharply defined in the selected tuber, and the flesh of the tuber was white and of good quality when cooked. Yams of the purple-skinned type vary considerably with respect to the thickness of the purple layer and also in quality, and it is still to be determined whether this selection will remain constant." (*R. A. Young.*)

56072 to 56074. PHASEOLUS spp. Fabaceæ.

From Santiago de las Vegas, Cuba. Seeds presented by Dr. Mario Calvino, director, Agricultural Experiment Station. Received December 29, 1922. Quoted notes by Doctor Calvino.

56072. PHASEOLUS CALCARATUS Roxb.

Rice bean.

"*Frijol mambi* or *Diablito*. Seeds of this variety were originally sent from Oriente, where the plant grows spontaneously in the thickets. The seeds are small, about the size of a grain of rice, kidney shaped, and dark red. It is a pole bean of rapid growth and is very productive."

56073. PHASEOLUS LUNATUS L.

Lima bean.

"This is a good variety of pole Lima which I imported from Trujillo, Peru."

56074. PHASEOLUS VULGARIS L.

Common bean.

"*Frijol negro*. One of the cultivated varieties of Cuba."

56075 to 56079.

From Santiago de las Vegas, Cuba. Seeds presented by Dr. Mario Calvino, director, Agricultural Experiment Station. Received December 30, 1922. Quoted notes by Doctor Calvino.

56075 and 56076. *PHASEOLUS LUNATUS* L. Fabaceæ. Lima bean.

"The following Lima beans are cultivated in Cuba."

56075. Light-red beans.

56076. Dark-red beans.

56077 to 56079. *VIGNA* spp. Fabaceæ.

56077. *VIGNA CYLINDRICA* (Stickm.) Skeels.

Catjang.

"*Frijol precioso.*"

56078 and 56079. *VIGNA SESQUIPEDALIS* (L.) Fruwirth.

Yard-Long bean.

56078. "*Habichuela china negra.*"

56079. "*Habichuela china variegata.*"

56080 to 56117.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received December 6, 1922. Quoted notes by Mr. Rock.

56080 to 56083. *CASTANEA* spp. Fagaceæ.

Chestnut.

56080. *CASTANEA* sp.

"(No. 6682. September 29, 1922.) A tree 60 to 100 feet tall, with trunk 4 to 5 feet in diameter, and hard, tough dark-brown wood, found at an altitude of 8,200 feet, and very common, four and a half days' journey west of Talifu, beyond a village called Paitoupu and 40 li (12 miles) from Yungping, where it forms dense forests. The leaves are large, broadly ovate, coarsely serrate, glossy above and silvery beneath. The burs are borne in spikes, with thick, green, short spines in spiral ridges, similar to those of *Castanea armata*. The nuts are very small, something like those of the chinquapin, and very sweet and palatable. The natives cut the tree for firewood a foot above the ground; it ratoons very freely, sending forth shoots from the old stump. I have not seen any evidence of disease in any of the trees of this species, although I have examined many trees. The timber is excellent, being used for building purposes."

For an illustration of the trunk of this chestnut, see Plate IV.

56081. *CASTANEA* sp.

"(No. 6683. September 30, 1922.) A tree 50 to 60 feet high, with a straight trunk 1 to 2½ feet in diameter and ascending branches, found in yellow clay loam in forests 20 li (6 miles) from Paitoupu, four and a half days' journey west of Talifu, at an altitude of 8,200 feet. The dark-green leathery leaves are very handsome, and the numerous burs, larger than those of the following [S. P. I. No. 56082], are borne in lateral spikes. The nuts are very sweet and delicious. These trees are perfectly healthy. Trees of this species are also found on the western slopes of the Tsangshan Range, but their fruits are all attacked by worms."

56082. *CASTANEA* sp.

"(No. 6683a. September 30, 1922.) A tree of the same size as the preceding [S. P. I. No. 56081] and with leaves similar but a paler green, found in the mountains 20 li (6 miles) from Paitoupu near a hamlet called Shiao-shui. The burs are smaller, with the spines arranged differently, and shorter and sharper. The nuts are the same size."

56080 to 56117—Continued.

56083. *CASTANEA* sp.

"(No. 6686. September 28, 1922.) This is the same as No. 6682 [S. P. I. No. 56080], but was collected near Taipingpu, three days' journey west of Talifu. The seeds were gathered from young shoots, for the trees had all been cut down."

56084. *CATALPA DUCLOUXII* Dode. Bignoniaceæ.

"(Nos. 3097, 3217.) A tree 80 feet tall, with a straight trunk 3 to 4 feet in diameter, found in the Likang Plain at an altitude of 8,800 feet: in large groves also south of Talifu on the Menghau Ting Plain. The pinkish lilac flowers are borne in large full panicles and make the tree very ornamental. It is a very valuable timber tree, and the wood is not attacked by insects. Seeds of this tree are exported from Tengyueh to other parts of Yunnan, Tengyueh being the center of distribution. The Chinese name is *Chun nin shu*."

For previous introduction, see S. P. I. No. 55931.

56085. *CORNUS CAPITATA* Wall. Cornaceæ. Bentham's cornel.

"(No. 6684. September 29, 1922.) A tree 30 feet or more in height with a trunk a foot or more in diameter, or at times only shrubby, found beyond Paitoupu, two days' journey west of Yangpi, at an altitude of 8,000 feet. The fruits, larger than a large strawberry and of the same shape and color, have sweet yellow flesh and are much relished; they are often sold in the markets."

56086. *CORYLUS* sp. Betulaceæ. Filbert.

"(No. 6635. September 24, 1922.) A shrub 6 to 10 feet high, with large hairy leaves, found among mica boulders at the foot of the steep hills rising behind Kinngintui, a village not far from Yangpi, at an altitude of 6,000 feet. At this time of the year the weather here is hot. The fruits, of fairly large size, are sweet and of a flavor like that of hazelnuts. This shrub is worthy of cultivation for the nuts."

56087. *CRATAEGUS PINNATIFIDA* Bunge. Malaceæ. Hawthorn.

"(No. 6685. September 27, 1922.) A tree 30 to 35 feet high, with straight ascending branches, found wild between Yangpi and Taipingpu, four days' journey west of Talifu. The large-seeded yellowish red fruits, the size of crab apples and ridged, are borne in large clusters at the ends of the branches; they are candied by the natives."

For previous introduction, see S. P. I. No. 55988.

56088 to 56090. *DIOSPYROS* spp. Diospyracæ. Persimmon.56088. *DIOSPYROS LOTUS* L.

"(No. 6693. September 25, 1922.) A wild persimmon found near watercourses on the hills back of Kinngintui, 20 li (6 miles) east of Yangpi, at an altitude of 6,000 feet. The fruits are the size of a large green olive."

56089. *DIOSPYROS LOTUS* L.

"(No. 6705. October, 1922.) A spreading tree 50 feet high with a drooping crown, found wild on the Salwin watershed, western slope of the Salwin Valley above Homushu, at an altitude of 7,000 feet. The tree was loaded with the small yellowish green persimmons, less than an inch in diameter."

56090. *DIOSPYROS* sp.

"(October 3, 1922.) A tree 35 feet high with a large spreading crown, which grows half wild on the hillsides near Shayang, two days' journey east of Yungchang. The edible persimmons, the size of a tennis ball, are orange-yellow and are very sweet and delicious."

56091. *JUGLANS REGIA* L. Juglandaceæ. Walnut.

"(No. 6694. September 27, 1922.) A very large tree with a huge crown, which is very numerous on the hills and slopes near Taipingpu."

56080 to 56117—Continued.

at an altitude of about 8,300 feet. The nuts are very thick shelled and difficult to break and are gathered by the natives for the sake of the oil. There are several varieties which vary in the shape of the nuts, some being oblong, some ovoid, and some globular; all are thick shelled."

56092 to 56099. *MALUS* spp. Malaceæ.

Apple.

56092. *MALUS* sp.

"(No. 6687. September 28, 1922.) A large tree with a large crown of ascending branches, found beyond Taipingpu, three days' journey west of Talifu, at an altitude of 8,200 feet. The yellowish green fruits are 2 inches in diameter, fragrant but sour."

56093. *MALUS* sp.

"(No. 6688. September 27, 1922.) A wild apple tree from the Yangpi Mountains, two days' journey from Talifu, where it grows at an altitude of 7,800 feet. The fruits are bright red and yellow, with rather numerous seeds."

56094. *MALUS* sp.

"(No. 6690. September 27, 1922.) A tree 30 feet in height with a trunk 2 to 2½ feet in diameter and straight ascending branches, found wild in red clayey soil all over the ranges between Yangpi and Taipingpu, at an altitude of 8,000 feet. The oblong leaves are dark green above and pale beneath; the very numerous fruits, the size of small apples, are yellowish with a bright reddish tinge, with firm, very fragrant but sour flesh. The tree is exceedingly hardy and free from disease and occurs here where nothing else will grow except the hardy Yunnan pine (*Pinus sinensis*)."

56095. *MALUS* sp.

"(No. 6691. September, 1922.) A peculiar tree with long spreading, drooping branches like a willow, found only along watercourses between Yangpi and Taipingpu, at an altitude of 8,300 feet. The tree was loaded with small oblong fruits less than an inch long and half an inch in diameter, with dull carmine-red skin and very juicy sour flesh. I did not see this species elsewhere."

56096. *MALUS* sp.

"(No. 6696. September 30, 1922.) A fine hardy tree 15 to 20 feet high, which grows wild with *Castanea* sp., in the hills between Huanglienpu and Chutung. The yellowish red fruits are 2 inches in diameter."

56097. *MALUS* sp.

"(No. 6696. September, 1922.) Seeds of the preceding [S. P. I. No. 56096] collected beyond Shiasuichi. The flowers are red."

56098. *MALUS* sp.

"(No. 6698. October 4, 1922.) A tree 20 feet tall which grows wild in the mountains beyond Pingpo, on top of the western ridge of the Mekong Valley, at an altitude of 8,000 feet. The tree was loaded with thousands of dark-crimson, oblong, mealy fruits the size of wild cherries; in fact, the tree could be mistaken at a short distance for a cherry tree. It is a prolific bearer and grows in clay loam mixed with slate."

56099. *MALUS* sp.

"(No. 6713. October, 1922.) A wild apple tree 20 to 30 feet high, sent to me through the kindness of Rev. Mr. Fullerton, of the Szemao Mission; it grows in the mountains near Szemao at an altitude of 5,000 feet or more. The globose fruits are little more than an inch in diameter and are called *toi*."

56080 to 56117—Continued.

56100. (Undetermined.)

"(No. 6689. September 27, 1922.) A tree 30 feet in height, found in the forests 20 li (6 miles) from Paitoupi, on steep hillsides with *Gastanea* spp., at an altitude of 8,100 feet. It is exceedingly ornamental, with its shining dark-green leaves and great masses of papery crimson berries; it excels holly in every respect as a decorative plant."

56101 to 56111. *PYRUS* sp. Malaceæ.

Pear.

56101. *PYRUS* sp.

"(No. 6636. September 24, 1922.) A wild pear tree 15 feet high, which grows in well-drained soil among huge boulders on the steep hillsides back of the temple of Fu Kwe Ssu, back of the village of Kinnqintui, 20 li (6 miles) from Yangpi. The fruits, larger than any of the ordinary wild pears collected (except No. 6553 [S. P. I. No. 56003]), are more pear shaped, with yellowish brown skins and very juicy subacid flesh. This species is very hardy and perfectly free from disease. The region where it grows has a hot, dry spring, a rainy summer, a hot, humid autumn, and a cold winter season of two months."

56102. *PYRUS* sp.

"(No. 6703. October, 1922.) A wild pear tree 25 feet high which grows near Talishao at an altitude of 8,000 feet. The very numerous fruits, the size of crab apples, have yellowish brown skin, yellow flesh, and large seeds."

56103. *PYRUS* sp.

"(No. 6704. October, 1922.) A wild pear tree 30 feet high found growing with the preceding [S. P. I. No. 56102] near Talishao. The tree was loaded with the globular russet-brown fruits, an inch in diameter, with very juicy, sour flesh."

56104. *PYRUS* sp.

"(No. 6711. September, 1922.) A tree 20 to 25 feet high, with spreading whiplike branches, found wild in the mountains between Hochiang and Pingpo, above the Hsiakuan River. The tree was loaded with small oval russet fruits, half an inch in diameter, with sour yellow flesh."

56105 to 56110. Seeds of domesticated varieties.

56105. *PYRUS* sp.56108. *PYRUS* sp.

"(Yungchang, October 5, 1922.)"

"(October 5, 1922.)"

56106. *PYRUS* sp.56109. *PYRUS* sp.

"(Yungchang, October 5, 1922.)"

"(Yangpi. September 26, 1922.)"

56107. *PYRUS* sp.56110. *PYRUS* sp.

"(October 16, 1922.)"

"(Yungchang. October 5, 1922.)"

56111. *PYRUS* sp.

"(October, 1922.) A tree 30 feet high, with ascending whiplike branches, found wild in the valley between Shiasuichi and Chutung, at an altitude of 6,500 feet. The tree was loaded with the small, ovoid, russet-yellow, very juicy fruits and was very ornamental."

56112. *QUERCUS* sp. Fagaceæ.

Oak.

"(No. 6712. September, 1922.) A shrubby oak 10 feet high, which forms dense bushes on the hills beyond Hsiakuan, one day's trip west of Talifu, at an altitude of 6,800 feet. The tree is a heavy bearer, but the acorns are not palatable."

56080 to 56117—Continued.

56113. *ROSA ROXBURGHII* Tratt. Rosaceæ.

Rose.

"(No. 6583. September 23, 1922.) A low shrubby rose 2 to 4 feet high, distributed from Talifu to the Hsiakuan Plain, at an altitude of 6,800 feet. It is a very attractive rose, with its large, handsome bright-red buds and large, bright magenta-red flowers. The compressed fig-shaped fruits are an inch in diameter."

56114. *RUBUS* sp. Rosaceæ.

"(No. 6706. October, 1922.) A spineless shrub 8 feet high, with ascending branches, found at an altitude of 8,000 feet on the top of the range separating the Salwin and Shweli watersheds. The leaves, palmately divided into three to five separate leaflets, are prominently ribbed and silvery beneath, and the solitary small fruits are yellowish red and watery. The shrub is very ornamental."

56115. *THEA* sp. Theaceæ.

"(No. 6697. October 2, 1922.) A tree 40 to 50 feet tall, with a trunk over a foot in diameter, found growing in the temple grounds of Yung Kwe Ssu, between Yungping and Shayang, at an altitude of 8,000 feet. The flowers are said to be white and 4 inches across and the fruits as large as a man's fist."

56116. *VIBURNUM* sp. Caprifoliaceæ.

"(No. 6699. October 4, 1922.) A beautiful shrub 5 to 8 feet in height, of spreading habit, found on the ridges beyond the valley of the Mekong, between Pingpo and Pangchiao, at an altitude of 8,000 feet, in a forest composed of *Pinus armandi* and *Thea* sp. The shrub was covered with clusters of small crimson berries which were almost transparent. They are somewhat acid and may be used for making jellies."

56117. *DICHOTOMANTHES TRISTANIAECARPA* Kuntz. Amygdalaceæ.

"(No. 6702. October, 1922.) A spreading shrub 15 feet high, found west of Hoachiao at an altitude of 7,000 feet. It is very ornamental, with large clusters of berries which are red with a yellowish tinge."

56118 to 56127.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received December 12, 1922. Quoted notes by Mr. Rock.

56118. *CASTANEA* sp. Fagaceæ.

Chestnut.

"(Kancha. October 15, 1922.) A wild chestnut occurring in the mountains one day's trip north of Tengyueh."

56119. *CASTANEA* sp. Fagaceæ.

Chestnut.

"(No. 6683. September, 1922.) Collected at Paitoupu, about 200 feet lower down than the seeds sent previously under the same number [S. P. I. No. 56081], which see for description."

56120. *GAULTHERIA* sp. Ericaceæ.

"(No. 6709. October 9, 1922.) A highly ornamental shrub, 10 to 15 feet tall, with long whiplike drooping branches reaching to the ground, found on the summit of the Salwin Divide at an altitude of 8,000 feet. The leaves are leathery and dark green, and the large white flowers are borne in great masses all along the branches. The fruits are dark purplish black."

56121. *PRUNUS* sp. Amygdalaceæ.

Plum.

"(No. 6700. October, 1922.) A tree 20 feet in height, with a spreading crown, which grows wild along brooks in the mountains between Shiao-shuichi and Chutung, at an altitude of 6,000 feet. The small globose, yellow, clingstone plums are little more than an inch in diameter, with firm, rather sour flesh."

56118 to 56127—Continued.

56122 to 56125. *PYRUS* spp. Malaceae.

Pear.

56122. *PYRUS* sp.

"(No. 6701. October, 1922.) A tree 25 feet high, found in clay soil on the mountains between Hoachiao and the temple of Yung Kwe Ssu. Shayang village, at an altitude of 6,000 to 7,000 feet. The fruits of this tree are larger than those previously found north of Talifu. The natives use this tree as a stock plant."

56123. *PYRUS* sp.

"(No. 6708. September, 1922.) A very hardy tree 25 to 30 feet high, growing in hard clay soil in the mountains near Yangpi at an altitude of 7,000 feet. The russet-yellow fruits are the size of small marbles."

56124. *PYRUS* sp.

"(Kiangpienkai. October, 1922.)"

Seeds of a domesticated variety.

56125. *PYRUS* sp.

"(October, 1922.) A wild pear tree 25 feet in height, closely related to the other wild pears of this region, found beyond Yangpi at an altitude of 8,000 feet. The russet fruits are about half an inch in diameter."

56126. *ROSA* sp. Rosaceae.

Rose.

"(No. 6692. September 27, 1922.) A large rambling or climbing shrub with long stout branches, which grows in the pine forest back of Yangpi, two days' journey west of Talifu, at an altitude of 6,000 feet. The flowers are said to be large and whitish cream colored and the fruits deep red to orange."

56127. *ZIZIPHUS* sp. Rhamnaceae.

"(No. 6695. September 27, 1922.) A very hardy tree 20 feet high, with a large, spreading crown, found growing wild in yellow clay soil on the hills back of Yangpi, in company with *Pinus sinensis*, at an altitude of 6,500 feet. The fruits, the size of small olives, are borne in large numbers; they are green with a slight reddish tinge, inedible, with almost no flesh, being mostly skin and stone. The seeds are large, angular, and brown."

56128 to 56141.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received December 19, 1922. Quoted notes by Mr. Rock.

56128 and 56129. *CASTANEA* spp. Fagaceae.

Chestnut.

56128. *CASTANEA* sp.

"(No. 6714. October 21, 1922.) A large tree 70 to 80 feet tall, found in white sandy micaceous soil on slopes in the mountains 30 li (9 miles) north of Manchi, at an altitude of 6,500 feet. The lanceolate leaves, entire or nearly so, are fawn colored beneath. The burs resemble those of *Castanea armata*, but are smaller; the black, shining nuts are quite small. The trees of this species appeared to be free from all disease."

56129. *CASTANEA* sp.

"(No. 6715. October 20, 1922.) A large tree, closely resembling *Castanea armata* except in foliage, found on tops of ridges before descending to the Manchi Valley and above Menglien, one and a half days' journey southeast of Tengyueh. The burs and nuts are as large as those of *C. armata*."

56128 to 56141—Continued.

56130. *CASTANOPSIS HYSTRIX* A. DC.

"(No. 6716. October, 1922.) Collected in the vicinity of Teng-yueh."

56131. *CHAENOMELES* sp. Malaceæ.

Chinese quince.

"(November 1, 1922.) A wild quince collected on the Puerhfu Plain, near Puerhfu, and sent to me by Miss Clara Petersen, a missionary of Puerhfu."

56132. *DIOSPYROS* sp. Diospyraceæ.

Persimmon.

"(No. 2872. Puerhfu. November 1, 1922.) A large tree 60 feet in height, with a huge spreading crown. According to Miss Clara Petersen, who sent me the seeds, the fruits are small and very sweet. This is also a fine shade tree."

56133. *DIOSPYROS* sp. Diospyraceæ.

Persimmon.

"(No. 6717. October 23, 1922.) A wild persimmon tree 20 to 25 feet high, which grows in dense forests between Menglieh and Manchi, at an altitude of 6,000 feet. The very numerous oblong yellow fruits are the size of crab apples and sweet."

56134. *DIOSPYROS* sp. Diospyraceæ.

Persimmon.

"(No. 6719. October, 1922.) A tree 35 feet high, with few ascending branches, found on the summit ridge on the road from Hsiangta to Manchi, four days' journey southeast of Tengyueh, at an altitude of 7,000 feet. The oblong, velvety, rich-yellow fruits are large for a wild species, being 2 inches in diameter, and the very sweet flesh incloses large seeds."

56135. *MALUS* sp. Malaceæ.

Apple.

"(No. 6721. October 30, 1922.) A much-branched tree 35 to 40 feet high, collected in the mountains of the Schweli Basin near Lungling, at an altitude of 6,700 feet. The foliage grows down to the ground, and the lanceolate leaves are dark green above and silvery white beneath. The somewhat ovoid greenish yellow fruits are 2½ inches in diameter, with very fragrant but very sour, firm flesh."

56136. *MALUS* sp. Malaceæ.

Apple.

"(November 1, 1922.) A small, sour, hard apple found wild in the mountains a half day's journey from Puerhfu, at an altitude of about 6,000 feet. These seeds were sent to me by Miss Clara Petersen, missionary, of Puerhfu."

56137 to 56141. *PYRUS* spp. Malaceæ.

Pear.

56137. *PYRUS* sp.

"(November 1, 1922.) A wild pear from the mountains near Puerhfu, where it grows at an altitude of about 6,000 feet. The fruits are globose, brown, and spotted, and of very sweet flavor."

56138. *PYRUS* sp.

"(November 1, 1922.) Collected half a day's journey from Puerhfu, in the mountains. The fruit is large, several inches in diameter, juicy, and contains only one or two seeds."

56139 to 56141. "The following wild pears were collected in the mountains near Puerhfu and sent by Miss Clara Petersen, November 1, 1922."

56139. *PYRUS* sp.56140. *PYRUS* sp.

"A small brown juicy pear."

56141. *PYRUS* sp.

"A small round pear with brown skin and juicy flesh. The tree is large."

56142 to 56144. PYRUS spp. Malaceæ.**Pear.**

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received December 27, 1922. Quoted notes by Mr. Rock.

56142. PYRUS sp.

"(No. 6718. October, 1922.) A wild pear tree 25 to 30 feet in height, with long drooping and ascending central branches, found beyond Menglieh, a day and a half south of Tengyueh. The leaves are oval, broadly heart-shaped, and the globose, yellowish red, spotted fruits, an inch or less in diameter, are closely related to *Pyrus pashia* of southern Yunnan."

56143. PYRUS sp.

"(No. 6720. October, 1922.) A wild pear tree 35 feet high, spreading in habit, with stout trunks and blackish brown bark, found in sandy soil at the summit ridge leading to Mengshi, four days from Tengyueh, at an altitude of 7,000 feet. The leaves, bronze colored to red, are oblong, acuminate at the apex and acute at the base, and the very numerous spherical, yellowish red, spotted fruits are an inch in diameter."

56144. PYRUS sp.

"(No. 6721. November 4, 1922.) A small wild pear tree 15 to 20 feet high, with rambling branches, found with No. 6718 [S. P. I. No. 56142] on the hills beyond Menglieh, at an altitude of 6,000 feet, growing in coarse quartz sand. The leaves are small and dark green, and the fruits, the size of small marbles, are dark yellowish red and spotted."

INDEX OF COMMON AND SCIENTIFIC NAMES

- Actinidia chinensis*, 55840.
Alcurites sp., 55926.
Amaranthus sp., 55972.
Amygdalus persica, 55831, 55835, 55836, 55885-55888, 55915-55919, 55927-55929.

Introductory statement.....	1
Inventory.....	5
Index of common and scientific names.....	39

INTRODUCTORY STATEMENT

THIS INVENTORY contains a record of some unusually rare plants which have been collected by Agricultural Explorer Joseph F. Rock, whose travels in the western part of the Province of Yunnan, China, have been carried on regardless of the unsettled conditions in that region. He has been obliged not only to take the usual risks of travel at high altitudes on primitive mountain passes where a misstep might mean instant death, run the usual dangers from infectious diseases, like pneumonic plague and dysentery, and bear the severe nervous strain of loneliness, but he also has had to keep out of the way of the roving bands of Tibetans and the Chinese soldiers carrying on an almost continuous conflict along the Tibetan border of Yunnan.

Collecting dried specimens or taking photographs of plants under such conditions requires great skill, an unusual knowledge of oriental languages, and a wide acquaintance with Asiatic plants. When, however, to the collecting of specimens and the taking of photographs is added the gathering and packing of living seeds and plants and getting them alive to America, requiring more than two months by letter post, the nature of the problem which Mr. Rock has had to solve is more correctly stated. Much of the material gathered on the Likiang Snow Range has had to come by special messenger as letter post over mountain passes at 12,000 feet altitude and be plunged into the torrid humidity of the Rangoon post office, to remain in that steaming atmosphere until the post bags were finally unloaded in the dry Italian air of Brindisi. To pack cuttings and seeds of high-mountain plants for such a voyage and have them arrive alive in Washington is a tribute to the attention to detail which Mr. Rock has shown, and it is to be hoped that his efforts will be repaid by the large number of species which have survived the ordeal and will thrive in this country.

By one of those fatalities of things, the trees which were most desired from Yunnan, Yunnan chestnuts and species of the related genus *Castanopsis*, are known to have very short-lived seeds which are particularly hard to transport. Although almost every conceivable method of packing was tried, nearly all the seeds of these genera perished on the way. It is believed, however, that enough lived to establish some of the species in America.

Mr. Rock's material described in this inventory came mainly from the general region of Likiang, which lies more than 8,000 feet above sea level, near the great mountain range around which the Yangtze River meanders on its way to the Pacific, a region of deep gorges and snow-capped mountain peaks.

The oriental persimmon has come into prominence as a promising fruit crop for the South, but as yet horticulturists are not satisfied with the American persimmon, *Diospyros virginiana*, or the Chinese, *D. lotus*, as a stock. Mr. Rock made a collection of undescribed species of *Diospyros* (Nos. 56308 to 56310) which may prove of particular value for this purpose. A tall, spreading species, 50 feet in height, from Tengyueh; another from an altitude of 8,500 feet on the slopes back of Likang; and a species with black fruit the diameter of a half dollar are three forms which, added to those previously collected by him, should provide us with the stock that is needed.

The wild apple of Yunnan (*Malus yunnanensis*, Nos. 56320, 56321, and 56324), which Mr. Rock found among the limestone boulders along the watercourses of the Likang Snow Range at 10,000 feet altitude, is 30 to 40 feet in height, has fruits an inch in diameter borne in large clusters, and, according to Mr. Rock, is one of the handsomest trees in this region. The value of this species in this country for breeding or stock purposes time alone will determine. Mr. Rock's two other species from the same region, as yet unidentified (*Malus* spp., Nos. 56322 and 56323), or his wild species from the dense forests of the Salwin Ridge (No. 56325), or that from the Tengyueh-Sadon Trail (No. 56459), or those from the hills back of Mengka (No. 56460), or the two from Puerhfu (Nos. 56474 and 56475), may, any one of them, prove of more value.

Of wild pears (*Pyrus* spp.) Mr. Rock found some remarkable forms in Yunnan: One (No. 56277) bearing mellow edible fruits 3 to 4 inches in diameter, from 6,000 feet altitude; a second one (No. 56278) growing to be 70 feet tall, with fruits 2½ inches in diameter; a third (No. 56279), from 6,500 feet, which is 30 feet tall and has greenish brown fruits the size of bullets, and a fourth (No. 56280), from 7,000 feet altitude, which grows to be 60 feet in height and has fruits 2½ inches in diameter.

On the Hocking Range, near Likang, Mr. Rock collected seeds of one of the rare genera of Chinese conifers (*Keteleeria* sp., No. 56316). Since only two species of this conifer appear to be known, and as the one which Robert Fortune discovered in China has grown well in Italy, this species of Rock's may thrive in California and Florida.

Two wild olives (*Olea* spp., Nos. 56328 and 56329) which make trees 50 feet in height, from the forests beyond Wolung and the Shweli Valley, should be added to the California collections of olives and their relatives, for some time, perhaps, a plant breeder may find it possible to cross them and get forms for uses now unknown.

Pinus ormandi (No. 56333), one of the tallest of the oriental pines, attaining a height of 90 feet, belongs unfortunately to the 5-leaved pines, which appear to be subject to the white-pine blister rust and may be of doubtful value for forestry purposes. But Rock's wild cherry (*Prunus* sp., No. 56335) from the Likang Snow Range, his remarkable collection of 10 wild pears (*Pyrus* spp., Nos. 56338 to 56347) and 1 (*Pyrus* sp., No. 56491) from Puerhfu, which has already been used as a stock for pears in Yunnan, his 7 species of oak (*Quercus* spp., Nos. 56348 to 56354), his 10 species of Rhododendrons (Nos. 56355 to 56364), his *Rubus lutescens* (No. 56369), his 4 species of Sorbus (Nos. 56373 to 56376), and 7 as yet unclassified viburnums (Nos. 56379 to 56385) will surely interest amateurs and park superintendents in those regions where they will grow.

Corylus colurna has been a pronounced success in the Arnold Arboretum and the Rochester parks, and another tree filbert (*Corylus* sp., No. 56490) that Mr. Rock discovered at 10,000 feet altitude in the Likang Snow Range, growing 50 feet high and from 2 to 3 feet in diameter and producing good-sized edible nuts, can scarcely fail to be a real addition to our parks and may even prove a profitable nut-producing tree.

Whether the giant lily (*Lilium* sp., No. 56778) that Mr. Rock found west of Tengyueh, which grows 15 feet high, will be easier of culture than *Lilium giganteum* remains to be determined, but already the lily breeders of the country are interested in it.

In Great Britain, the Chinese shrub *Photinia serrulata* is considered by Bean as "undoubtedly one of the finest evergreens ever introduced," and Rock's Yunnan species (*Photinia* sp., No. 56779), which he remarks is "one mass of deep orange-red fruits in November," may prove slightly different from this species and better adapted to American conditions.

In addition to the material collected by Mr. Rock, the following new introductions are worthy of special mention:

Aesculus wilsonii (No. 56390), a narrow-leaved species of horsechestnut from central China, has been tried in the State of Washington and found better suited to the windy conditions there than the European species.

Acer sterculiaceum (No. 56399), a rare species of maple growing 80 feet high in the Himalayas at an altitude of 9,000 feet, has been sent by G. H. Cave, of Darjiling, India, as has also the handsome Himalayan birch (*Betula utilis*, No. 56400), which is still a rare tree in Great Britain.

C. A. Reed, nut expert of the Department of Agriculture, during his mission to China to study the walnut industry secured among other things a collection of walnuts (*Juglans regia*, Nos. 56409 to 56425) from the northern limit of the culture of this species in China which ought to prove decidedly valuable for American growers of this nut.

Cudrania javanensis (No. 56787), a thorny shrub which was introduced in 1915 from Taiwan and has grown unusually well on the rocky soils of southern Florida, is again introduced from New South Wales. Its value as a fruiting shrub or, as suggested, for hedge purposes deserves to be studied. It is related to the Chinese species, *Cudrania tricuspidata*, and to the Osage orange, *Toxylon pomiferum*, and as crosses between the two genera have been successfully made plant breeders may do something worth while with them.

Hydnocarpus alpina (No. 56445), a relative of one of the chaulmoogra-oil-producing trees of Burma, *H. wightiana*, and *H. anihelminthica*, from the Nilghiri Hills of southern India, were sent in by Edmond Versin, of St. Jean le Blanc, France.

Four rare species of maple (*Acer* spp., Nos. 56453 to 56456), from Darjiling, which may thrive in the State of Washington and add their beauty to the parks there, have come from G. H. Cave.

Through Dr. H. L. Shantz seeds have come from Capt. Charles M. F. Swynerton, of Kilossa, Tanganyika Territory, East Africa, of the Johnston clover, *Trifolium johnstoni* (No. 56458). In the high altitudes of East Africa this is one of the prominent forage plants.

Dr. Carl Hartley sent in on request seeds of the large edible chestnut of western Java, *Castanopsis argentea* (No. 56461), which, because of its excellent quality, is worthy of the consideration of tropical horticulturists. The possibilities of a tropical chestnut for the northern markets, we believe, have not yet been considered.

In 1911 Sir Percy Fitzpatrick, of Johannesburg, Transvaal, sent the seeds of *Asparagus africanus*, with his opinion that it is better in flavor than any of the cultivated varieties. In view of the possibility of this species being adapted to certain conditions in America for which our ordinary varieties of *A. officinalis* are not suitable, we are glad to get an additional lot of seeds (No. 56483) through Mr. Gossweiler, of Loanda, Angola.

In 1919 Mr. Gossweiler sent seeds of a remarkable vegetable, *Rumex abyssinicus*, which made an unusual growth in American gardens, often attaining 7 feet in height, and because of its entire freedom from fiber and its delicate texture it has recommended itself for general use in the Southern States as a new source of summer "greens," a class of vegetable much desired by residents there. Mr. Gossweiler has sent another lot of seed (No. 56486) for further experimentation.

Tecoma garrocha (No. 56535), a native of Argentina, may supplant with its slender raceme of bright-yellow and scarlet flowers the well-known *T. stans* so commonly grown in Florida. Doctor Proschowsky has sent seeds from Nice, France.

From Hobart, Tasmania, the Secretary of Agriculture has sent a collection of seeds which includes three handsome acacias (*Acacia* spp., Nos. 56559 to 56561), a species of Casuarina new to Florida (*C. suberosa*, No. 56564), the Wallaby grass (*Danthonia semiannularis*, No. 56566), a perennial tufted fodder grass (*Stipa pubescens*, No. 56569), and *Eucalyptus regnans* (No. 56567), the tallest of the genus, even reaching, according to earlier records, 400 feet in height; in other words, one of the tallest trees of which there is any record.

Twelve selected varieties of sugarcane (*Saccharum officinarum*, Nos. 56617 to 56628) representing a long series of selections and plant-breeding experiments to produce plants resistant to the mosaic disease have been received from Robert M. Grey. Field tests will show whether these are highly resistant under other conditions than those about Cienfuegos, Cuba, where Mr. Grey carried on his breeding experiments.

A collection of mango varieties (*Mangifera indica*, Nos. 56648 to 56659) from Rio de Janeiro, presented by Dr. P. H. Rolfs, of Vicosia, Minas Geraes, although inferior in size and color to the East Indian mangos, may be valuable for southern Florida, where the anthracnose is so prevalent, on account of their resistance to that disease.

Aleurites montana (No. 56676), the mu-oil tree of southern China, bears nuts that yield the southern tung oil of commerce, which appears to be indistinguish-

able from the northern tung oil obtained from *A. fordii*. In view of the increasing use for this oil southern Florida may become a domestic source of supply through the growth of the southern species.

Vicary Gibbs has given us his Aldenham flowering apple (*Malus sylvestris*, No. 56693), said to be a chance hybrid originating at Aldenham and one of the very finest of all the red-flowered apples, for our parks and dooryards. He has sent also seeds of *Stranvaesia davidiana* (Nos. 56695 and 56696), a handsome bush or small standard tree which is evergreen and hardy at Washington and because of its bright foliage worthy of a place in any small garden.

After many years of fruitless effort there have been collected at last, through the kindness of C. T. White, Government botanist of Queensland, the seeds of the two unusually hardy species of *Garcinia*, *G. mestoni* (No. 56699) and *G. gibbsiae* (No. 56698), both native to the forests of the Bellenden Ker Hills of Queensland at altitudes of 2,000 feet. Since these may grow better in southern Florida than the more tropical species of *Garcinia*s, they have a special interest for those interested in the establishment of the mangosteen in the Western Hemisphere. *Garcinia mestoni* has a large, very juicy fruit of a pleasant acid flavor, but ripe fruits of *G. gibbsiae* have not yet been eaten by any collector who could describe its character. Although the seeds sent by Mr. White failed to live, he is now growing plants in Brisbane for shipment to America.

Thirty-six seedling sweet-potato varieties (*Ipomoea batatas*, Nos. 56710 to 56745) from plantings of the Big Wig, Key West "yam," and Black Rock varieties which it is believed were crossed naturally, for trial in the sweet-potato regions of this country, were sent by J. B. Thompson, of St. Croix, Virgin Islands.

Consul Charles E. Allen, of Damascus, sent a collection of apple varieties (*Malus sylvestris*, Nos. 56746 to 56755) from the Plain of Zebdani, which lies northwest of Damascus and is 3,500 feet above the sea. It is possible that some of these may prove better adapted to the Mohave Desert apple region of California than are the Jonathan, Rome Beauty, Yellow Newtown, and other varieties now being tried there.

The botanical determinations of introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared by Paul Russell, who has had general supervision of this inventory.

DAVID FAIRCHILD,
Agricultural Explorer in Charge.

OFFICE OF FOREIGN SEED AND PLANT INTRODUCTION,
Washington, D. C., July 25, 1924.

INVENTORY¹

56145. RUBUS sp. Rosaceæ.

Raspberry.

From Stavanger, Norway. Plants presented by Thoralf Bryne. Received March 1, 1923.

"Paradise berry. A large red raspberry, almost as large as the largest variety known in cultivation, which is the English variety 'The Royal.' (Bryne.)

56146 and 56147.

From Brisbane, Queensland. Seeds presented by C. T. White, Government botanist. Received January 4, 1923.

56146. DAVIDSONIA PRURIENS F. Muell. Cunoniaceæ.

A small (30 to 40 feet) tree of graceful erect habit with long drooping pinnate leaves and pendulous clusters of reddish flowers. The oval fruit about the size of a goose egg is covered with short stiff hairs. Rubbing with a rough cloth quickly and easily removes these and exposes the smooth, plumlike, purple skin. The soft fleshy pulp is rich purple and has a sharply acid flavor; it contains a few flat, irregularly shaped seeds which are small for the size of the fruit, a feature not frequently occurring in wild fruits. This "plum," as it is called, is largely used by settlers in Queensland for making jam and jelly. The hard dark-brown, close-grained wood is tough and durable and is used for tool handles and mallets. This tree is a native of tropical Queensland; a smaller form is found in southern Queensland and adjoining parts of New South Wales.

For previous introduction, see S. P. I. No. 54785.

56147. EUCALYPTUS STAIGERIANA F. Muell. Myrtaceæ. Lemon-scented ironbark.

"This is a valuable oil-yielding species which so far has not been exploited because the trees grow in rather isolated places in North Queensland." (White.)

A tree of medium size with oval or narrow blue-green leaves covered with numerous oil dots. The foliage of this tree yields a large quantity of oil, equal in fragrance to that of lemons, for which it is an agreeable substitute. The proportion of oil obtained from dry leaves is 2½ per cent; the specific gravity of the oil is 0.901. (Adapted from *Bailey, Synopsis of the Queensland Flora*, p. 176.)

56148. PAPPEA CAPENSIS Eckl. and Zeyh. Sapindaceæ.

From Pretoria, Transvaal, Union of South Africa. Seeds presented by I. B. Pole Evans, Chief, Division of Botany. Received January 5, 1923.

A shrub or small tree which occurs abundantly in the vicinity of the Fish River, Cape Province,

South Africa. The wood is white, close-grained, and hard and is used for farm implements and furniture. The leathery, hard fruit, about half an inch in diameter, usually contains one reddish brown seed with a brittle shell; within is a soft kernel which is yellow and very oily. The kernel constitutes about 65 per cent of the entire seed. The entire seeds contain 47.8 per cent of oil, which is golden yellow and fairly viscous. The oil is of the "nondrying" type and probably could be used either for soap manufacture or as a lubricant. The residual meal left after extracting the oil has a fairly good nutritive value, but also a small quantity of a saponin, and feeding trials would be necessary to determine whether the meal could be used as cattle feed. (Adapted from *Bulletin of the Imperial Institute, London*, vol. 17, p. 488.)

56149. LILIUM sp. Liliaceæ. Lily.

From Burma. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 5, 1923.

"(No. 6732. Kachin Hills. November 13, 1922.) A tall lily 10 feet high, with a stem 2 inches in diameter, collected along a brook in a rhododendron thicket on the Mengka-Sadon Trail, in northern Burma, on the Changfang Mountains at an altitude of 9,400 feet. The leaves are broadly triangular, and although the plant was seen only in the fruiting stage, it is probable that the flowers are large. In the region where this species grows it is now extremely cold, ice forming on the brooks at about 4 p. m." (Rock.)

56150 to 56152.

From China and India. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 5, 1923. Quoted notes by Mr. Rock.

56150. MALUS sp. Malaceæ. Apple.

"(No. 6725. Hpunkaw, Burma. November 11, 1922.) A tree 60 to 70 feet tall, with a trunk 3½ feet in diameter, found in sandy soil in dense forests on the ridge above the Kachin village of Hpunkaw. The branches are apt to have long spinelike branchlets near the trunk, but these do not occur on the older branches. The fruits, about 2 inches in diameter, are somewhat oval, with firm aromatic flesh."

56151 and 56152. PYRUS spp. Malaceæ. Pear.

56151. PYRUS sp.

"(No. 6730. Mengka, Yunnan. November 12, 1922.) A tree 30 feet high, with long spreading branches, found wild in sandy loam on a small plain at an altitude of 5,400 feet. The large oblong leaves are acute at both ends, and the very numerous, spherical-compressed, russet-brown fruits are an inch in diameter. Where this species grows it is very cold; ice forms now every day in the late afternoon."

¹ It should be understood that the varietal names of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Seed and Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their identity fully established, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized American codes of nomenclature.

56150 to 56152—Continued.

56152. *PYRUS* sp.

"(No. 6731. Mengka, Yunnan. November 12, 1922.) A wild pear which grows in company with the preceding. No. 6730 [S. P. I. No. 56151], but has smaller leaves and fruits; the latter are oblong pear shaped, reddish yellow, and very numerous."

56153 to 56157. *FRAGARIA* spp. *Rosa-ceæ*. Strawberry.

From Bourg la Reine, Seine, France. Plants presented by Millet & Fils. Received January 5, 1923. Quoted notes from catalogue of Millet & Fils.

Secured for department horticulturists experimenting with small fruits.

56153. *FRAGARIA* sp.

"*Belle Lyonnaise*. Plant thickset, vigorous; fruit round, very fragrant, with white flesh."

56154. *FRAGARIA* sp.

"*Docteur Morère*. Fruit very large and sweet; one of the best varieties; forces well."

56155. *FRAGARIA* sp.

"*Madame Meslé*. A very vigorous plant variety with enormous brilliant vermilion red fruits with pink flesh; a good commercial variety of large yield. Season medium."

56156. *FRAGARIA* sp.

"*St. Fiacre*. This is the best variety obtained thus far: the plant is very vigorous, with dark-green foliage, and the fruits very large, of a brilliant red and extra quality. The yield is large the first season, and the variety is excellent for forcing and quantity production."

56157. *FRAGARIA* sp.

"*Marguerite Lebreton*. A very early variety, with abundant elongated fruits. One of the best forcing varieties."

56158. *GUILIELMA UTILIS* Oerst. *Phœnicaceæ*. (*Bactris utilis* Benth.) Pejibaye.

From San Jose, Costa Rica. Seeds purchased from Otón Jimenez. Received January 16, 1923.

A shipment of seeds of the pejibaye. For an extended account of this interesting food palm, see the *Journal of Heredity*, vol. 12, pp. 154-166, April, 1921.

For previous introduction, see S. P. I. No. 54776.

56159 to 56175. *FRAGARIA* spp. *Rosa-ceæ*. Strawberry.

From Maidstone, England. Plants purchased from George Bunyard & Co. Received January 6, 1923. Quoted notes from Bunyard's Catalogue of Fruit Trees.

These varieties, not in the American trade, have been secured for department specialists engaged in strawberry breeding.

56159. *FRAGARIA* sp.

"*Bedford Champion*. Plant robust, with fine foliage; fruit large, with refreshing acid flavor. Season medium."

56160. *FRAGARIA* sp.

"*Black Prince*. Fruit small, dark red with scarlet flesh, one of the best for preserving, as the flesh turns a deep red and has a delicious flavor. This is the earliest ripening strawberry here."

56159 to 56175—Continued.

56161. *FRAGARIA* sp.

"*Countess*. Fruit handsome, wedge shaped, dark crimson, and of first-rate flavor. A moderate cropper. Season late."

56162. *FRAGARIA* sp.

"*Hibberd's George the Fifth*. Fruits large, some cockscomb shaped, very bright shining scarlet, with carmine, very firm flesh and a flavor equal to the best. This should not be confounded with *Laxton's George the Fifth*. Season late."

56163. *FRAGARIA* sp.

"*Laxton's Tidbit*. Fruit firm, brilliant scarlet, with white flesh of an exquisite flavor. Central fruits are ovate wedge shaped. Season medium."

56164. *FRAGARIA* sp.

"*Little Scarlet*. Fruit small, firm, light red, very freely produced, recommended especially for jam. Season early."

56165. *FRAGARIA* sp.

"*Madame Kooi*. Fruit enormous, hollow, poor flavor, white flesh, crop large. Of Dutch origin. Season medium."

56166. *FRAGARIA* sp.

"*President*. Fruit handsome, of pale color, with rich pine flavor; fine for forcing, as it retains its flavor and bears well. One of the best all-round sorts as regards quality and productiveness for main crop. Season medium."

56167. *FRAGARIA* sp.

"*Royal Hautbois*. A fine form of alpine strawberry, of rich aromatic flavor; good free habit."

56168. *FRAGARIA* sp.

"*St. Fiacre*. The berries, as large as Royal Sovereign, are freely produced and are of a bright color and rich flavor. Bears well in the summer without spoiling the autumn crop which ripens in September and October. A prolific bearer."

56169. *FRAGARIA* sp.

"*Sir Douglas Haig*. Fine flavor, brilliant color, early, and of large size. Season early."

56170. *FRAGARIA* sp.

"*The Bedford*. Constant and free bearer; fruit round, of fine appearance, first-rate sweet flavor; foliage ample. Season medium."

56171. *FRAGARIA* sp.

"*The Earl*. This may be best described as a much improved *Viscountess de Thury*, larger in size, more vigorous, and free cropping. Season late."

56172. *FRAGARIA* sp.

"*The Queen*. An improved *British Queen*. Season medium."

56173. *FRAGARIA* sp.

"*Twentieth Century*. Large bright-red fruits, produced in enormous quantity; constitution very vigorous."

56174. *FRAGARIA* sp.

"*Utility of Laxton*. Good color, size, and flavor; the finest late strawberry yet produced."

56175. *FRAGARIA* sp.

"*Waterloo*. Plant heat resistant, runners few; fruit large, remarkable for its black mulberrylike appearance. Season late."

56176. CITRUS GRANDIS (L.) Osbeck.
Rutaceae. Grapefruit.

From Bangkok, Siam. Seeds presented by Dr. Y. S. Sanitwongse, through Maurice P. Dunlap, American consul. Received January 9, 1923.

"*Thong Dee* or '*Golden pummelo*'. Fruit neither globose nor pear shaped, but somewhat flattened with one side of pistil end somewhat cheeked; size large, measuring 6 inches wide and only $4\frac{3}{4}$ inches high; rind averaging half an inch thick, slightly colored pink in pithy part, especially near the flesh; flesh colored like that of *Daang Ai Chaa*, except that it is rather of a light brown than deep red and the color appears only in streaks in a flesh which is in reality quite white; seeds many; pulp vesicles large and easily separating from membrane, very juicy; flavor good but not so delicious as *Kao Pan*; general shipping qualities not so favorably reported as many other varieties; tree vigorous and reported to produce fruits of attractive flavor and juiciness under somewhat adverse conditions." (G. Weidman Groff.)

56177 and 56178. AMYGDALUS COMMUNIS L. Amygdalaceae. Almond.
(*Prunus amygdalus* Stokes.)

From Serai, Bagdad, Mesopotamia. Seeds presented by G. S. Cameron, officiating director of agriculture. Received January 8, 1923. Quoted notes by Mr. Cameron.

Seeds of two native almond varieties of Mesopotamia.

56177. "Sweet almonds with a thin, soft shell."

56178. "Sweet almonds with a hard, thick shell."

56179. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Milan, Italy. Seeds purchased from Fratelli Ingegneri. Received January 24, 1923.

Seeds of a giant red clover introduced for cultural and comparison tests.

56180. GUILIELMA UTILIS Oerst. Phœnicaceae. (Bactris utilis Benth.) Pejibaye.

From Limon, Costa Rica. Seeds presented by G. P. Chittenden, manager, United Fruit Co. Received January 16, 1923.

For previous introduction, see S. P. I. No. 56158.

56181 and 56182. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received January 31, 1923.

Locally grown red-clover seeds introduced for cultural and comparison tests.

56181. *Surchoix Extra*. Grown northwest of Paris.

56182. *Violet de Bretagne*. Grown in Brittany.

56183 to 56191.

From Brisbane, Queensland. Seeds presented by E. W. Bick, curator, Botanic Garden. Received January 22, 1923.

56183 and 56184. *ACACIA* spp. Mimosaceae.

56183. *ACACIA FASCICULIFERA* F. Muell.

A tall acacia from southwest Queensland, where it sometimes reaches a height of 70 feet. The phyllodia or "leaflike stems" are leathery, very narrow, with

56183 to 56191—Continued.

callous tips, and from 4 to 6 inches long. The flower heads, each containing 20 to 30 flowers, are borne in small axillary clusters. The very hard red wood is close grained and commonly used for building.

56184. *ACACIA JUNCIFOLIA* Benth.

A large slender-branched shrub, native to Queensland, with rushlike phyllodia 6 inches long or more and tipped with erect or curved points. The small fuzzy globular flower heads are borne singly or in pairs.

56185. *BRACHYCHITON DISCOLOR* F. Muell. Sterculiaceae. (*Sterculia discolor* F. Muell.)

A large tree native to southern Australia, with roundish heart-shaped leaves, 4 to 6 inches in diameter, with white-velvety lower surfaces. The rose-red flowers, up to 2 inches long, are borne in few-flowered clusters in the upper axils. The wood is soft, light colored, and of rather coarse grain; when dried, however, it hardens and makes good shingles.

56186. *CASSIA BREWSTERI TOMENTELLA* F. Muell. Cæsalpinaceae.

An erect slender tree 20 to 30 feet high, found in thickets about Obum Obum, Queensland, where it is known as "bean tree." The branches, under surface of the leaflets, and small yellow flowers are covered with fine white hairs. The cylindrical pods, 1 or 2 feet long, are bright reddish brown. (Adapted from *Bailey, Queensland Flora*, pt. 2, p. 456.)

For previous introduction, see S. P. I. No. 37137.

56187 and 56188. *ERYTHRINA* spp. Fabaceae.

56187. *ERYTHRINA TOMENTOSA* R. Br.

A small tree 10 to 15 feet high, with thick, rough, prickly bark, native to South Africa. The trifoliolate long-stemmed leaves, 10 to 14 inches long and wide, are densely hairy on both surfaces, and the bright-crimson flowers are borne in many-flowered spikelike clusters. The woody pods, velvety on the surface, are alternately swollen and contracted, which gives them a bizarre appearance. (Adapted from J. Medley Wood, *Natal Plants*, vol. 4, pls. 384, 386.)

56188. *ERYTHRINA VESPERTILIO* Benth. Coral tree.

Usually a small tree with prickly branches, broadly 3-lobed leaves, and numerous erect showy racemes of red flowers. The soft straw-colored wood is very light and spongy and is used by the natives for making shields. The roots are eaten raw.

56189. *EUCALYPTUS RARIFLORA* F. M. Bailey. Myrtaceae.

A tall eucalypt from Queensland, where it appears to be rather rare. The slender branchlets are of a pleasing red, and the very variable leaves are almost circular on young trees, becoming very narrow on the older wood. The slender panicles contain usually only a few scattered flowers. (Adapted from *Queensland Agricultural Journal*, new series, vol. 1, p. 62.)

56190. *EVODIA ACCEDENS* Blume. Rutaceae.

An erect tree 70 to 80 feet in height, native to damp scrubby places throughout Queensland. The light-colored bark is somewhat corky, and the papery trifoliolate leaves are up to 5 inches long. The small pink flowers, which turn bluish as they die away, are borne in dense lateral clusters. The wood is very white, light, and soft.

56183 to 56191—Continued.

56191. *FLINDERSIA OXLEYANA* F. Muell.
Meliaceæ.

A tall, much-branched tree, often becoming 100 feet in height, with opposite compound leaves which are crowded under the loose, many-flowered panicles. The bright-yellow, strong and fibrous wood is used in cabinet work; it is not readily attacked by white ants. (Adapted from *Bailey, Queensland Flora*, pt. 1, p. 239.)

56192. *RAPHANUS SATIVUS* L. Brassicaceæ. Radish.

From Algiers, Algeria, North Africa. Seeds presented by Dr. L. Trabut, Government botanist. Received January 5, 1923.

"Variety *campestris*. An improved giant radish, with large roots, used as cattle feed. The seeds are sown at the beginning of the rainy season, from August to October." (*Trabut*.)

56193 to 56195. *COIX LACRYMA-JOBI* MA-YUEN (Rom.) Stapf. Poaceæ. Ma-yuen.

From Buitenzorg, Java. Seeds presented by H. de Veer, chief of the plant-breeding station for annual crops, Java Department of Agriculture. Received January 8, 1923. Quoted notes by Mr. de Veer.

The *ma-yuen* is an edible soft-hulled variety of Job's-tears (*Coix lacryma-jobi*) quite different from the ordinary form, with hard beadlike seeds. It is grown in India, China, the East Indies, and also in the Philippines, where it is known as "adlay." For an account of the uses of adlay as a cereal and for analytical data, see *The Philippine Agricultural Review*, vol. 14, pp. 159-177.

56193. "*Djali ketan*. A glutinous form."

56194. "*Witte djali bras*. A form with white seeds."

56195. "*Zwarte djali bras*. A form with black seeds."

For illustrations of the *ma-yuen*, see Plates I and II.

56196 and 56197. *NAGEIA* spp. Taxaceæ.

From Hogsback, via Lovedale, Cape Province, South Africa. Seeds presented by David A. Hunter. Received January 8, 1923.

"These trees grow slowly but finally become very large. The timber is fine grained and is largely used in our shops for furniture." (*Hunter*.)

56196. *NAGEIA ELONGATA* (Ait.) Kuntze.
(*Podocarpus elongata* L'Herit.)

This is known in South Africa as the "common yellow-wood," and it is the largest, most plentiful, and one of the most useful trees of Cape Province. The narrow evergreen leaves are quite short, being little more than an inch long. The tree becomes 80 to 120 feet in height, with a trunk usually 3 to 4 feet in diameter, occasionally 10 feet. The wood is light, soft, moderately strong and elastic, and of a pale yellow brown. When exposed to the weather the wood is quite durable.

56197. *NAGEIA THUNBERGII* (Hook.) F. Muell. (*Podocarpus thunbergii* Hook.)

A fine evergreen timber tree, up to 100 feet tall and with a trunk 4 feet in diameter, which occurs throughout all the timber forests from the Cape of Good Hope to Natal. The quality of the wood of this species is very similar to that of the preceding [*S. P. I. No. 56196*], and for most purposes they are used indiscriminately.

56198. *CYRTANTHUS CONTRACTUS* N. E. Brown. Amaryllidaceæ.

From Pretoria, Transvaal, Union of South Africa. Bulbs presented by I. B. Pole Evans, Chief, Division of Botany, Department of Agriculture. Received January 10, 1923.

A handsome member of the amaryllis family from the Transvaal, where its conspicuous beauty as it flowers on the burnt-over fields has earned it the name of "fire lily." The narrow bluish green leaves are over a foot in length, and the Van Dyke red peduncle, 7 inches or over long, bears a pendulous cluster of faintly scented scarlet or carmine flowers with strawberry-red pedicels. (Adapted from *Flowering Plants of South Africa*, vol. 1, pl. 4.)

56199 to 56265. *TRITICUM* spp. Poaceæ.

From Lisbon, Portugal. Seeds presented by Prof. D. A. Tavares da Silva, Instituto Superior de Agronomia. Received January 10, 1923. Quoted notes by Professor Tavares da Silva.

A collection of the wheat varieties of Portugal, obtained from the Instituto Superior de Agronomia, Lisbon. Secured for department cerealists.

56199 to 56231. *TRITICUM AESTIVUM* L.
(*T. vulgare* Vill.) Common wheat.

56199 and 56200. "Hard white-bearded wheat."

56199. "No. 5. *Barbella*."

56200. "No. 11. *Rieti*."

56201 to 56208. "Soft wheat."

56201. "No. 30. *Barbella*."

56202. "No. 31. *Beirão*."

56203. "No. 33. *Galêgo barbado*."

56204. "No. 34. *Portuquez*."

56205. "No. 35. *Precoce italiano*."

56206. "No. 36. *Ribeiro*."

56207. "No. 37. *Rieti*."

56208. "No. 38. *Temporão de Coruche*."

56209 to 56217. "Beardless wheat."

56209. "No. 42. *Aurora*."

56210. "No. 43. *Galêgo rapado*."

56211. "No. 44. *Gentil rosso*."

56212. "No. 45. *Manitoba*."

56213. "No. 46. *Môcho de espiga quadrada*."

56214. "No. 48. *Galêgo rapado* × *Vermelhoilo*."

56215. "No. 49. *Fucense* × *Môcho de espiga branca*."

56218. "No. 50. *Rieti* × *Galêgo rapado*."

56217. "No. 51. *Rieti* × *Môcho de espiga branca*."

56218 to 56231. "Bearded wheat."

56218. "No. 52. *Amarillo de barba branca* × *Ribeiro*."

56219. "No. 53. *Amarillo de barba preta* × *Ribeiro*."

56220. "No. 54. *Amarillo* de barba preta × *Ribeiro* (*Sado*)."

56221. "No. 55. *Anafil* × *Galêgo barbado* (*Belem*)."

56222. "No. 56. *Barbella* × *Santa Martha*."

MA-YUEN, AN EDIBLE SOFT-HULLED VARIETY OF JOB'S-TEARS. (COIX LACRYMA-JOBI MA-YUEN (ROM.)

STAFF.; S. P. I. NOS. 56193 TO 56195)

Although an edible soft-hulled form of Job's-tears appears to have been known since ancient times in India and also for a considerable time in other parts of Asia. It was not until recent years that horticulturists in the Philippines began to see the possibilities of adlay, as this cereal is known there. Under equal conditions it is more productive than rice, the average yield being about 35 bushels per acre, a yield which could probably be increased 10 or 15 per cent by systematic breeding. Wherever rice can be grown adlay will grow, and where the growing wet season is followed by a dry period adlay is more productive than rice. Furthermore, it should be possible to cultivate and harvest adlay with machinery like that used for wheat. (Photographed at the Lanna Experiment Station, Lanna, Philippine Islands)

ONE OF THE BEST PHILIPPINE FORMS OF MA-YUEN. (COIX LACRYMA-JOBI MA-YUEN (ROM.) STAPP.;
S. P. I. Nos. 56193 TO 56195)

According to P. J. Wester, of the Philippine Bureau of Agriculture, there are at present in the Philippines seven distinct forms of adlay. These vary greatly in size, shape, color, and hardness of the dried grains; the most desirable forms having small grains with very thin hulls. It is claimed for adlay that it is more easily hulled than rice; it is more nutritious and at least as palatable as rice and can be prepared and eaten in the same manner; it can be ground and mixed with wheat flour to make bread of good quality; it is excellent as chicken feed; and, finally, when cracked it makes a delicious breakfast food. As a supplementary crop to rice and corn it appears to have a promising future in the Philippines and elsewhere in the Tropics, and as a substitute for wheat it deserves very careful consideration. (Photographed at the Lanao Experiment Station, Lanao, Philippine Islands)

Rice.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received January 15, 1923. Quoted notes by Mr. Hernandez.

Secured for department rice specialists.

"Seeds of six more or less scented or flavored varieties of rice. The material was raised by this bureau at its Alabang Rice Station, Alabang, Rizal. These rices are white, nonglutinous, and non-bearded. Averages on maturity and yield were taken from results of previous years. The corresponding data for this year (1922) are not yet available."

56266. "(No. 13.) *Macan piña*. Tested 13 years under lowland conditions; matures usually in 139 days. Average yield 2,539 kilograms per hectare (approximately 2,260 pounds per acre)."
56267. "(No. 15.) *Mangasa III*. Tested 3 years under lowland conditions; matures usually in 137 days. Average yield 1,245 kilograms per hectare (approximately 1,110 pounds per acre)."
56268. "(No. 27.) *Antique*. Tested 7 years under lowland conditions; matures usually in 149 days. Average yield 2,889 kilograms per hectare (approximately 2,500 pounds per acre)."
56269. "(No. 31.) *Bong Dua*. Tested 3 years under lowland conditions; matures usually in 164 days. Average yield 1,660 kilograms per hectare (approximately 1,470 pounds per acre)."
56270. "(No. 163.) *Sipot*. Tested 14 years under lowland conditions; matures usually in 137 days. Average yield 2,486 kilograms per hectare (approximately 2,200 pounds per acre)."
56271. "(No. 164.) *Guinalong*. Tested 12 years under lowland conditions; matures usually in 140 days. Average yield 2,340 kilograms per hectare (approximately 2,080 pounds per acre)."

56272. *TRIFOLIUM SQUARROSUM* L.
Fabacæ. **Clover**.

From Florence, Italy. Seeds presented by Prof. A. Fiori, Reale Istituto Superiore Forestate de Firenze. Received January 16, 1923.

Introduced for cultural and comparison tests with American clovers.

An upright or ascending, robust annual with branches up to 30 inches in length, native to the

Mediterranean countries. The pink or white flower heads are oval when young, becoming more elongated later.

56273 and 56274. RUBUS spp. Rosa-ceæ. Raspberry.

From Los Banos, Philippine Islands. Seeds presented by Prof. J. E. Higgins, Los Banos College of Agriculture. Received January 16, 1923.

Philippine species of Rubus introduced for breeding experiments with our cultivated blackberries and raspberries.

56273. RUBUS FRAXINIFOLIUS Poir.

A scrambling shrub, with branches 2 to 4 meters (6½ to 13 feet) long, which is very common in the mountains from Luzon to Mindanao, Philippine Islands. The stems and leaves are armed with sharp spines, and the white flowers are about 2 centimeters (nearly an inch) across. The bright-red berries 10 to 15 millimeters (about half an inch) in diameter, borne in clusters, are fairly juicy and edible but rather tasteless. (Adapted from *Brown, Wild Food Plants of the Philippines*, p. 63.)

56274. RUBUS ROSAEFOLIUS J. E. Smith.

A spiny shrub rarely over 3 feet high, common in the mountains of Luzon, the Bisaya Islands, and Mindanao, Philippine Islands. The red fruits borne singly or in clusters are about 1.5 centimeters (half an inch) in diameter; they are juicy but rather insipid. (Adapted from *Brown, Wild Food Plants of the Philippines*, p. 66.)

56275 to 56281.

From China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 15, 1923. Quoted notes by Mr. Rock.

56275. MALUS sp. Malaceæ. Apple.

"(No. 7003. November, 1922.) A tree 30 to 40 feet high occurring wild along water-courses in the Kuyung Mountains north of Tengyueh at an altitude of 7,000 feet. Probably a good stock plant."

56276. PHOTINIA sp. Malaceæ.

"(No. 7002. November, 1922.) A roseaceous tree 30 to 40 feet tall, with a dense crown, collected in the Kuyung Mountains at an altitude of 6,000 feet. The narrow pale-green leaves are toothed, and the flowers, said to be white, are borne in large panicles about 5 inches across. The fruits are deep orange red."

56277 to 56280. PYRUS spp. Malaceæ. Pear.

56277. PYRUS sp.

"(November, 1922.) A wild pear found in the mountains near Puerhfu at an altitude of 6,000 feet. The large mellow edible fruits are 3 to 4 inches in diameter."

56278. PYRUS sp.

"(No. 6735. November 20, 1922.) A large hardy tree 60 to 70 feet tall, which grows in the mountains beyond Taho, north of Tengyueh, at an altitude of 7,000 feet. The leaves are large, oblong, and acuminate, and the numerous reddish brown, somewhat acrid fruits are 2½ inches in diameter."

56279. PYRUS sp.

"(No. 6736. November 21, 1922.) A tree 30 feet high with a spreading crown, found at an altitude of 6,500 feet in a valley in an oak forest along a brook beyond Chiehnmachin, a day's journey north of Tengyueh. This species has small oval leaves and globose, greenish brown fruits the size of bullets."

56275 to 56281—Continued.

56280. PYRUS sp.

"(No. 7001. November, 1922.) A large tree 60 feet tall with a huge ascending crown, found in sandy soil in an oak forest in the Kuyung Mountains north of Tengyueh at an altitude of 7,000 feet. The leaves are large, oblong-lanceolate, with a reddish tinge. The numerous globose, greenish brown fruits are 2½ inches in diameter."

56281. ROSA sp. Rosaceæ.

Rose.

"(No. 6738. November, 1922.) A large climbing rose growing wild on the slopes of the mountains near Mengka, four days' journey west of Tengyueh, at an altitude of 6,000 feet, in a region where frost and ice are common in December. The white flowers are in large terminal corymbs, and the fruits are oval and reddish."

56282. POLYALTHIA LONGIFOLIA (Sonner.) Benth. and Hook. Annonaceæ.

From Honolulu, Hawaii. Seeds presented by Dr. H. L. Lyon, in charge, department of botany and forestry, experiment station of the Hawaiian Sugar-Planters' Association. Received January 15, 1923.

A large, handsome, erect evergreen tree which is wild in the drier parts of Ceylon and southeastern India and, because of its ornamental appearance and suitability as a shade tree, is commonly planted in avenues along roads in Bengal and South India. The ovoid purple fruits ripen during the rainy season, June to October; these are not eaten except in times of scarcity. The wood is white or whitish yellow, light and very flexible, and used for making matches, pencils, boxes, etc. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 6, pt. 1, p. 313.)

For previous introduction, see S. P. I. No. 53923.

56283. LESPEDEZA STRIATA (Thunb.) Hook. and Arn. Fabaceæ.

Japanese clover.

From Kobe, Japan. Seeds presented by E. R. Dickover, American consul in charge. Received January 19, 1923.

Introduced for the use of department specialists engaged in breeding forage plants.

56284. PANICUM MAXIMUM Jacq. Poaceæ. Guinea grass.

From Marti, Camaguey, Cuba. Seeds purchased from Jose Sanchez Moran. Received January 24, 1923.

Introduced for the use of specialists engaged in forage-crop investigations.

A perennial erect bunch grass 4 to 6 feet tall, with broad, flat leaves and open spreading panicles of spikelets. It is a native of Africa introduced into tropical America, where it is cultivated for forage, furnishing pasture and green feed.

56285 to 56287. TRIFOLIUM spp. Fabaceæ.

From Aarhus, Denmark. Seeds presented by Fr. Dreyer, Aarhus, through S. Sørensen, agricultural adviser to the Danish Government, Washington, D. C. Received February 6, 1923. Quoted notes by Mr. Sørensen.

56285. TRIFOLIUM PRATENSE L. Red clover.

"*Hersnap*. This represents our best strain of red clover, and in several tests at the Danish State Experiment Station this gave about 20 per cent more hay than the usual commercial varieties."

For previous introduction, see S. P. I. No. 44107.

56285 to 56287—Continued.

56286 and 56287. *TRIFOLIUM REPENS* L.
White clover.

"The white clovers represent two of our best strains, one developed on the island of Fyn and the other on the mainland of Jutland. Both of these are very popular in Denmark."

56286. *Morso*.

56287. *Stryno*.

56288 to 56386.

From China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received February 2, 1923. Quoted notes by Mr. Rock.

56288 to 56291. *ACER* spp. *Aceraceae*. Maple.

56288. *ACER DAVIDI* Franch.

"(No. 6799. October, 1922.) A very attractive maple 50 to 60 feet in height, found on the Likiang Snow Range at an altitude of 10,000 feet. It has large oval heart-shaped, coarsely toothed leaves and long pendent clusters of samaras."

56289. *ACER* sp.

"(October, 1922.) A tall, stately tree 50 to 80 feet high, with a straight trunk, found among limestone boulders back of Nguluku on the Likiang Snow Range at an altitude of 9,600 feet. The rather small leaves are 5-lobed, and the samaras are in erect spikes."

56290. *ACER* sp.

"(No. 6806. October, 1922.) A tall tree 70 to 80 feet high, with a dense round crown, from the western slopes of the Likiang Snow Range on the Ashi Road at an altitude of 11,000 feet. The leaves are large and 3-lobed, and the samaras are borne in stout drooping clusters."

56291. *ACER* sp.

"(No. 6834.) A handsome evergreen maple 70 to 80 feet in height, with a huge crown, found at an altitude of 8,000 feet in the forest between Hpunkaw and Mengka, one and a half days' travel from the Burmese Kachin Hills. The trunk is more than 3 feet in diameter, and the branches descend almost to the ground."

56292. *BENZON* sp. *Lauraceae*.
(*Lindera* sp.)

"(Nos. 6723 and 7010. November, 1922.) A tree 35 feet high, with a spreading crown, common around Tengyueh and along the Taping River. The trunk is sometimes a foot or more in diameter, usually smaller; the leathery aromatic leaves are dark green and glossy. From the scarlet 1-seeded fruits, borne in short clusters, is obtained a white oily liquid used to make a yellow wax. This wax is used for burning, for keeping leather soft, and for other household purposes."

56293. *BERBERIS DICTYOPHYLLA* Franch.
Berberidaceae. Barberry.

"(No. 6804. October, 1922.) A spiny shrub 6 to 8 feet high, found on alpine meadows of the Likiang Snow Range at an altitude of 12,000 feet. It is very ornamental, with yellow flowers and red fruits."

For previous introduction, see S. P. I. No. 55718.

56294. *BUDDLEIA FORRESTII* Diels. *Loganiaceae*.

"(No. 6816. October, 1922.) A very attractive shrub found only in limestone soil on the Likiang Snow Range at an altitude of 10,000 feet. It has white woolly leaves and spikes of lavender-blue flowers."

56288 to 56386—Continued.

56295. *BUXUS* sp. *Buxaceae*. Box.

"(No. 6793. October, 1922.) A very handsome shrub about 5 feet high, which grows among limestone boulders on the Likiang Snow Range at an altitude of 11,000 feet. The small elliptical leaves are bright green."

56296 to 56300. *CASTANOPSIS* spp. *Fagaceae*. Chestnut.

56296. *CASTANOPSIS* sp.

"(No. 6751. October, 1922.) A tall tree 70 to 80 feet in height, found on the slopes of the Likiang Snow Range at an altitude of 10,000 feet. The thick leathery leaves are silvery beneath, and the small edible nuts are sweet."

56297. *CASTANOPSIS DELAVAYI* Franch.

"(No. 6768. November 30, 1922.) One of the finest and largest species of *Castanopsis* in Yunnan; it reaches 80 feet in height, with trunks 2 to 3 feet in diameter, and is found on the summit ridge of the Shweli-Salwin Divide at an altitude of 8,000 feet. It is a fine timber tree, free from disease. The small brown nuts are edible and sweet."

56298. *CASTANOPSIS* sp.

"(No. 6819. November 30, 1922.) A tree 50 to 80 feet high, with a trunk 4 feet in diameter, found on the Salwin Ridge at an altitude of 8,000 feet. The dark-green elliptic leaves are brown beneath, and the small black nuts are edible and sweet."

56299. *CASTANOPSIS* sp.

"(No. 7006. Kuyung. November, 1922.) A tree 40 to 50 feet in height, with a trunk 1 to 2 feet in diameter, which grows in the mountains north of Tengyueh at altitudes of 7,000 to 8,000 feet. The broad oval leaves are pointed, with the upper half toothed, and the spines on the burs are arranged in concentric rings. The small nuts are edible and sweet."

56300. *CASTANOPSIS* sp.

"(No. 7007. Kuyung. November, 1922.) A tree 60 to 80 feet high, with a high trunk 2 to 3 feet in diameter, found in the mountains north of Tengyueh at altitudes of 7,000 to 8,000 feet. The small elliptical dark-green leaves are thick and leathery, and the burs, an inch in diameter, are covered with branched spines. Each bur contains two or three brown, pubescent, sweet edible nuts."

56301 and 56302. *CORNUS CAPITATA* Wall.
Cornaceae. Benthams' cornel.

"A tree 30 feet high, with a trunk a foot or more in diameter, or at times shrubby. The fruits, about 2 inches in diameter, are strawberrylike in shape and color and have sweet yellow edible flesh. They are very popular with the natives and are often sold in the markets."

For previous introduction, see S. P. I. 56085.

56301. "(No. 6791. October, 1922.) From the lower slopes of the Likiang Snow Range at an altitude of 9,000 feet."

56302. "(No. 7008. Kuyung. November, 1922.) From the mountains north of Tengyueh at an altitude of 7,000 feet."

56303 and 56304. *COTONEASTER* spp. *Mala-ceae*.

56303. *COTONEASTER* sp.

"(No. 6742. November 29, 1922.) A stiff, erect, very ornamental shrub 3 to 4

56288 to 56386—Continued.

feet in height, found on the highest point of the Shweli-Salwin watershed (altitude 11,000 feet), at a place called Hsuehshanting (summit of snow mountain), in company with rhododendrons and canebrae. Here during the winter months the mountains are covered with snow, and ice covers the pools and brooks all day. The reddish leaves are small and roundish, and the oval scarlet persistent berries are half an inch in diameter."

56304. COTONEASTER sp.

"(No. 6789. October, 1922.) A stout ornamental prostrate shrub which creeps over limestone rocks on the Likiang Snow Range at an altitude of 10,000 feet. The very small elliptical leaves are dark green, and the small berries are red."

56305. CUPRESSUS sp. Pinaceae. Cypress.

"(No. 6802. Peshwe. October, 1922.) A tall tree 40 to 50 feet high, with a stout trunk, found on margins of meadows north of Ngu-lukeu at an altitude of 11,000 feet."

56306 and 56307. DEUTZIA sp. Hydrangeaceae.

56306. DEUTZIA sp.

"(No. 6813. October, 1922.) A very ornamental shrub, with purplish white flowers, found along stream beds on the Likiang Snow Range at altitudes of 10,000 to 11,000 feet."

56307. DEUTZIA sp.

"(No. 7752.) From the Likiang Snow Range."

56308 to 56310. DIOSPYROS sp. Diospyraceae. Persimmon.

56308. DIOSPYROS sp.

"(Tengyueh. November 24, 1922.) A large spreading tree 50 feet tall, with a huge crown, found in the vicinity of Tengyueh, where it freezes every night during the cold season. It is a fine shade tree. The yellow fruits are the size of cherries."

56309. DIOSPYROS sp.

"(No. 6787. October, 1922.) A wild persimmon which grows as a tall, spreading tree on the dry slopes back of Likiang at an altitude of 8,500 feet. The small oval fruits are black."

56310. DIOSPYROS sp.

"(No. 6805. Shiku, Yangtze River. October, 1922.) A large spreading tree which bears black, sweet edible fruits the size of a half dollar."

56311 to 56313. EUONYMUS spp. Celastraceae.

56311. EUONYMUS PORPHYREUS Loes.

"(No. 6784. October, 1922.) An ornamental shrub 5 to 6 feet high, with red berries, found on the Likiang Snow Range at an altitude of 12,000 feet."

56312. EUONYMUS sp.

"(No. 6809. October, 1922.) A tree 25 feet tall found among limestone rocks on the lower slopes of the Likiang Snow Range at an altitude of 9,000 feet. The leaves are oval heart shaped and the fruits red and yellow."

56313. EUONYMUS sp.

"(No. 6812. October, 1922.) An ornamental tree 30 to 40 feet in height, with rich-green, narrow, sharp-pointed leaves and red fruits. It grows on the Likiang Snow Range at an altitude of 12,000 feet."

56288 to 56386—Continued.

56314. ILEX sp. Aquifoliaceae. Holly.

"(No. 6781. October, 1922.) A wild holly from the Likiang Snow Range at about 12,000 feet altitude. It is an ornamental tree 25 feet high, with leathery dark-green leaves and small yellowish berries."

56315. INDIGOFERA PENDULA Franch. Fabaceae.

"(No. 6798. October, 1922.) An exceedingly ornamental shrub 10 to 15 feet high, with long racemes of bluish purple flowers, found on the Likiang Snow Range at an altitude of 10,000 to 11,000 feet."

56316. KETELEERIA sp. Pinaceae.

"(No. 6321. October, 1922.) A handsome tree 50 feet in height, with light-green foliage and long oblong cones, found on the Sungkwe Pass, Hocking Range, two days' travel from Likiang, at an altitude of 11,000 feet."

56317 and 56318. LIGUSTRUM spp. Oleaceae. Privet.

56317. LIGUSTRUM IONANDRUM Diels.

"(No. 6810. October, 1922.) A very compact shrub 10 to 12 feet high, found among limestone boulders back of Ngulukeu on the Likiang Snow Range at an altitude of 10,000 feet. It has elliptical leaves and short terminal clusters of cream-colored fragrant flowers."

56318. LIGUSTRUM sp.

"(No. 6803. October, 1922.) A tree 40 to 50 feet high, with a trunk 1 to 2 feet in diameter, which grows along water-courses on the Likiang Snow Range at an altitude of 8,500 feet. The small fragrant cream-colored flowers are in large panicles."

56319. LITSEA sp. Lauraceae.

"(No. 6814. October, 1922.) An ornamental aromatic shrub 10 to 15 feet high, found on the Likiang Snow Range at an altitude of 10,000 to 11,000 feet."

56320 to 56325. MALUS spp. Malaceae. Apple.

56320 and 56321. MALUS YUNNANENSIS (Franch.) C. Schneid.

"A tree 30 to 40 feet high, which grows among limestone boulders along water-courses on the Likiang Snow Range at altitudes of 10,000 to 12,000 feet. The large oval heart-shaped, coarsely toothed leaves are hairy beneath and the yellowish crimson fruits, an inch in diameter, are in large clusters. One of the handsomest trees of the Likiang Snow Range."

56320. "(No. 6760. October, 1922.)"

56321. "(No. 6764. October, 1922.)"

56322. MALUS sp.

"(No. 6753. October, 1922.) A tree 60 to 80 feet in height, with stout straight branches, which grows on the slopes of the Likiang Snow Range at an altitude of 12,000 feet. The dark-green leaves are silvery beneath, and the oval yellow fruits have sour fragrant flesh and large seeds. The tree is very ornamental."

56323. MALUS sp.

"(No. 6758. October, 1922.) A tree 35 to 40 feet high which is found on the Likiang Snow Range at altitudes of 10,000 to 11,000 feet. The reddish green, strongly veined leaves are whitish beneath, and the numerous fruits are in large clusters."

56288 to 56386—Continued.

56324. *MALUS YUNNANENSIS* (Franch.) C. Schneid.

"(No. 6762. October, 1922.) A tree 40 feet high, with a dense crown, found on the lower slopes of the Likiang Snow Range among limestone boulders along watercourses at an altitude of about 10,000 feet. The large leaves are grayish hairy beneath."

56325. *MALUS* sp.

"(No. 6821. November 30, 1922.) A hardy tree 15 to 20 feet in height, found in dense forest on the Salwin Ridge at an altitude of 8,000 feet. The oblong leaves have red veins and petioles and the calyx portion of the oval yellow fruits is drawn out into a beak. The fruit flesh is firm and sour."

56326 and 56327. *MECONOPSIS* spp. Papaveraceæ.

56326. *MECONOPSIS INTEGRIFOLIA* (Maxim.) Franch.

"(No. 6777. October, 1922.) A fine alpine plant 2 feet or more in height found rather commonly at altitudes of 14,000 to 14,500 feet among limestone boulders on the Likiang Snow Range. The leaves are linear, with the basal ones forming a rosette, and covered with red hairs. The large bright-yellow flowers are 4 inches across."

For previous introduction, see S. P. I. No. 55957.

56327. *MECONOPSIS RUDIS* Prain.

"(No. 6797. October, 1922.) An alpine plant found on limestone gravel on the Likiang Snow Range at altitudes above 16,000 feet. The glaucous leaves are covered with red spines and the satiny blue flowers, 2 inches across, completely cover the spikes, which are 2 feet in length."

56328 and 56329. *OLEA* spp. Oleaceæ.

56328. *OLEA* sp.

"(No. 6737. November 21, 1922.) A large tree 50 feet high, with a trunk a foot in diameter and whitish bark, which grows wild in the forests beyond Wolung and Chienmachin, north of Tengyueh. The narrowly oblong, leathery leaves are dark green, and the small oval, bluish black, juicy fruits are borne in clusters below the leaves."

56329. *OLEA* sp.

"(No. 6741. November 29, 1922.) A tree 30 feet or more in height, found in the Shweli Valley, two days' travel north-east of Tengyueh near Chiangtso and Chuchi. It has elliptical leaves and small oval, bluish black, juicy fruits."

56330 and 56331. *PHOTINIA* spp. Malaceæ.

56330. *PHOTINIA* sp.

"(No. 6800. October, 1922.) A tree 25 feet high from the western slopes of the Likiang Snow Range, in the Ashi Road forest, at an altitude of 10,000 to 11,000 feet. The flowers are white and the small orange-red fruits are in large terminal panicles."

56331. *PHOTINIA* sp.

"(No. 6815. October, 1922.) An ornamental shrub 5 to 6 feet high, from limestone meadows in the Likiang Snow Range. It has very narrow leaves and clusters of dark carmine fruits."

56288 to 56386—Continued.

56332. *PIERIS* sp. Ericaceæ.

"(No. 7660. November 27, 1922.) A shrub 6 to 8 feet high with white flowers, collected on the summit of Hsuehshanting at an altitude of 11,000 feet."

56333. *PINUS ARMANDI* Franch. Pinaceæ.

Pine.

"(No. 6792. Likiang. October, 1922.) A pine tree 90 feet or more tall, with a straight trunk, common at altitudes above 8,000 feet in the northern part of Yunnan; also from the Black River Valley to Talifu and Likiang."

For previous introduction, see S. P. I. No. 45914.

56334. *PRIMULA FORRESTII* Balf. f. Primulaceæ.

Primrose.

"(No. 6811. October, 1922.) A perennial plant which becomes 50 years or more in age, with a thick woody rootstock, found among rocks and under trees in rich soil and also among limestone boulders on the Likiang Snow Range, at an altitude of 11,000 to 12,000 feet. The large basal leaves have a fresh-apple odor and the rich orange-yellow flowers are in large umbels."

For previous introduction, see S. P. I. No. 48361.

56335. *PRUNUS* sp. Amygdalaceæ. Cherry.

"(No. 6782.) A tree 35 to 40 feet high, which grows on the road from Ashi to the Yangtze River, Likiang Snow Range, at an altitude of 10,000 feet. The globose, bluish black fruits are in drooping clusters."

56336 to 56347. *PYRUS* spp. Malaceæ. Pear.

56336. *PYRUS FASHIA* Buch.-Ham.

"(November, 1922.) A handsome tree 30 feet high, with a round crown and dark-green heart-shaped leaves, which grows in southern Yunnan in the valleys south of Puerhfu. The yellowish brown globose pears are the size of marbles. The seeds were secured through Miss Clara Peterson, of the Puerhfu Mission."

For previous introduction, see S. P. I. No. 54998.

56337. *PYRUS* sp.

An unlabeled packet of pear seeds from Yunnan.

56338. *PYRUS* sp.

"(No. 6752. Chinhaize. October, 1922.) A sturdy tree 30 to 40 feet in height, with a dense crown and ascending branches, which grows along watercourses on the eastern side of the Likiang Snow Range. The small globose fruits are crimson when ripe."

56339. *PYRUS* sp.

"(No. 6754. October, 1922.) A wild pear from the lower slopes of the Likiang Snow Range, where it grows at an altitude of 9,600 feet and forms a tree 30 to 40 feet high. The oval pedicel fruits are crimson when ripe."

56340. *PYRUS* sp.

"(No. 6757. October, 1922.) A very handsome tree 35 to 40 feet high, which grows among limestone boulders along watercourses on the lower slopes of the Likiang Snow Range at an altitude of 10,000 feet. The handsome leaves are dark green above and white beneath, with serrate margins and sharp points, and the fruits are small, oval, and red."

56288 to 56386—Continued.

56341. PYRUS sp.

"(No. 6759. Ganhaitze. October, 1922.) A tree very similar to the preceding [S. P. I. No. 56340] but with few fruits, which are pear shaped and yellow. It grows at an altitude of 10,000 feet on the Likiang Snow Range."

56342. PYRUS sp.

"(No. 6761. October, 1922.) A very ornamental tree 30 to 40 feet in height, which grows along watercourses among limestone boulders on the Likiang Snow Range. It has oval dark-green leaves, grayish beneath, and red and yellow fruits the size of bullets."

56343. PYRUS sp.

"(No. 6763. October, 1922.) A tree 40 feet high from the Likiang Snow Range, where it grows at an altitude of 14,000 feet. The large oblong, coarsely toothed leaves are dull green above and white beneath, and the small globose yellow fruits, the size of bullets, are in corymbs."

56344. PYRUS sp.

"(No. 6765. October, 1922.) A wild pear which grows on the road from Ashi to the Yangtze River, Likiang Snow Range, at an altitude of 10,000 feet. It is a tree 30 feet high, with large smooth dark-green leaves and fruits $2\frac{1}{2}$ inches in diameter, yellow, with small russet rings and spots."

56345. PYRUS sp.

"(No. 6766. October, 1922.) A tree 30 feet high, with small crimson fruits, found along stream beds among limestone boulders on the Likiang Snow Range north of Nguluken, at an altitude of 10,000 feet."

56346. PYRUS sp.

"(No. 6767. Likiang. October, 1922.)" Seeds of a domesticated pear.

56347. PYRUS sp.

"(No. 6823. Chinho. October, 1922.) A wild pear collected two days' travel south of Likiang, where it grows as a tree 30 to 40 feet in height, with oval-elliptic leaves and small, spotted, russet-brown fruits the size of bullets. This is used as a stock plant."

56348 to 56354. QUERCUS spp. Fagaceæ. Oak.

56348. QUERCUS sp.

"(No. 6748. October, 1922.) An oak tree 30 to 40 feet high, found in the forest on the road to Ashi north of Likiang at an altitude of 12,000 feet. The leaves are large, obovate, and coarsely toothed; the acorns are not bitter."

56349. QUERCUS sp.

"(No. 6794. Ashi. October, 1922.) A tree 50 feet tall, with a trunk 3 feet in diameter, found on the Likiang Snow Range in dry regions near the Yangtze River at an altitude of 9,000 feet. The small pale-green leaves are obovate, and the small acorns have papery involucre."

56350. QUERCUS sp.

"(No. 6817. October, 1922.) A tree 50 to 60 feet tall, from the western slopes of the Likiang Snow Range on the road from Ashi to the Yangtze River, at an altitude of 11,000 feet. It has large sessile, oblong-oval lacinate leaves and small edible sweet acorns."

56288 to 56386—Continued.

56351. QUERCUS sp.

"(No. 6822. November 30, 1922.) A tree 30 to 40 feet high, which grows on the Salwin Ridge at an altitude of 8,000 feet. The leaves are dark glossy green, and the obovoid bitter acorns are in spikes several inches long."

56352. QUERCUS sp.

"(No. 7004. Kuyung. November, 1922.) A tall tree, 70 to 80 feet in height, with trunks 3 to 4 feet in diameter, which grows in sandy soil in the mountains north of Tengyueh, at an altitude of 7,500 feet. The numerous acorns are borne in dense spikes 5 or 6 inches long, the involucre inclosing the acorn."

56353. QUERCUS sp.

"(No. 7005. Kuyung. November, 1922.) Very similar to the preceding [S. P. I. No. 56352], except that the acorns are inclosed in a truncate involucre. The tree, 70 to 80 feet tall with trunks 3 to 4 feet in diameter, grows in sandy soil in the mountains north of Tengyueh at an altitude of 7,500 feet."

56354. QUERCUS sp.

"(No. 7009. Kuyung. November, 1922.) A tall tree 70 to 80 feet in height, with large straight trunks 3 or 4 feet in diameter, which grows in the mountains north of Tengyueh at an altitude of 7,000 to 8,000 feet. The acorns are inclosed in conical involucre and are borne in stout, densely packed spikes."

56355 to 56364. RHODODENDRON spp. Ericaceæ.

56355. RHODODENDRON DELAVAYI Franch.

"(Nos. 3012 and 6743. November 27, 1922.) A small tree 15 to 20 feet or more in height, common throughout Yunnan; these seeds were collected on the Salwin-Shwell watershed at an altitude of 8,000 feet. The stiff, spreading narrow leaves are brownish beneath, and the crimson flowers are in large terminal heads."

56356. RHODODENDRON FORTUNEI Lindl.

"(No. 6829. October, 1922.) A shrub or small tree 15 to 20 feet in height, with a trunk a foot in diameter, which grows on the Likiang Snow Range at altitudes of 9,000 to 11,000 feet. The leaves are large and smooth and the large, exceedingly handsome, fragrant light-pink flowers are in large terminal clusters."

56357. RHODODENDRON HELIOLEPIS Franch.

"(No. 6828. October, 1922.) A beautiful compact shrub 10 to 15 feet high, which grows on the edge of alpine meadows in large groves at an altitude of 12,500 feet. In early spring the plant is one mass of flowers; these are lavender with the lower lip purple spotted."

56358. RHODODENDRON TALIENSE Franch.

"(No. 6832. October, 1922.) A shrub 15 feet high, which grows on the upper slopes of the Likiang Snow Range at altitudes of 15,000 to 15,500 feet among limestone boulders. The leaves are large and whitish mealy beneath, and the large light-pink flowers are in terminal clusters."

56359. RHODODENDRON sp.

An unlabeled packet of rhododendron seeds.

56288 to 56386—Continued.

56360. RHODODENDRON sp.

"(No. 6744. November 28, 1922.) A shrub or small tree which grows on the summit of the Salwin Ridge (Shweli-Salwin Divide) at altitudes of 10,000 to 11,000 feet, in a forest one stage from Chiangso. The pale-green oblong leaves are whitish beneath, and the flowers, which vary from pink to red, are terminal. The fruits are black and hairy."

56361. RHODODENDRON sp.

"(No. 6745. Hsuehshanting. November 28, 1922.) A shrub 5 to 10 feet high, dense brownish woolly throughout, which is not uncommon on the summit of the Salwin-Shweli watershed at altitudes of 8,000 to 10,000 feet. The flowers are red and are borne at the ends of the branches."

56362. RHODODENDRON sp.

"(No. 6826. October, 1922.) A very handsome shrub 10 to 12 feet high, which occurs on the edge of alpine meadows on the Likiang Snow Range at altitudes of 14,000 to 15,000 feet. The leaves are small and elliptical, and the rich purple flowers an inch and a half wide are in terminal clusters."

56363. RHODODENDRON sp.

"(No. 6827. October, 1922.) A shrub 6 to 10 feet high, found among limestone boulders on the Likiang Snow Range at an altitude of 11,000 feet. The leaves are small and elliptical, white beneath when young, and the flowers, pink with spotted red lower lips, are in terminal clusters."

56364. RHODODENDRON sp.

"(No. 6830. October, 1922.) A shrub 2 feet high, found in rather dry situations in pine forests on the Likiang Snow Range at an altitude of 11,000 feet. It has small elliptical leaves and small but handsome bluish purple flowers."

56365 and 56366. RIBES spp. Grossulariaceæ.

56365. RIBES sp. Currant.

"(No. 6778. October, 1922.) A shrub 5 feet high, with mapelike leaves and long drooping racemes of large oval carmine fruits which are edible, with a sweet acid flavor. This shrub grows on the Likiang Snow Range at an altitude of 15,000 feet."

56366. RIBES sp.

"(No. 6780. October, 1922.) A shrub 4 feet high which grows on the Likiang Snow Range at an altitude of 15,000 feet. The leaves are small and mapelike, and the small oval black fruits, crowned by the persistent calyx, are insipid."

56367 and 56368. ROSA spp. Rosaceæ. Rose.

56367. ROSA sp.

"(No. 6747. November, 1922.) A handsome climbing shrub 16 or 18 feet high, from the Likiang Snow Range at an altitude of 11,000 feet, near Yulungtsuin. The white flowers are 2 inches across and the fruits are oval and red."

56368. ROSA sp.

"(No. 6795. October, 1922.) A shrub 8 feet high, with small white flowers and round red fruits, found along water-courses back of Ngulukeu on the Likiang Snow Range at altitudes of 9,000 to 10,000 feet."

56288 to 56386—Continued.

56369. RUBUS LUTESCENS Franch.

"(No. 6749. October, 1922.) This is perhaps the best raspberry of the Likiang Snow Range, where it grows as a small shrub a foot or two high on the western slopes at an altitude of 15,000 feet. The leaves are small and the large deep orange-yellow berries are sweet and very delicious."

56370. SCHIZANDRA AXILLARIS (Blume) Hook. f. and Thoms. Magnoliaceæ.

"(No. 6825. October, 1922.) An ornamental climber which occurs in fir forests on the Likiang Snow Range at altitudes of 11,500 to 12,000 feet. The axillary flowers are magenta in color."

56371 and 56372. SMILAX spp. Smilacaceæ. Smilax.

56371. SMILAX sp.

"(No. 6746. November 29, 1922.) A handsome, climbing, thorny shrub which grows on the Shweli-Salwin Divide, in open scrub forest at altitudes of 6,000 to 7,000 feet. The leaves are small and oval and the berries scarlet."

56372. SMILAX sp.

"(No. 6808. October, 1922.) An attractive climber which occurs in fir forests on dry slopes among pines on the Likiang Snow Range at an altitude of 10,000 feet."

56373 to 56376. SORBUS spp. Malaceæ. Mountain ash.

56373. SORBUS sp.

"(No. 6775. October, 1922.) An ornamental tree 25 feet high, with small pinnate leaves, which grows on the road from Ashi to the Yangtze River, Likiang Snow Range, at an altitude of 10,000 feet. The white fruits are in large clusters."

56374. SORBUS sp.

"(No. 6776. October, 1922.) An ornamental tree 25 to 30 feet high, with large pinnate leaves, which grows on the road from Ashi to the Yangtze River, Likiang Snow Range, at altitudes of 10,000 to 11,000 feet. The white fruits are in large clusters."

56375. SORBUS sp.

"(No. 6779. October, 1922.) A shrub 15 or 16 feet high, found on the Likiang Snow Range at an altitude of about 12,000 feet. The leaves are narrowly pinnate, and the red fruits are in large clusters."

56376. SORBUS sp.

"(No. 6785. October, 1922.) A tree 20 feet in height which grows in forests of *Abies forrestii* on the Likiang Snow Range at an altitude of 12,000 feet. It is very ornamental because of the large clusters of round red berries."

56377. TILIA sp. Tiliaceæ.

"(No. 6801. October, 1922.) A tree 35 to 40 feet high, with large heart-shaped leaves and fragrant flowers, found along water-courses among limestone boulders on the Likiang Snow Range at an altitude of 11,000 to 12,000 feet."

56378. VACCINIUM sp. Vacciniaceæ.

"(No. 6796. October, 1922.) A bushy shrub 2 to 3 feet high, found under pine trees on the Likiang Snow Range at an altitude of 10,000 to 11,000 feet. The small black berries are edible."

56288 to 56386—Continued.

56379 to 56385. *VIBURNUM* spp. Caprifoliaceæ.

56379. *VIBURNUM* sp.

"(No. 6770. October, 1922.) A handsome shrub 15 feet high from alpine meadows and steep slopes of the Likiang Snow Range, where it grows at an altitude of 12,500 feet. It has small wedge-shaped leaves and large corymbs of crimson or carmine berries."

56380. *VIBURNUM* sp.

"(No. 6771. October, 1922.) A very attractive shrub 4 feet in height with maplelike leaves, found growing among limestone boulders in the Likiang Snow Range at an altitude of 15,000 feet. The oval crimson berries are in loose panicles."

56381. *VIBURNUM* sp.

"(No. 6772. October, 1922.) A handsome shrub or small tree 15 feet high, with smooth oval leaves and small drooping clusters of scarlet berries, found on the slopes of the Likiang Snow Range at an altitude of 12,000 feet."

56382. *VIBURNUM* sp.

"(No. 6773. October, 1922.) A shrub 4 or 5 feet high which grows on the eastern end of the Likiang Plain among limestone rocks, at an altitude of 10,000 feet. It has small hairy oval leaves and large drooping panicles of rich carmine berries."

56383. *VIBURNUM* sp.

"(No. 6774. October, 1922.) An attractive shrub 6 to 10 feet high, with large hairy, broadly oval leaves and large clusters of carmine-crimson berries. It grows in alpine meadows on the Likiang Snow Range at an altitude of 11,000 feet."

56384. *VIBURNUM* sp.

"(No. 6786. October, 1922.) A tall shrub 12 to 15 feet in height, which grows at an altitude of 12,000 to 13,000 feet on the Likiang Snow Range. The leaves are smooth and uniformly green, and the crimson berries are in large terminal corymbs."

56385. *VIBURNUM* sp.

"(No. 6820. November 30, 1922.) An exceedingly handsome shrub 20 feet tall, with large oval leaves and huge terminal clusters of large transparent scarlet berries, found on the summit of the Salwin Ridge at an altitude of 8,000 feet. The juice is used by the natives in pickling turnip leaves."

56386. (Undetermined.)

"(No. 6831. October, 1922.) A handsome tree 15 to 20 feet high, which grows on the western slopes of the Likiang Snow Range at an altitude of 11,000 feet. The large oblong leaves are brownish woolly beneath, and the deep pink or red flowers are in large corymbs."

56387. *MEIBOMIA* sp. Fabaceæ.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received February 7, 1923.

"(No. 6783. October, 1922.) An ornamental bush 10 feet high, with very attractive deep pink flowers, found on the western and eastern slopes of the Likiang Snow Range at an altitude of 10,000 feet."

56388. *FESTUCA OVINA* NOVO-ZELANDIAE Hack. Poaceæ.

Fescue tussock grass.

From Stanley, Falkland Islands. Seeds presented by the Colonial Secretary. Received January 18, 1923.

Introduced for testing as a forage plant.

A densely tufted perennial grass with culms 12 to 20 inches high and erect, very narrow, cylindric, sharply pointed rough leaves almost as long as the culms. This grass is native to North Island, New Zealand. (Adapted from *Cheeseman, Manual of the New Zealand Flora*, p. 917.)

56389. *DIOSPYROS KAKI* L. f. *Diospyraceæ*. **Kaki.**

From Yokohama, Japan. Seeds purchased from the Yokohama Nursery Co. Received February 12, 1923.

A semiwild variety with a long pointed fruit used by Japanese nurserymen as a stock plant on which to graft the cultivated kakis.

56390 to 56398.

From China. Seeds presented by C. A. Reed, Bureau of Plant Industry. Received January 10, 1923. Quoted notes by Mr. Reed, unless otherwise stated.

56390. *ÆSCULUS WILSONI* Rehder. *Æsculaceæ*. **Horsechestnut.**

"(No. 22c. Peking.) Obtained from J. Hers, secretary general, Lunghai Railway Co."

A horsechestnut native to Szechwan and Hupeh, China, which is very closely allied to *Æsculus chinensis*, from which it differs only in a few minor characters. It is a large tree with leaves which are downy when young and white flowers borne in racemes which sometimes become 16 inches in length. The burs are rough but not spiny.

56391. *ARACHIS HYPOGAEA* L. Fabaceæ. **Peanut.**

"(No. 45gc. Hangchow, Chekiang.) Typical specimens obtained in the market."

56392 to 56397. *CASTANEA MOLLISSIMA* Blume. Fabaceæ. **Chestnut.**

56392. "(No. 17c. Hsinchuang, Chihli.) Nuts obtained from wild trees growing about 32 li (about 9 miles) north of the Ming tombs, among walnut trees of various species. The nuts are of fair size and quality, although not equal to those of S. P. I. No. 56397 from the Lanchow-Changli district, Chihli."

56393. "(No. 18c. Anshan, Chihli. October, 1922.) Nuts obtained on the streets of Anshan, a railroad station between Lanchow and Changli; perhaps originally from north of Lanchow. There are many orchards containing a hundred trees or more about a day's travel north of Lanchow."

56394. "(No. 20c. Tsinan, Shantung.) Typical nuts obtained in the market; probably grown in a chestnut district 15 or 20 miles north of Tsinan."

56395. "(No. 21c. Yihhsien, Shantung.) Typical nuts purchased on the streets."

56396. "(No. 34c. Shihkiachwang, Chihli.) Typical specimens from the market."

56397. "(Nos. 58c and 59c. Vanchiachuan, near Gupu, in the Lanchow-Changli district. October 15, 1922.)

A PROMISING CHESTNUT FROM NORTHERN CHINA. (*CASTANEA MOLLISSIMA* BLUME; S. P. I. NO. 56397)

The rapidly progressing destruction of native American chestnut forests by blight has focused the attention of horticulturists upon this Chinese species, which has already shown its adaptability to climatic and soil conditions in this country as well as a remarkable degree of resistance to the disease. It is promising not only as a source of tannin but also for its edible nuts, which are nearly as large and as good as those of the native American chestnut. The attention of the Department of Agriculture was first directed to this species by the late Frank N. Meyer, Agricultural Explorer. (Photographed by C. A. Reed, Vanchiachuan, Chihli, China, September 7, 1922; P3689FS)

PREPARING WALNUTS IN CHINA FOR EXPORT. (JUGLANS REGIA L.; S. P. I. No. 56418)

According to an estimate made by an official of the United States Department of Commerce, more than 8,000 tons of walnuts were produced in northern China during the year 1921. While less than half this quantity was exported to other countries, the rapid improvement of transportation facilities is almost certain to give an immense stimulus to this industry in China. Few orchards have as yet been planted, however; the bulk of the crop is harvested from scattered trees. The illustration shows the nuts being sun dried in the market place of Wullput, Shantung Province. (Photographed by C. A. Reed, September 15, 1922; P36739Fs)

56390 to 56398—Continued.

A large tree with decidedly sweet nuts."

For an illustration of this chestnut, see Plate III.

56398. *CHAETOCLOA ITALICA* (L.) Scribn. Poaceæ. (*Setaria italica* Beauv.) Millet.

"(No. 60c. Peking, Chihli.) Millet forms one of the most important cereal foods of the natives of northern China. I consider it delightful as a breakfast food, although among the Chinese it is classed with sweet potatoes as 'coolie food.' There are many varieties ranging in height up to 3 or 4 or even 6 feet, and there are said to be two distinct groups, the ordinary kind and the glutinous kind."

56399 and 56400.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Gardens. Received January 8, 1923.

56399. *ACER STERCULIACEUM* Wall. Aceraceæ. (*A. villosum* Wall.) Maple.

A handsome tree with gray bark, native to the northwestern parts of the Himalayas at altitudes of 7,000 to 9,000 feet. It sometimes reaches a height of 80 feet. The thin shining-green leaves are occasionally used for fodder, and the white close-grained wood is beautifully mottled.

56400. *BETULA UTILIS* D. Don. Betulaceæ. (*B. bhojpattri* Wall.) Birch.

A tree about 60 feet in height, with creamy white trunk and branches and bark which peels off in papery flakes. It is native to subtropical regions of the Himalayas. The oval, coarsely toothed, sharp-pointed leaves are dark green above and paler beneath, and 3 inches long. In winter the orange-chocolate color of the twigs is very striking.

56401 to 56437.

From China. Seeds presented by C. A. Reed, Bureau of Plant Industry. Received January 10, 1923. Quoted notes by Mr. Reed, unless otherwise stated.

56401 to 56403. *CORYLUS* spp. Betulaceæ. Filbert.

56401. *CORYLUS* sp.

"(No. 34ac. Shihkiachwang, Chihli.) Typical nuts from the market, said to have come from trees growing 100 miles south of the town."

56402. *CORYLUS* sp.

"(No. 45fc. Hangchow, Chekiang.) Nuts bought in the local market, but evidently brought from some distance, presumably western China."

56403. *CORYLUS* sp.

"(No. 65c. Hwailai, Chihli.) Nuts collected from wild plants growing along the mountainous roadway southeast of the Trappist Monastery."

56404. *HOLCUS SORGHUM* L. Poaceæ. (*Sorghum vulgare* Pers.) Sorghum.

"(No. 42c. Taiyuan, Shansi.) Typical specimens from the market."

56405 to 56426. *JUGLANS* spp. Juglandaceæ.

56405 to 56408. *JUGLANS MANDSHURICA* Maxim. Manchurian walnut.

56405. "(No. 10c. Nankow Pass, near Nankow, Chihli.) Obtained through J. Hers, of Peking. An uncultivated species with small thick-shelled nuts, not valued very highly by the natives. None of the

56401 to 56437—Continued.

trees were of large size, 30 feet being the maximum height, with an average height of less than 20 feet. In habit this species resembles *Juglans sieboldiana*."

56406. "(No. 19c. Hsinghuang, Chihli. August, 1922.) Collected in a valley north of the Ming tombs."

56407. "(No. 45ac. Nanking, Kiangsu.) Nuts taken from a tree near the residence of the president of the University of Nanking. The nuts of this species are known here as 'butternuts,' as they are also throughout Chosen and Manchuria."

56408. "(No. 63c. Hwailai, Chihli.) Nuts obtained from wild trees growing southeast of the Trappist Monastery not far from the Great Wall of China."

56409 to 56425. *JUGLANS REGIA* L. Walnut.

56409. "(Nos. 1c, 3c, 4c, 5c, 53c, and 54c. Hwailai, Chihli.) Nuts obtained from thrifty seedling trees in the vicinity of the Trappist Monastery. This place, which has an altitude of about 2,500 feet, is near the northernmost limit at which Persian walnuts are found in China. With these walnut trees were apricots, plums, pears, and peaches."

56410. "(No. 2c. Pienshih, Shansi.) Nuts obtained from a farmer living near Pienshih, a half day's travel west of Fenchow. This is an arid mountainous region with loess soil, subject to severe winters with little precipitation. The temperature falls gradually in the autumn, however, and rises gradually in the spring, which may account for the successful raising of walnuts here and in other parts of northern China."

56411. "(No. 6c. Yihsien, Shantung. October 15, 1922.) Nuts from a young seedling tree in the garden of K. M. Gordon. These nuts ripened on the tree and are of good quality. Usually the walnut crop of China is clubbed from the trees two to five weeks before ripening and the nuts covered with straw and left to sweat and wilt for a period of five to eight days. The hulls are then removed, the nuts superficially cured and then placed on the market."

56412. "(No. 7c. Tsinghua, Honan.) Nuts selected in the market by J. L. Buck, of the University of Nanking, as being typical for that locality."

56413. "(No. 8c. Sinsiang, Honan.) Nuts selected by J. L. Buck, of the University of Nanking, as being typical for that locality."

56414. "(No. 9c. Peking.) From the curio stands on Hattamen Street. Nuts large, very rough, with exceedingly thick, hard shells."

56415. "(No. 11c. Tsingchow, Shantung.) Nuts with very hard shells, purchased in the market and said to have come originally from western China."

56416. "(No. 12c. Tsinan, Shantung.) Typical nuts from the market."

56401 to 56437—Continued.

56417. "(No. 13c. Yih sien, Shantung.) Typical nuts from the market."

56418. "(No. 14c. Wulipu, Shantung.) Typical nuts from the market of this town, which is about 1½ miles southwest of Tsingchow."

For an illustration of this, see Plate IV.

56419. "(No. 15c. Shangyen, Shantung.) Typical nuts from the market."

56420. "(No. 16c. Tsingchow, Shantung. September 15, 1922.) Typical nuts from an orchard about 2½ miles southwest of Tsingchow."

56421. "(No. 39c. Fenchow, Shansi.) Typical nuts from a nut-cracking establishment."

56422. "(Nos. 52c and 55c. Hsin-chuang, Chihli.) Large, rough, thick-shelled nuts from wild trees."

56423. "(No. 56c.) Exact source for these nuts in China not known."

56424. "(No. 57c. Tsinan, Shantung.) Typical nuts from the market."

56425. "(No. 64c.) Exact source for these nuts in China not known."

56426. JUGLANS sp. Walnut.

"(Nos. 47c, 48c, 50c, and 51c. Hsin-chuang, Chihli.) Local types of walnuts."

56427. LENTILLA LENS (L.) W. F. Wight. Fabaceae. (*Lens esculenta* Moench.) Lentil.

"(No. 25c. Yih sien, Shantung.) Lentil seeds obtained in the market."

56428. PHASEOLUS AUREUS Roxb. Fabaceae. Mung bean.

"(No. 31c. Yih sien, Shantung.) Purchased on the streets."

56429. PINUS BUNGEANA Zucc. Pinaceae. White-barked pine.

"(Nos. 40c and 49c. Shansi.) Seeds from a planted forest east of Pingting. The erect, slender trees were not more than 20 or 25 feet tall. The wood was found to be very brittle."

56430 to 56434. SOJA MAX (L.) Piper. Fabaceae. (*Glycine hispida* Maxim.) Soybean.

56430 and 56431. ("Nos. 28c and 29c. Yih sien, Shantung.) Bought on the street."

56430. Yellow beans.

56431. Black beans.

56432 and 56433. ("Nos. 37c and 38c. Taiyuan, Shansi.) From the market."

56432. Big roundish yellow beans.

56433. Black beans.

56434. "(No. 43c. Taiyuan, Shansi.) From the market."

Green roundish beans.

56435 to 56437. VIGNA SINENSIS (Tornei) Savi. Fabaceae. Cowpea.

56435. ("No. 26c. Yih sien, Shantung.) From the market."

Red string beans.

56436. "(No. 30c. Yih sien, Shantung.) From the market."

White string beans.

56401 to 56437—Continued.

56437. "(No. 41c. Taiyuan, Shansi.) From the market."
Pinkish beans.

56438. WASABIA PUNGENS Mats. Brassicaceae. (*Eutrema wasabi* Maxim.)

From Yokohama, Japan. Plants purchased from the Yokohama Nursery Co. Received February 5, 1923.

A Japanese perennial belonging to the mustard family, with large bright-green, heart-shaped, long-stemmed leaves and white flowers borne in clusters on a flowering stalk over 3 feet in height. The long roots are about an inch in diameter, grayish, with many knots. In the humid valleys in Japan this plant is often spontaneous and is much cultivated on the banks of little streams near dwellings. The grafted roots are used in the same manner as ordinary horse-radish and by many are considered to be superior in all ways. (Adapted from *Vilmorin-Andrieux & Co., Les Plantes Potagères*, p. 646.)

For previous introduction, see S. P. I. No. 41567.

56439. CASTANEA sp. Fagaceae. Chestnut.

From Lancaster, Pa. Nuts presented by J. F. Jones. Received February 3, 1923.

"Nuts sent to me by the Kinshan Arboretum, near Shanghai, China. I do not know where they were originally collected." (Jones.)

56440. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Milan, Italy. Seeds purchased from Fratelli Ingegnoli. Received February 19, 1923.

"This clover was grown in clay soil in dry regions in the mountains of central Italy at an altitude of about 1,300 feet, where the climate is hot and the rains infrequent. Olives are grown in the same regions." (Fratelli Ingegnoli.)

56441. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Budapest, Hungary. Seeds purchased from the Hungarian Seed Culture Co. Received February 10, 1923.

Locally grown Hungarian red-clover seed introduced for department specialists engaged in clover-breeding experiments.

56442 to 56444.

From Ibarra, Ecuador. Seeds presented by José Felix Tamayo. Received February 10, 1923. Quoted notes by Señor Tamayo.

56442 and 56443. PHASEOLUS spp. Fabaceae.

56442. PHASEOLUS COCCINEUS L. Scarlet Runner bean.

"A wild perennial climber with brown beans which grows here in Ibarra and in the Chota Valley."

56443. PHASEOLUS LUNATUS L. Lima bean.

"Perennial climbing plants which grow at altitudes of 5,000 to 8,000 feet in arid or semiarid places where there is an abundant supply of water available."

56444. VIGNA SINENSIS (Tornei) Savi. Fabaceae. Cowpea.

"A small wild annual, said to be of bushy habit, from the hot humid region in the lower part of the Rio Mira, where the beans are eaten by the natives."

56445. HYDNOCARPUS ALPINA Wight.
Flacourtiaceae.

From Orleans, France. Seeds presented by Edmond Versin, St. Jean le Blanc. Received January 18, 1923.

Introduced for study because of its close relationship to *Taraktogenos kurzii*, the source of the genuine chaulmoogra oil.

A large tree 70 to 100 feet in height, with very variable leaves (red when young and deep green when old), up to 7 inches in length and $2\frac{1}{2}$ inches in width, and dioecious flowers in axillary racemes. The fruit is globose, about the size of an apple, with a brown hairy surface. The seeds yield an oil which is used as fuel, and the wood is employed for general carpentry. The tree is native to the Nilghiri Hills in southern India. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 4, p. 303, and *Hooker, Flora of British India*, vol. 1, p. 197.)

56446 to 56449.

From Cuenca, Ecuador. Seeds presented by Dr. Federico Malo. Received February 9, 1923. Quoted notes by Doctor Malo.

56446. MEDICAGO SATIVA L. Fabaceae. Alfalfa.

"(Guanando, Province of Chimborazo. November, 1922.) A celebrated variety."

56447 to 56449. ZEA MAYS L. Poaceae. Corn.

56447. "(Vicinity of Valle, Province of Azuay.) *Maiz blanco*, the largest and best variety of this region."

56448. "*Maiz jesuita*. A variety of the quality of *Maiz blanco*, but with pink kernels. From this the natives make 'mote,' the best one of their favorite dishes."

56449. "(Azogues, Province of Canar, and Province of Azuay. December, 1922.) *Maiz zhima*, a very resistant variety with pearl-colored kernels."

56450 and 56451.

From Elstree, Herts, England. Seed presented by Vicary Gibbs, Aldenham House Gardens. Received February 8, 1923.

56450. COTONEASTER FRIGIDA Wall. Malaceae.

Variety *vicarii*. This is an improved form with deep-green leaves, grayish beneath, and large clusters of rich-red berries which are larger and brighter than those of the typical species.

56451. PYRACANTHA GIBBSII A. Jackson. Malaceae. Firethorn.

A fine ornamental evergreen bush, vigorous and hardy, native to Hupeh and Szechwan, China. It becomes 12 to 14 feet high, is nearly spineless, and in the autumn bears large clusters of scarlet berries which contrast admirably with the glossy dark-green foliage.

For previous introduction, see S. P. I. No. 52938.

56452. CASSIA BREWSTERI F. Muell.
Caesalpinaceae.

From Brisbane, Queensland. Seeds presented by E. W. Bick, curator, Brisbane Botanic Gardens. Received February 14, 1923.

A shrub or small tree found in hilly pastures and on river banks in northern Queensland. It becomes 30 or 40 feet high and bears yellow flowers in axillary clusters 3 to 6 inches long. The thick pods are often a foot in length. The pale-yellow close-grained wood is prettily marked. (Adapted from *Bailey, Queensland Flora*, pt. 2, p. 455.)

56453 to 56456. ACER spp. **Acera-Maple.**

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Gardens. Received January 8, 1923.

56453. ACER CAUDATUM Wall.

A large tree with dark-gray bark and 5-lobed red-stemmed leaves $2\frac{1}{2}$ to 5 inches long. The shiny, compact, moderately hard wood is white with a faint pink tinge. This maple is found in the temperate Himalayas at altitudes of 7,000 to 11,000 feet.

56454. ACER HOOKERI Miquel.

A tree 40 to 50 feet high with deeply fissured brown bark, native to the Sikkim Himalayas at altitudes of 8,000 to 10,000 feet. The oval leaves are not lobed and, though usually green, are sometimes copper colored. The wood is gray, with small pores and very numerous fine red medullary rays.

For previous introduction, see S. P. I. No. 47630.

56455. ACER PECTINATUM Wall.

A small maple closely related to *Acer caudatum*, from which it differs chiefly in foliage characters. It is common in the Sikkim Himalayas at altitudes of 8,000 to 12,000 feet.

56456. ACER SIKKIMENSE Miquel.

A small tree with thin gray bark, native to the eastern temperate Himalayas at altitudes of 7,000 to 9,000 feet. The leaves are undivided and up to 6 inches in length. The wood is a shining gray with distinct annual rings, with numerous fine medullary rays.

56457. DENDROCALAMUS SIKKIMENSIS Gamble. Poaceae. **Bamboo.**

From Sibpur, Calcutta, India. Seeds obtained from the Royal Botanic Garden, Sibpur, and presented by E. M. Ehrhorn, Division of Plant Inspection, Honolulu, Hawaii. Received January 17, 1923.

A beautiful tufted bamboo native to Sikkim, India, where the dark-green culms reach a height of 60 feet or more and a diameter of 5 to 7 inches. The species is easily distinguished by its large reddish brown, globular flower heads and densely velvety stem sheath. The long narrow leaves are said to be poisonous, and from the stems are made the "chunga," or native buckets, used for carrying water and milk and for churning. (Adapted from *Annals of the Royal Botanic Garden*, vol. 7, p. 82.)

For previous introduction, see S. P. I. No. 55815.

56458. TRIFOLIUM JOHNSTONI Oliver. Fabaceae. **Clover.**

From Kilossa, Tanganyika Territory, East Africa. Seeds presented by Capt. Charles M. F. Swynnerton, Kilossa, through Dr. H. L. Shantz, Bureau of Plant Industry. Received January 17, 1923.

"At high altitudes in East Africa clover is one of the prominent forage plants. It grows where the temperature probably never exceeds 85° F. and where for the greater part of the year it is much below this point. However, no frosts occur in the region." (*Shantz*.)

A smooth perennial clover with the habit of white clover (*Trifolium repens*), found at an altitude of 10,000 feet on Kilimanjaro, Tanganyika Territory. The leaves are long stemmed, with membranous leaflets and globose flower heads about an inch in diameter. (Adapted from *Transactions of the Linnean Society*, 2d ser., vol. 2, p. 331.)

56459 and 56460. MALUS spp. Malaceæ. Apple.

From western Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 18, 1923. Quoted notes by Mr. Rock.

56459. *MALUS* sp.

"(No. 6724. November 9, 1922.) A wild apple tree 30 feet high, with wide-spreading branches, found in sandy soil along water-courses between Tsinchi and Chansi on the Tengyueh-Sadon Trail, at an altitude of 6,500 feet. The very numerous dark-carmine long-stemmed fruits are the size of small cherries."

56460. *MALUS* sp.

"(No. 6734. November 12, 1922.) A wild apple tree 25 feet high, with long whiplike ascending branches, found in sandy loam on the hills back of Mengka at an altitude of 5,700 feet. The dark-carmine fruits are half an inch in diameter."

56461. CASTANOPSIS ARGENTEA (Blume) A. DC. Fagaceæ. Chestnut.

From Buitenzorg, Java. Seeds presented by Carl Hartley. Received January 18, 1923.

"Seeds of this edible chestnut were collected in western Java." (Hartley.)

An evergreen tree 50 to 60 feet high, with narrow thin leaves 5 to 7 inches long and very dense clusters of spiny burs; each bur is about 2 inches wide and contains normally a single nut an inch in diameter.

For previous introduction, see S. P. I. No. 55811.

56462. DATURA INNOXIA Mill. Solanaceæ.

From San Luis Potosi, S. L. P., Mexico. Seeds purchased through Walter F. Boyle, American consul. Received January 18, 1923.

Introduced for the use of specialists studying the genus *Datura*.

A plant with a purplish stem 3 to 4 feet high, with several strong branches and oblong heart-shaped leaves. The large erect, axillary white flowers are succeeded by oval fruits which are covered with long, soft, harmless spines. (Adapted from *Journal of the Washington Academy of Sciences*, vol. 11, p. 179.)

56463. EUTERPE EDULIS Mart. Phœnicaceæ. Palm.

From Georgetown, Demerara, British Guiana. Seeds presented by R. Ward, superintendent, Botanic Gardens, through Dr. B. E. Dahlgren, of the Field Museum, Chicago, Ill. Received January 18, 1923.

A shade-loving palm with a slender, generally inclined trunk 30 to 40 feet in height and edible fruits about the size of marbles. The inhabitants of Para, Brazil, where this palm is native, prepare a nutritious beverage from the thin coating of fibrous flesh surrounding the seed.

56464 to 56471. SACCHARUM OFFICINARUM L. Poaceæ. Sugarcane.

From Georgetown, Demerara, British Guiana. Seeds presented by James Crabtree, superintendent, British Guiana Sugar-Planters' Experiment Station. Received January 19, 1923. Quoted notes by Mr. Crabtree.

"All of the following varieties grow strongly here and do not appear to suffer from any disease, except leaf spots on the Java seedlings. I have never seen any evidence of mosaic disease on them. These are not regarded as good commercial varieties here. The minimum temperature in the sugar belt is 70° F."

56464 to 56471—Continued.

56464. *Java* 139.

56465. *Java* 238.

"The three following varieties are very closely similar."

56466. *Bamboo*.

56467. *Uba*.

For previous introduction, see S. P. I. No. 41154.

56468. *Zwinga*.

"The following thin purple canes are probably Indian; they produce fertile seeds and the seedlings resemble the parent fairly closely."

56469. *Brekeret*.

56470. *Kamba Kamba Sati*.

56471. *Kara Kara Wa*.

56472 to 56477.

From Yunnan, China. Collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 24, 1923. Quoted notes by Mr. Rock.

56472. *CASTANOPSIS* sp. Fagaceæ. Chestnut.

"(No. 6729. Mengka. October 12, 1922.) Seeds of a tree 50 to 60 feet high, which grows in the mountains at an altitude of 6,500 feet. The glossy glabrous leaves are ovate-acuminate and toothed near the apices, and the burs, an inch to an inch and a half in diameter, inclose two or three brown hairy nuts in each bur. The bur is quite similar to that of *Castanopsis armata*."

56473. *LIGUSTRUM* sp. Oleaceæ. Privet.

"(No. 7670. November 30, 1922.) Seeds of a small tree 20 to 60 feet high, found in dense forest on the Salwin Ridge at an altitude of 8,000 feet. This is evidently a very ornamental tree, judging by the large panicles, which bear numerous bluish black fruits."

56474 and 56475. *MALUS* spp. Malaceæ.

Apple.

56474. *MALUS* sp.

"(Puerhfu. December, 1922.) Seeds of a wild apple tree which grows in the hills at an altitude of 6,000 feet. The small globose fruits are yellowish with a tinge of pink on the sun-exposed side. Obtained through Miss Clara Peterson, a missionary of Puerhfu."

56475. *MALUS* sp.

"(Puerhfu. December 6, 1922.) Seeds of a wild apple tree obtained from the hills at an altitude of 6,000 feet, by Miss Clara Peterson, a missionary of Puerhfu."

56476. *PYRUS* sp. Malaceæ.

Pear.

"(Szemao. December, 1922.) Seeds of a wild pear tree from the mountains; obtained through Miss Clara Peterson, a missionary of Puerhfu."

56477. *ROSA* sp. Rosaceæ.

Rose.

"(December 3, 1922.) Cuttings of a wild rose found in the valley of the Upper Salwin. It is very attractive with thousands of large white flowers, each 3 inches across, and could easily be trained on arbors. Strange to say, the flowers are double; perhaps it is a sport."

56478 to 56482. SACCHARUM OFFICINARUM L. Poaceæ. Sugarcane.

From Santiago de las Vegas, Cuba. Seeds presented by Dr. Mario Calvino, Estación Experimental Agronómica. Received January 25, 1923. Quoted notes by Doctor Calvino.

"All of these are good sugar-producing canes but are subject to yellow-stripe disease."

56478. "Cuba 450. Seedling of *Demerara 419*, obtained in 1917-1918."

56479. "Cuba 519. Seedling of *Demerara 99* obtained in 1918-1919."

56480. "Demerara 74."

56481. "Demerara 99."

56482. "Demerara 108."

56483 to 56487.

From Loanda, Angola, Africa. Seeds presented by John Gossweiler. Received January 30, 1923.

56483. *ASPARAGUS AFRICANUS* Lam. Con-vallariaceae.

"This asparagus is a great delicacy and in my opinion better than any of the cultivated kinds." (Sir Percy Fitzpatrick, in note under S. P. I. No. 32271.)

A much-branched tall shrub native to many places in tropical and South Africa. The main branches are woody, and the leaves are spiny at the base. The 1-seeded berries are a sixth of an inch in diameter. (Adapted from *Thiselton-Dyer, Flora of Tropical Africa*, vol. 7, p. 433.)

56484. *MELINIS MINUTIFLORA* Beauv. Poaceae. Molasses grass.

"John Morley, of Lake Alfred, Fla., informed me that the molasses grass (*Melinis minutiflora*) was so successful on his place that he is going to get a large quantity of seeds for the planting of a very considerable area of it. He said the trouble which other people who had tried to use this grass experienced was, apparently, that they did not keep it grazed or cut closely enough. When permitted to grow unmolested it is likely to get rank." (David Fairchild.)

For previous introduction, see S. P. I. No. 54680.

56485. *MUSA GILLETII* Wildem. Musaceae. Banana.

A close relative of the Abyssinian banana (*Musa ensata*), native to the vicinity of Kisantu, Belgian Congo. It is a plant up to 6½ feet high, with the lower leaves reaching a length of 5 feet and the upper leaves becoming smaller and smaller until they merge into the floral bracts. The fruits, 2 inches long, are oblong and somewhat pear shaped, with a grayish surface irregularly marked because of the prominence of the seeds. The powdery pulp incloses shiny black seeds. (Adapted from *Revue des Cultures Coloniales*, vol. 8, p. 102.)

56486. *RUMEX ABYSSINICUS* Jacq. Polygonaceae.

"This *Rumex* has proved a most interesting plant, reaching a height of from 7 to 8 feet in one season and yielding, from the first of June all through the summer, an abundance of succulent green leaves which make an excellent substitute for spinach. It promises to be an excellent plant for our Southern States where summer green-leaved vegetables are very scarce." (Peter Bisset.)

For previous introduction, see S. P. I. No. 48023.

56487. *NATHUSIA ALATA* Hochst. Oleaceae. (*Schrebera alata* Hochst.)

A tree of moderate size, native to Abyssinia and parts of British East Africa, with large compound leaves having winged stems and small white flowers, tinged with lilac, borne in lax terminal clusters. The timber is very hard.

56488 to 56494.

From China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received February 9, 1923. Quoted notes by Mr. Rock.

56488. *CASTANEA* sp. Fagaceae. Chestnut.

"(No. 6436. October, 1922.) A tall tree 60 to 70 feet high, with a trunk 3 to 4 feet in diameter, found wild in a dry district of the Shiku Valley, Yangtze River, two days' travel west of Likiang."

56489. *CASTANOPSIS* sp. Fagaceae.

"(No. 6739. November 29, 1922.) A fine tree 60 to 80 feet tall, with a straight trunk 2 to 3 feet in diameter, found in an oak and pine forest in the Shwell Valley, between Chiang-tso and Linchiapu, on the Shwell-Salwin watershed, two days' travel north of Teng-yueh at an altitude of about 7,000 feet. In this region at this time of the year there is frost every night.

"The slightly crenate leaves are oblong, silvery glaucous beneath and dark green above, and the small burs, with short thick spines, are in axillary spikes 4 or 5 inches long. The small nuts are at first brown, later becoming black, and they are sweet in taste."

56490. *CORYLUS* sp. Betulaceae. Filbert.

"(No. 6756. October, 1922.) A tree 50 feet high, with trunks 2 or 3 feet or more in diameter, found wild among limestone boulders and humus on the Likiang Snow Range at an altitude of 10,000 feet. The nuts are large and edible."

56491. *PYRUS* sp. Malaceae. Pear.

"(November, 1922.) A fine tree with a dense round crown from the mountains near Puerhu. The white flowers are borne in great profusion and the fruits remain for a long time on the tree, becoming black and sweet. This is the species used in southern Yunnan as a stock for the cultivated pears. Obtained through Miss Clara Peterson, of the Puerhu Mission."

56492. *QUERCUS* sp. Fagaceae. Oak.

"(No. 6818. October, 1922.) A tall tree 50 to 60 feet in height, from the western slopes of the Likiang Snow Range, on the road to the Yangtze River at an altitude of 11,000 feet. The leaves are lanceolate and entire and the acorns oblong."

56493. *ZIZIPHUS* sp. Rhamnaceae.

"(No. 6824. October, 1922.) A handsome spreading tree 30 feet high, with a round crown, found above Yangpi two days' travel from Talifu, at an altitude of 7,500 feet. The leaves are large, oval, and finely serrate, and the tree was loaded with olive-shaped drupes."

56494. (Undetermined.)

"(No. 6740. November 28, 1922.) *He ko* (black fruit tree). A tree 25 to 30 feet high with tall, spreading, drooping branches, which grows commonly on the trail to Chuchi, one day's journey northeast of Tengyueh. The tree was loaded with fleshy, bluish black 3-lobed capsular fruits; the one fertile lobe contained an oily, bitter seed. The fruits are gathered by the natives, dried, pressed, and heated, and an oil extracted which is used for lighting purposes."

56495 to 56498.

From Burringbar, New South Wales. Seeds presented by B. Harrison. Received February 7, 1923. Quoted notes by Mr. Harrison.

56495 to 56498—Continued.

56495. *ACACIA* sp. Mimosaceæ.

"The 'creeping wattle' is 4 or 5 feet high, growing in sandy soil near the sea. As the branches take root on the surface of the ground, this may prove of value as a sand binder."

56496. *AMARANTHUS* sp. Amaranthaceæ.

"A new 'Chinese spinach.'"

56497. *TIBOUCHINA* sp. Melastomaceæ.

"A splendid native pink-flowered shrub which grows to a height of 5 or 6 feet."

56498. *VIGNA CYLINDRICA* (Stickm.) Skeels. Fabaceæ. Catjang.

"Edible white Bechuana cowpea." This produces heavy crops on long runners."

56499 and 56500. *PERESKIA BLEO* (H. B. K.) DC. Cactaceæ. Cactus.

From Gatun, Canal Zone. Presented by J. A. Close. Received February 5, 1923.

"This cactus, which is also known under the name of *Pereskia panamensis*, is not uncommon in Panama and is also found in Colombia. In the city of Panama it is sometimes cultivated in the yards. It has large yellow flowers and peculiar truncated fruits. As a greenhouse plant it does well but rarely flowers." (J. N. Rose.)

56499. Cuttings.

56500. Fruits.

56501 to 56521.

From Simferopol, Crimea. Seeds presented by George Nikolaevich Visozki, professor of agronomy, Crimean Agricultural Institute, through Herbert Hoover, chairman, American Relief Administration. Received January 25, 1923. Quoted notes by Professor Visozki.

"These seeds were collected in 1922, mostly in the Koyash and Bodrac estates of the Crimean Agricultural Institute, in the southern part of the Crimea along the Boulganac Valley, 17 or 18 versts (about 12 miles) west of Simferopol. Some were collected on the virgin steppes of the Askania-Nova estate."

A collection of wild and cultivated grasses from the Crimea. Many are widely known species, but they are introduced for cultural and comparison tests with American-grown forms.

56501 and 56502. *AGROPYRON* spp. Poaceæ. Grass.56501. *AGROPYRON CRISTATUM* (L.) Gaertn.

"(Nos. 1 to 3.) A very good grass for dry regions. Native name *jitniak*."

For previous introduction, see S. P. I. No. 28306.

56502. *AGROPYRON INTERMEDIUM* (Host) Beauv.

"(No. 4.) Very good for dry soils, especially on slopes."

For previous introduction, see S. P. I. No. 30016.

56503. *AVENA STERILIS* L. Poaceæ. Wild oats.

"(No. 36.) Found as a weed among cultivated plants on the steppes of southern Crimea."

For previous introduction, see S. P. I. Nos. 25361-25363.

56504. *BECKMANNIA ERUCAEFORMIS* (L.) Host. Poaceæ. Grass.

"(No. 21. Askania Nova.) A very good fodder plant for growing on moist soil."

For previous introduction, see S. P. I. No. 20214.

56501 to 56521—Continued.

56505. *BROMUS VARIEGATUS* Bieb. Poaceæ. Grass.

"(No. 14.) A grass found commonly in the Crimea in wild places and also in cultivated land."

56506 and 56507. *FESTUCA* spp. Poaceæ. Grass.56506. *FESTUCA ELATIOR* L.

"(No. 25. Koyash and Bodrac estates.) A grass which grows in low-lying places."

For previous introduction, see S. P. I. No. 32216.

56507. *FESTUCA OVINA* L.

"(Nos. 23 and 24. Koyash and Bodrac estates.) A grass growing wild on the steppes and in unplowed ground."

For previous introduction, see S. P. I. No. 20738.

56508 and 56509. *HORDEUM* spp. Poaceæ. Grass.56508. *HORDEUM MARITIMUM* Roth.

"(No. 34. Koyash estate.) Grows in salty soil in meadows."

For previous introduction, see S. P. I. No. 49807.

56509. *HORDEUM NODOSUM* L.

"(No. 35.) A grass growing in salty places."

56510. *KOELERIA GRACILIS* Pers. Poaceæ. Grass.

"(No. 22.) Growing on the steppes."

56511. *LOLIUM MARSCHALLII* Stev. Poaceæ. Grass.

"(No. 29. Koyash estate.) Common on sloping meadows."

56512. *MELICA CILIATA* L. Poaceæ. Grass.

"(No. 26.) Grows along slopes in unplowed ground and in low-lying places."

For previous introduction, see S. P. I. No. 53149.

56513. *PANICULARIA FLUITANS* (L.) Kuntze. Poaceæ. Grass.

"(No. 30.) An aquatic grass."

56514. *POA PRATENSIS* L. Poaceæ. Kentucky bluegrass.

"(No. 28.) A rather common meadow grass."

56515 to 56517. *STIPA* spp. Poaceæ. Grass.56515. *STIPA CAPILLATA* L.

"(No. 11. Askania Nova.) The most popular pasture grass here."

For previous introduction, see S. P. I. No. 20686.

56516. *STIPA PENNATA* LESSINGIANA (Trin. and Rupr.) Richter.

"(No. 13.) A type with downy sheaths; grows on dry soil."

56517. *STIPA PENNATA* L. Feathergrass.

"(No. 12.) A feathery grass from the foothill steppes."

56518 to 56521. *TRITICUM* spp. Poaceæ.56518. *TRITICUM CYLINDRICUM* (Host) Ces. Pas. and Gib.

"(No. 10.) A grass from the plains."

For previous introduction, see S. P. I. No. 20689.

56501 to 56521—Continued.

56519. *TRITICUM MONOCOCCUM* L.
Wild wheat.

"(No. 7.) A wild wheat supposed to be the parent of our present types. The native Tatar name is *orkish*."

56520. *TRITICUM OVATUM* (L.) Rasp.

"(No. 8.) A grass from the plains."

For previous introduction, see S. P. I. No. 30112.

56521. *TRITICUM TRIUNCIALE* (L.) Gren. and Godr.

"(No. 9.) A grass from the plains."

56522. \times *MALUS MAGDEBURGENSIS*
Zimmerm. Malaceae. Apple.

From Glashevin, Ireland. Plant presented by J. W. Besant, acting keeper, Royal Botanic Gardens. Received January 26, 1923.

This is in all probability a hybrid between *Malus spectabilis* and *M. dasyphylla*, discovered among some old trees by the municipal gardener, Mr. Schoch, in Magdeburg, Germany. The old parent trees were probably introduced from Japan early in the past century, and some years ago Mr. Schoch moved the hybrids out into the open, where they are now fine growing trees. (Adapted from *Möller's Deutsche Gärtner-Zeitung*, vol. 20, p. 254.)

56523 to 56527. *LESPEDEZA* spp. Fabaceae.

From Kagoshima, Japan. Seeds presented by Dr. Takeo Kusano, Kagoshima Imperial College of Agriculture and Forestry. Received February 3, 1923.

A collection of native Japanese bush clovers introduced for department forage-crop specialists.

56523. *LESPEDEZA BICOLOR INTERMEDIA* Maxim.

Yama-hagi.

56524. *LESPEDEZA BICOLOR SIEBOLDI* (Miquel) Maxim.

Miyagino-hagi.

56525. *LESPEDEZA JUNCEA* Pers.

Variety *latifolia*. *Hai-medo-hagi*.

56526. *LESPEDEZA JUNCEA SERICEA* (Miquel) Forbes and Hemsl.

Medo-hagi.

56527. *LESPEDEZA PILOSA* (Thunb.) Sieb. and Zucc.

Neko-hagi.

56528 to 56535.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received February 1, 1923.

56528. *ALANGIUM CHINENSE* (Lour.) Rehder. Cornaceae. (*Marlea begoniaefolia* Roxb.)

"A tree, hardy here, but loses its leaves in winter, which might not happen in a warmer climate." (*Proschowsky*.)

A tall tree, up to 60 feet in height, with oval leaves about 8 inches in length and clusters of small whitish fragrant flowers. It is a native of Africa and southeastern Asia. This tree might be grown in the extreme southern United States.

For previous introduction, see S. P. I. No. 44859.

56529. *ARBUTUS CANARIENSIS* Duham. Ericaceae.

56528 to 56535—Continued.

"A beautiful evergreen tree attaining a height of 40 feet. It is, as the name indicates, a native of the Canary Islands. It has pretty rose-colored flowers in racemes, followed by orange-colored fruits about an inch in diameter, which are very beautiful as seen against the shining-green foliage. The fruits are sweeter and more pulpy than those of the strawberry tree and are considered very good by the natives in spite of their rather numerous seeds. The bark is smooth and very thin, the wood rose colored and useful in cabinetmaking. This species should be used by plant breeders in hybridizing with the strawberry tree, *Arbutus unedo*." (*W. T. Swingle*.)

For previous introduction, see S. P. I. No. 36529.

56530. *BENTINCKIA NICOBARICA* (Kurz) Bccarl. Phœnicaceae. Palm.

An elegant little palm with a habit resembling that of a *Kentia*; its native home is the Nicobar Islands, Indian Ocean. The pinnate, irregularly divided fronds are large and spreading, and the branched spadix bears small purplish berries.

For previous introduction, see S. P. I. No. 51707.

56531. *CORDIA ROTHII* Roem. and Schult. Boraginaceae.

A small tree found in dry situations in northwestern and southern India; the fruit is eaten both raw and pickled by the poorer classes, and rope is made from the inner bark. The tough, hard gray wood is used for building purposes.

56532. *DENDROCALAMUS STRICTUS* (Roxb.) Nees. Poaceae. Bamboo.

"A strikingly beautiful plant." (*Proschowsky*.)

A very tall bamboo, up to 100 feet in height, which is native to India and parts of Burma. It grows in drier situations than most bamboos and endures great cold as well as dry heat. It is useful for the consolidation of embankments on account of the network of fibrous roots, and its strength and solidity render it fit for many technical purposes. (Adapted from *Mueller, Select Extra-Tropical Plants*, p. 165.)

For previous introduction, see S. P. I. No. 53610.

56533. *FICUS CAPENSIS* Thunb. Moraceae.

A lofty tree 50 feet or more in height, which grows commonly in the forests of the southeastern parts of South Africa. It flowers twice a year, the flowers appearing in large bunches on the trunk or even on its main roots near the trunk. The fruits become as large as the smaller varieties of cultivated figs; the pulp is sweetish but rather dry. (Adapted from *Marloth, Flora of South Africa*, vol. 1, p. 135.)

56534. *SOLANUM CYANANTHUM* Dunal. Solanaceae.

A spiny shrub from the desert regions in the vicinity of the Rio Sao Francisco, Brazil. The leaves are long stemmed, very large, heart shaped, white tomentose beneath, and about 9 inches wide. The large sky-blue flowers, about 2 inches across, are in few-flowered racemes.

56535. *TECOMA GARROCHA* Hieron. Bignoniaceae.

"A small glabrous shrub, native to Argentina. It is strikingly handsome with its slender racemes of bright-yellow and scarlet flowers and is smaller and more graceful than *Tecoma stans*." (*Alfred Rehder*.)

56536. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Paris, France. Seeds purchased from Messrs. Rouget & Van der Walle. Received March 16, 1923.

Locally grown seed from central France, introduced for specialists in the department engaged in clover breeding.

56537 to 56549.

From Shantung, China. Scions sent in by K. M. Gordon, South Shantung Industrial and Agricultural School of the American Presbyterian Mission (North), at the request of C. A. Reed, Bureau of Plant Industry. Received February 12, 1923.

56537 to 56541. *CASTANEA MOLLISSIMA* Blume. **Chestnut.**

56537. No. 1. 56540. No. 4.

56538. No. 2. 56541. No. 5.

56539. No. 3.

56542. *DIOSPYROS KAKI* L. f. **Diospyraceæ. Kaki.**

"This persimmon is extensively used for drying." (Gordon.)

56543 to 56549. *JUGLANS REGIA* L. **Juglandaceæ. Walnut.**

56543. No. 1. 56547. No. 5.

56544. No. 2. 56548. No. 6.

56545. No. 3. 56549. No. 7.

56546. No. 4.

56550. SPERGULA ARVENSIS L. Silenaceæ. Spurry.

From Paris, France. Seeds purchased from Messrs. Vilmorin-Andrieux & Co. Received February 15, 1923.

Seeds of common spurry, introduced for department forage-crop specialists.

For previous introduction, see S. P. I. No. 1494.

56551. TRIFOLIUM FRAGIFERUM L. Fabaceæ. Strawberry clover.

From Melbourne, Victoria. Seeds purchased from F. H. Brunning. Received February 15, 1923.

"Strawberry clover is a perennial suitable as a pasture plant for wet, marshy ground. It has spreading stems, pink flowers, and foliage very similar to that of White Dutch clover. The name is derived from the fact that the seed heads resemble the strawberry in appearance." (Bunning.)

56552 to 56557. ORYZA SATIVA L. Poaceæ. Rice.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received February 19, 1923. Quoted notes by Mr. Hernandez.

"The following are white, nonglutinous varieties and have been tested under lowland conditions. They were grown at the Rosales Rice Station, Rosales, Pangasinan."

56552. "(No. 1.) *Apostol*. A nonbearded variety tested two years under lowland conditions; matures usually in 144 days. Average yield per hectare, 2,283 kilograms (approximately 2,000 pounds per acre)."

56553. "(No. 6.) *Cardenia I*. A bearded variety tested three years under lowland conditions; matures usually in 154 days. Average yield per hectare, 2,014 kilograms (approximately 1,800 pounds per acre)."

56552 to 56557—Continued.

56554. "(No. 5.) *Cayading a Nalabaga*. A bearded variety tested four years under lowland conditions; matures usually in 187 days. Average yield per hectare, 2,502 kilograms (approximately 2,200 pounds per acre)."

56555. "(No. 4.) *Macanining*. A bearded variety tested three years under lowland conditions; matures usually in 169 days. Average yield per hectare, 2,349 kilograms (approximately 2,100 pounds per acre)."

56556. "(No. 3.) *Mimis a Nalabaga*. A nonbearded variety; matures usually in 184 days. The value of this variety has not yet been fully determined."

56557. "(No. 2.) *Mimis a Purao*. A nonbearded variety tested four years under lowland conditions; matures usually in 188 days. Average yield per hectare, 3,245 kilograms (approximately 2,900 pounds per acre)."

56558. PISTACIA VERA L. Anacardiaceæ. Pistache.

From Palermo, Italy. Plants presented by Antonio D'Alia, Casa Agricola, Piana dei Greci. Received February 23, 1923.

A locally grown variety introduced for department specialists engaged in pistache investigations.

56559 to 56570.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received February 16, 1923.

56559 to 56561. *ACACIA* spp. **Mimosaceæ.**

56559. *ACACIA ELATA* A. Cunn.

A handsome unarmed tree 60 feet or more in height, with the young shoots often tinged with a golden yellow pubescence. The globular yellow flower heads are in clusters often 6 inches long. The tree is native to New South Wales. (Adapted from *Bentham, Flora Australiensis*, vol. 2, p. 413.)

56560. *ACACIA LINFOLIA PROMINENS* (A. Cunn.) Moore.

An unarmed shrub 12 to 18 feet high, with angular branchlets and very narrow phyllodia (leaflike stems). The very small globular yellow flower heads are borne in racemes about as long as the phyllodia. Native to New South Wales.

56561. *ACACIA SALIGNA* (Labill.) Wendl.

The "weeping wattle," an ornamental acacia found in West Australia, is a tall shrub or small tree, 10 to 30 feet in height, with long thick phyllodia (leaflike stems) and short clusters of rather large globular flower heads. This is said to be the principal source of tan bark in southwestern Australia.

56562. *BILLARDIERA LONGIFLORA* Labill. **Pittosporaceæ.**

A twining shrub sometimes many feet in length, with leaves varying in shape from oval to linear and solitary flowers which are greenish yellow, often changing to purple. It is found in thickets and along water-courses in New South Wales, Victoria, and Tasmania. (Adapted from *Bentham, Flora Australiensis*, vol. 1, p. 123.)

56563. *CANDOLLEA GRAMINIFOLIA* (Swartz) F. Muell. **Candolleaceæ.**
(*Stylidium graminifolium* Swartz.)

An ornamental Australian plant with stiff grasslike leaves, sometimes 9 inches long, and

56559 to 56570—Continued.

always growing in a tuft from the end of a very short stem, and scapes 6 to 18 inches long bearing a simple raceme of pink flowers.

For previous introduction, see S. P. I. No. 44324.

56564. *CASUARINA SUBEROSA* Otto and Dietr. Casuarinaceæ.

A tree 30 to 40 feet tall, quite similar to *C. equisetifolia*, with smooth, slender branchlets. It is considered a valuable fodder tree in the interior districts which are subject to drought. The wood is of great beauty for cabinetwork, but should be used only in veneers, as it is apt to split in drying.

56565. *CERVICINA GRACILIS* (Forst.) J. Britten. Campanulaceæ.
(*Wahlenbergia gracilis* DC.)

A very variable species, either a slender annual 6 to 18 inches high or a perennial with a rootstock which is almost woody. The leaves vary in shape from oval to linear, and the blue flowers, up to an inch across, are borne singly on long stems. The plant is native to many parts of Australia, extending to New Zealand and perhaps to the East Indies.

56566. *DANTHONIA SEMIANNULARIS* (Labill.) R. Br. Poaceæ.

Spreading through the pastures, this native grass, known as *wallaby grass*, is becoming very popular, and rightly so. It is a perennial tufted grass, producing a fair amount of soft succulent fodder suitable for either sheep or cattle. The leaves are narrow, usually hairy, and light green. The flower stems grow to a height of about 2 feet, and the seed, which sheds easily, is produced in clusters that have a white woolly appearance when ripe. *Wallaby grass* provides good pasturage during the spring and summer and remains green in the winter months. (Adapted from *The Agricultural Gazette of New South Wales*, vol. 28, p. 286.)

For previous introduction, see S. P. I. No. 49018.

56567. *EUCALYPTUS REGNANS* F. Muell. Myrtaceæ.

A large tree, the largest, in fact, in Australia; trees 300 feet tall are known in Victoria, and Muellert states that frequently a height of 400 feet is reached. The trunks are whitish and very straight, and the narrow leaves, shining on both sides, are of rather thin texture. The wood is well adapted for shingles, plank, and general construction. (Adapted from Maiden, *A Critical Revision of the Genus Eucalyptus*, vol. 1, p. 183.)

56568. *EXOCARPUS CUPRESSIFORMIS* Labill. Santalaceæ.

Usually a tree about 20 feet in height, with very numerous green rigid wiry, apparently leafless branches; the leaves are reduced to minute scales. The flowers are very small, appearing in short spikes; usually only one of these flowers is fertilized, and the small roundish nut is borne on a red succulent stem which is eaten by the natives. The close-grained handsome wood is used for cabinetwork and for tool handles. Native throughout Australia.

56569 and 56570. *STIPA* spp. Poaceæ.

56569. *STIPA PUBESCENS* R. Br.

A tufted perennial grass much relished by stock, found only in the wooded portions of Australia, where it seeds in October. The seed heads differ from those of other species of *Stipa* in being a rich brown.

56559 to 56570—Continued.

56570. *STIPA SEMIBARBATA* R. Br.

A perennial grass with stems 2 to 3 feet high, which is abundant in dry soil throughout Tasmania and also in many parts of Australia. The leaves are narrow, often almost subulate, and the panicles, 6 to 10 inches in length, are very dense.

56571 to 56576.

From Georges Bay, Tasmania. Seeds presented by Dr. Arthur H. Clarke. Received February 16, 1923. Quoted notes by Doctor Clarke, unless otherwise specified.

56571 to 56573. *ACACIA* spp. Mimosaceæ.

56571. *ACACIA DISCOLOR* Willd.

"An autumn flowering acacia 5 to 7 feet high."

A tall unarmed shrub or sometimes a small tree, with bipinnate leaves, pale beneath, and yellow flower heads in axillary and terminal clusters. It is native to southeastern Australia and Tasmania.

56572. *ACACIA LONGIFOLIA* SOPHORÆ (Labill.) F. Muell.

"A yellow-flowered shrub 15 to 20 feet high."

A rapid-growing acacia which frequents the seacoast of southeastern Australia from southern Queensland to South Australia, and also in Tasmania. It often becomes a small tree and is excellent for preventing the encroachments of the sea along sandy coasts. The wood is white, hard, and durable.

56573. *ACACIA MYRTIFOLIA* Willd.

"A yellow-flowered shrub 2 to 3 feet high."

A glabrous shrub with very angular branches and phyllodia (leaflike stems) which vary in shape from oval to linear, the linear forms being much longer than the others. The flower heads, almost sessile, contain only a few large flowers. The shrub is native to dry and rocky places in many parts of Australia.

56574. *EUCALYPTUS VIRGATA* Sieber. Myrtaceæ.

"*Tasmanian ironbark*. A tree 150 feet tall, with very tough hard wood, excellent for making piles."

For previous introduction, see S. P. I. No. 38727.

56575. *INDIGOFEA AUSTRALIS* Willd. Fabaceæ. Indigo.

An erect branching shrub 2 to 4 feet high with attractive compound leaves and dense or loose clusters of showy red flowers. It is very variable in regard to habit and foliage, and in its various forms is found almost throughout Australia, except in the Northern Territory.

For previous introduction, see S. P. I. No. 47152.

56576. *KENNEDIA PROSTRATA* R. Br. Fabaceæ.

"Creeping, about 2 feet long, with pink to scarlet flowers."

A prostrate or sometimes twining hairy perennial, with leaves composed of three roundish leaflets less than an inch long and scarlet flowers, usually solitary, nearly three-fourths of an inch long. Native to most parts of Australia.

56577 to 56590.

From the city of Guatemala, Guatemala. Seeds presented by Sr. Jorge García Salas, Dirección General de Agricultura. Received February 19, 1923. Quoted notes by Señor Salas.

56577. *MEIBOMIA* sp. Fabaceæ.

"(No. 3.) *Lentaje crimmarrona*. From Amatitlan."

56578 to 56588. *PHASEOLUS* spp. Fabaceæ.

56578 to 56581. *PHASEOLUS LUNATUS* L. Lima bean.

56578. "*Mexican pole Lima*; flat red snap beans."

56579. "*Cuban pole Lima*; flat white snap beans."

56580. "*Frijol pintado*; a pole Lima with speckled, flat snap beans."

56581. "(No. 4.) *Piligue*; from borders of cultivated fields near the city of Guatemala."

56582 to 56585. *PHASEOLUS VULGARIS* L. Common bean.

56582. "Originally from Mexico; a bush variety with light snap beans."

56583. "*Frijol de Mantua*, originally from Valencia, Spain. A bush form with red snap beans; can be used also as a green string bean."

56584. "*Alubia*, originally from Zamora, Spain. A bush form with white, longish rounded beans; can be used also as a string bean."

56585. "*Bahama* bean; a pole variety with white rounded snap beans."

56586. *PHASEOLUS* sp.

"*Chlorototo*; collected in the vicinity of Lake Amatitlan, Guatemala."

56587. *PHASEOLUS* sp.

"*Frijolillo*. Lake Amatitlan, Guatemala."

56588. *PHASEOLUS* sp.

"*Choreque*. San Andres Semetabaj, Solola, Guatemala."

56589 and 56590. *VIGNA SINENSIS* (Torner) Savi. Fabaceæ. Cowpea.

56589. "*Frijol garbanzo*. A long-podded bush variety."

56590. "*Frijol de cosita*. A bush variety with long pods and black-eyed beans."

56591 to 56593.

From Bogota, Colombia. Seeds presented by Brother Ariste Joseph, Instituto de la Salle. Received February 19, 1923.

56591. *SOLANUM* sp.

"Cultivated in Bogota as an ornamental; the fruit is poisonous." (Ariste.)

56592 and 56593. *TACSONIA* spp. Passifloraceæ.

56592. *TACSONIA LANATA* Juss.

An evergreen climbing plant, native to Colombia. All parts of the plant are covered with a downy wool, and the narrowly heart-shaped leaves resemble those of the mullein. The long slender salmon-pink flowers are borne singly on short stems, and the fruit is said to be edible.

56591 to 56593—Continued.

56593. *TACSONIA MOLLISSIMA* H. B. K. Curuba.

"This species is more commonly cultivated on the mesa of Bogota than any of the several others whose fruits are also known as curuba. The vine is not quite so ornamental as that of some other species, but the fruit is considered one of the best. It is slender, oblong-oval, 2 to 4 inches long, and slightly more than an inch thick, with a thin leathery pericarp (not brittle as in most other species) inclosing many black seeds, each surrounded by an orange-colored juicy aril. The flavor is sprightly and aromatic. While much eaten out of hand, the fruit is perhaps best when prepared in the form of *creme de curuba* or when made into an ice. Certainly the curuba is one of the most popular fruits in Bogota." (Wilson Popenoe.)

For previous introduction, see S. P. I. No. 51399.

56594 and 56595.

From Santiago de las Vegas, Cuba. Seeds presented by Dr. Mario Calvino, Agricultural Experiment Station. Received January 30, 1923. Quoted notes by Doctor Calvino.

56594. *PHASEOLUS LUNATUS* L. Fabaceæ. Lima bean.

"*Frijol caballero perenne*. A climbing white variety perennial in Cuba; these seeds come from Oriente."

56595. *VIGNA CYLINDRICA* (Stickm.) Skeels. Fabaceæ. Catjang.

"*Frijol precioso*. From eastern Cuba."

Introduced in connection with disease-resistance experiments.

56596 to 56603.

From Tengyueh, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the United States Department of Agriculture. Received February 16, 1923. Quoted notes by Mr. Rock.

56596. *ALLIUM* sp. Liliaceæ. Onion.

"*Tsung*. A variety resembling our small spring onion; it does not form a bulb."

56597 to 56599. *BRASSICA* spp. Brassicaceæ.

56597. *BRASSICA* sp.

"(No. 7814.) *Hsiao petsai* (small white cabbage). A stout lettuce-shaped cabbage with compact leaves, dark green above with a snow-white base, up to 4 inches broad, extending up into the dark-green leaf blades and forming prominent white ribs. The roots are short and stout."

56598. *BRASSICA* sp.

"(No. 7815.) *Ta petsai*. A large oblong cabbage, resembling the following [No. 7813; S. P. I. No. 56599]. The very large oblong leaves are pale green, and the broad base and midribs are snow white. This is a succulent vegetable, cooked like cabbage."

56599. *BRASSICA* sp.

"(No. 7813.) *Tsin tsai* (green cabbage). A green cabbage with leaves 2 feet or more in length and a foot broad, green throughout, including the thick sessile base. The root is turnip shaped but divided. This variety is cooked like cabbage."

56600. *CORIANDRUM SATIVUM* L. Apiaceæ. Coriander.

"(No. 7818.) *Yen sui*. This plant has an obnoxious odor, but is used in the same manner as European parsley."

56596 to 56603—Continued.

56601. *LACTUCA SATIVA* L. Cichoriaceae.
Lettuce.

"(No. 7817.) *Oh soon*. A peculiar vegetable of which the thick inner stalk is eaten; this stalk is about 2½ feet long and 2 inches in diameter, and it is cut into slices and boiled. The leaves are discarded, as they are bitter."

56602. *RAPHANUS SATIVUS* L. Brassicaceae.
Radish.

"(No. 7816.) *Water radish*. A large snow-white oblong radish 3 feet long and 5 inches thick, cooked like kohlrabi."

56603. *SPINACIA OLERACEA* L. Chenopodiaceae.
Spinach.

"(No. 7812.) *Po tsai*. The dull-green leaves are lyrate sinuate, with sharp-pointed tips and lobes and long-ribbed fleshy stems. The roots are turnip shaped. The leaves are cooked like spinach. The seeds are sown in seed beds and set out in October or a little earlier and are brought to the market in December."

56604. *STACHYS SIEBOLDI* Miquel.
Menthaceae.

From Tengyueh, Yunnan, China. Tubers collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received February 16, 1923.

"*Yee huai*. Small tubers spirally twisted like snails, about 2 inches long, tapering at both ends. When boiled for a half hour or an hour, seasoned, and placed in butter and milk, these are delicious."

56605. *ZEA MAYS* L. Poaceae. Corn.

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, director, General Experiment Station. Received February 14, 1923.

"*White St. Croix mais* (white St. Croix corn). In 1918 this corn was imported from St. Croix, Virgin Islands, and it is one of the two imported varieties which have done well in Java. St. Croix is a dent corn, growing to 6 or 8 feet, with a very strong coarse stem. Each plant produces normally one large ear and no rubbins. The variety is medium maturing (about 100 days in Java) and yields about the same as *Gele Menado mais* [S. P. I. No. 56663]. The grain is not as popular as that of flint-corn varieties, as it can not be pounded like these. For the feeding of cattle I think it to be of the same value as *Madoera mais* [S. P. I. No. 56662] and *Gele Menado mais*." (L. Koch.)

56606 and 56607. *MALUS SYLVESTRIS* Mill. Malaceae. (*Pyrus malus* L.) Apple.

From Orleans, Loiret, France. Plants presented by Edmond Versin, St. Jean le Blanc. Received February 26, 1923. Quoted notes by Mr. Versin.

56606. "*Court pendu*. The tree is prolific, but not very vigorous. The fruits are greenish gray, becoming yellow at maturity, and marked with red. They are of good quality and will keep from November to March."

56607. "*Reinette de Canada gris*. The tree is vigorous and very prolific, and the flowering season medium. The fruits are large, of a tarnished green which becomes a gray russet, and of very good quality. They will keep from December to March."

56608. *ACTINIDIA CHINENSIS* Planch.
Dilleniaceae. Yang-tao.

From Chengtu, Szechwan, China. Seeds presented by George B. Newman, West China Union University, at the request of B. F. Lawrence, West China Mission, Suining, Szechwan. Received February 23, 1923.

"These 'hairy pears' came from the high foothills, at altitudes of 4,000 to 8,000 feet, near Chengtu, Szechwan." (Lawrence.)

"The *yang-tao*, an ornamental deciduous climber native to Szechwan, has attracted considerable attention because of the high quality of its fruits. The leaves have a plushlike texture and an unusual dark-green color, and their large size and regular spacing add to the beauty of the vine. The flowers are buff yellow to white, fragrant, often 1½ inches across, and are produced in great abundance. The ovoid to globose, russet-brown villous fruits are about 2 inches long. The flesh is green, of most excellent flavor, resembling that of a gooseberry but tempered with a flavor peculiarly its own. The fruit is good when eaten fresh and also makes very fine jam and sauce." (David Fairchild.)

For previous introduction, see S. P. I. No. 55840.

56609 and 56610. *HORDEUM* spp.
Poaceae. Barley.

From Ayr, Scotland. Seeds presented by McGill & Smith. Received February 24, 1923. Quoted notes by McGill & Smith.

56609. *HORDEUM DISTICHON PALMELLA* Harlan.

"Recent trials of our new barley Golden Pheasant show that it is a better yielder than Plumage Archer, and we think it should be well adapted for the United States, as it is hardy and tillers well. It is a cross between Goldthorpe, one of the best British brewers' varieties, with Pilsener, the best brewers' variety in Germany. It is a big yielder."

56610. *HORDEUM INTERMEDIUM HAXTONI* Koern.

"Our 6-rowed barley is still in the experimental stage. It will probably never be anything but a feeding barley because of the amount of small seeds. The center rows are small twisted seeds, while the two side rows are equal to any other variety; the small seeds could be used for sowing. This variety was produced by crossing two 2-rowed barleys."

56611 to 56614.

From Nioka, Ituri, Belgian Congo. Seeds presented by Jean Claessens, Ferme Experimentale du Haute Ituri. Received February 26, 1923. Quoted notes by Mr. Claessens.

56611. *AMARANTHUS CAUDATUS* L. Amaranthaceae.

"*Lenga-lenga*, an interesting plant from which the natives prepare a flour which is made into dough and cooked. The plants become 70 or 80 centimeters high, with a rather open habit, and the fruiting panicles are red, yellowish, or yellowish with reddish striae."

56612 and 56613. *HOLCUS SORGHUM* L. Poaceae. (*Sorghum vulgare* Pers.) Sorghum.

56612. "(October, 1922.) A variety grown by the Bolos, but not by the Walendi."

56613. "(October, 1922.) A variety grown by the Walendi, probably a mixture."

56614. *NICOTIANA RUSTICA* L. Solanaceae. Tobacco.

"(October, 1922.) A yellow-flowered tobacco grown by the natives of Haute Ituri and eastern Uele. This tobacco is very strong and aromatic and very popular with the natives. The plant becomes 60 or 70 centimeters in height."

56615. PHLEUM PRATENSE L. Poaceae. Timothy.

From Paris, France. Seeds purchased from Messrs. Vilmorin-Andrieux & Co. Received February 26, 1923.

"This has been grown near Epinal, Vosges, France, for four or five generations." (*Vilmorin-Andrieux & Co.*)

Introduced for timothy-breeding investigations.

56616. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Padua, Italy. Seeds purchased from Nicola Gribaldo, Padua, through Asher Hobson, American representative, International Institute of Agriculture, Rome. Received February 26, 1923.

Locally grown seed from the Province of Padua, Italy, introduced for cultural and comparison tests.

56617 to 56628. SACCHARUM OFFICINARUM L. Poaceae. Sugarcane.

From Soledad, Cienfuegos, Cuba. Seeds presented by R. M. Grey, superintendent, Cuban Gardens. Received February 13, 1923.

"Seeds selected from our best varieties. The plants from which the seeds were taken are highly resistant to mosaic disease." (*Grey.*)

56617. A. H. 175.	56623. A. H. 9172.
56618. A. H. 247.	56624. A. H. 11,152.
56619. A. H. 4124.	56625. A. H. 12,096.
56620. A. H. 6301.	56626. A. H. 12,100.
56621. A. H. 6304.	56627. A. H. 13,024.
56622. A. H. 6307.	56628. A. H. 13,168.

56629 and 56630.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received February 26, 1923.

56629. GLADIOLUS SEGETUM Ker. Iridaceae.

"One of the most beautiful wild flowers around here. It might be very valuable for hybridizing." (*Proschowsky.*)

A European gladiolus of free habit, fond of warm, dry soil and a sunny situation, with rather small rose-purple flowers. It is an admirable species for mixed borders. (Adapted from *Robinson, English Flower Garden*, p. 577.)

For previous introduction, see S. P. I. No. 51146.

56630. TRIFOLIUM ALEXANDRINUM L. Fabaceae. Berseem.

Introduced for department specialists engaged in clover-breeding investigations.

56 31 FICUS CARICA L. Moraceae. Fig.

From Saonara, Padova, Italy. Cuttings purchased from Fratelli Sgaravatti. Received March 31, 1923.

Dottato. The best-known in Tuscany, Italy, and the variety which constitutes the largest part of the dried figs exported from Italy. The tree loves rich, moist soils and is not suitable for dry lands; it is a strong grower and heavy bearer. The medium-sized fruits, about 3 inches long, are ovoid-pyriform, with smooth, thin, yellowish green amber skin. (Adapted from *Gustav Eisen, The Fig*, p. 229.)

This well-known Italian variety is introduced for cultural and comparison tests by department specialists engaged in fig-breeding experiments.

56632. SACCHARUM OFFICINARUM L. Poaceae. Sugarcane.

From Coimbatore, India. Seeds presented by T. S. Venkatraman, Government sugarcane expert, the Agricultural College. Received February 6, 1923.

"These seeds are from cane of a rather thin type, but which should prove resistant to mosaic disease." (*Venkatraman.*)

56633 and 56634.

From Upper Chindwin, northwestern Burma. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received February 28, 1923. Quoted notes by J. F. Rock.

56633. TARAKTOGENOS KURZII King. Flacourtiaceae.

(January 8, 1923.) Collected near the jungle village of Kyokta, Upper Chindwin. These seeds are from the same forest as those sent in 1921.

For previous introduction, see S. P. I. No. 52803.

56634. ZIZIPHUS sp. Rhamnaceae.

(January 6, 1923.) A tree 40 feet high, with a stout trunk 1½ feet in diameter, found in a very dry region on the Mytha River near Kalewa, Upper Chindwin. The very small round leaves are less than an inch wide and the small globose, yellowish red drupes, less than an inch in diameter, have large stones and very scanty flesh.

56635. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Budapest, Hungary. Seeds purchased from the Hungarian Seed Culture Co. Received March 1, 1923.

Introduced for department specialists engaged in clover-breeding investigations.

56636 and 56637.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received March 3, 1923. Quoted notes by Mr. Rock.

56636. ALNUS NEPALENSIS D. Don. Betulaceae. Alder.

(No. 6858. September 27, 1922.) A tree up to 70 feet in height, with a trunk 3 to 4 feet in diameter, which is very common all over Yunnan at altitudes of 4,000 to 7,000 feet. It is a rapid grower, used chiefly for firewood, and appears to thrive in spite of the tall grass, 5 to 8 feet high, which surrounds it. I would recommend it strongly for planting in grassland where trees can not usually be grown.

For previous introduction, see S. P. I. No. 55670.

56637. BUCKLANDIA POPULNEA R. Br. Hamamelidaceae.

(Nos. 7574, 7575. November 21, 1922.) A tall straight tree 60 to 80 feet in height, of fine appearance, found near Kaotien, one day's journey north of Tengyueh, at an altitude of 6,000 feet. The broadly triangular leaves are dark green, and the yellow male flowers are in globose heads. This should be an ornamental lawn tree.

For previous introduction, see S. P. I. No. 55674.

56638. BROMUS UNIOLOIDES (Willd.) H. B. K. Poaceae. Grass.

From Auckland, New Zealand. Seeds presented by W. S. Hill, agricultural instructor, Seddon Memorial Technical College. Received March 1, 1923.

"*Giant bromegrass*. I made this selection at the Mounahaki Experimental Farm in 1913, and during the six generations through which it has passed it has exhibited the characters of a pure line. It has proved superior to the commercial prairie grass (*Bromus unioloides*) in yield and resistance to smut. The seed is heavier and retains its vitality well. The strain is likely to prove of great value as pasture in regions of mild winters and on the lighter soils. The bulk of the growing from early autumn sowing is made during the winter and early spring." (Hill.)

56639 to 56647. ZEA MAYS L. Poaceæ. Corn.

From Johannesburg, Transvaal. Seeds presented by P. J. Stevenson, trade commissioner. Received March 5, 1923. Quoted notes by Mr. Stevenson.

Nine varieties of corn sent in from South Africa for testing in this country.

56639. "*Ten-row Yellow Flint*. Grown by G. Mitchell-Innes, Blannerne, Elandslaagte, Natal."

56640. "*Hickory King*. Grown by Hubert v. d. Merve, Smithfield, Potchefstroom, Transvaal."

56641. "*Iowa Silver Mine*. Grown by C. Mottram, Bushybend, Machavie, Transvaal."

56642. "*Ladysmith*. Grown by J. Meiklejohn, Rosyth, Private Bag, Pienaars River, Transvaal."

56643. "*Natal 8-row Flint*. Grown by G. Mylrea, Reismierbult, Transvaal."

56644. "*Palins Cornflake*. Grown by P. Erasmus, Avondale, Potchefstroom, Transvaal."

56645. "*Potchefstroom Pearl*. Grown by George Parks, Machavie, Transvaal."

56646. "*Reid Yellow Dent*. Grown by E. Papendorp, Reismierbult Station, Transvaal."

56647. "*Salisbury*. Grown by W. Bean, Shamva, Rhodesia."

56648 to 56659. MANGIFERA INDICA L. Anacardiaceæ. Mango.

From Rio de Janeiro, Brazil. Plants presented by P. H. Rolfs, Vicosia, Minas Geraes, through Crittenden Marriott, Bureau of the Public Health Service, Treasury Department. Received January 27, 1923. Quoted notes by Mr. Rolfs, unless otherwise specified.

"As a general rule the mangos of Brazil are not of good quality when compared with those of India, the Philippines, and several other regions. Most of them are decidedly fibrous, and few have as rich a flavor as such Indian varieties as Amini, Mulgoba, and Paheri. Some of them are resistant to anthracnose, however, and for this reason are worthy of trial in Florida and the West Indies." (Wilson Pope-noe.)

56648. "No. 12. *Augusta*. A small mango, but one of the few varieties propagated in Brazil by inarching or grafting. As seen growing in the garden of Sr. Antonio Calmon do Pin e Almeida on Itaparica Island near Bahia, it may be described as follows: General form obliquely oval; cross section oval, size small, length $2\frac{3}{4}$ inches, breadth $2\frac{1}{2}$ inches, thickness 2 inches; stem inserted obliquely; base obliquely flattened, cavity practically none; dorsal shoulder rounded, low; ventral shoulder rounded, high; apex rounded, not five-sixteenths of an inch from longitudinal apex, a slight depression; sur-

56648 to 56659—Continued.

face smooth, green-yellow, tinged and overspread with orange on cheek; dots numerous, subcutaneous, small, rounded, lighter in color than surface; skin thick, firm, and tough, adhering closely; flesh pale orange, very juicy, aroma pleasant but not pronounced; flavor subacid; seed large for size of fruit, ovate-reniform, $2\frac{1}{4}$ by $2\frac{1}{4}$ by 1 inches, very fibrous over entire surface, monoembryonic; season December and January. For trial in the mango-growing regions of Florida." (Dorsett, Shamel, and Popenoe.)

For previous introduction, see S. P. I. No. 37848.

56649. "No. 11. *Carlota*. This has a better color than *Itamaraca* and is more resistant to anthracnose, but the most interesting thing about it is its tendency to produce sports."

For previous introduction, see S. P. I. No. 37847.

56650 and 56651. "The two following numbers are simply variants of what appear to be quite similar fruits; they are heavy croppers and precocious and are especially interesting because dwarf forms."

56650. No. 1. *Familia*.

56651. No. 2. *Familia*.

56652 to 56654. *Itamaraca* is probably the best variety of mango in the vicinity of Bahia, Brazil. It takes its name from the island of Itamaraca, off the Brazilian coast near Pernambuco, a place especially noted for its mangos. The fruit is small and of very unusual form, distinctly oblate, and commonly not more than 3 inches in diameter. The skin is yellow and the flesh rather free from fiber, with an aromatic, spicy flavor. (Adapted from *Bulletin No. 446*, U. S. Dept. of Agr., p. 24.)

56652. No. 3. *Itamaraca-A*.

56653. No. 4. *Itamaraca-B*.

56654. No. 5. *Itamaraca-B*.

56655. No. 6. *Itaparica*.

56656. No. 7. *Itaparica*.

56657. No. 8. *Julieta*.

56658. No. 10. *Julieta*.

56659. No. 9. *Melifera*.

56660. DIOSCOREA TRIFIDA L. f. Dioscoreaceæ. Yampi.

From Cristobal, Canal Zone. Tubers presented by James E. Lewis, manager, Hotel Washington, Cristobal. Received March 9, 1923.

"This yampi is usually of even form and somewhat club shaped, and the tubers are commonly 4 to 10 ounces in weight; the inner skin is pink. The flesh is white, but often becomes slightly grayish when cooked. The flavor is much like that of the white potato, but the yampi has in addition an agreeable sweetness." (R. A. Young.)

56661. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Italy. Seeds purchased from Girardino Allegra, Catania, Sicily, through Asher Hobson, American representative, International Institute of Agriculture, Rome. Received March 12, 1923.

A strain of locally grown red clover from Sicily, introduced for department specialists.

**56662 and 56663. ZEA MAYS L. Po-
aceæ. Corn.**

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, director, General Experiment Station. Received January 31, 1923. Quoted notes by L. Koch.

56662. "*Madoera mais* (Madura corn). Madura corn was obtained from the island of Madura. This is an early variety, maturing in Java in from 75 to 85 days. The plants remain low (under 6 feet) and produce as a rule not more than one ear. The variety is less susceptible to diseases and drought than others, this being one of the principal reasons for its culture. The yield is usually less than that of Yellow Menado, but under good conditions 50 and more bushels to the acre have been harvested. The grain is very popular with the Madurese, who eat it pounded as rice."

56663. "*Gele Menado mais* (Yellow Menado corn). This variety was received from the northern Moluccas, where it is planted extensively by the natives. It resembles very closely the Nation Yellow Flint from the Philippines and I presume that both varieties are the same. *Yellow Menado* is a flint variety of late maturity; it ripens at Buitenzorg in 115 to 120 days, growing to a height of 8 to 11 feet. It is prolific, 100 plants producing 150 to 180 ears, the percentage of sterile plants usually being low. At Buitenzorg, where the climate is not favorable for corn plantings, the average yield in the dry season is about 28 bushels per acre; in the wet season, however, it is much less. Under good conditions, such as after a green-manure crop, much higher yields have been reported (60 to 70 bushels per acre). The grain is of good taste and is very much favored by the natives."

**56664 and 56665. DAHLIA MAXONII
Safford. Asteraceæ. Dahlia.**

From Chimaltenango, Guatemala. Seeds presented by W. Cameron Townsend. Received March 12, 1923. Quoted notes by Mr. Townsend.

56664. "I think these seeds are of the 'White dahlia'; they were taken from plants cultivated in Chimaltenango."

56665. The wild tree dahlia of the Guatemalan highlands blooms in its native land in the months of December and January, and its starry lilac-pink flowers in graceful clusters on long stems make a very agreeable contrast with the dark-green hillsides. This beautiful plant is extremely abundant, both wild and cultivated, in many parts of the Guatemalan highlands at altitudes of 3,000 to 7,000 feet. The stems sometimes reach 15 or even 18 feet in height and become quite woody toward the base. The slender branches bear the clusters of nodding flowers, some of which measure 4 or 5 inches across. When brought into cultivation around the huts of the natives the species seems to lose its stability, and in place of the single lilac-pink flowers appear double pink and double white forms and, less commonly, single white varieties. This dahlia is subtropical in its requirements and should succeed in southern Florida, provided suitable soil conditions are found. (Adapted from *Journal of Heredity*, vol. 11, pp. 265-268.)

**56666. ALEURITES FORDII Hemsl.
Euphorbiaceæ. Tung-oil tree.**

From Hongkong, China. Seeds presented by H. Green, superintendent, Botanical Forestry Department. Received March 12, 1923.

"A rapid-growing broad-leaved deciduous tree which attains a height of 25 to 35 feet. It is said to be comparatively short-lived. Clusters of pinkish

white flowers are produced just as the leaves begin to come out in the spring, followed by green or reddish fruits somewhat larger than those of the black walnut. The fruits contain the large nut-like oily seeds from which tung oil, a valuable drying oil, is expressed. The oil constitutes about 24 per cent (by weight) of the seeds, or about 40 per cent of the kernels from which the shells have been removed. The tree appears to be particularly well adapted to the sandy clay soils and the climate of northwestern Florida and the adjacent regions of Alabama and Georgia." (R. A. Young.)

For previous introduction, see S. P. I. No. 50635.

**56667. GARCINIA MANGOSTANA L.
Clusiaceæ. Mangosteen.**

From Kingston, Jamaica. Seeds presented by W. S. Goodman, acting superintendent, Hope Gardens. Received March 12, 1923.

Mangosteen seeds introduced from Jamaica for testing in our tropical dependencies.

For previous introduction, see S. P. I. No. 56070.

56668 to 56675.

From New England. Seeds presented by Dr. A. H. Hill, director, Royal Botanic Gardens. Received March 12, 1923.

Introduced for the use of specialists in the department engaged in forage-crop investigations.

56668 to 56670. LOTUS spp. Fabaceæ.

56668. LOTUS EDULIS L.

A more or less hairy annual with ascending or erect branched stems 4 to 16 inches long, short-stemmed grayish green leaflets, and large yellow flowers in few-flowered heads. The plant grows only in sandy areas in the Mediterranean region.

For previous introduction, see S. P. I. No. 51861.

56669. LOTUS REQUIENI Mauri.

A hairy ascending or erect plant with stems about a foot long, native to the vicinity of Rome, Italy. The leaflets are rhombic in shape and sharp pointed, and the flowers are small and red.

56670. LOTUS TETRAGONOLOBUS L.

A purple-flowered annual from the eastern Mediterranean countries, where it frequents the edges of cultivated fields, roadsides, etc. It is more or less hairy, with obovate leaflets. The edible seeds are sometimes used as a substitute for coffee, and the plant is often cultivated as an ornamental.

For previous introduction, see S. P. I. No. 38415.

**56671 to 56675. TRIFOLIUM spp. Fabaceæ.
Clover.**

56671. TRIFOLIUM ALPESTRE L.

A perennial clover with long underground roots, found over almost all the mountainous parts of Europe, especially in calcareous soils, and ascending to a height of 16,000 feet. The narrowly oval leaflets are velvety hairy, and the flowers are pinkish purple.

For previous introduction, see S. P. I. No. 35276.

56672. TRIFOLIUM ELEGANS Savi.

A smooth perennial clover with stems 8 to 20 inches long, found throughout Europe and the Caucasus, especially in siliceous soils. The flowers are whitish or pink. The plant is cultivated for forage.

For previous introduction, see S. P. I. No. 35275.

6668 to 56675—Continued.

56673. *TRIFOLIUM OCHROLEUCON* Huds.

A perennial clover with brown underground stems, which grows wild in western, central, and southern Europe. The flowers are yellowish. The plant multiplies by means of buds produced on the underground stems.

For previous introduction, see S. P. I. No. 25387.

56674. *TRIFOLIUM PANNONICUM* Jacq.

A clover with stems up to 10 inches long and yellowish flowers, found on the high mountains of southeastern France. It is considered by some authorities to be merely a race of red clover.

For previous introduction, see S. P. I. No. 28312.

56675. *TRIFOLIUM PHYSODES* Stev.

A perennial prostrate clover with oval leaflets and roundish heads of pink flowers which open in July and August. Native to southeastern Europe. In the flowering stage this species resembles white clover, but it does not creep.

56676. *ALEURITES MONTANA* (Lour.) Wilson. Euphorbiaceae. Mu-oil tree.

From Hongkong, China. Seeds presented by H. Green, superintendent, Botanical and Forestry Department. Received March 17, 1923.

Aleurites montana yields an oil from the seeds practically identical with that from *A. fordii*, the tung-oil tree of China. While the seeds of the two species are almost indistinguishable, the fruits are easily recognized by their exteriors; those of the former are prominently ridged, while those of the latter are smooth.

56677. *CASTANOPSIS DELAVAYI* Franch. Fagaceae. Chestnut.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received March 9, 1923.

"(No. 7742. December 1, 1922.) A tree 60 to 100 feet tall, with trunk 4 to 5 feet in diameter, which grows on the summit of the Salwin Ridge. The leaves are large, broadly ovate, coarsely serrate, glossy above and silvery beneath. The burs are in spikes, and the nuts are small, something like those of the chinquapin, and very sweet and palatable. This is identical with the chestnut sent from the Talifu-Yangpi Trail, No. 6682 [S. P. I. No. 56080]."

56678. *SOLANUM TUBEROSUM* L. Solanaceae. Potato.

From Bogota, Colombia. Tubers presented by Brother Ariste Joseph. Received February 26, 1923.

"These potatoes are from the Paramos de Guasca, where this curious variety is grown by the ancient tribe known as the Chibchas." (Ariste.)

56679 to 56683. *TRIFOLIUM* spp. Fabaceae.

From Reading, England. Seeds purchased from Sutton & Sons. Received March 20, 1923. Quoted notes from Sutton's Farmers' Yearbook.

Introduced for the use of department specialists engaged in clover breeding.

56679 and 56680. *TRIFOLIUM INCARNATUM* L. Crimson clover.

"These crimson clovers are used as catch crops. The seed is harrowed into the stubble as soon as the wheat crop is off, and sometimes it is sown in the spring."

56679. Late red. 56680. Late white.

56679 to 56683—Continued.

56681 to 56683. *TRIFOLIUM PRATENSE* L.

Red clover.

56681. "Red or broad clover. An indigenous strain used for fodder."

56682. "Sutton's cow grass or late-flowering red clover. A most valuable strain where ordinary red clover is unsuitable."

56683. "Sutton's Giant Hybrid cow clover. Produces a greater quantity per acre than any other clover, giving two and sometimes three cuttings a year. Duration two or three years."

56684. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Italy. Seeds purchased from Consorzio Agrario Cooperativo Canavesano, Ivrea, through Asher Hobson, American representative, International Institute of Agriculture, Rome. Received March 12, 1923.

A strain of locally grown red clover from Sicily introduced for specialists in the Department of Agriculture.

56685 and 56686. *PHASEOLUS* spp. Fabaceae.

From Chicacao, Guatemala. Seeds presented by Jorge G. Salas, Director General of Agriculture. Received March 20, 1923. Quoted notes by Señor Salas.

"From Chicacao, Solola; altitude 1,300 feet."

56685. *PHASEOLUS ADENANTHUS* G. Meyer.

"Frijol de animal."

56686. *PHASEOLUS* sp.

"Frijol de monte."

56687 and 56688. *PYRUS CALLERYANA* Decaisne. Malaceae. Pear.

From Nanking, China. Seeds purchased from J. Lossing Buck, acting dean, College of Agriculture. Received March 22, 1923.

Introduced for the use of department specialists engaged in pear-breeding investigations.

56687. From Hunan.

56688. From Kuling, Kiangsi.

56689 to 56692.

From Bedford, England. Plants presented by Laxton Bros. Received March 26, 1923. Quoted notes from catalogue of Laxton Bros.

56689 and 56690. *PYRUS* spp. Malaceae.

Pear.

56689. *PYRUS* sp.

"Superb. A hybrid between *Beurre Superfin* and *Williams*. A very early dessert pear of fine flavor, partaking of the good qualities of both its parents, but ripening earlier than *Williams*."

56690. *PYRUS* sp.

"*Beurre Bedford*. A hybrid between *Marie Louise* and *Durondeau*. The fruit, which is as large as *Marie Louise*, and borne as freely as *Conference*, is pear shaped, tapering at the end with a long stalk. The skin is yellow, marked with russet brown and crimson, and the juicy melting flesh is of very fine flavor. This is superior to any other October pear and a very heavy cropper."

56691 and 56692. *RUBUS* spp. Rosaceae.

56689 to 56692—Continued.

56691. *RUBUS* sp. Dewberry.

"Newberry. This is similar to the Logan blackberry, but darker and sweeter."

56692. *RUBUS* sp. Blackberry.

"Pollards. A blackberry which ripens later than *Edward Langley*, but is a strong grower and better adapted to exposed situations. The fruit clusters are very large, and the berries are rich in flavor and very juicy. This variety is strongly recommended for making jelly and jam."

56693 to 56696.

From Elstree, Herts, England. Plants presented by Hon. Vicary Gibbs, Aldenham House Gardens. Received March 26, 1923. Quoted notes by Edwin Beckett, superintendent.

56693. *MALUS SYLVESTRIS* Mill. Malacæ.
(*Pyrus malus* L.) Apple.

Variety *Aldenhamsensis*. "This is a chance hybrid which occurred at Aldenham and is considered the finest of all red-flowered crab apples. It flowers three weeks later than *Malus niedzwetzkyana* and *M. purpurea* and, unlike the former, bears in autumn a large number of large dark-red fruits."

56694. *PYRACANTHA GIBBSII* A. Jackson. Malacæ. Firethorn.

A fine ornamental evergreen bush, vigorous and hardy, native to Hupeh and Szechwan, China. It becomes 12 to 14 feet high, is nearly spineless, and in the autumn bears large clusters of scarlet berries which contrast admirably with the glossy dark-green foliage.

For previous introduction, see S. P. I. No. 56451.

56695 and 56696. *STRANVAESIA DAVIDIANA* Decaisne. Malacæ.

56695. "This may be trained as a small standard tree, otherwise of bush form. The foliage is evergreen, and the terminal corymbs of white flowers are soon followed by the handsome bunches of scarlet fruits."

56696. "This yellow-fruited form was raised from the same batch of seeds as the preceding [S. P. I. No. 56695], but the fruits were found to have a distinct orange-yellow color. Seedlings of this may revert to the original type."

56697. *PHALARIS BRACHYSTACHYS* Link. Poacæ. Grass.

From Milan, Italy. Seeds presented by Fratelli Ingegneri. Received March 12, 1923.

Introduced for specialists in the department engaged in forage-crop investigations.

An annual grass a foot or two in height, native to the Mediterranean coastal regions. It is closely related to canary grass (*Phalaris canariensis*).

56698 and 56699. *GARCINIA* spp. Clusiaceæ.

From Brisbane, Queensland. Seeds presented by C. T. White, Government botanist. Received March 26, 1923.

56698. *GARCINIA GIBBSIAE* S. Moore.

A wild relative of the mangosteen which grows in forests in the Bellenden Ker Hills, at an altitude of about 2,000 feet. The leaflets are oval with mucronate tips, and the flowers, in clusters of two or three, are green, later

56698 and 56699—Continued.

turning brown. The fruit is not known. (Adapted from *Journal of Botany*, vol. 55, pp. 298, 502.)

56699. *GARCINIA MESTONI* F. M. Bailey. Meston's garcinia.

An erect, slender, graceful tree 20 feet or more in height, with drooping branches and glossy dark-green leaves. The roundish fruits, 2 or 3 inches in diameter, are of a bright-olive green, with very juicy pulp of a pleasant acid flavor. The tree grows wild in the Bellenden Ker Hills at an altitude of about 2,000 feet. (Adapted from *Report of the Government Expedition to Bellenden Ker Range, Queensland, 1889*, p. 31.)

For previous introduction, see S. P. I. No. 41802.

56700. *EREMOCITRUS GLAUCA* (Lindl.)

Swingle. Rutacæ.

(*Atlantia glauca* Benth.)

Australian desert kumquat.

From Dundas, New South Wales. Seeds presented by Herbert J. Rumsey. Received March 28, 1923.

"This is one of the most interesting of all citrus fruits and one which, curiously enough, has never yet received adequate attention from botanists or horticulturists. It was first mentioned by Leichhardt, the German explorer, to whom we owe much of our knowledge concerning the interior of the deserts of northeastern Australia. It is a shrub or small tree from 12 to 15 feet high, with a trunk 2 to 6 inches in diameter. It has small but thick leathery leaves of gray-green, and one is struck by the scantiness of the foliage. The flowers are small and the fruits about a half inch in diameter. An agreeable beverage is made from the acid juice and a fair preserve may be made out of the fruit. The peel has the sweetish flavor of the kumquat. It is known in Australia as the native lemon. The plant was described botanically in a footnote to Lieut. Col. Thomas Livingston Mitchell's 'Journal of an Expedition into the Interior of Tropical Australia in Search of a Route from Sydney to the Gulf of Carpentaria.' This plant was discovered on October 17, 1846, not far from Lieutenant Colonel Mitchell's camp, near the junction of the Maranoa and Merivale Rivers, in the southern limit of Queensland, latitude 26° S. Decidedly cold weather was encountered near this point, in some cases the ice being so thick that it had to be broken in the morning before the horses could drink. It seems quite probable from this that the plant grows in a region where the temperature occasionally falls to 10° F. and in rare cases nearly to zero. It is the hardiest of all evergreen citrus fruits and is very promising for use in breeding new and hardy types." (W. T. Swingle.)

For previous introduction, see S. P. I. No. 29537.

56701 to 56709. *ZEA MAYS* L. Poacæ. Corn.

From Sapporo, Japan. Seeds presented by M. Akemine, professor of plant breeding, Hokkaido Imperial University. Received March 21, 1923. Quoted notes by Professor Akemine.

Seeds introduced from the chief corn-producing regions of Japan and China, for the use of department specialists engaged in corn breeding.

56701. "A local yellow flint variety from Chosen."

56702 and 56703. "From Ehime."

56702. "A local white flint variety."

56703. "A local yellow flint variety."

56704. "A local yellow flint variety from Kumamoto."

56701 to 56709—Continued.

56705 to 56707. "From Manchuria, China."

56705. "A local white flint variety."

56706. "Lao-lai-tsou (white dent)."

56707. "Ma-ya-tsou (red dent)."

56708 and 56709. "From Sapporo."

56708. "Longfellow (imported from the United States about 35 years ago)."

56709. "Stephens Waushacum (imported from the United States about 25 years ago)."

56710 to 56745. IPOMOEA BATATAS (L.) Poir. Convolvulaceæ.

Sweet potato.

From St. Croix, Virgin Islands. Tubers represented by J. B. Thompson, agronomist in charge, Agricultural Experiment Station. Received March 22, 1923. Quoted notes by Mr. Thompson.

"All these seedlings were grown from seeds at this station during February, March, and April, 1922. The seeds were collected from plantings of the Big Wig, Key West 'yam,' and Black Rock varieties grown close together, and it is believed they may have been cross pollinated. We believe that there are good possibilities even from these seedlings which are most unpromising."

56710. "No. 2. A Big Wig seedling. Vines in nursery row 18 to 24 inches long, medium in thickness, green with red coloring at juncture with petiole. Leaf large, cordate, resembling that of Black Rock; red midribs and green veins. Tubers dark red. The original seedling plant yielded 5 tubers weighing 6 pounds 6 ounces. Flesh yellow, mottled with red."

56711. "No. 3. A Big Wig seedling. In the nursery row the vine growth was 2 to 4 feet in length, medium in diameter, green with red at juncture of petiole, and hairy. Leaf 3 parted, midrib and veins red, leaf growth dense. The tubers are red and the first or original seedling yielded 7 tubers weighing 1 pound 1 ounce. The color of the flesh is a rich yellow."

56712. "No. 4. A Big Wig seedling. Plants in the nursery row were 5 to 8 feet long, completely covering the soil. The stems were rather slender, green with red coloring at juncture of petiole. The leaves were numerous, 3 parted with red midribs. The tubers are coppery red, the flesh yellow, occasionally mottled with red. The original seedling bore 7 tubers weighing 2 pounds 8 ounces."

56713. "No. 5. A Big Wig seedling. The vines were 2 to 4 feet in length in the nursery row. The leaves were cordate and resembled those of Black Rock rather than those of Big Wig, and the seedling is probably a cross between these two varieties. The petioles, midribs, and veins are red and the tubers are a peculiar light red. The flesh is white, mottled with red. The original seedling plant yielded 12 tubers weighing 6 pounds 4 ounces."

56714. "No. 7. A Big Wig seedling. This seedling is as yet untested. The very leafy vine, 3 to 4 feet long, covers the ground completely. The leaves are dark green, broadly shouldered and lanceolate. The roots are red, flesh white. Although not thoroughly tested this is not regarded as a promising seedling."

56715. "No. 14. A Big Wig seedling. The vines in the nursery row were 2½ to 4 feet in length, numerous, green and leafy. Leaves numerous, making a dense growth

56710 to 56745—Continued.

and affording a perfect covering for the hill, broad, 3 parted, with long green petioles. The midribs and veins are green, but the tubers are red. The original seedling yielded 4 tubers weighing only 12 ounces. Flesh pale yellow, almost white."

56716. "No. 15. A Big Wig seedling. A rampant grower, vines 2 to 3 feet long, numerous, stout, chocolate colored, hairy. Leaves large, broad, pointed, very dark green, petioles green tinged with red, 10 to 12 inches long on old growth, midribs and veins red. Tubers dark red, flesh pale yellow. Original seedling yielded 2 tubers weighing 8 ounces."

56717. "No. 18. A Big Wig seedling. A rampant grower, the vines reaching out 8 or 10 feet on each side of the nursery row. This variety flowers profusely. Tubers red, flesh pale yellow. Not considered very promising."

56718. "No. 19. A Big Wig seedling. Vines in nursery row 18 to 24 inches long, bearing a dense growth of finely cut leaves. Leaves deeply cut and lobed, 5 parted, midribs red, veins green to wine colored. The tubers are dark red and the flesh a golden yellow sometimes mottled with red. Original seedling plant had no tubers."

56719. "No. 20. A Big Wig seedling. In the nursery row the stems were from 2 to 4 feet long and numerous. The leaves were numerous, dark green, with red midribs and veins. The original seedling plant yielded 6 tubers weighing 10 ounces. The tubers are a dark red with pale-yellow flesh sometimes mottled with a little red."

56720. "No. 22. A Big Wig seedling. In the nursery row the vines were slender, 2 to 4 feet in length and moderately leafy. Leaves broad, relatively short, pointed, 3 parted, midribs and veins green. Flesh of tubers deep yellow. The original seedling plant bore 12 tubers weighing 3 pounds."

56721. "No. 24. A Big Wig seedling. In the nursery row this vine was medium stout, 3 to 4 feet in length, leaves medium size, dull green, 3 and 5 parted (usually 3 parted). The tubers are light red, irregular in form, and show a tendency to burst and split badly. The variety shows a tendency also to produce tubers at the joints where they root, even at a distance from the hill. The original seedling plant produced 33 tubers weighing 13 pounds 8 ounces and was the heaviest producing hill among all the original plants. The flesh is pale yellow."

56722. "No. 26. A Big Wig seedling. In the nursery row this seedling shows short vine growth with rather sparse foliage. The stems are short and stout, attaining a maximum length of 2 to 3 feet. The leaves are lanceolate with a wine-colored midrib. The tubers are dark red and grow at the ends of fleshy roots that are 12 to 18 inches long; flesh white. The tubers are traversed by a number of pronounced ribs or veins. The original seedling yielded 4 pounds of tubers under very adverse conditions."

56723. "No. 28. A Big Wig seedling. Stems rather slender, 2 to 3 feet in length, green and leafy. Leaves broad, 3 parted, midrib wine colored. Tubers long, white, smooth, and hanging on roots in a cluster around the main stem, flesh creamy yellow. The original seedling plant produced 13 tubers weighing a total of 3 pounds 4 ounces."

56724. "No. 29. A Big Wig seedling. Stems short, stout, leafy, covering the ridge well, but not having sufficient length to completely cover the full area between rows. Leaves large, broad, 5 parted, midribs and

56710 to 56745—Continued.

veins red. The original seedling plant bore 15 tubers weighing 4 pounds 7 ounces. The tubers are light red, short and thick, and the flesh is yellow."

56725. "No. 30. A Big Wig seedling. Vines 2 to 4 feet long and densely covered with leaves. Leaves large, cordate, and dark green. Tubers light red, flesh yellow. The original seedling plant bore 7 small tubers weighing a total of 12 ounces."

56726. "No. 31. A Big Wig seedling. In the nursery row the vines are strong but short and sparsely leaved. The leaves are small with five deeply cut lobes. This variety shows a tendency to produce tubers at the nodes of the vines where they attach themselves to the soil. The tubers are a light red or rose, flesh yellow. The original seedling yielded 38 tubers weighing 5 pounds 4 ounces."

56727. "No. 39. A Big Wig seedling. Vines short, stout, bunching, and bearing an abundance of foliage. Leaves medium in size, 3 and 5 parted, midribs and veins wine colored. The tubers are dark red, flesh creamy yellow. The original seedling plant bore 1 tuber weighing 3 ounces."

56728. "No. 40. A Big Wig seedling. The stems are stout and numerous and about 18 inches in length. Leaves dark green, cordate, attractive, midrib and veins red. The tubers are dark red, flesh pale yellow. The original seedling plant bore no tubers."

56729. "No. 55. A Black Rock seedling. The stems are 2 to 3 feet long in our nursery row. The leaves are somewhat variable in form but usually lanceolate and bear some resemblance to those of the variety grown at this station under the name of the 'Key West yam.' The tubers are dark red and are borne on the ends of long fleshy roots; flesh rich yellow, also cooks yellow. The original seedling plant yielded 30 tubers weighing a total of 4 pounds 12 ounces."

56730. "No. 57. A Black Rock seedling. The stems are 2 to 5 feet in length, medium stout, and leafy. Leaves light green, large, broad, lanceolate, midribs wine colored, veins green. The tubers are light coppery red, smooth, and attractive. The flesh is a rich yellow. The original seedling plant bore 77 tubers weighing 8 pounds."

56731. "No. 58. A Black Rock seedling. The vine is 2 to 3 feet in length and very leafy. The leaves are cordate and rounded and the younger ones are wine colored, especially around the margins. The tubers are dark red, flesh yellow, mottled with red. The original seedling plant bore 37 tubers weighing 5 pounds

56732. "No. 73. A Big Wig seedling. Vines short, 1 to 2 feet long. Leaves broad and lobed, usually 5 parted, broad blade. The tubers are smooth and dark red, flesh yellow, often mottled with red. The original seedling hill bore 8 tubers weighing 1 pound 14 ounces.

56733. "No. 80. A Big Wig seedling. The vines are 2 to 3 feet in length and leafy. Leaves large, broad, 5 parted, dark green, midribs and veins amber. The tubers are white, flesh pale yellow, mottled with a little red. The original seedling plant bore 18 tubers weighing a total of 3 pounds 10 ounces.

56734. "No. 105. A Big Wig seedling. The vines are 5 feet or less in length and very leafy. Leaves large, deeply cut and lobed, the lobes narrow, midribs wine colored. Tubers light red and growing in clusters close to base of main plant. The original seedling plant bore 14 tubers having a total weight of 6 pounds 4 ounces. Tubers light red with pink underskin, flesh yellow."

56710 to 56745—Continued.

56735. "No. 110. A Big Wig seedling. The parent plant yielded 4 tubers weighing 5 ounces. Vines medium to long, reaching 3 to 5 feet or more from hills. Leaves not numerous, deeply cut and lobed, 5 parted, midribs and veins nearly green. The original seedling plant bore 11 tubers weighing 3 pounds 8 ounces. The tubers are smooth and light red, with pale-yellow flesh."

56736. "No. 142. A Big Wig seedling. Stems 1 to 3 feet long, green. Leaves small, green, cordate, midribs and veins green. The tubers have a smooth white exterior and yellow flesh."

56737. "No. 157. A Big Wig seedling. The parent plant bore 4 tubers weighing 12 ounces. The stems are short, bunching, and leafy. The leaves are 5 parted and have dark-red midribs and veins. The tubers are smooth and yellow, and the flesh is pale yellow or almost white with occasional faint red rings. The original seedling plant yielded 40 tubers weighing 5 pounds 1 ounce."

56738. "No. 195. A Black Rock seedling. The parent plant yielded 5 tubers weighing 12 ounces. Vines long, running to 6 feet or more from hill and covering the hill and interspaces well. Leaves medium in size, cordate to cordate-lanceolate in form, midribs green or amber, veins green. The original seedling plant bore 9 tubers weighing 4 pounds. The tubers were smooth and light red, the flesh a rich yellow."

56739. "No. 205. A Black Rock seedling the parent plant of which bore 5 tubers weighing 7 ounces. Vines 2 to 5 feet long, numerous and leafy. Leaves dark green, cordate, midribs wine colored. The original seedling plant bore 25 tubers weighing 5 pounds 4 ounces. The tubers are dark red with pale-yellow flesh."

56740. "No. 222. A Key West 'yam' seedling. The parent hill bore 2 tubers weighing 12 ounces. The vines are 2 to 4 feet in length, green. Leaves light green, midribs and veins green, cordate. The tubers are light rose, flesh yellow. The original seedling plant bore 26 tubers weighing 3 pounds 14 ounces."

56741. "No. 233. A Black Rock seedling. Tubers smooth, yellow; flesh yellow, sometimes mixed with a little red. Vines 2 to 3 feet long. Leaves cordate, midribs green. The original seedling plant produced 13 tubers weighing 6 pounds 2 ounces."

56742. "No. 240. A Black Rock seedling, not yet described. The original seedling plant yielded 26 smooth coppery red tubers with a total weight of 5 pounds 4 ounces; flesh yellow."

56743. "No. 251. A Black Rock seedling, not yet described. The original seedling plant produced 14 yellow tubers weighing 1 pound 11 ounces; flesh yellow."

56744. "No. 259. A Big Wig seedling. The parent hill yielded 5 tubers weighing 8 ounces. Vines short, bunching, about 2 feet long. Leaves small to medium in size, comparatively long, 3 to 5 parted. The original hill yielded 10 tubers weighing 3 pounds 8 ounces. The tubers are dark red and the flesh yellow."

56745. "No. 275. The parentage of this number is unknown. The original seedling plant bore 17 tubers weighing 8 pounds 1 ounce. The tubers are dark red and the flesh pale yellow, mottled with a little red."

56746 to 56755. MALUS SYLVESTRIS Mill. Malaceæ. (*Pyrus malus* L.) Apple.

From Damascus, Syria. Scions presented by Charles E. Allen, American consul. Received March 29, 1923.

"These apple varieties are grown in the Plain of Zebdani, about 25 miles northwest of Damascus, at an altitude of a little above 3,500 feet. The apples of this region, though small, are known for their delicious flavor and bring good prices in the markets of Syria and Palestine. The methods of culture are primitive, and it is believed that the quality and size of the apples could be greatly improved by modern methods." (Allen.)

56746. No. 1. *Dershawî*.

56747. No. 4. *Hamod*.

56748. No. 6. *Feudy*.

56749. No. 7. *Fatima*.

56750. No. 8. *Lazkani*.

56751. No. 9. *Iraki*.

56752. No. 10. *Hamani*.

56753. No. 12. *Zebdani*.

56754. No. 13. *Kilatty*.

56755. No. 14. *Marius*.

56756 to 56759.

From Shantung, China. Scions sent in by K. M. Gordon, South Shantung Industrial and Agricultural School of the American Presbyterian Mission (North), at the request of C. A. Reed, Bureau of Plant Industry. Received March 23, 1923. Quoted notes by Mr. Gordon.

56756 to 56758. JUGLANS REGIA L. Juglandaceæ. Walnut.

56756. "(No. 1.) From Cheng Chia Chuang, southwest of Tsingchowfu; the tree was one of the finest seen, and was said to have produced 600 cattie (about 800 pounds) of nuts the previous season."

56757 and 56758. "From Cheng Chia Chuang district."

56757. "(No. 2.)"

56758. "(No. 3.)"

56759. PYRUS sp. Malaceæ. Pear.

"(No. 5.) *Ya li* (Duck pear). From 35 li (about 10 miles) northwest of Tschow. The fruits are large, with thin smooth yellow skin and white juicy sweet flesh. This variety is a good keeper."

56760 to 56766.

From China. Scions sent in by K. M. Gordon, South Shantung Industrial and Agricultural School of the American Presbyterian Mission (North), at the request of C. A. Reed, Bureau of Plant Industry. Received March 26, 1923. Quoted notes by Mr. Gordon.

56760. AMYGDALUS PERSICA L. Amygdalaceæ. (*Prunus persica* Stokes.) Peach.

"(No. 4.) *Fei peach*. From 90 li (about 30 miles) northwest of Taianfu, Shantung. This is the most famous peach of China; it is a clingstone with the skin and flesh tinged with red."

56761. CASTANEA MOLLISSIMA Blume. Fagaceæ. Chestnut.

"(No. 7.) From Wan Chia Chang, 45 li (about 15 miles) northwest of Changli, Chihli. This tree, the finest I saw in China, is reported to produce very large sweet nuts."

56760 to 56766—Continued.

56762. DIOSPYROS KAKI L. f. Diospyraceæ. Kaki.

"(No. 3.) *Honey persimmon*. From Nan Tui Shou, 110 li (about 35 miles) southeast of Tsinanfu, Shantung. The skin slips off the small red fruits when they are ripe; they are very sweet."

56763 and 56764. JUGLANS REGIA L. Juglandaceæ. Walnut.

"From Wan Chia Chuang, Chihli. This district probably produces the best walnuts of China."

56763. "(No. 7.)" 56764. "(No. 8.)"

56765 and 56766. PYRUS spp. Malaceæ. Pear.

56765. PYRUS sp.

"(No. 2.) *Laiyang*. A variety from Laiyang, Shantung. The fruit is large and dark skinned, and said to be very fine grained, sweet, and juicy."

56766. PYRUS sp.

"(No. 6.) *Peking White*. From Tungshan, 35 li (about 10 miles) northwest of Peking. The fruit is small and round with light lemon-yellow skin and fine-grained sweet flesh."

56767. CASTANEA sp. Fagaceæ.

Chestnut.

From Tengyueh, Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 16, 1923.

Received without data; possibly the same as S. P. I. No. 56768, which comes from the same general region.

56768. CASTANOPSIS HYSTRIX DC.

Fagaceæ. Chestnut.

From southwestern Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 10, 1923.

"(No. 6716. October 24, 1922.) A lofty tree 80 to 100 feet tall, with trunks 3 feet in diameter, found in the pine forests of the Shweli Valley 40 li (about 12 miles) north of Lungling at an altitude of 6,000 feet. The smooth fawn-colored bark is flaky, and the straight ascending branches give the tree an oblong appearance. The burs are in long densely packed spikes, and the involucre are covered with long soft green spines. The small nuts are borne singly or in twos. This is one of the finest forest trees of the region. According to the natives the wood is very durable and never attacked by insects." (Rock.)

56769. SACCARUM OFFICINARUM L.

Poaceæ. Sugarcane.

From Honolulu, Hawaii. Seeds presented by H. P. Agee, director, Hawaiian Sugar-Planters' Association. Received March 28, 1923.

"D 1135. A sugarcane variety introduced for planting at Canal Point, Fla." (C. O. Townsend.)

56770 and 56771. TRIFOLIUM spp.

Fabaceæ.

From Jonkoping, Sweden. Seeds presented by Prof. Hernfrid Witte, Swedish Moor-Culture Association. Received March 28, 1923. Quoted notes by Professor Witte.

Introduced for department specialists engaged in clover-breeding investigations.

56770. TRIFOLIUM HYBRIDUM L.

Alsike clover.

"Genuine Swedish-grown alsike clover."

56770 and 56771—Continued.56771. *TRIFOLIUM PRATENSE* L. Red clover.

"In Sweden this late-flowering type of red clover is grown for seed and hay throughout the country; the early-flowering type can be grown only in the South."

56772 to 56776. *TRIFOLIUM* spp. Fabaceæ.

From Copenhagen, Denmark. Seeds purchased from I. C. Bjerg Jensen. Received March 31, 1923.

Introduced for department specialists engaged in clover breeding.

56772 and 56773. *TRIFOLIUM PRATENSE* L. Red clover.56772. *Hersnap.*

For previous introduction, see S. P. I. No. 56285.

56773. *Tystoffe* No. 70.56774 to 56776. *TRIFOLIUM REPENS* L. White clover.56774. *Morso.*56775. *Stryno.*56776. *Polonian White clover.***56777 to 56779.**

From Yunnan, China. Collected by J. F. Rock, Agricultural Explorer of the U. S. Department of Agriculture. Received January 18, 1923. Quoted notes by Mr. Rock.

56777. *CASTANEA* sp. *Fagacæ.* Chestnut.

"(No. 6729. November 12, 1922.) Seeds collected in the hills back of Mengka."

56778. *LILIUM* sp. *Liliacæ.* Lily.

"(November 8, 1922.) Bulbs of a wild lily 12 to 15 feet in height, found in forests of *Quercus* and *Schima* 1½ days' journey west of Tengyueh, on the Taping watershed, at an altitude of 8,000 feet. The leaves are long and lanceolate, and the large, ample panicles probably contain 10 or 12 flowers, which are said to be large and white."

56779. *PHOTINIA* sp. *Malacæ.*

"(No. 6726. November 11, 1922.) Seeds of a tree 30 to 40 feet high with a dense crown, found on the plain and hills near Mengka, at 5,000 to 6,000 feet altitude. The leaves are pale green and lanceolate, and the flowers, said to be white, are in large panicles 5 inches across. In November the tree is one mass of deep orange-red fruits."

56780 and 56781. *NEPHELIO* spp. Sapindacæ.

From Buitenzorg, Java. Seeds presented by the director, Botanic Garden. Received March 3, 1923.

56780. *NEPHELIO LAPPACEUM* L. Rambutan.

"This well-known fruit is probably a native of the Malayan Peninsula. The fruit is popular both with Europeans and natives alike and claims a place amongst the best fruits of the East. The tree is of medium size and, when bearing a good crop of fruit, one of the most ornamental of trees. The small green flowers are produced in loose panicles and are unisexual. Trees having all male flowers are often met with; such trees, of course, bearing no fruit. The flowering period varies somewhat with the season, but usually the tree blooms in April and May and again to a lesser extent in September and

56780 and 56781—Continued.

October. The fruit takes about four months to mature, and the main crop is generally ripe in August and September, to be followed by another crop toward the end of the year. As with most fruits, the crop varies in quantity; some years such enormous crops of fruit are produced that a difficulty is experienced in disposing of them. A considerable number of slight variations are to be noticed on the rambutans grown here. The color of the fruit varies from yellow to crimson. There is much difference in the flavor of the fruit; some are acid while others are sweet and of a delicious flavor. Also the quantity of flesh on the stones varies considerably. In the best varieties the flesh comes away easily from the seed. The fruit is usually eaten raw as dessert, but it can also be stewed or made into a preserve.

"The rambutan will grow in most soils, but responds well to good cultivation. The writer has in mind a certain tree which was long unproductive; by judicious management this tree was brought into fine condition and bore quantities of fruit yearly. In this instance a trench was dug round the tree at about 4 feet radius from the trunk. A charge of dynamite was employed to loosen the subsoil and the trench refilled with a compost of good soil and well-rotted cow manure. Clearly the rambutan is a tree that likes deep cultivation and an open soil. It may be raised from seed sown under shade, though it appears highly desirable to propagate the best varieties by grafting on seedling stocks. The Malays frequently raise young trees by a process of marcottage termed 'tut' in the Malay language. The advantages of this method are several and have been explained previously. The rambutan is a fruit worthy of the plant breeder's attention. By selection and good cultivation it seems quite possible that well-flavored varieties might in time replace the poor kinds frequently met with." (*J. N. Milsum, Fruit Culture in Malaya, p. 79.*)

56781. *NEPHELIO MUTABILE* Blume. *Pulasan.*

"*Pulasan.* A Malayan tree which is similar to the rambutan in appearance, but differs in the fruit and in the leaves being gray beneath. The fruit is larger than that of the rambutan and is a deep purple-brown with short blunt processes. According to Ridley, the flavor is decidedly superior to that of the latter fruit." (*Macmillan, Handbook of Tropical Gardening, 2d ed., p. 176.*)

For previous introduction, see S. P. I. No. 42385.

56782 to 56784. *ORYZA SATIVA* L. Poacæ.

From Seoul, Chosen. Seeds presented by the director, Department of Agriculture and Industry. Received March 20, 1923.

Early-maturing varieties introduced for department specialists engaged in rice-breeding experiments.

56782. *Kokuryomi Yaka.*56783. *Tamanishiki.*56784. *Waseshiniki.***56785. *MUSA GILLETII* Wildem. Musacæ.**

From Kisantu, Belgian Congo. Seeds presented by Père J. Gillet. Received March 21, 1923.

"From Lower Uele." (*Gillet.*)

For previous introduction and description, see S. P. I. No. 56485.

56786 to 56789.

From Burringbar, New South Wales. Seeds presented by B. Harrison. Received March 26, 1923. Quoted notes by Mr. Harrison, unless otherwise stated.

56786. *ALLOTHEROPSIS SEMIALATA* (R. Br.) Hitchc. Poaceæ. **Cockatoo grass.**

"A native grass which becomes 2 to 3 feet high in sandy soil."

"Cockatoo grass is excellent pasturage and of good seeding habit. It is leafy at the base." (Roland McKee.)

For previous introduction, see S. P. I. No. 41751.

56787. *CUDRANIA JAVANENSIS* Trecul. Moraceæ.

"*Cocklespur*. A thorny trailing shrub which should prove useful in making an almost impenetrable hedge."

The fruit, which is edible and of pleasant flavor, is irregular in shape and about as large as a small custard-apple.

For previous introduction, see S. P. I. No. 40618.

56788. *DAVIDSONIA PRURIENS* F. Muell. Cunoniaceæ.

56786 to 56789—Continued.

For previous introduction and description, see S. P. I. No. 56146.

56789. *PASPALUM SCROBICULATUM* L. Poaceæ. **Koda millet.**

"A native grass about a foot high, relished by all kinds of livestock."

An erect annual grass averaging 2 feet in height, native to India, where it is also extensively cultivated for the edible grain. The grain is poisonous, however, unless kept for a number of years. Cattle are fond of the grass when it is young; at the time of ripening it is poisonous to stock.

For previous introduction, see S. P. I. No. 51317.

56790. *GOSSYPIUM* sp. Malvaceæ. **Kidney cotton.**

From Horqueta, Paraguay. Seeds presented by Thomas R. Gwynn. Received February 26, 1923.

"*Mandiyu*, single seeded. Especially strong and used for hammocks." (Gwynn.)

Inventory.....	3
Index of common and scientific names.....	32

INTRODUCTORY STATEMENT

When the first Inventory of Seeds and Plants Imported was prepared in 1898, there were practically no government plant-breeding institutions in existence, and almost all of the plants introduced were for direct trial as new crops. Few wild forms were represented, and almost no collections of seeds which were the result of the hybridization or selection work of foreign plant breeders. To-day, as is particularly evident in this inventory, an exchange between the plant breeders of the world is going on which shows a remarkable activity in this field. This practice should be encouraged, for it opens up a wide field of trial for any new variety, and it can be confidently predicted that out of these newly made and plastic forms are likely to come many great commercial varieties of the future. Forms which in the country of their origin have proved inferior to others may prove superior in some other environment.

This inventory contains a record of many selected and previously studied varieties of plants sent by foreign plant-breeding institutions: A collection of peanut varieties from the Department of Agriculture at Buitenzorg, Java (*Arachis hypogaea*; Nos. 56842 to 56849); a new strain of red clover from Dr. H. N. Knudsen's selection station in Denmark (*Trifolium pratense*; No. 56850); two new Hungarian wheats, one a selection of the famous Canadian Marquis wheat originated by Charles Saunders (*Triticum aestivum*; Nos. 56858 and 56859); a new oat from Dr. R. J. Mansholt, of the Royal Netherlands College of Agriculture (*Avena sativa*; No. 56892); three new strains of red clover from Dr. G. Martinet, of the Seed-Control Station, Lausanne, Switzerland (*Trifolium pratense*; Nos. 56896 to 56898); two recently evolved varieties of oats from the Svalof Seed-Breeding Station of Sweden (*Avena sativa*; Nos. 56899 and 56900); eight selected potato strains resistant to disease from the station for potato culture of Czechoslovakia (*Solanum tuberosum*; Nos. 56912 to 56919); over 200 selected seedlings of the sweetpotato (which seldom seeds in the United States) from J. B. Thompson, of the experiment station of the Virgin Islands (*Ipomoea batatas*; Nos. 56920 to 57012, 57395 to 57514); a collection of 22 varieties of barley from the Cambridge School of Agriculture, England (*Hordeum* spp.; Nos. 57013 to 57034); a hardy variety of red clover selected by Doctor Knudsen, of the Danish Royal Agricultural Society (*Trifolium pratense*; No. 57036); a large collection of varieties of barley, rye, and wheat from L. Dekapreleevitch, Director of Plant Breeding, Tiflis, Transcaucasia (Nos. 57094 to 57210); a collection of clover varieties from Prof. N. I. Vavilov, of Petrograd (*Trifolium* spp.; Nos. 57229 to 57247); 12 strains of cotton, including the American Pima variety after being grown three generations in Egypt, from Dr. R. H. Forbes, formerly of Arizona (*Gossypium* spp.; Nos. 57248 to 57259); and a collection of grass and cereal varieties from the Russian experiment station of Ekaterinoslav (Nos. 57515 to 57611).

The growing volume of the selections which are being made by foreign plant breeders indicates a greater appreciation on the part of governments of the value of plant varieties in the agriculture of their countries.

The special explorations made by Dr. H. V. Harlan through North Africa, extending into India, in search of certain useful plant characters, which through sporting or otherwise have made their appearance in the barley fields of these regions, mark, it is believed, a turning point in the development of plant introduction and plant breeding alike. They attract attention to the value of a character, such as that of silkiness instead of harshness of awns, as a desirable thing to introduce and incorporate into American barleys through crossing. In the beginning new varieties were introduced because they might themselves be better than those we had. Varieties are now being introduced which are known to be inferior to those already grown in all but perhaps one or two characters, for the purpose of incorporating these superior characters into new and superior strains. Doctor Harlan's collections, a few of which appear in this inventory, will be found described under Nos. 57042 to 57074 and 57612 to 57664 (which include what is reported to be the original Mariout barley that has been so successful in America).

Of the other introductions in this seventy-fifth inventory, the following appear unusually interesting to the writer:

Rock's wild apple from the Likiang Snow Range of Yunnan, *Malus yunnanensis* (No. 57225), which grows at altitudes of 10,000 feet among the rocks on the borderland of Tibet and bears large corymbs of yellow and red fruits about an inch in diameter, and his fragrant-scented rich-pink-flowered *Luculia* (No. 56825) which he found on the Shweli-Salwin Divide in Yunnan and that he declares is "one of the handsomest shrubs of which I know" with salver-shaped flowers 2 inches across; Matsuda's three wild varieties of the Japanese persimmon, or kaki, from the mountains of Kyusiu Island, Japan, one of which may prove to be the wished-for ideal stock for the fine cultivated varieties now assuming rapid commercial importance (*Diospyros kaki*; Nos. 56831 to 56833); Mundy's "perennial Sudan grass," a variety which volunteers readily from seed, especially on cultivated land, and is a form of *Sorghum arundinaceum* (No. 56801); Roberts's long, fleshy cucumber (*Cucumis sativus*; No. 56805) from the Malwa Plateau of Rajputana, India, which is grown there in the hot rainy season and may prove adapted to cultivation in our Southern States in the summer; the eight varieties of bor, or Indian jujube (*Ziziphus mauritiana*; Nos. 56812 to 56819), sent in by G. S. Cheema from Poona, India, a species that has already become naturalized in southern Florida through the efforts of this office and is being used as a stewed fruit by a number of people; Nilsson's mutation of the ordinary European aspen *Populus tremula* (Nos. 56871 and 56872), which was found in the woods of western Sweden (it is fastigate, resembling the Lombardy poplar, and may prove useful for dooryards); Cooper's seed of the beautiful yellow flowering shrub, *Prinsepia sinensis* (No. 57087), from the mountains back of Patung, Hupeh. The early-flowering hardy character of this Chinese shrub, as Professor Sargent has already pointed out, will make it popular throughout the North Atlantic States, where it is hardy. The handsome deep-blue flowering *Exacum zeylanicum macranthum* (No. 57260), relative of our gentian, which Frank B. Noyes, of Washington, brought back from the mountains of Ceylon, may thrive in Florida and southern California. The supply of seeds of the grumichama of Brazil, *Eugenia dombeyi* (No. 57270), which Willis T. Pope sent from Honolulu, is of interest because this highly ornamental new fruiting shrub has proved hardy in southern Florida, and its cherrylike fruits are sure to be appreciated by those who can grow it. Johansen's *Triplaris cumingiana* (No. 57092), a striking ornamental tree from the Isthmus of Panama, deserves a place in the parks of the tropical world. A remarkable collection of seeds of hardy trees and shrubs presented by A. D. Woeikoff, director of the experimental farm at Echo, Manchuria, and including such rare species as *Betula davurica* (No. 57278), *Acanthopanax senticosum* (No. 57274), *Euonymus hamiltonianus* (No. 57281), *Prunus maackii* (No. 57310), *Tilia amurensis* (No. 57345), *T. mandshurica* (No. 57346), *Viburnum burejaeticum* (No. 57366), and *Prinsepia sinensis* (No. 57309), can not fail to be valuable in the ornamental plantings of the parks and dooryards in the Northwest.

As during the years past, the work of determination of the names of the various species introduced has been done by H. C. Skeels. The descriptive notes have been prepared by Paul Russell, who has had general supervision of this inventory.

DAVID FAIRCHILD,

Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN SEED AND PLANT INTRODUCTION,
Washington, D. C., May 25, 1925.

INVENTORY¹

56791. DILLENIA INDICA L. Dillenia- ceæ.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received May 25, 1923.

A handsome medium-sized tree with a round compact crown; the dark-green leaves are 15 inches long and 3 inches wide. The large white flowers are fragrant and very attractive. The smooth greenish heart-shaped fruits, 3 inches long and 4 inches wide, are produced in great profusion, maturing in September and October. The edible part consists of the large fleshy sepals which inclose the carpels and are pleasantly acid, suggesting the flavor of an unripe apple. In India the sepals are used in making jelly and cooling drinks and are also used in curries. (Adapted from *Philippine Agricultural Review*, vol. 10, p. 16.)

For previous introduction, see S. P. I. No. 49713.

56792. PRUNUS SEROTINA Ehrh. Amygdalaceæ. Capulin.

From Cuenca, Ecuador. Seeds presented by Dr. Federico Malo. Received May 26, 1923.

"Capulin seeds of a number of good varieties, collected in the vicinity of the Challuabamba Valley, about 11 kilometers from Cuenca, Ecuador." (Malo.)

To be grown for selection of promising seedlings.

For previous introduction, see S. P. I. No. 55765.

56793. TRIFOLIUM INCARNATUM L. Fabaceæ. Crimson clover.

From Paris, France. Seeds presented by H. Fauchet and A. Plessis. Received May 26, 1923.

Locally grown seed introduced for department specialists engaged in clover breeding.

56794. CUCUMIS sp. Cucurbitaceæ.

From Johannesburg, South Africa. Seeds presented by A. J. Bester. Received May 28, 1923.

"A 'cucumber' which I found being grown by the natives. It makes a very fine salad." (Bester.)

56795. TRIFOLIUM PRATENSE L. Fa- baceæ. - Red clover.

From Wellington, New Zealand. Seeds presented by A. H. Cockayne, biologist, Department of Agriculture. Received May 29, 1923.

"Grown on the Canterbury Plains in the South Island, New Zealand." (Cockayne.)

Locally grown seed introduced for department specialists engaged in clover breeding.

56796 and 56797. LYCOPERSICON ESCU- LENTUM Mill. Solanaceæ. Tomato.

From Nancy, France. Seeds presented by Edmond Gain, director, Botanic Garden. Received May 31, 1923.

Introduced for department specialists engaged in the study of tomato diseases.

56796. Var. *pyriforme*. A pear-shaped form of the common tomato.

56796 and 56797—Continued.

56797. Var. *pimpinellifolium*. A South American form, sometimes called the "currant tomato," with 2-ranked racemes of red fruits somewhat larger than a large red currant. The plant grows wild in Peru and Brazil, is very vigorous and comparatively hardy, and the fruits are excellent for preserving. (Adapted from *Sturtevant, Notes on Edible Plants*, p. 347.)

56798. STYLOSANTHES ERECTA Beauv. Fabaceæ.

From Boma, Belgian Congo. Seeds presented by the General Secretary, Belgian Congo Government General. Received May 26, 1923.

"This plant prospers in sandy soils, but does not thrive in black, humid soils. It is very drought resistant. In Guadeloupe horses search through the pastures for this plant." (*The General Secretary*.)

A copiously branched ascending shrub about 4 feet high, with broad, rather stiff, compound leaves, and terminal oblong heads of inconspicuous flowers. It is native to tropical Africa. (Adapted from *Olinier, Flora of Tropical Africa*, vol. 2, p. 156.)

Introduced for department forage-crop specialists.

56799. GARCINIA BUCHANANI Baker. Clusiaceæ.

From Dominica, British West Indies. Seeds presented by Alfred Keys, assistant curator, Botanic Gardens. Received June 6, 1923.

A tropical African relative of the mangosteen (*Garcinia mangostana*), introduced for breeding experiments with the mangosteen.

56800. PHYTOLACCA CLAVIGERA W. W. Smith. Phytolaccaceæ.

From Edinburgh, Scotland. Seeds presented by William W. Smith, regius keeper, Royal Botanic Garden. Received May 19, 1923.

A robust perennial about 4 feet high, first discovered in Yunnan, China, by George Forrest. It bears rounded terminal spikes of small rosy flowers which are followed by dense club-shaped masses of black fruits. The plant has flowered and fruited freely at the Royal Botanic Garden, Edinburgh, Scotland. (Adapted from *Gardeners' Chronicle*, ser. 3, vol. 71, p. 39.)

56801 and 56802. SORGHUM spp. Poa- ceæ.

From Salisbury, Rhodesia. Seeds presented by H. G. Mundy, Chief Agriculturist and Botanist of the British South Africa Co., through H. N. Vinall, Bureau of Plant Industry. Received June 7, 1923. Quoted notes by Mr. Mundy.

Introduced for department agronomists.

56801. SORGHUM ARUNDINACEUM (Willd.) Stapf.

"This is called locally 'perennial Sudan grass'; it is closely related to Sudan grass. In its natural habitat it grows on heavy, black, fertile lands and is apparently quite

¹ It should be understood that the varietal names of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Seed and Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their identity fully established, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized American codes of nomenclature.

56801 and 56802—Continued.

perennial. It does not spread by underground roots but volunteers very freely from seed, especially where the land has been cultivated. The stems are somewhat woody and more canelike than those of Sudan grass."

56802. *SORGHUM VERSICOLOR* Anderss.

"This is called locally 'black Sudan grass.'"

56803. *SOLANUM TUBEROSUM* L. Solanaceæ. Potato.

From Bogota, Colombia. Tubers presented by Brother Ariste Joseph. Received June 8, 1923.

"The yellow-fleshed potato is one of the most interesting varieties found in the Andean region, home of many remarkable potatoes. The tubers are rather small and have deep eyes, so that they are not as easily prepared for the table as those of some other varieties; but in point of quality they yield to none that I have tasted. The flesh is the color of American butter and has a rich, nutty flavor suggesting that of the chestnut. It seems to me the variety might be improved, so as to do away with the objectionable eyes, and that it would then be worth extensive cultivation." (*Wilson Popenoe*.)

56804. *TETRASTIGMA* sp. Vitaceæ.

From Belgian Congo. Seeds presented by C. Passau, Kilometer 309, near Kongolo. Received June 5, 1923.

"An annual climber greatly resembling the grape in habit, fruits, and general appearance, with non-woody stems from 30 to 50 feet in length. The plant seems to require having its feet in the shade and its head in the sun; it is never found in real forests, but grows up through underbrush." (*Passau*.)

56805. *CUCUMIS SATIVUS* L. Cucurbitaceæ. Cucumber.

From Jaipur, Rajputana, India. Seeds presented by Sir James Roberts. Received April 2, 1923.

"This cucumber is from Malwa, Central India. It is 18 to 20 inches in length and thicker and more fleshy than the ordinary cucumber varieties. It is grown in the rainy season, and as the Malwa Plateau is nearly 2,000 feet above sea level the temperature at that season is lower than in many parts of India. I believe that this variety should do well in the warmer parts of the United States." (*Roberts*.)

56806. *TRIFOLIUM PRATENSE* L. Fabaceæ. Red clover.

From Reading, England. Seeds presented by Sutton & Sons. Received April 2, 1923.

Wild red clover.

Introduced for department specialists engaged in clover breeding.

56807. *TRIFOLIUM PRATENSE* L. Fabaceæ. Red clover.

From Groningen, Netherlands. Seeds purchased from C. Broekema, manager, Groninger Zaaizaadvereeniging.

Rozendaal red clover.

Introduced for department specialists engaged in clover-breeding investigations.

For previous introduction, see S. P. I. No. 54889.

56808 to 56810.

From Verrieres le Buisson, Seine et Oise, France. Presented by A. Meunissier. Received April 3, 1923.

56808. *CARAGANA BOISI* C. Schneid. Fabaceæ.

Seeds of a handsome bush 10 to 12 feet high, with long, arching branches, native to Szechwan and eastern Tibet, China. In May the light-green foliage and numerous yellow flowers make this an especially attractive ornamental. (Adapted from letter of A. Meunissier, May 18, 1923.)

56809 and 56810. *CRATAEGUS LAVALLEI* Herinq. Malaceæ. Hawthorn.

"A tree of garden origin with pure-white flowers and red fruits an inch in diameter, well displayed by the rich-brown leaves in autumn." (*H. C. Seels*.)

For previous introduction, see S. P. I. No. 54078.

56809. Seeds.

56810. Scions.

56811. *IRIS* sp. Iridaceæ. Iris.

From western Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the Bureau of Plant Industry. Received April 3, 1923.

"(February 6, 1923.) Seeds collected from a fruiting plant about 2 feet high found in the snow at an altitude of 8,800 feet on the crater of the extinct volcano Tayinshan, near Tengyueh. The natives say that this is a very handsome plant with large, purplish blue flowers." (*Rock*.)

56812 to 56819. *ZIZIPHUS MAURITIANA* Lam. (*Z. jujuba* Lam., not Mill.) Rhamnaceæ. Bor.

From Poona, Bombay, India. Seeds presented by G. S. Cheema, Horticulturist to the Government of Bombay, College of Agriculture. Received April 4 and 11, 1923.

"The bor, or Indian jujube, is grown throughout India for its fruits, which are usually small and more or less spherical in the wild forms. The cultivated kinds which have been selected are larger and oval or oblong in shape. When cooked some of the varieties have a very pleasing acid flavor not unlike that of plums. The bor is a valuable fruit for the warmer parts of Florida and other Southern States, and merits serious consideration as a home fruit in these sections." (*C. C. Thomas*.)

For previous introduction, see S. P. I. No. 55485.

56812. No. 13.

56816. No. 17.

56813. No. 14.

56817. No. 19.

56814. No. 15.

56818. No. 21.

56815. No. 16.

56819.

56820. *ROSA SEMPERVIRENS* L. Rosaceæ. Rose.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received April 12, 1923.

A shrubby wild rose which grows in hedgerows and rather dry situations in the southern and western parts of France. The shining green leaves, composed of five to seven leaflets, are persistent throughout all or part of the winter, and the single white flowers appear from May to July. There are a number of horticultural forms cultivated as ornamentals. (Adapted from *Bonnier, Flore Complète de France*, vol. 4, p. 6, pl. 181.)

For previous introduction, see S. P. I. No. 32960.

56821. ANDROCYMBIUM PUNCTATUM
(Cav.) Baker. Melanthaceæ.

From Tripoli, Libya, North Africa. Bulbs presented by E. O. Fenzi. Received April 4, 1923.

A stemless ornamental of the Amaryllis family, native to the Cape of Good Hope. The flowers, whitish with green veins and purple stamens, are in a dense umbel surrounded by about four narrow, spreading, bright-green leaves 5 or 6 inches long. (Adapted from *Gardeners' Chronicle*, vol. 1, new series, p. 786.)

56822. GARCINIA MANGOSTANA L. Clusiaceæ. **Mangosteen.**

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, director, General Experiment Station, Department of Agriculture, Industry, and Commerce. Received April 11, 1923.

Mangosteen seeds introduced from Java for testing in our tropical dependencies.

For previous introduction, see S. P. I. No. 56667.

56823 to 56829.

From Yunnan, China. Seeds collected by J. F. Rock, Agricultural Explorer of the Bureau of Plant Industry. Received April 2, 1923. Quoted notes by Mr. Rock.

56823. GORDONIA sp. Theaceæ.

"(No. 7884. Tienyinssu. January, 1923.) A shrub about 8 feet high found at an altitude of 6,000 feet. The handsome white flowers are 1½ inches across, and the fruit is a woody capsule."

56824. LIGUSTRUM sp. Oleaceæ. **Privet.**

"(No. 7877. Wolung. January, 1923.) A very ornamental shrub 10 feet high which grows among lava boulders near Tengyueh at an altitude of 6,000 feet. The cream-colored flowers are in large pyramidal clusters."

56825. LUCULIA sp. Rubiaceæ.

"(No. 7824. December, 1922.) A handsome shrub 6 to 18 feet in height which grows on the Shweli-Salwin Divide in mixed rain forests at an altitude of 8,000 feet and also in open gulches at a slightly lower altitude, even as low as 6,000 feet, but reaches its best development at 8,000 feet. In winter this region is often covered with snow and ice. The bright-green narrow leaves have reddish stems, and the rich-pink flowers are in large terminal corymbs 6 inches wide. The individual flowers are deliciously fragrant and nearly 2 inches across, with a salver-shaped corolla and a tube an inch long. This is one of the handsomest shrubs of which I know."

56826. PITTOSPORUM sp. Pittosporaceæ.

"(No. 7886. Kaotien. January 21, 1923.) A tree 30 to 40 feet high, handsome in shape and foliage, with cream-colored flowers borne in large terminal panicles and red fruits."

56827 and 56828. RHODODENDRON spp. Ericaceæ.**56827. RHODODENDRON sp.**

"(No. 7865. Homushu. December, 1922.) A shrub 10 to 15 feet high, which grows at an altitude of 8,000 feet on the summit of the Salwin watershed in dense forests but near the margins. The oval dark-green leaves, deeply wrinkled above, are covered with matted brown wool, as is also the inflorescence. The flowers are white."

56823 to 56829—Continued.**56828. RHODODENDRON sp.**

"(No. 7866. Kaotien. January 6, 1922.) A handsome compact shrub 6 to 8 feet high, found in forests 2 days' travel from Tengyueh at an altitude of 6,500 feet. The uniformly green leaves are quite narrow, and the flowers are said to be white."

56829. SCHIMA sp. Theaceæ.

"(No. 7864. Homushu. December, 1922.) A fine tree 30 to 40 feet in height, which grows in dense forests on the Salwin watershed at an altitude of 8,000 feet. The leaves are narrowly oval, the flowers are white, and the fruits are small globular capsules. There are about four species of Schima found in Yunnan, and this one is rarer than the others."

56830. TRIFOLIUM INCARNATUM L. Fabaceæ. **Crimson clover.**

From Valence sur Rhone, France. Seeds purchased from Tézier Frères. Received April 12, 1923.

Locally grown seed introduced for department specialists engaged in clover breeding.

56831 to 56833. DIOSPYROS KAKI L. f. Diospyraceæ. **Kaki.**

From Osaka Machi, Tokyo, Japan. Seeds presented by Sengo Matsuda. Received April 6, 1923. Quoted notes by Mr. Matsuda.

Wild kaki varieties introduced as stocks for the cultivated sorts.

56831. "Gara-gara (prolific bearer). A very stout tree from the mountainous districts of Kyusiu Island. The sour fruits are pickled, and the juice is used for waterproofing purposes."

56832. "Tsurushi-gaki. This is good for using dried."

56833. "Yama-gaki. Sour fruits used for pickles."

56834 to 56837. SOJA MAX (L.) Piper.
(*Glycine hispida* Maxim.) Fabaceæ. **Soybean.**

From Liaoyuanchow, Manchuria, China. Seeds presented by H. C. Chang. Received April 12, 1923. Quoted notes by Mr. Chang.

56834. "Black (green inside)."

56835. "Black (yellow inside)."

56836. "Green." 56837. "Yellow."

56838 to 56841. MANGIFERA INDICA L. Anacardiaceæ. **Mango.**

From Honolulu, Hawaii. Plants presented by Willis T. Pope, horticulturist, Agricultural Experiment Station. Received April 12, 1923. Quoted notes by Mr. Pope.

56838. "West India No. 9. This variety, now quite common in Hawaii, was introduced about 1885 under this name by Joseph Marsden.

"Description of fruit: Shape resembling the letter S; stem prominent; size from 3½ to 4½ inches long, from 2¾ to 2½ inches broad, and from 2 to 2½ inches thick; color before fruit is mature green, turning to a pale yellow when ripe, with a slight blush of pink on the upper end of the exposed side; peeling qualities very good; texture variable but in most specimens rather fibrous; flesh light yellow, sweet but watery; seed small; tree an abundant bearer. The fruit appears to be quite resistant to the attacks of the mango blight."

56838 to 56841—Continued.

56839. "*Kalihi chutney* mango. Original tree supposed to be a cross between West Indian No. 5 and some other mango. It grows near the Kalihi stream, King Street, Honolulu. The tree is vigorous and prolific, and the fruit is large, handsome, and of excellent quality.

"Description of the fruit: Size medium to large; shape almost round with blunt double apex; weight varying from 8 to 12 ounces; weight of seed about three-fourths ounce; color, a beautiful golden apricot, splashed with a few irregular dashes of bright red about the shoulder, yellow dots visible all over the surface of the fruit. Flesh yellow to orange-yellow, firm, with little fiber and of a most delicious rich flavor. An excellent keeper."

56840. "*Victoria* mango. The original tree, *Victoria No. 8*, is a seedling growing on the residence property of Thomas G. Thrum, Honolulu, Hawaii. During the eighties a number of mango seeds were brought from the West Indies by Joseph Marsden, a Government official of Hawaii. Among the seedlings developed from the introduced seeds was one known as No. 9. In 1897 a seed of this No. 9 was given to Mr. and Mrs. George Ashley. Mrs. Ashley germinated this seed, setting it in the front yard in its present location on June 20, 1897, the date of the Diamond Jubilee of Queen Victoria of England. For this reason the tree was called *Victoria No. 9*. When it fruited it was discovered that the fruit was different from any of the other mangos growing in Hawaii, particularly in color. Its qualities are superior to any of those mangos formerly brought to Hawaii by Mr. Marsden.

"The tree has proved to be very prolific, often producing as many as three distinct crops per year. The fruits are but little clustered, generally hanging singly on individual stems. From the time the fruits set they are red, becoming more brilliant on ripening. Like some other mangos, the *Victoria No. 9* reproduces its quality of fruit fairly true on seedling trees.

"Description of the fruit: Size medium, weight about 9 ounces; shape oblong, slightly 8 shaped and necked somewhat at the stem end; apex broadly rounded with curve ending in a small blunt beak which sometimes contains a small hole-like depression; color when ripe shaded with brilliant vermilion over yellow ground color which is most evident at apex. Surface marked with small yellow dots which become indistinct where red is deepest. Shoulder of fruit has delicate powdery bloom. Skin of medium thickness, strong enough to peel well. Odor pleasant. Ripe flesh a deep rich yellow, of good texture; juice sweet acid and of flavor of the Pirie mango. Seed small, weight three-fourths of an ounce. In marketing qualities this ranks among the best varieties in Hawaii."

For previous introduction, see S. P. I. No. 54690.

56841. "*Whitney* mango. Original tree a seedling of the sweet Hawaiian mango, growing in the yard of Dr. J. M. Whitney, 1325 Punahou Street, Honolulu. This variety grows large and vigorous and is a prolific bearer.

"Description of fruit: Size medium; shape oblong, broader than thick, with a rather extended, pointed apex; weight 8 to 10 ounces; color when ripe light greenish yellow with light dots; skin rather tough; peeling qualities fair. Flesh light yellow, without fiber, melting, sweet, and of excellent flavor. It is claimed that the fruit of this variety has never shown signs of having been stung by the fruit fly. A good variety for the fresh-fruit market."

56842 to 56849. *ARACHIS HYPOGAEA* L.
Fabaceæ. Peanut.

From Buitenzorg, Java. Seeds presented by Carl Hartley. Received April 12, 1923. Quoted notes by Mr. Hartley.

56842 to 56849. "The following numbers are of the Holle type. This type has a seed considerably heavier than the Broel and, of course, a larger pod. It is also an early-ripening bunch type, though not quite as pronounced in these characters as the Broel. It is ordinarily harvested on low and middle elevations in Java in 100 days after the seed is sown. It is by far the most popular type. It is my understanding that these varieties were tried by the United States Department of Agriculture in South Carolina last year and that they indicated high yielding ability but a much longer growing period than in Java."

56842. "No. 50. Obtained from Menado."

56843 to 56846. "From native sources in Java."

56843. No. 52. 56845. No. 66.

56844. No. 64. 56846. No. 67.

56847. "No. 77. The so-called 'Pure Line 21' of the Department of Agriculture's selection station at Buitenzorg. This is probably the best number from the standpoint of productiveness."

56848. "No. 78. The so-called 'White Hybrid No. 3' of this station."

56849. "*Broel*. This is a mixture of various Broel races from Java and Sumatra. The Broel is a very early ripening bunch type with small pods and short nuts. It is cultivated to a considerable extent in eastern Java on soils which are poor and on which other varieties showed too high a percentage of unfilled pods. In general, it is not as popular as the Holle type. It corresponds very closely to the American type known as 'Spanish.'"

56850. *TRIFOLIUM PRATENSE* L. Fa-
baceæ. Red clover.

From Copenhagen, Denmark. Seeds presented by H. N. Knudsen, Danish Royal Agricultural Society. Received April 12, 1923.

"*Hersnap*. This is a Danish strain and has given, with us, a higher yield than foreign seed." (Knudsen.)

Introduced for department specialists engaged in clover-breeding investigations.

For previous introduction of this variety, see S. P. I. No. 56285.

56851 and 56852. *ANANAS* sp. Bro-
meliaceæ. Pineapple.

From Vicosa, Minas Geraes, Brazil. Seeds presented by P. H. Rolfs, director, Escola Superior de Agricultura e Veterinaria. Received April 13, 1923. Quoted notes by Mr. Rolfs.

"These are considered to be wild pineapples and are very abundant here. In general the fruits are cylindrical, about 4 inches in diameter and 6 inches long. The crowns are medium sized in comparison with the size of the fruit, and crown slips are produced as well as basal ones. In color the fruits vary from white to dull green and red. The leaves are long and narrow, with very rigid and very sharp spines set quite a distance apart; they remind one of the leaves of the *Ananaz ratao* of the Cubans, which also grows wild here. The bract which subtends each segment of the fruit is so large that, when the fruit is ripe, the bract laps over the subtended segment. These pineapples should be useful in hybridization experiments."

56851 and 56852—Continued.

56851. "(No. 1. March 12, 1923.) From several fruits."

56852. "(No. 2. March 12, 1923.) From one fruit."

For illustrations of this pineapple, see Plate I.

56853. MEDICAGO SATIVA L. Fabaceæ. Alfalfa.

From Tucuman, Argentina. Seeds presented by W. E. Cross, Estación Experimental Agrícola. Received April 13, 1923.

"*Inverniza No. 3*. A new variety which we discovered in this section; it is of the same type as the smooth form of Peruvian alfalfa, but of considerably greater vigor and also of greater permanence when once established." (Cross.)

56854 and 56855.

From Avondale, Auckland, New Zealand. Seeds presented by H. R. Wright. Received April 13, 1923. Quoted notes by Mr. Wright.

56854. CUCURBITA PEPO L. Cucurbitaceæ. Vegetable marrow.

"This is the vegetable marrow as grown by the natives of New Zealand. It is a good keeper and can be used either green or ripe."

56855. PHYSALIS PERUVIANA L. Solanaceæ. Poha.

"*Golden Nugget*. A new variety of Cape gooseberry. It is not a dessert fruit, but is suitable for making jam."

56856. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Helsingfors, Finland. Seeds purchased through Leslie A. Davis, American consul, from Centralandelslaget Labor m. b. t. Received April 13, 1923.

"This strain has been cultivated in Finland for about 34 years." (Ernst Hasselblatt.)

Introduced for the use of department specialists engaged in clover breeding.

56857. RHODODENDRON DELAVAYI Franch. Ericaceæ. Rhododendron.

From Tengyueh, Yunnan, China. Seeds collected by J. F. Rock, Collaborator of the Bureau of Plant Industry.

"(No. 7935. February 20, 1923.) A shrub 5 to 6 feet high which grows on the summit of the extinct volcano, Lutsungshan, at an altitude of 9,050 feet, about 10 miles north of Tengyueh. The very narrow leaves are pale brown beneath, and the crimson flowers, which are not fragrant, are in terminal clusters. This is the first of all the rhododendrons to bloom, the flowers appearing in early February." (Rock.)

For previous introduction, see S. P. I. No. 56355.

56858 and 56859. TRITICUM AESTIVUM L. (T. vulgare Vill.) Poaceæ.

Common wheat.

From Magyarovar, Hungary. Seeds presented by J. Gyárfás, director, Hungarian Agricultural Experiment Station for Plant Research. Received April 13, 1923. Quoted notes by Mr. Gyárfás.

56858. "*Bankuti No. 5*. Hungarian selected wheat; one of the best varieties and excellent for baking."

56859. "*Bankuti Marquis No. 4*. Selected Marquis wheat grown in Hungary."

56860 and 56861. VICIA spp. Fabaceæ. Vetch.

From Omagari, Akita Ken, Japan. Seeds presented by Dr. Isabura Nagai, director, Riku-u substation, Agricultural Experiment Station. Received April 17, 1923. Quoted notes by Dr. Nagai except as otherwise stated.

56860. VICIA TETRASPERMA (L.) Moench.

"*Kasuma gusa*."

An annual vetch found throughout Europe except in the extreme north and south. The stems, usually smooth, climb to a maximum height of 20 inches. The leaflets are very narrow and small, and the flowers vary in color from bluish to lilac, with violet veins. (Adapted from Ascherson und Graebner, *Synopsis der Mitteleuropäischen Flora*, vol. 6, pt. 2, p. 912.)

56861. VICIA UNJUGA A. Br.

"*Nantenhagi*."

"An erect-growing plant which would appear to be valuable as a forage plant on wooded pasture ground in the cooler sections of the United States." (Frank N. Meyer.)

A perennial vetch, native to Siberia, with an upright or ascending stem 8 to 16 inches long and rather large, purplish flowers. It is sometimes cultivated in European gardens as an ornamental. (Adapted from Ascherson und Graebner, *Synopsis der Mitteleuropäischen Flora*, vol. 6, pt. 2, p. 919.)

56862 to 56867. ZEA MAYS L. Poaceæ. Corn.

From Krizevac, Croatia, Yugoslavia (Kingdom of the Serbs, Croats, and Slovenes). Seeds presented by the director, Royal Agricultural College, Krizevac, through J. F. McGurk, American consul, Zagreb. Received April 16, 1923. Quoted notes by the director.

56862 to 56865. "Grown at the college for many years."

56862. "*Krizevacka okrugla Hrvatica* (Croatian maid of Krizevac), a very good and fruitful sort, which ripens early and flourishes even in colder parts."

56863. "*Rumski zlatni zuban* (gold-kernel corn of Ruma, a town in Syrmia), a late very prolific kind. It does not always ripen with certainty in Krizevac, but in the lowlands along the Danube, Save, and Theiss Rivers, where the climate is somewhat like that of the steppes, with very hot summers, it ripens well."

56864. "*Krivacki hangari* (Krizevac warrior). An especially early kind, perhaps the earliest known. It originated in the Bosnian Mountains. It can be sown also in high mountain regions, and in upper Croatia it is sown after the field has been cleared of the winter barley, and ripens regularly."

56865. "*Krizevacki Pignoletto*, an early sort with tiny grains, very suitable and popular for human consumption. Has been grown a long time in Krizevac."

56866 and 56867. "Varieties raised by peasants."

56866. "*Krizevacki zuban* from the vicinity of Krizevac, a variety that ripens under conditions halfway between those mentioned in 1 [S. P. I. No. 56862] and 2 [S. P. I. No. 56863]."

56867. "*Hercegotacki* (the Herzegovian) from the mountains of Herzegovina, where the ground is stony, the winters severe, and the summers hot and dry, a climate which is very unfavorable for corn."

56868 and 56869. ACACIA spp. Mimosa- osaceæ.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received April 19, 1923.

56868. ACACIA CARDIOPHYLLA A. Cunn.

"Weeping wattle. This native tree is one of the most beautiful wattles that I know of." (Baker.)

56869. ACACIA VERNICIFLUA A. Cunn.

A slender, much-branched shrub, with leathery, very narrow phyllodia [leaflike stems] about 2 inches in length, and deep-yellow flowers in small heads which are generally in pairs. It is native to the barren hills around Bathurst, New South Wales. (Adapted from *Curtis's Botanical Magazine*, pl. 3565.)

56870. TRIFOLIUM PRATENSE L. Fab- aceæ. Red clover.

From Helsingfors, Finland. Seeds purchased through Leslie A. Davis, American consul, from Keskusosuusliike Hankkija r. i. Received April 13, 1923.

"This strain has been cultivated in Finland for about 34 years." (Ernst Hasselblatt.)

Introduced for the use of department specialists engaged in clover breeding.

56871 and 56872. POPULUS TREMULA L. Salicaceæ. Aspen.

From Svalof, Sweden. Presented by N. H. Nilsson, Sveriges Utsädesforening. Received April 24, 1923.

Var. erecta.

"This is a mutation of the ordinary aspen and is found in the woods in this vicinity. Especially interesting is the fact that it strongly resembles the Lombardy poplar, which is a very similar mutation of *Populus nigra*." (Nilsson.)

56871. Plants. 56872. Cuttings.

56873 and 56874. ZEA MAYS L. Poa- ceæ. Corn.

From Bengazi, Cyrenaica, Libya, North Africa. Seeds presented by the director, Economic and Financial Affairs. Received April 25, 1923. Quoted notes by the director.

"These native varieties of maize are grown under irrigation in Cyrenaica. Attempts to grow them in dry culture have not resulted favorably."

56873. "From Derna."

56874. "From Bengazi."

56875. CERATONIA SILIQUA L. Cæsal- pinia- ceæ. Carob.

From Lisbon, Portugal. Budwood presented by Capt. Mendes d'Almeida, through W. Stanley Hollis, consul general. Received April 28, 1923.

Sent in response to a request for cuttings of the best varieties of carob grown in Portugal.

For previous introduction, see S. P. I. No. 55464.

56876 to 56878. TRITICUM AESTIVUM L. (*T. vulgare* Vill.) Poaceæ.

Common wheat.

From Villiers Saint Georges, France. Seeds presented by Hector Gagneux. Received April 23, 1923. Quoted notes from catalog of Hector Gagneux, autumn, 1923.

56876 to 56878—Continued.

56876. "*Blé de Silène*. A variety with white straw, a long white head, and white kernels. It is a selection from *Hybride des Alliés*, to which it is superior in its resistance to disease and lodging."

56877. "*Le Cérés*. This is claimed by its originators to be the finest variety known; our experiments with it allow us to confirm in a measure this statement. It is remarkably vigorous with white heads and clear-yellow kernels which are much appreciated in the milling industry. The variety is very resistant to cold and almost never lodges. Season medium early."

56878. "*Hybride Inversable*. An early and very vigorous variety which requires rich and well-prepared soil for its best development. It is very resistant to lodging."

56879. HAKEA ACICULARIS (Vent.) Knight. Proteaceæ.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received April 12, 1923.

A tall evergreen shrub or small bushy tree, native to Australia, with very handsome foliage which is rigid and spiny, thus serving to protect the plant against animals. The plant is suitable for hedges and shrubberies, is quite hardy, and requires but little moisture or cultivation. (Adapted from *University of California Publications, Botany*, vol. 4, p. 19.)

For previous introduction, see S. P. I. No. 40047.

56880 to 56882. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Bologna, Italy. Seeds purchased from Ditta E. Pini, through Asher Hobson, American representative, International Institute of Agriculture, Rome. Received April 20, 1923. Quoted notes by Mr. Pini.

Locally grown seed introduced for department specialists engaged in clover breeding.

56880. "From Emilia."

56881. "From Marches."

56882. "From Umbria."

56883 to 56891. COIX LACRYMA-JOBI MA-YUEN (Rom.) Stapf. Poaceæ.

Ma-yuen.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture, at the request of P. J. Wester. Received April 23, 1923.

The ma-yuen, or adlay, has attracted considerable attention as a cereal for tropical regions. According to P. J. Wester, Bureau of Agriculture, Manila, it is better than upland rice for tropical agriculture in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

56883. *Batangas*.

56884. *Cotabato Brown*.

56885. *Cotabato White*.

56886. *La Union White*.

56887. *Lamao No. 1*.

56888. *Lamao No. 2*.

56889. *Lamao White*.

56890. *Momungan*.

56891. *Mountain Province*.

FIG. 1.—HABITAT OF THE WILD PINEAPPLE (*ANANAS* SP.; S. P. I. Nos. 56851 AND 56852)

The origin of the cultivated pineapple is obscure. The Spaniards found it growing in the gardens of the Indians when they reached tropical America at the end of the fifteenth century. It seems probable that the cultivated varieties were derived from one or more of the wild forms which are still found in the central part of Brazil. The environmental conditions under which one of these forms occurs is shown in the above reproduction of a photograph taken by Professor Rolfs near Vicosa, in the State of Minas Geraes, at an altitude of about 650 meters (approximately 2,130 feet)

FIG. 2.—A WILD PINEAPPLE FROM CENTRAL BRAZIL (*ANANAS* SP.; S. P. I. Nos. 56851 AND 56852)

Plant breeders occupied with the production of new pineapple varieties will be interested in this wild form sent from the State of Minas Geraes by Professor Rolfs. The fruits, which are about 6 inches long and 4 inches in diameter, are whitish green, dull green, or nearly red; they have whitish flesh of acid flavor. It seems possible that this form may be the wild prototype of some of the cultivated pineapples; it occurs abundantly on the rolling plains of central Brazil. (Photographed by P. H. Rolfs, Vicosa, Minas Geraes, Brazil)

FIG. 1.—BARLEY GROWING IN AN ALGERIAN OASIS (*HORDEUM VULGARE PALLIDUM* SERINGE; S. P. I. NO. 57052)

In the endeavor to secure new cereal strains for use in improving varieties now being cultivated in the United States, the United States Department of Agriculture recently sent abroad an experienced cerealist to look for promising types. Among the places visited were a number of the larger oases in northern Africa. The illustration shows a plot of barley, probably a winter variety, growing in the oasis of Temacin, Algeria. Seeds of this variety were obtained for testing in the warmer portions of the semiarid Southwest. (Photographed by H. V. Harlan, April 5, 1923)

FIG. 2.—MARIOUT BARLEY IN ITS ORIGINAL HOME (*HORDEUM VULGARE PALLIDUM* SERINGE; S. P. I. NOS. 57637 TO 57639)

The semiarid region in the vicinity of Lake Mariut, northern Egypt, has the distinction of being the home of the original Mariout barley, from which many selections have been made. This region probably has the lowest rainfall of any in the world in which crops are grown, and seed was secured here of a number of promising barley types which may prove of great value in sections of the United States where drought resistance in cereals is essential. (Photographed by H. V. Harlan, Burg el Arab, Egypt, May 7, 1923)

56892. AVENA SATIVA L. Poaceæ.**Oats.**

From Wageningen, Netherlands. Seeds presented by Dr. R. J. Mansholt, Royal Netherlands College of Agriculture. Received May 1, 1923.

Mansholt III. A variety obtained by selection from *Victoire de Svalof*. Its chief characteristics are straw fairly short, very thick, stiff; grain white and plump like that of *Victoire de Svalof*, but distinctly larger; season early. It is an excellent variety, very resistant to lodging. It should not be grown on poor, light soils, as it requires rich, well-fertilized land. (Adapted from *International Review of the Science and Practice of Agriculture, Monthly Bulletin of Agricultural Intelligence, vol. 13, p. 331.*)

56893 to 56895. TRIFOLIUM INCARNATUM L. Fabaceæ. Crimson clover.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received May 1, 1923. Quoted notes by Vilmorin-Andrieux & Co.

Introduced for department specialists engaged in clover breeding.

56893. "A late crimson clover."

56894. "An early crimson clover."

56895. "A very late white-flowered crimson clover."

56896 to 56898. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Lausanne, Switzerland. Seeds purchased from Dr. G. Martinet, director, Seed-Control Station. Received May 1, 1923. Quoted notes by Doctor Martinet.

Introduced for department specialists engaged in clover breeding.

56896. "No. 1021. Descended from the celebrated variety of Winkel, near Bulach, Switzerland. It is of rapid growth, yields heavily, and can be used for two years after seeding."

56897. "No. 943 (*Mattenklee*). A long-enduring variety which yields well and renews itself from time to time. The seeds are almost entirely yellow."

56898. "No. 950 (*Mattenklee*). A long-enduring variety which gives abundant forage and seeds; the latter are dark violet."

56899 to 56901.

From Svalof, Sweden. Seeds presented by N. H. Nilsson, Sveriges Utsädesforening. Received May 1, 1923.

56899 and 56900. AVENA SATIVA L. Poaceæ. Oats.

56899. *Orion*. An early-ripening black oat obtained at Svalof, Sweden, by crossing *Ligowo* and *0668*, a line from a Norwegian variety. *Orion* ripens two days earlier than the earliest variety known in Norrland and is distinctly superior to the variety *Guldregn*. In regard to yield, *Orion* has produced 5.5 per cent more grain and 7.5 per cent more straw than *Mesdag*. In short, *Orion* is very satisfactory because it produces a heavy crop of grain of good quality, ripens early, and has stiff straw. (Adapted from *International Review of the Science and Practice of Agriculture, Monthly Bulletin of Agricultural Intelligence, vol. 13, p. 667.*)

56899 to 56901—Continued.

56900. *Odal*. In the attempt to obtain an early variety of oats with the good qualities of the late variety *Guldregn*, a cross between the latter variety and *Dala* yielded a strain, *01163 b*, in which the desired characters were obtained. *Odal* does not head early, but ripens quickly. In regard to yield, *Odal* produces on an average 9 per cent more grain than *Dala*, but, owing to the shortness of the stems, gives less straw than either *Dala* or *Guldregn*. In its resistance to lodging, *Odal* is nearly equal to *Guldregn*. (Adapted from *International Review of the Science and Practice of Agriculture, Monthly Bulletin of Agricultural Intelligence, vol. 13, p. 321.*)

56901. PHELEUM PRATENSE L. Poaceæ. Timothy.

Gloria. A high-yielding strain, developed at Svalof by Dr. Hernfried Witte.

56902 to 56904. ZEA MAYS L. Poaceæ. Corn.

From Peru. Seeds presented by D. S. Bullock, agricultural commissioner, Bureau of Agricultural Economics. Received April 20, 1923. Quoted notes by Mr. Bullock.

56902. "(Cuzco. January, 1923.) From Sr. Gallegos, Comisionado Agronómico."

56903. "(Cuzco. January, 1923.) From T. E. Payne. Grown under irrigation at about 7,000 feet altitude."

56904. "(Same.) From Sr. Mendoza. Grown at a low altitude under irrigation."

56905. ZEA MAYS L. Poaceæ. Corn.

From La Paz, Bolivia. Seeds presented by D. S. Bullock, agricultural commissioner, Bureau of Agricultural Economics. Received April 20, 1923.

"(January, 1923.) Bought in the market." (*Bullock.*)

56906. PHYLLOCARPUS SEPTENTRIONALIS Donn.-Smith. Cæsalpiniaceæ.

From El Barranquillo, Guatemala. Seeds purchased from Fernando Carrera through A. C. Frost, American consul, Guatemala. Received May 3, 1923.

"A magnificent flowering tree found in sandy loam in eastern Guatemala at 1,500 to 2,000 feet altitude. It is of broad, spreading habit, 40 to 50 feet high, with light-green compound leaves. In January and February the tree is a mass of crimson-scarlet flowers, each about an inch broad, borne in small clusters." (*Wilson Popenoe.*)

For previous introduction, see S. P. I. No. 51409.

56907. ANANAS sp. Bromeliaceæ. Wild pineapple.

From Bello Horizonte, Minas Geraes, Brazil. Seeds presented by P. H. Rolfs, director, Escola Superior de Agricultura e Veterinaria. Received May 5, 1923.

"A wild pineapple known locally as 'ananás.' The fruit is more cylindrical than that of *Red Spanish*." (*Rolfs.*)

Introduced for department specialists engaged in pineapple breeding.

56908 and 56909.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received May 5, 1923.

56908. *ABUTILON MOLLISSIMUM* (Cav.) Sweet. Malvaceæ.

An annual bushy plant, usually 4 to 5 feet high, but reported to reach a height of 10 feet in Peru, where it is native. The stem and the large, very soft, heart-shaped leaves are quite hairy, and the solitary axillary flowers, about an inch long, are sulphur yellow. (Adapted from *Caranilles, Secunda Dissertatio Botanica*, p. 49, No. 67.)

56909. *FRANCOA SONCHIFOLIA* (Willd.) Cav. Saxifragaceæ.

A rather shrubby ornamental about 3 feet high, with bright-green, downy, wavy-margined leaves, handsome lilac-colored flowers in long, erect, spike-like racemes. The plant is native to Chile. (Adapted from *Curtis's Botanical Magazine*, pl. 3309.)

56910. *POA AUSTRALIS* R. Br. Poaceæ.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received June 6, 1923.

"Collected near Lake Tiberias at an altitude of about 1,400 feet. This is a rather cold area with a light rainfall." (Evans.)

This is the most abundant grass in many districts of South Island, New Zealand, and is also plentiful in the elevated central portions of North Island. It is seldom eaten by stock, however, except in the absence of better feed. (Adapted from *Cheeseman, Manual of the New Zealand Flora*, p. 908.)

Introduced for department agrostologists.

For previous introduction, see S. P. I. No. 31503.

56911. *COLOCASIA ESCULENTA* (L.) Schott. Araceæ. Dasheen.

From Canton, China. Tubers presented by G. Weidman Groff, director, Canton Christian College. Received May 7, 1923.

"A taro, or dasheen, of good quality. The sprouts are distinctly reddish. The tubers are said to be small and quite uniformly elliptical and the leaves dark green. The variety is also reported to yield well." (R. A. Young.)

56912 to 56919. *SOLANUM TUBEROSUM* L. Solanaceæ. Potato.

From Nemecky Broad, Czechoslovakia. Tubers presented by the Czechoslovakia Experiment Station for Potato Culture. Received May 14, 1923.

"These Czechoslovakian varieties came from the Czechoslovakia Experiment Station for Potato Culture, where they were grown under careful supervision and are claimed to be free from disease. They are introduced for breeding and disease-resistance investigations." (Dr. E. H. Myers.)

56912. *Cesky zelenac*.

56913. *Fakutske*.

56914. *Janorky*.

56915. *Nolcovy rohlicky*.

56916. *Podhajky*.

56917. *Ranne Hradce*.

56918. *Vaclaraka*.

56919. *Visnovske rohlicky*.

56920 to 57012. *IPOMOEA BATATAS* (L.) Poir. Convolvulaceæ. Sweetpotato.

From St. Croix, Virgin Islands. Seeds presented by J. B. Thompson, agronomist in charge, Agricultural Experiment Station. Received May 2, 1923. Quoted notes by Mr. Thompson.

56920. "No. 7. A Big Wig seedling. The vine is 3 to 4 feet in length. It is very leafy and covers the ground completely with a dense leafy mass. The leaves are green, broadly shouldered, and lanceolate. The roots are red."

For introduction of tubers under this number, see S. P. I. No. 56714.

56921. "No. 11. A Big Wig seedling. The vines are 2 to 3 feet in length. The leaves are lanceolate and range from small to medium in size. The roots are white."

56922 to 56928. "No. 18. A Big Wig seedling. This is a rampant grower, the vines reaching out for 8 or 10 feet or more on either side of the row. It flowers profusely. The roots are red."

For introduction of tubers under this number, see S. P. I. No. 56717.

56922. (No. 1.) 56926. (No. 5.)

56923. (No. 2.) 56927. (No. 6.)

56924. (No. 3.) 56928. (No. 7.)

56925. (No. 4.)

56929 to 56931. "No. 26. A Big Wig seedling. In the nursery row this seedling shows short vine growth with rather sparse foliage. The stems are short and stout, attaining a maximum length of 2 to 3 feet. The leaves are lanceolate with a wine-colored midrib. The tubers are dark red and grow at the ends of fleshy roots that are 12 to 18 inches long. The tubers are traversed by a number of pronounced ribs or veins. The original seedling yielded 4 pounds of tubers under very adverse conditions."

For introduction of tubers under this number, see S. P. I. No. 56722.

56929. (No. 1.) 56931. (No. 3.)

56930. (No. 2.)

56932 and 56933. "No. 36. A Big Wig seedling. Stems rather slender to medium and 2 to 4 feet in length. Leaves small and cordate. The original seedling plant produced 1 pound 6 ounces of smooth white tubers."

56932. (No. 1.) 56933. (No. 2.)

56934 and 56935. "No. 31. A Big Wig seedling. In the nursery row the vines are strong but short and sparsely leaved. The leaves are small with five deeply cut lobes. This variety shows a tendency to produce tubers at the nodes of the vines where they attach themselves to the soil. The tubers are a light red or rose. The original seedling yielded 38 tubers weighing $5\frac{1}{4}$ pounds."

For introduction of tubers under this number, see S. P. I. No. 56726.

56934. (No. 1.) 56935. (No. 2.)

56936 to 56940. "No. 36."

For description, see S. P. I. Nos. 56932 and 56933.

56936. (No. 3.) 56939. (No. 6.)

56937. (No. 4.) 56940. (No. 7.)

56938. (No. 5.)

56920 to 57012—Continued.

56941. "No. 45. A Big Wig seedling. In the nursery row this bore short leafy stems 24 to 30 inches long which afforded perfect protection to the hill. The leaves are dark green and cut and lobed similar to those of the Big Wig parent. The original seedling plant yielded eight small tubers weighing 15 ounces. The tubers are dark red. The flesh is yellow with a pink underskin."

56942. "No. 50. A Black Rock seedling. In the nursery row this seedling had short stems 12 to 18 inches long. The leaves are deeply cut with five lobes and are dark green with red midribs and veins. The tubers are dark red."

56943 and 56944. "No. 55. A Black Rock seedling. The stems are 2 to 3 feet long in our nursery row. The leaves are somewhat variable in form but usually lanceolate and bearing some resemblance to those of the variety grown at this station under the name of the Key West 'yam.' The tubers are dark red and are borne on the ends of long fleshy roots. The original seedling plant yielded 30 tubers weighing a total of 4¾ pounds."

For introduction of tubers under this number, see S. P. I. No. 56729.

56943. (No. 1.) 56944. (No. 2.)

56945. "No. 58. A Black Rock seedling. The vine is 2 to 3 feet in length and very leafy. The leaves are cordate and rounded and the younger ones are wine colored, especially around the margins. The tubers are dark red. The original seedling plant bore 37 tubers weighing 5 pounds."

For introduction of tubers under this number, see S. P. I. No. 56731.

56946. "No. 74. A Big Wig seedling. Stems slender, leafy, 3 to 5 feet long or more. The leaves are small and have five lobes. The roots are red."

56947. "No. 75. A Big Wig seedling. Vines 2 to 4 feet in length and leafy. Leaves dark green, broad, 3 pointed; midribs and veins red. Tubers red. The original seedling plant yielded 18 tubers weighing 2¾ pounds."

56948 to 56951. "No. 92. A Big Wig seedling. Vines long and slender. Leaves small, broad as compared with length, lobed but not deeply cut. The yield of the original seedling plant was 19 tubers weighing 1 pound. The tubers were small, red, and borne at the nodes as far as 10 feet from the hill."

56948. (No. 1.) 56950. (No. 3.)

56949. (No. 2.) 56951. (No. 4.)

56952. "No. 103. A Big Wig seedling. A small, bunching, rather unthrifty vine. The roots are of a light red or rose."

56953 to 56955. "No. 106. A Big Wig seedling. The vines are from 1 to 3 feet long and sparsely clothed with small green lanceolate leaves. The original seedling hill yielded three tubers weighing 10 ounces. The tubers were dark red."

56953. (No. 1.) 56955. (No. 3.)

56954. (No. 2.)

56956. "No. 112. A Big Wig seedling. Vines 1 to 3 feet in length and rather sparsely leaved. Leaves small, light green with three or five lobes and green midribs and veins. The original seedling plant bore three light-red tubers weighing 6 ounces."

56920 to 57012—Continued.

56957. "No. 122. A Big Wig seedling. Vines 12 to 30 inches in length. This was like the preceding, No. 112 [S. P. I. No. 56956], in that it yielded from the original seedling plant three small red tubers weighing 6 ounces."

56958. "No. 123. A Big Wig seedling. This forms bunching plants with leafy stems 12 to 18 inches long. The original seedling plant bore three light-red tubers weighing 13 ounces."

56959. "No. 125. A Big Wig seedling. The plant is rather bunching in habit. The stems are 1 to 2 feet long and leafy. Leaves dark green, cordate, resembling its Black Rock parent. The original seedling plant bore seven dark-red tubers weighing 1 pound 9 ounces."

56960 to 56963. "No. 138. A Big Wig seedling. The stems are long and leafy. The leaves are dark green and 5 lobed."

56960. (No. 1.) 56962. (No. 3.)

56961. (No. 2.) 56963. (No. 4.)

56964 to 56966. "No. 153. A Big Wig seedling. The vines were from 3 to 6 feet in length with sparse growth of leaves. The leaves were lanceolate or sometimes 3 lobed. The original seedling plant yielded 10 dark-red tubers with a total weight of 1½ pounds."

56964. (No. 1.) 56966. (No. 3.)

56965. (No. 2.)

56967. "No. 162. A Big Wig seedling. The stems are stout and 1 to 2 feet in length. The leaves are large, cordate, and strikingly ornamental. The original seedling plant yielded five tubers of a coppery red, having a total weight of 1½ pounds."

56968 to 56970. "No. 169. A Black Rock seedling. Vines in the nursery row grew to a maximum distance of 6 feet from the hill and were sparsely covered with leaves. Leaves dark green when mature, but immature ones were dark wine colored. Tubers a light yellowish pink. The original seedling plant yielded four tubers weighing 3 ounces."

56968. (No. 1.) 56970. (No. 3.)

56969. (No. 2.)

56971. "No. 188. A Black Rock seedling. The stems are long and slender and in the nursery row run to a maximum distance of 8 feet from the hill. The vine is not densely covered with leaves and makes a thin covering for the ground. The tubers are light red. The original seedling plant yielded 14 tubers weighing a total of 2 pounds 2 ounces."

56972. "No. 191. A Black Rock seedling. A low bunching leafy plant. Leaves deeply cut, with five lobes."

56973 and 56974. "No. 196. A Black Rock seedling. Stems 12 to 30 inches long, with few leaves. Leaves small, cordate, pointed."

56973. (No. 1.) 56974. (No. 2.)

56975 and 56976. "No. 204. A Black Rock seedling. Stems long and slender, 8 or 10 feet long. Leaves comparatively small in size, 3 pointed, lanceolate. The original seedling had dark-red roots but no tubers."

56975. (No. 1.) 56976. (No. 2.)

56920 to 57012—Continued.

56977 to 56980. "No. 217. A Black Rock seedling. The stems are long and slender, attaining a length of 8 to 10 feet or more. The original seedling yielded 24 tubers weighing an aggregate of 3 pounds. The tubers have creamy yellow skin and yellow flesh."

56977. (No. 1.) 56979. (No. 3.)

56978. (No. 2.) 56980. (No. 4.)

56981 and 56982. "No. 223. A Key West 'yam' seedling. Tubers dark red. The original seedling plant yielded 12 tubers weighing 1 pound 13 ounces."

56981. (No. 1.) 56982. (No. 2.)

56983 to 56985. "No. 226. A Key West 'yam' seedling grown at the Virgin Islands Experiment Station in 1922. The original seedling plant had yellow roots but no tubers."

56983. (No. 1.) 56985. (No. 3.)

56984. (No. 2.)

56986 to 56988. "No. 235. A Black Rock seedling. Original seedling plant had dark-red roots but no tubers."

56986. (No. 1.) 56988. (No. 3.)

56987. (No. 2.)

56989 and 56990. "No. 240. A Black Rock seedling. The original seedling plant yielded 26 smooth coppery red tubers with a total weight of $5\frac{1}{4}$ pounds."

For introduction of tubers under this number, see S. P. I. No. 56742.

56989. (No. 1.) 56990. (No. 2.)

56991 to 56993. "No. 247. A Black Rock seedling. The original seedling plant bore six white tubers weighing 1 pound 2 ounces."

56991. (No. 1.) 56993. (No. 3.)

56992. (No. 2.)

56994. "No. 251. A Black Rock seedling. The original seedling plant produced 14 yellow tubers weighing 1 pound 11 ounces."

For introduction of tubers under this number, see S. P. I. No. 56743.

56995. "No. 306. A Black Rock seedling. This is a volunteer seedling which sprang up in the Black Rock plot after the latter was harvested."

56996 and 56997. "Big Wig variety. It is not known whence this variety came. It was obtained by the station from Estate Strawberry Hill in 1920 or 1921 and has since been grown continuously at the station. It is of bunching vineless growth and bears many dark-green deeply cut 5-lobed leaves. The original form as obtained by the station has red tubers. The seed collected has all been from the ordinary red Big Wig."

56996. (No. 1.) 56997. (No. 2.)

56998 to 57000. "Black Rock variety. This was introduced from Barbados by Dr. Longfield Smith, of this station, in 1911 and is undoubtedly the most popular variety grown in St. Croix. The vines are vigorous, bearing dark-green, cordate leaves. The tubers, which are long and often ill shaped, are dark purplish red and attain large size under favorable conditions. The variety has the reputation of keeping longer in storage than other varieties."

56998. (No. 1.) 57000. (No. 3.)

56999. (No. 2.)

56920 to 57012—Continued.

57001 and 57002. "Hug-me-tight variety. A few tubers of this variety were purchased on the St. Thomas market in May, 1922, under the above name. The tubers were said to have been grown on the island of Tortola, a British island some miles off the east coast of St. Thomas. The tubers are white."

57001. (No. 1.) 57002. (No. 2.)

57003 and 57004. "John Siddon variety. A few tubers of this variety were obtained at the same time and came from the same source as those of Hug-me-tight [S. P. I. Nos. 57001 and 57002]. The tubers are light red."

57003. (No. 1.) 57004. (No. 2.)

57005 to 57010. "Key West 'yam.' This variety was obtained from the Federal Experiment Station at Mayaguez, Porto Rico, and planted at the Virgin Islands Experiment Station some two or three years ago. After growing this variety in a number of comparative tests, in which a large number of local varieties were represented, the Porto Rico Experiment Station pronounced this the best variety tested under the conditions at Mayaguez. It has shown considerable merit in St. Croix, but has not fully established its superiority over the Black Rock and Big Wig varieties. The vines are medium in length, and the leaves are of a very noticeably yellow-green. The tubers are yellow."

57005. (No. 1.) 57008. (No. 4.)

57008. (No. 2.) 57009. (No. 5.)

57007. (No. 3.) 57010. (No. 6.)

57011 and 57012. "Wrenchy variety. This is an old local variety the history of which is not known. The vines are long and slender and the tubers are white. This variety is said to yield comparatively well on hard or poorly plowed land."

57011. (No. 1.) 57012. (No. 2.)

57013 to 57034. HORDEUM spp. Poaceæ. Barley.

From Cambridge, England. Seeds presented by Prof. F. L. Engledon, School of Agriculture, Cambridge, through Dr. H. V. Harlan, United States Department of Agriculture. Received April 24, 1923.

A collection of local barley strains introduced for department cereals.

57013 and 57014. HORDEUM DEFICIENS Steud.

57013. No. 1. 57014. No. 6.

57015. HORDEUM DISTICHON NIGRICANS Seringe. Two-rowed barley. No. 13.

57016. HORDEUM DISTICHON NUDUM L. Two-rowed barley. No. 8.

57017 to 57022. HORDEUM DISTICHON PALMELLA Harlan. Two-rowed barley.

57017. No. 4. 57020. No. 14.

57018. No. 9. 57021. No. 16.

57019. No. 10. 57022. No. 19.

57023. HORDEUM INTERMEDIUM HAXTONI Koern.

No. 7

57013 to 57034—Continued.

57024. *HORDEUM VULGARE COELESTE L.*
Six-rowed barley.
No. 22.

57025 and 57026. *HORDEUM VULGARE HORSFORDIANUM* Wittmack. Six-rowed barley.

57025. No. 3. 57026. No. 5.

57027 and 57028. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Six-rowed barley.

57027. No. 12. 57028. No. 17.

57029 to 57034. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.

57029. No. 2. 57032. No. 18.

57030. No. 11. 57033. No. 20.

57031. No. 15. 57034. No. 21.

57035. *TRIFOLIUM PHYSODES* Stev.
Fabaceæ. Clover.

From Kew, England. Seeds presented by Dr. A. H. Hill, director, Royal Botanic Gardens. Received May 7, 1923.

A perennial prostrate clover with oval leaflets and roundish heads of pink flowers which open in July and August. Native to southeastern Europe. In the flowering stage this species resembles white clover, but it does not creep. (Adapted from *Ascheron und Graebner, Synopsis der Mitteleuropäischen Flora*, vol. 6, pt. 2, p. 525.)

For previous introduction, see S. P. I. No. 56675.

57036. *TRIFOLIUM PRATENSE L.* Fa-
baceæ. Red clover.

From Copenhagen, Denmark. Seeds presented by H. N. Knudsen, Danish Royal Agricultural Society. Received May 7, 1923.

Tystofte No. 40 originated in a 2-year plot of Rozen-daal clover. Seed of this variety was sown in 1900, and the clover was thus subjected to the hard winter of 1901. In 1902 the strongest plants from this test were selected, one of which was No. 40. Later this strain was compared with others in several tests. In three of four tests all the clovers made vigorous growth during the first year, and in this respect No. 40 averaged well above the others. In all four tests No. 40 gave the largest crop, fully 20 per cent better than that of the next best. These results agree well with the results of earlier tests at Lyngby and Tystofte, in which this strain decidedly surpassed all others. (Adapted from *Beretning fra Statens Forsøgsvirksomhed i Plantekultur*, No. 96, p. 401.)

For previous introduction, see S. P. I. No. 54739.

57037 to 57041. *ORYZA SATIVA L.* Poa-
ceæ. Rice.

From the island of Guam. Seeds presented by J. Guerrero, assistant in horticulture, Guam Agricultural Experiment Station. Received May 7, 1923.

Varieties of seed rice introduced for department specialists engaged in rice breeding.

57037. *Guam.*

57038. *Guam Experiment Station Selection.*

57039. *Inantipolo II.*

57040. *Mangasa.*

57041. *Mayoro II.*

57042 to 57074.

From Algeria. Seeds collected by Dr. H. V. Harlan, Bureau of Plant Industry. Received May 9, 1923. Quoted notes by Doctor Harlan.

Introduced for department cerealists.

57042. *AVENA LUDOVICIANA* Durieu. Poa-
ceæ. Oats.

"(No. 52. Biskra. April 8, 1923.) Wild oats collected in barley fields. No oats are cultivated near Biskra."

57043. *AVENA STERILIS L.* Poaceæ. Oats.

"(No. 60. Algiers. April 21, 1923.) The only sample of oats seen in the native market. It appears to be screenings from other grain."

57044 and 57045. *HOLCUS SORGHUM L.* (*Sorghum vulgare* Pers.) Poaceæ.

Sorghum.

57044. "(No. 57. Algiers. April 21, 1923.) Purchased in the native market."

57045. "(No. 62. Algiers. April 21, 1923.) A poor sample collected in the native market."

57046 to 57065. *HORDEUM* spp. Poaceæ.
Six-rowed barley.

57046. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven.

"(No. 53. Biskra. April, 1923.) A black barley from Biskra. The Arabs tell me that before the big famine of 20 years ago when seed was imported black barley was often grown. The few seeds under this number were found by picking over many samples in the market. They may be from widely separated points."

57047 to 57065. *HORDEUM VULGARE PALLIDUM* Seringe.

57047. "(No. 30. Tuggurt. April 3, 1923.) Purchased in the market. Probably grown on this or a nearby oasis."

57048. "(No. 33. Tuggurt. April 5, 1923.) Barley from the Oasis of Tuggurt, purchased in the market."

57049. "(No. 35. Tuggurt. April 5, 1923.) Barley from the Oasis of Tuggurt, purchased in the market."

57050. "(No. 36. Biskra. March 31, 1923.) The barley was grown under irrigation. The spikes collected represented variation present in the field. Few spikes were taken, as they were not fully ripe and a larger sample might be damaged by heating."

57051. "(No. 37. El Outaia. April 1, 1923.) Conditions similar to No. 36 [S. P. I. No. 57050] and similar selections made."

57052. "(No. 38. Temacin. April 5, 1923.) The barley at Temacin was grown beneath the date palms of the oasis. This may be a winter variety or at least one related to those of Lower Egypt."

For an illustration of this barley, see Plate II, Figure 1.

57042 to 57074—Continued.

57053. "(No. 39. Temacin. April 5, 1923.) Collected from a small plat under date palms; a fairly pure variety of the Peruvian or Portuguese type not seen at Biskra."
57054. "(No. 40. Biskra. May 8 and 13, 1923.) Barley spikes collected from fields about the town. Several types are included."
57055. "(No. 42. Biskra. April 13, 1923.) Barley of the new crop purchased in the market at Biskra."
57056. "(No. 43. El Kantara. April 10, 1923.) Purchased in the market at El Kantara. The 1922 crop is probably from Batna or Setif."
57057. "(No. 46. Biskra. April 13, 1923.) Barley purchased in the market. Said to have been grown at Soada, 20 miles southeast of Biskra. From the 1923 crop."
57058. "(No. 47. Biskra. April 13, 1923.) New crop from Soada, 20 miles southeast of Biskra."
57059. "(No. 48. Biskra. April 13, 1923.) Purchased in the market place. The dealer claimed the shipment came from Morocco."
57060. "(No. 50. El Outaia. April 13, 1923.) Barley of the 1923 harvest purchased in Biskra. Grown at El Outaia."
57061. "(No. 51. Biskra. April 13, 1923.) Barley of the 1923 harvest purchased in the market."
57062. "(No. 55. Setif. April 20, 1923.) Barley of the 1922 crop obtained from the grower."
57063. "(No. 58. Algiers. April 21, 1923.) Barley purchased in the native market."
57064. "(No. 59. Algiers. April 21, 1923.) Barley purchased in the native market."
57065. "(No. 61. Algiers. April 21, 1923.) Barley purchased in the native market. Appears to be a mixture of 2-rowed and 6-rowed barleys. Probably imported."

57066 to 57072. *TRITICUM* spp. Poaceæ.57066 to 57071. *TRITICUM DURUM* Desf.
Durum wheat.

57066. "(No. 31. Tuggurt. April 3, 1923.) Wheat from the Oasis of Tuggurt. Purchased in the market. All wheat here is of the durum type, probably because of its wide use in the manufacture of kushos."
57067. "(No. 34. Tuggurt. April 5, 1923.) The sample of wheat was the best quality seen in the market."
57068. "(No. 41. Ghouff. April, 1923.) Wheat with a little barley secured by Capt. M. W. Hilton-Simpson from the Rossira Valley, Aures Mountains. It may be an old variety long established there. This is a remote locality, and Roman ruins are common."

57042 to 57074—Continued.

57069. "(No. 45. El Kantara. April 10, 1923.) Purchased at El Kantara, probably originally from Batna. 1922 crop."

57070. "(No. 49. Biskra. April 13, 1923.) Wheat from a native mill. Source not known, but probably from the plateau."

57071. "(No. 56. Setif. April 20, 1923.) Wheat of the 1922 crop obtained from the grower."

57072. *TRITICUM VENTRICOSUM* (Tausch)
Ces. Pass. and Gib.

"(No. 54. Biskra. April, 1923.) The seeds under this number were obtained by picking over samples of barley for sale in the Biskra market."

57073 and 57074. *ZEA MAYS* L. Poaceæ.
Corn.

57073. "(No. 32. Tuggurt. April 5, 1923.) The seed of this sample shelled from a single ear purchased in the market. No other type of corn was on sale here."

57074. "(No. 44. Biskra. April 13, 1923.) Purchased in the market. Grown at Mgous, where, according to the Arabs, more corn than wheat or barley is grown."

57075 and 57076. *DIOSPYROS KAKI* L. f.
Diospyraceæ. Kaki.

From Weihsien, Shantung, China. Scions presented by Rev. J. A. Fitch, American Presbyterian Mission. Received May 22, 1923. Quoted notes by Mr. Fitch.

"These are reported to be nonastringent."

57075. "*Tie shi dze* (iron kaki)."57076. "*Toa shi dze* (palm-of-the-hand kaki)."57077. *LYCOPERSICON ESCULENTUM*
Mill. Solanaceæ. Tomato.

From St. Vincent, British West Indies. Seeds presented by T. Jackson, agricultural superintendent, Botanic Gardens. Received May 19, 1923.

"A small native variety said to be immune to point-rot." (Jackson.)

57078. *SABINEA CARINALIS* Griseb.
Fabaceæ.

From Dominica, British West Indies. Seeds presented by Joseph Jones, curator, Botanic Gardens. Received May 21, 1923.

This tree is known locally as *bois charibe* and is one of the most showy of our native plants. It is a very fine flowering tree, and I have seen nothing in the Tropics to surpass it as a mass of color. If grown on fairly good land it will not make a good show, but if planted on a dry, rocky hillside where it will be scorched by the sun for a period of three or four months each year it makes a marvelous display of flowers." (Jones.)

A shrub or small tree with featherlike leaves and large scarlet flowers which are borne in clusters of three to five, appearing before the leaves. (Adapted from Grisebach, *Flora of the British West Indies*, p. 183.)

57079. AGATI GRANDIFLORA (L.) Desv.
(*Sesbania grandiflora* Poir.) Fabaceæ.

From Honolulu, Hawaii. Seeds presented by Dr. H. L. Lyon, in charge, department of botany and forestry, experiment station of the Sugar Planters' Association. Received May 22, 1923.

A small, rapid-growing, soft-wooded tree 15 to 20 feet in height, with pinnate leaves and large pendulous white flowers, followed by long sickle-shaped pods. The fleshy petals are used in curries and soups in the Indian Archipelago, where this tree is native. The leaves and young shoots are sometimes used as fodder. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 6, pt. 2, p. 544.)

For previous introduction, see S. P. I. No. 54928.

57080. JUNIPERUS CEDRUS Webb. Pinaceæ. Juniper.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received May 22, 1923.

A Canary Island relative of the common juniper, differing only in minor botanical characters and also in being less hardy. Dr. Georges Perez, of Orotava, Canary Islands, reports trees of this species with trunks a yard or more in diameter. The leaves are uniformly awl shaped and in whorls of threes. The wood is very pleasantly perfumed. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 669.)

57081 to 57088.

From Ichang, China. Seeds presented by Albert S. Cooper, American Church Mission. Received May 22, 1923. Quoted notes by Mr. Cooper except as otherwise stated.

"Collected on the mountains back of Patung, Hupeh, at altitudes of 6,000 to 8,000 feet."

57081. BERBERIS sp. Berberidaceæ. Barberry.

57082. CELASTRUS sp. Celastraceæ.

57083. COTONEASTER sp. Malaceæ.

"An evergreen growing prostrate on rocky surfaces."

57084. DELPHINIUM sp. Ranunculaceæ. Larkspur.

57085. ILEX sp.

"A small-leaved holly."

57086. ILEX sp.

"This bore an especially abundant lot of berries."

57087. PRINSEPIA SINENSIS Oliver. Amygdalaceæ.

"*Prinsepia sinensis* is a species which has been comparatively unknown to horticulturists until recent times. It is quite distinct from *P. utilis*, which yields a cooking oil common in India, but is closely similar to *P. uniflora*, which has been introduced by this office several times. Like *P. uniflora*, it is a Chinese ornamental shrub with gray or whitish bark and small gray spines. But while *P. uniflora* has white flowers, dark-purple fruits, and thick linear-lanceolate leaves, *P. sinensis* is distinguished by yellow flowers, deep-red fruits, and thin ovate-lanceolate leaves. The shrub is said to be somewhat harder than *P. uniflora*. The plant is of striking habit, and the clusters of large bright-yellow flowers must make it a brilliant sight on its native Mongolian hills from Mukden to the Yaboo. It is early blooming, but at the Arnold Arboretum it bears only a few fruits." (D. C. Peattie.)

For previous introduction, see S. P. I. No. 55711.

57081 to 57088—Continued.

57088. THEA SASANQUA (Thunb.) Nois.
(*Camellia sasanqua* Thunb.) Theaceæ.

A large, wide-spreading ornamental shrub or small tree common throughout the warmer parts of Japan. The branches are very slender, and in the wild plant the flowers are always white. It is a popular garden shrub; and, under cultivation, forms with pink and rose-colored flowers are common. The seeds contain an inferior sort of oil used by the Japanese women for dressing their hair. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 2, p. 394.)

For previous introduction, see S. P. I. No. 50646.

57089 to 57091.

From Hankow, China. Seeds presented by Rev. William Ruhl, Minhsien, Kansu, through P. S. Heintzleman, consul general. Received May 23, 1923. Quoted notes by Mr. Heintzleman.

57089. HORDEUM VULGARE COELESTE L. Poaceæ. Barley.

"This is planted about the middle of April and harvested the first week in August."

57090. PISUM SATIVUM L. Fabaceæ. Pea.

"These are planted about the end of April and harvested the latter part of September."

57091. VICIA FABA L. Fabaceæ. Broad bean.

"These are planted about the end of April and harvested the latter part of September."

57092. TRIPLARIS CUMINGIANA Fisch. and Mey. Polygonaceæ.

From Balboa Heights, Canal Zone. Seeds presented by Holger Johansen, agronomist. Received May 24, 1923.

"A native tree about 20 feet in height, generally of pyramidal habit, which prefers moist situations, such as the borders of lakes and streams. From February until the middle of April it is ablaze with red, produced by the bracts surrounding the capsules, and forms an exceedingly striking object in the landscape. As a beautiful ornamental this tree is well worthy of further distribution." (Johansen.)

57093. TITHONIA DIVERSIFOLIA (Hemsl.) A. Gray. Asteraceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received May 24, 1923.

"A perennial composite with large yellow flowers which are produced in great abundance during the autumn and early winter months. It should therefore be a good ornamental for southern Florida during the tourist season." (Wester.)

For previous introduction, see S. P. I. No. 54461.

57094 to 57210.

From Tiflis, Transcaucasia. Seeds presented by L. Dekapreleitch, director, Plant-Breeding Department, Botanic Garden. Received May, 1923. Quoted notes by Mr. Dekapreleitch.

Local varieties of cereals introduced for department specialists.

57094 to 57114. HORDEUM spp. Poaceæ. Barley.

57094 and 57095. HORDEUM DISTICHON PALMELLA Harlan.

57094. No. 1. 57095. No. 2.

57094 to 57210—Continued.

57211. *HAKEA NODOSA* R. Br. Prote-
aceæ.From Hobart, Tasmania. Seeds presented by
L. A. Evans, Secretary of Agriculture, Agri-
cultural and Stock Department. Received
June 29, 1923.An ornamental Australian shrub 2 to 6 feet in
height, with slender branches, short, needlelike or
extremely narrow leaves crowded on the stems, and
axillary clusters of very small flowers. (Adapted
from *Bentham, Flora Australiensis*, vol. 5, p. 514.)57212. *AGROPYRON CRISTATUM* (L.)
Gaertn. Poaceæ. Grass.From Ekaterinoslav, Russia. Seeds presented
by the Russian Bureau of Applied Botany,
through D. Borodin, New York, N. Y. Re-
ceived June 14, 1923.

"No. 685. 1921 crop." (Borodin.)

From the Ekaterinoslav Agricultural Experiment
Station; introduced for department agrostologists.

57213. SOLANUM COMMERSOII Dunal.
Solanaceæ.

From Montevideo, Uruguay. Tubers presented by Luis Guillot, Dirección General de Paseos Públicos. Received May 31, 1923.

Introduced for department horticulturists engaged in potato breeding.

A wild relative of the potato which is found native in humid situations in the vicinity of Montevideo, Uruguay. In general appearance the wild plant resembles that of the potato, having dark-green leaves composed of two to four pairs of leaflets, white flowers, small green fruits, and small potato-like tubers with a bitter flavor. Under cultivation in France a lavender-flowered variety developed, with larger tubers which were only slightly bitter and fragrant. It has been thought that this species might be one of the parents of some of the European varieties of the potato. (Adapted from *Revue Horticole*, vol. 78, p. 303.)

For previous introduction, see S. P. I. No. 53846.

57214. CHRYSALIDOCARPUS BARONII
Beccari. Phœnicaceæ. Palm.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut, Government botanist. Received June 5, 1923.

A medium-sized palm, native to central Madagascar, with a cylindrical stem about 3 inches in diameter and regularly pinnate leaves about 4 feet long, with very narrow pinnæ 16 to 18 inches long. Native name *jarthazo*. (Adapted from *Engler, Botanische Jahrbücher*, vol. 38, *Beiblatt* 87, p. 35.)

57215. TACSONIA sp. Passifloraceæ.

From Bogota, Colombia. Seeds presented by Brother Ariste Joseph. Received June 5, 1923.

"One of the curubas from the region of Bogota, where there are several, esteemed both for their ornamental value and their fruits, which are usually the size of small cucumbers and of sprightly acid flavor. Worthy of trial in California and Florida." (*Wilson Popenoe*.)

57216. THUNBERGIA GRANDIFLORA
Roxb. Acanthaceæ.

From St. Clair, Trinidad, British West Indies. Plants presented by R. T. Williams, superintendent, Royal Botanic Gardens. Received June 11, 1923.

"The typical form of *Thunbergia grandiflora* is well known in tropical gardens, where it is highly esteemed for its large sky-blue flowers and the ornamental effect of its foliage. The white form (var. *alba*) is less widely cultivated, though perhaps as meritorious as the type. It is a strong-growing climber, useful for covering pergolas and fences, and is sufficiently frost resistant for cultivation in the warmer parts of Florida and the most favored sections of southern California." (*Wilson Popenoe*.)

57217. ARECA sp. Phœnicaceæ. Palm.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received June 6, 1923.

"A very graceful dwarf palm, with a slender trunk about 2 inches in diameter, from Palawan. It ought to be a good conservatory plant." (*Wester*.)

57218. AMPELOCISSUS ACAPULCENSIS
(H. B. K.) Planch. Vitaceæ. Grape.

From Juatusco, Vera Cruz, Mexico. Seeds presented by Dr. C. A. Purpus. Received June 27, 1923.

"This was collected on very dry, rocky mountain slopes near Jalisco in Chiapas. The vine bore enormous bunches of red grapes and was in flower at the same time. It had no leaves. The fruits were partly ripe at the end of April and in May and I believe would make excellent jelly." (*Purpus*.)

57219. SOLANUM MAGLIA Schlecht. Solanaceæ.

From Lima, Peru. Tubers presented by the director, Estación Central Agronómica. Received June 28, 1923.

A nearly glabrous wild potato, native to Chile, with angled, winged stems about 2 feet high, light-green leaves 4 to 8 inches long, and cymes of white flowers an inch in width. The subglobose or oblong tubers are about 1½ inches long, with smooth, reddish brown surfaces. When boiled the tubers shrink and become watery and insipid. (Adapted from *Curtis's Botanical Magazine*, pl. 6756.)

Introduced for department specialists engaged in potato breeding.

For previous introduction, see S. P. I. No. 53445.

57220. CALYDorea SPECIOSA (Hook.)
Herbert. Iridaceæ.

From Santiago, Chile. Bulbs presented by Dr. Carlos Camacho. Received June 1, 1923.

An ornamental bulbous plant about 4 inches high, native to Chile, where it generally prefers the lower altitudes. The flower, about 2 inches wide, is a bright navy blue with a golden center. The bulbs are eaten boiled, roasted, or baked. (Adapted from note of José D. Husbands, under S. P. I. No. 30074.)

57221 and 57222. AGROPYRON spp.
Poaceæ. Grass.

From Ekaterinoslav, Russia. Seeds presented by the Russian Bureau of Applied Botany, through D. Borodin, New York, N. Y. Received June 14, 1923. Quoted notes by Mr. Borodin.

From the Ekaterinoslav Agricultural Experiment Station; introduced for department agrostologists.

57221. AGROPYRON ELONGATUM (Host)
Beauv. (*A. rigidum* Beauv.)

"No. 368. 1920 crop. Originally from Pamir."

57222. AGROPYRON SIBIRICUM (Willd.)
Beauv.

"No. 819. 1918 crop. Originally from Krasnikut."

57223. CROTALARIA JUNCÆA L. Fabaceæ. Sunn hemp.

From Calcutta, India. Seeds purchased from Messrs. Barnard & Co. Received June 11, 1923.

Introduced for testing as a green manure, for which purpose it is used in India. It is also used in that country as a fiber plant and as a catch crop.

57224. ARTOCARPUS COMMUNIS Forst.
Moraceæ. Breadfruit.

From Honolulu, Hawaii. Plants presented by Willis T. Pope, horticulturist, Agricultural Experiment Station. Received June 27, 1923.

"There is but one kind of breadfruit in Hawaii; while there are slight variations, due probably to local conditions, there are no true varietal differences." (*Pope*.)

This variety, which now grows wild throughout the Hawaiian Islands, was originally introduced from Tahiti. It has large, rough, ovate, deeply lobed leaves, and the staminate flowers appear in large yellow catkins. The large-stemmed fruit is either round or oblong and varies from 5 to 8 inches in diameter. The thick, tough rind, which is brownish at maturity, incloses a firm, very starchy, and somewhat fibrous pulp, which becomes mealy when cooked, slightly resembling a dry sweet-potato, and is much esteemed as an article of diet. The tree is propagated by suckers or by layering. (Adapted from G. P. Wilder, *Fruits of the Hawaiian Islands*, p. 100, pl. 48, under *A. incisa*.)

For previous introduction, see S. P. I. No. 44908.

57225. MALUS YUNNANENSIS (Franch.)
C. Schneid. (*Pyrus yunnanensis*
Franch.) Malaceæ. **Appie.**

From Yunnan, China. Fruits collected by J. F. Rock, Agricultural Explorer of the Bureau of Plant Industry. Received June 19, 1923.

"(No. 6760. October, 1922.) One of the finest apple trees of the Likiang Snow Range, where it grows in rocky situations at altitudes of 9,600 to 10,000 feet. It becomes 30 feet in height, with velvety leaves, and the exceedingly handsome yellow and red fruits, about 1 inch in diameter, are borne in December in large corymbs at the ends of the branches." (Rock.)

For previous introduction, see S. P. I. No. 56320.

57226 and 57227. RUBUS MACRAEI A. Gray. Rosaceæ. **Akala.**

From Hilo, Hawaii. Seeds presented by L. W. Bryan, Hawaiian Sugar-Planters' Association. Received June 19, 1923.

"The Hawaiian giant raspberry, occurring at an altitude of about 6,000 feet. It is a straight bush with the older branches thornless. The fruits, borne at the drooping tips of the branches, are very numerous, about 2 inches in diameter, and exceedingly juicy; the seeds are comparatively small. The flesh is slightly bitter but otherwise delicious. This berry is of great promise, as it grows in a region where frost is not uncommon in the winter months. It should grow well in the regions of the Pacific coast." (J. F. Rock.)

For previous introduction, see S. P. I. No. 53480.

57226. Red variety. 57227. Yellow variety.

57228. RUBUS ELLIPTICUS J. E. Smith.
Rosaceæ. **Raspberry.**

From Naini Tal, United Provinces, India. Seeds presented by Rev. N. L. Rockey. Received June 18, 1923.

"This is the most common wild yellow raspberry, which grows here in great profusion. The bush is tall, thorny, and hairy. The fruit, which ripens in early May, is a trifle insipid in its sweetness and full of seeds, but it is very tender and we enjoy it. I believe it will be valuable for breeding purposes. The native name is *hissauloo*." (Rockey.)

57229 to 57247. TRIFOLIUM spp.
Fabaceæ.

From Petrograd, Russia. Seeds presented by Prof. N. I. Vavilov, Bureau of Applied Botany. Received June 19, 1923. Quoted notes by Professor Vavilov.

Locally grown strains introduced for department agronomists engaged in clover breeding.

57229 to 57231. TRIFOLIUM HYBRIDUM L.
Alsike clover.

57229 and 57230. "From the 'Schloss Sagnitz' estate, Province of Livonia."

57229. No. 72. 57230. No. 460.

57231. "No. 793. From the Marussino Forage-Plant Selection Station, District of Morshansk, Province of Tambov."

57232 to 57245. TRIFOLIUM PRATENSE L.
Red clover.

57232. "No. 207. From the 'Schloss Sagnitz' estate, Province of Livonia."

57233. "No. 763. From the Province of Kasar."

57229 to 57247—Continued.

57234 to 57237. "From Kolodino, District of Poshekhonje, Province of Yaroslavl."

57234. No. 767.

57236. No. 769.

57235. No. 768.

57237. No. 770.

57238. "No. 776. From the Agricultural Plant-Breeding Station at Ekaterinoslav, Province of Ekaterinoslav."

57239 to 57243. "From the Marussino Forage-Plant Selection Station, District of Morshansk, Province of Tambov."

57239. No. 799.

57242. No. 802.

57240. No. 800.

57243. No. 803.

57241. No. 801.

57244. "No. 994. From the Phytosociological Station at Tsarskoye Selo, near Petrograd."

57245. "No. 1007. From the Province of Brijsansk."

57246 and 57247. TRIFOLIUM REPENS L.
White clover.

"From the 'Schloss Sagnitz' estate, Province of Livonia."

57246. No. 144.

57247. No. 145.

57248 to 57259. GOSSYPIUM spp.
Malvaceæ. **Cotton.**

From Cairo, Egypt. Seeds presented by Prof. R. H. Forbes. Received June 13, 1922. Numbered June, 1923.

Introduced for department cotton specialists.

57248 and 57249. "Pima cotton seed from the third generation of Pima cotton grown in Egypt." (Forbes.)

57248. GOSSYPIUM sp.

No. 47.

57249. GOSSYPIUM sp.

No. 48.

57250. GOSSYPIUM sp.

No. 51. "Pima cotton seed grown at Bah-tim, 1921." (Forbes.)

57251. GOSSYPIUM sp.

No. 52 (No. 111).

57252. GOSSYPIUM sp.

No. 53 (No. 77).

57253. GOSSYPIUM sp.

No. 54 (No. 310).

57254. GOSSYPIUM sp.

Nubari, grade 3.

57255. GOSSYPIUM sp.

Sakel.

57256. GOSSYPIUM sp.

No. 57. *Assili X*.

57257. GOSSYPIUM sp.

No. 57a.

57258. GOSSYPIUM sp.

No. 70. Prehistoric cotton.

57259. GOSSYPIUM sp.

No. 70a. Hindi cotton.

57260 and 57261.

From Ceylon, India. Seeds presented by the Governor of Ceylon, through Frank B. Noyes, Washington, D. C. Received June 11, 1923.

57260. *EXACUM ZEYLANICUM MACRANTHUM* (Arnott) C. B. Clarke. Gentianaceae.

An erect, slightly branched annual from the mountains of Ceylon, where it grows at an altitude of 6,000 feet. The stem, over a foot in height, is copiously leafy below and bears a terminal cluster of large handsome flowers. The latter have deep, rich-purple petals and showy bright-orange stamens. (Adapted from *Curtis's Botanical Magazine*, pl. 4771.)

57261. *OSBECKIA RUBICUNDA* Arnott. Melastomaceae.

A branched shrub, 4 to 6 feet in height, with hairy elliptic leaves about 2 inches long and brilliant purplish crimson flowers borne in clusters of one to five. Native to Ceylon. (Adapted from *Macmillan, Handbook of Tropical Gardening*, p. 393, and from *Hooker, Flora of British India*, vol. 2, p. 520.)

57262 and 57263. *CERATONIA SILIQUA* L. Caesalpiniaceae. Carob.

From Faro, Portugal. Budwood presented by Antonio Barreto Martins Terra Boa. Received June 11, 1923.

Sent in response to a request for cuttings of the best carob varieties cultivated in Portugal.

57262. *V. II. Pagenia* 500. 57263. *Mulata*.

57264 to 57266. *PROTEA* spp. Proteaceae.

From Kirstenbosch, Cape of Good Hope, South Africa. Seeds presented by Prof. R. H. Compton, director, National Botanic Gardens. Received June 20, 1923.

57264. *PROTEA LANCEOLATA* E. Mey.

"A very attractive shrub with light-yellow flowers and pale yellowish green foliage, not as striking as some of the other *Proteas* when in flower, but of decided value as a decorative plant. The habit and requirements are the same as those of the other *Proteas*." (*Dr. H. L. Shantz*.)

For previous introduction, see S. P. I. No. 48182.

57265. *PROTEA LATIFOLIA* R. Br.

"A wonderful *Protea*, with flowers 4 inches across. The Cape region is noted for its beautiful flowers, and of these none are more popular than the large flowers of the *Proteas*. The shrubs are from 2 to 6 feet high and bear a large flower on the tip of almost every branch. Seeds only are sent, but these are said to grow easily, and it will be possible to test the seedlings on several types of soil. Acid, or at least humus, soils should be tried in Florida and California." (*Dr. H. L. Shantz*.)

For previous introduction, see S. P. I. No. 48183.

57266. *PROTEA ROSACEA* L.

An attractive small shrub about 6 inches high, with numerous gracefully curved branches, needlelike leaves nearly an inch long, and sessile flower heads a little more than an inch in diameter, with bracts varying in color from bright rose to crimson. The shrub is native to the Cape of Good Hope, where it grows chiefly in the coastal regions. (Adapted from *Thielsen-Dyer, Flora Capensis*, vol. 5, sec. 1, p. 595.)

57267. *NAGEIA THUNBERGII* (Hook.) F. Muell. (*Podocarpus thunbergii* Hook.) Taxaceae.

From Hogsback, via Lovedale, Cape of Good Hope, South Africa. Seeds presented by David A. Hunter. Received June 25, 1923.

"This tree grows slowly, but finally becomes very large. The timber is fine grained and is largely used in our shops for furniture." (*Hunter*.)

A fine evergreen timber tree, up to 100 feet tall and with a trunk 4 feet in diameter, which occurs throughout all the timber forests from the Cape of Good Hope to Natal. The quality of the wood of this species is very similar to that of *Nageia elongata*, and for most purposes they are used indiscriminately.

For previous introduction, see S. P. I. No. 56197.

57268 and 57269.

From Burringbar, New South Wales, Australia. Seeds presented by B. Harrison. Received June 22, 1923.

57268. *ALLOTERPIS SEMIALATA* (R. Br.) Hitchc. Poaceae. Cockatoo grass.

"A native grass which becomes 2 to 3 feet high in sandy soil." (*Harrison*.)

"Cockatoo grass is excellent pasturage and of good seeding habit. It is leafy at the base." (*Roland McKee*.)

For previous introduction, see S. P. I. No. 56786.

57269. *GOMPHOCARPUS PHYSOCARPUS* E. Mey. Asclepiadaceae.

"A tall-growing plant which bears balloon-like pods containing brown seeds furnished with tufts of fine silky cotton." (*Harrison*.)

A branched plant 2 or 3 feet high, with opposite, very narrow, sharp-pointed leaves and 6 to 10 flowered umbels of small white flowers. (Adapted from *Thielsen-Dyer, Flora of Tropical Africa*, vol. 4, sec. 1, p. 328.)

57270. *EUGENIA DOMBEYI* (Spreng.) Skeels. (*E. brasiliensis* Lam.) Myrtaceae. Grumichama.

From Honolulu, Hawaii. Seeds presented by Willis T. Pope, horticulturist, Agricultural Experiment Station. Received June 30, 1923.

"The grumichama is found both wild and cultivated in southern Brazil, particularly in the States of Parana and Santa Catharina. Elsewhere, with the exception of Hawaii, it is scarcely known.

"The tree, which grows to the same size as the orange, is shapely and attractive in appearance, with ovate-elliptic, glossy, deep-green leaves 2 to 3 inches long. The small white flowers are followed by pendent fruits, round or slightly flattened, the size of a cherry, and deep crimson. The persistent green sepals which crown the apex are a distinguishing characteristic. The skin is thin and delicate, the soft flesh melting and of a mild subacid flavor suggesting that of a Bigarreau cherry. The seeds are round or hemispherical when one or two in number; sometimes there are three or more, in which case the size is reduced and they are angular. The fruit is usually eaten fresh, but may also be used to make jams and preserves.

"The grumichama (sometimes *grumizama*, to conform to old Portuguese orthography) has recently been planted in California and Florida. In the latter State it has withstood a temperature of 26° F. without injury, which indicates that it is subtropical rather than strictly tropical in character. It prefers a deep sandy loam, but succeeds in Florida on shallow sandy soils.

"For its value as an ornamental plant as well as for its pleasant fruit, the grumichama deserves cultivation throughout the Tropics and Subtropics." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 55978.

57271 and 57272. COFFEA spp. Rubiaceae. Coffee.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received June 29, 1923.

Introduced for department specialists engaged in coffee-growing experiments.

57271. COFFEA EXCELSA Cheval.

A coffee which thrives from sea level to 700 meters, succeeds well on rather stiff clayey soils, and is quite drought resistant—it might be grown with an annual rainfall of 48 inches. It is the most resistant to drought and blight of any coffee, is of strong vigorous growth, and produces 1 kilogram of coffee from 7 to 8 kilograms of berries. *Coffea excelsa* makes an excellent stock for other coffees. The first crop is obtained at the age of 4 to 5 years and a full crop at the age of 7 to 8 years. (Adapted from *Philippine Review*, vol. 9, p. 121.)

For previous introduction, see S. P. I. No. 53438.

57272. COFFEA LAURENTH Wildem. (*C. robusta* Hort.)

A white-flowered shrub, native to Belgian Congo, with oval dark-green leaves up to a foot in length and shortly elliptic 2-seeded fruits. The roundish seeds are sometimes nearly half an inch long. (Adapted from *Actes du Premier Congrès International de Botanique*, 1900, p. 234.)

For previous introduction, see S. P. I. No. 51481.

57273. PITTOSPORUM FLORIBUNDUM Wight and Arn. Pittosporaceae.

From Darjiling, India. Seeds presented by G. H. Cave, director, Lloyd Botanic Garden. Received January 8, 1923. Numbered June, 1923.

A handsome tree, with a short straight trunk and spreading branches and numerous yellowish flowers in terminal panicles. The tree has light-colored, strong tough wood and yields an aromatic yellow resin or oleoresin having very adhesive properties. It is a native of the outer Himalayas, ascending to 3,500 feet. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 6, pt. 1, pp. 283, 284, and *Brandis, Forest Flora of India*, p. 19.)

For previous introduction, see S. P. I. No. 47757.

57274 to 57386.

From Echo, Tiehlingho, Manchuria, China. Seeds presented by A. D. Woeikoff, director, experimental farm. Received June 21, 1923. Quoted notes by Mr. Woeikoff unless otherwise stated.

57274. ACANTHOPANAX SENTICOSUM (Rupr.) Harms. (*Eleutherococcus senticosus* Maxim.) Araliaceae.

"A very spiny shrub bearing palmate divided leaves and having at the end of its long shoots small umbels of black berries. Grows generally in dense shade. May be of use as a park or garden shrub or as an undergrowth beneath tall trees." (*F. N. Meyer*.)

For previous introduction, see S. P. I. No. 20309.

57275. ACANTHOPANAX SESSILIFLORUM (Rupr. and Maxim.) Seem. Araliaceae.

An ornamental, hardy shrub found in eastern Siberia. The leaves are palmate, the brownish flowers occur in dense umbels on the spiny branches, and the fruits are blackish berries. (Adapted from note of *F. N. Meyer*, November 24, 1906.)

For previous introduction, see S. P. I. No. 43675.

57274 to 57386—Continued.

57276. ARUNDINELLA ANOMALA Steud. Poaceae. Grass.

"Seeds of a tall grass, 3 to 5 feet, found growing here and there in large masses; of a spread-out growth, coarse. May be of use as a fodder grass." (*F. N. Meyer*.)

For previous introduction, see S. P. I. No. 21896.

57277. AVENA SATIVA L. Poaceae. Oats.

Introduced for department cerealists.

57278. BETULA DAURICA Pall. Betulaceae. Birch.

A tree 60 feet or more tall, with the trunk clothed with curling flakes of papery bark, giving it a curious ragged appearance. The broadly wedge-shaped, coarsely toothed leaves are dark green and smooth above and downy beneath along the midrib. This birch is native to Manchuria, Chosen, and northern China. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 256.)

For previous introduction, see S. P. I. No. 33151.

57279. CALAMAGROSTIS EPIGEJOS (L.) Roth. Poaceae. Grass.

A perennial, robust Manchurian grass, introduced for department agrostologists.

57280. ERIOCHLOA VILLOSA (Thunb.) Kunth. Poaceae. Grass.

A wild grass, native to Manchuria, introduced for department agrostologists.

57281. ETONYMUS HAMILTONIANUS Wall. Celastraceae.

A large Himalayan shrub which under favorable circumstances becomes a moderate-sized tree 30 to 35 feet high, with a short straight trunk 4 to 5 feet in girth. The clusters of 15 to 30 greenish white flowers are followed by yellow capsules the seeds of which are entirely surrounded by a scarlet aril. The fruit ripens from August onward. The leaves are brilliantly colored in fall. The wood is beautifully white, compact and close, not very hard, and is used for making spoons. The young shoots and leaves are lopped for fodder. (Adapted from *Brandis, Forest Flora of India*, p. 78, and *Arnold Arboretum Bulletin of Popular Information*, No. 13, 1911.)

For previous introduction, see S. P. I. No. 53699.

57282. FAGOPYRUM VULGARE Hill. (*F. esculentum* Moench.) Polygonaceae. Buckwheat.

"No. 175. *Ch'iao mai*. From Tulin."

57283. FRAXINUS MANDSHURICA Rupr. Oleaceae. Ash.

A handsome tree often 100 feet in height, native to Japan and the adjacent parts of the Asiatic mainland. The leaves are up to 15 inches in length, with dull-green, bristly leaflets. It is said to be susceptible to late spring frosts. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 569.)

57284 to 57295. HOLCUS SORGHUM L. (*Sorghum vulgare* Pers.) Poaceae. Sorghum.

Introduced for department cerealists.

57284. "No. 36. *Niang kaoliang*, a glutinous form from Mulin."

57285. "No. 37. *Niang kaoliang*, a glutinous form from Mulin."

57274 to 57386—Continued.

57286. "No. 38. *Tie chu mi tsa*, from Ninguta."57287. "No. 39. *Hung kaoliang*, red, from Mulin."57288. "No. 40. *Hung kaoliang*, red, from Mulin."57289. "No. 41. *Hung kaoliang*, red, from Mulin."57290. "No. 42. *Hung kaoliang*, red, from Mulin."57291. "No. 45. *Ts'o kaoliang*, from Tulin."57292. "No. 46. *Shejen kaoliang*, from Ninguta."57293. "No. 47. *Shejen kaoliang*, from Ninguta."57294. "No. 48. *Shejen kaoliang*, from Ninguta."57295. "No. 49. *Shejen kaoliang*, from Ninguta."57296. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Barley.

Introduced for department cerealists.

57297. *IRIS SETOSA* Pall. Iridaceae. Iris.

This was originally described as an Asiatic plant, but forms that can not be separated from it are found in North America. At least half a dozen forms come true to seed. The peculiarity of this iris is that the standards have dwindled until they are only small points about a half inch long, but their disappearance is usually counterbalanced by the increased size of the falls. The color is usually blue, but some shades are so light as to be almost gray. (Adapted from *W. Rickatson Dykes, Irises*, p. 64.)

57298. *JUNIPERUS RIGIDA* Sieb. and Zucc. Pinaceae. Juniper.

A Japanese juniper which is a tree about 20 feet in height and of elegant habit with the branches pendulous at the ends. The needle-like leaves are triangular in section and very slender. The tree thrives very well in southern England. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 569.)

57299. *LESPEDEZA BICOLOR* Turcz. Fabaceae.

Introduced for department forage-crop specialists.

A bushy, herbaceous Japanese perennial which flowers in early autumn, bearing a profusion of rosy purple flowers which practically cover its drooping branches. These branches sometimes become 6 feet in length. (Adapted from *Florists' Exchange*, vol. 49, p. 985.)

57300. *LONICERA MAACKII* (Rupr.) Herd. Caprifoliaceae. Honeysuckle.

A bush honeysuckle, native to northeastern China, becoming about 10 feet in height with widely spreading branches and dark-green leaves which are downy on both surfaces. The pure-white flowers, an inch in diameter, are produced in pairs on the upper side of the branchlets. The fruits are red. (Adapted from note under *S. P. I. No. 53712*.)

57301. *MAACKIA AMURENSIS* Rupr. Fabaceae.

A small tree, native to eastern Asia, with orange-brown bark, dull-green compound leaves, and short erect clusters of small yellowish white flowers. (Adapted from *Arnold Arboretum Bulletin of Popular Information*, No. 11, 1911.)

57274 to 57386—Continued.

57302 to 57308. *ORYZA SATIVA* L. Poaceae. Rice.57302. "No. 115. *Chalbe*, from Mulin."57303. "No. 120. *Handjontsa*, from Mulin."57304. "No. 125. *Shuidjontsa*, water rice from Tulin."57305. "No. 126. *Shuidjontsa*, water rice from Ninguta."57306. "No. 127. *Shuidjontsa*, water rice from Mulin."57307. "No. 128. *Shuidjontsa*, water rice from Mulin."57308. "No. 129. *Hokkaido* (*Sapporo akage*), from Mulin."57309. *PRINSEPIA SINENSIS* Oliver. Amygdalaceae.For previous introduction and description, see *S. P. I. No. 57087*.57310. *PRUNUS MAACKII* Rupr. Amygdalaceae. Cherry.

A Manchurian bird cherry, 40 feet or more in height, with very smooth brownish yellow bark which peels off like that of a birch. The leaves are pointed and very finely toothed, and the white flowers are in short racemes borne on the previous season's wood. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 2, p. 242.)

57311. *RHAMNUS DAVURICA* Pall. Rhamnaceae. Buckthorn.

A shrub or small tree, up to 30 feet in height, with more or less arching branches which are often thornless. The oblong or oval leaves are slender pointed and finely toothed. The black fruits, in dense clusters, are about one-fourth of an inch in diameter. This species is native to northeastern China and Siberia and is of value for rough shrubberies. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 2, p. 532.)

57312. *RHAMNUS PARVIFOLIA* Bunge. Rhamnaceae. Buckthorn.

"A *Rhamnus* of dense growth, having small foliage and bearing large jet-black berries. This shrub does not grow tall, but is densely branched and assumes well-rounded forms when not mutilated. Of value as a garden park shrub and as material for medium-sized hedges, especially for the drier sections of the United States." (*F. N. Meyer*.)

For previous introduction, see *S. P. I. No. 36735*.57313. *ROSA DAVURICA* Pall. Rosaceae. Rose.

"A Manchurian shrub closely related to the cinnamon rose, with straight, slender prickles, smaller double-serrate leaflets, purple flowers, and ovate scarlet fruits." (*H. C. Skeels*.)

For previous introduction, see *S. P. I. No. 54193*.57314. *SCHIZANDRA CHINENSIS* (Turcz.) Baill. Magnoliaceae.

"A trailing vine of small growth, found among boulders and rocks. The leaves are not unlike those of *Actinidia kolomikta*, and the red, sour berries are in small clusters. Might be of use as a small porch and trellis vine for the colder sections of the United States." (*F. N. Meyer*.)

For previous introduction, see *S. P. I. No. 36755*.

57274 to 57386—Continued.

57315 to 57340. SOJA MAX (L.) Piper. (*Glycine hispida* Maxim.) Fabaceae. Soybean.

57315. "No. 176. *Ssu luih hwa*, from Kungshuling."

57316. "No. 177. *Kungshuling wunhsin*, from Kungshuling."

57325. "No. 204. *Hsiao ch'in huang tou*, a golden form from Ninguta."

57326. "No. 205. *Hsiao ch'in huang tou*, a golden form from Ninguta."

57327. "No. 206. *Hsiao ch'in huang tou*, a golden form from Ninguta."

57328. "No. 207. *Hsiao ch'in huang tou*, a golden form from Ninguta."

57329. "No. 208. *Hsiao ch'in huang tou*, a golden form from Tubin."

57330. "No. 209. An early soybean from Musan, Mulin."

57331. "No. 211. *Ta ch'in mi huang tou tsa*, from Tubin."

57332. "No. 212. *Hua lia tou tsa*, from Ninguta."

57333. "No. 213. *Huang tou*, a yellow form from Ninguta."

57334. "No. 214. *Huang tou*, a yellow form from Ninguta."

57335. "No. 215. *Huang tou*, a yellow form from Mulin."

57336. "No. 216. *Hei tou*, a black form from Tubin."

57337. "No. 217. *Ch'ing tou*, a green form from Ninguta."

57338. "No. 218. *Ch'ing huang tou*, a green-yellow form from Ninguta."

57339. "No. 219. *Ch'ing huang tou*, a green-yellow form from Mulin."

57340. "No. 220. *Yao li er huang tou tsa*, from Mulin."

57341. PHASEOLUS VULGARIS L. Fabaceae. Common bean.

"No. 221. *O iar kong*, a Korean variety, from Mulin."

57342. SOJA MAX (L.) Piper. Fabaceae. (*Glycine hispida* Maxim.) Soybean.

"No. 222. *Hei tou*, from Ashiho."

57274 to 57386—Continued.

57343. SPODIOPOGON SIBIRICUS Trin. Poaceae. Grass.

"A perennial grass, 2 to 3 feet high, occurring on mountain slopes on decomposed porphyritic rock in partial shade. Possibly of forage value in Rocky Mountain localities." (F. N. Meyer.)

For previous introduction, see S. P. I. No. 44288.

57344. SYRINGA AMURENSIS Rupr. Oleaceae. Lilac.

A privetlike lilac, native to Manchuria, introduced for stock and breeding experiments.

57345. TILIA AMURENSIS Rupr. Tiliaceae. Linden.

A Manchurian linden with a habit similar to that of the small-leaved linden (*Tilia cordata* Mill.), with ovate, papery, long-pointed leaves which are dark green above and blue-green below. It is distinguished from the small-leaved linden by its coarser dentations. (Adapted from Schneider, *Illustrirtes Handbuch der Laubholzkunde*, vol. 2, p. 374.)

57346. TILIA MANDSHURICA Rupr. and Maxim. Tiliaceae. Linden.

"A very large-leaved linden growing here and there in the forests. Locally used for making water troughs, barrels, and also beehives. May be utilized in the colder parts of the United States as an ornamental park and shade tree." (F. N. Meyer.)

For previous introduction, see S. P. I. No. 20292.

7347 to 57365. TRITICUM AESTIVUM L. (T. vulgare Vill.) Poaceae. Common wheat.

57347. "No. 135. *Kuang tu erh hsiao mai*, from Tubin."

57348. "No. 136. *Kuang tu erh hsiao mai*, from Ninguta."

57349. "No. 137. *Kuang tu erh hsiao mai*, from Ninguta."

57351. "No. 139. *Kuang tu erh hsiao mai*, from Ninguta."

57352. "No. 145. *Hsiao mai*, from Mulin."

57353. "No. 146. *Hsiao mai*, from Ninguta."

57354. "No. 147. *Hsiao mai*, from Ninguta."

57355. "No. 148. *Hsiao mai*, from Mulin."

57356. "No. 149. *Hsiao mai*, from Mulin."

57357. "No. 155. *Ta wan hsiao mai*, from Ninguta."

57358. "No. 156. *Ta wan hsiao mai*, from Ninguta."

57359. "No. 157. *Ta wan hsiao mai*, from Ninguta."

57274 to 57386—Continued.

57360. "No. 160. *Ta wan hsiao mai*, from Tubin."

57361. "No. 161. From Ninguta."

Received as *Triticum vulgare lutescens* forma *pollavensae*.

57362. "No. 162. From Ninguta."

Received as *Triticum vulgare erythrospermum* forma *gracuum amylosum*.

57363. No. 163.

Received as *Triticum vulgare erythrospermum*.

57364. "No. 164. From Ninguta."

Received as *Triticum compactum icterinum*.

57365. "No. 165. From Ninguta."

Received as *Triticum ferrugineum* forma *rossicum*.

57366. *VIBURNUM BUREJAETICUM* Regel and Herd. Caprifoliaceae.

A shrub, 4 to 10 feet high, native to Chosen. The small light-green leaves and the small umbels of white flowers, followed by the jet-black berries, make this plant very ornamental. (Adapted from note of F. N. Meyer, August 20, 1906.)

For previous introduction, see S. P. I. No. 43730.

57367. *VITIS AMURENSIS* Rupr. Vitaceae. Amur grape.

A strong-growing deciduous vine somewhat similar in habit to *Vitis vinifera*. It is worth growing as an ornamental for its vigorous habit and for the fine crimson and purple autumn hues of its foliage. It is native to Chosen (Korea) and northeastern China. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 2, p. 666.)

57368 to 57386. *ZEA MAYS* L. Poaceae. Corn.

57368. "No. 1. *Niang pao mi*, a glutinous white corn from Ninguta."

57369. "No. 2. *Niang pao mi*, a glutinous white corn from Tubin."

57373. "No. 9. *Pai pao mi*, a white corn from Mulin."

57374. "No. 10. *Pai pao mi*, a white corn from Mulin."

57375. "No. 11. *Pai pao mi*, a white corn from Tubin."

57376. "No. 15. *Huang pao mi*, a yellow corn from Tubin."

57377. "No. 16. *Huang pao mi*, a yellow corn from Ninguta."

57378. "No. 18. *Huang pao mi*, a yellow corn from Mulin."

57379. "No. 19. *Huang pao mi*, a yellow corn from Ninguta."

57274 to 57386—Continued.

57380. "No. 22. *Huang pao mi*, a yellow corn from Mulin."

57381. "No. 25. *Huang pao mi*, a yellow corn from Mulin."

57382. "No. 26. *Hung pao mi*, a red corn from Ninguta."

57383. "No. 27. *Hung pao mi*, a red corn from Ninguta."

57384. No. 28.

57385. "No. 30. *Hei pao mi*, a black corn from Ninguta."

57386. "No. 32. *Hei pao mi*, a black corn from Mulin."

57387 to 57394.

From Sayo, Abyssinia. Seeds presented by Fred L. Russell, agricultural missionary. Received June 23, 1923. Quoted notes by Mr. Russell.

57387. *ELEUSINE CORACANA* (L.) Gaertn. Poaceae. Ragi.

"*Dagooja*. The seeds of this plant form an important food in western Abyssinia; for human consumption they are parched and cooked as porridge. The straw is a favorite stock feed."

57388. *ERAGROSTIS ABYSSINICA* (Jacq.) Schrad. Poaceae. Teff.

"*Teff*. Bought in the native market, near the trading center called Sayo by Europeans and Dumbi Dola by the Abyssinians."

57389. *GOSSYPIMUM* sp. Malvaceae. Cotton.

"Seed from cotton obtained in the native market near Sayo."

57390. *GOSSYPIMUM* sp. Malvaceae. Cotton.

"Found growing on an Abyssinian plantation in the lowlands near the River Birbir about 20 miles from where it empties into the Baro or Sobat River."

57391. *HORDEUM DISTICHON PALMELLA* Harlan. Poaceae. Two-rowed barley.

"The commonest variety of barley in western Abyssinia."

57392 and 57393. *TRITICUM AESTIVUM* L. (T. *vulgare* Vill.) Poaceae.

Common wheat.

57392. "A variety from western Abyssinia which the natives claim they have always had. Varieties which are not rust resistant do not survive here."

57393. "A variety from western Abyssinia which the natives say has been grown here about 40 years and was probably brought from southern Europe."

57394. *TRITICUM DICOCUM* Schrank. Poaceae. Emmer.

"Grown as a minor crop in western Abyssinia."

57395 to 57424. *IPOMOEA BATATAS* (L.) Poir. Convolvulaceae. Sweetpotato.

From St. Croix, Virgin Islands. Tubers presented by J. B. Thompson, agronomist in charge, Agricultural Experiment Station. Received April 2, 1923. Quoted notes by Mr. Thompson.

57395 to 57424—Continued.

57395. No. 36.

For a description of this plant, see S. P. I. Nos. 56932 and 56933.

57396. "No. 47. A Big Wig seedling. The stems are comparatively short, being 2 to 3 feet in length, are leafy, and cover the bank well. Leaves light green and cordate. The original seedling bore seven tubers weighing 13 ounces. The tubers were light red, short, thick, and not uniform in shape. The flesh is yellow, sometimes mottled with red."

57397. "No. 60. A Black Rock seedling. Vines in the nursery row slender to medium stout, 2 to 3 feet in length, leafy, and covered the bank well. Leaves dark green, broad, and 3 parted, with red midribs. Tubers smooth, short, rounded, coppery red or rose color; flesh yellow, mottled with red."

57398. "No. 63. A Black Rock seedling. Vines short, bunching, leafy. Leaves lobed and to some extent resembling those of Big Wig; midribs and vines green. The original seedling produced seven tubers weighing only 9 ounces. Tubers red and rather rough; flesh yellow."

57399. "No. 65. A Black Rock seedling. The stems are short, 1 to 2 feet long, and stout. Leaves 3 parted, with broad blade; veins and midribs red. The original seedling bore four tubers weighing 3 ounces. Tubers light red; flesh almost white."

57400. "No. 68. A Black Rock seedling. Stems 2 to 3 feet long, stout, green. Leaves large, broad, green; midrib and veins green. The original seedling bore three tubers weighing 5 ounces. Tubers red, variable in form; flesh rich yellow."

57401. "No. 72. A Big Wig seedling. The stems are about 3 feet long and leafy. Leaves dark green, 5 parted; midribs and veins red. The original seedling bore eight tubers weighing 1 pound. Tubers dark red; flesh yellow or yellow mottled with red."

57402. "No. 82. A Big Wig seedling. Leaves large, broadly lanceolate, with red midribs and veins. The original seedling bore 12 tubers weighing 2¼ pounds. Tubers red, smooth; flesh pale yellow."

57403. "No. 84. A Big Wig seedling. Vines 1 to 2 feet in length and leafy. Leaves 3 parted; midribs and veins amber."

57404. "No. 89. A Big Wig seedling. Stems 1 to 2 feet long, leafy. Leaves large, dark green, 5 parted, deeply cut and lobed; midribs and veins red. The original seedling bore two tubers weighing 1 ounce. Tubers light red, rough and irregular in shape; flesh almost white, sometimes mottled with red; cooks rather wet."

57405. No. 92.

For a description of this plant, see S. P. I. Nos. 56948 to 56951.

57406. "No. 93. A Big Wig seedling. Stems 1 to 2 feet long and leafy. Leaves dark green, lobed, 3 or 5 parted; midribs and veins red. Tubers light red, irregular in form; flesh white or white mottled with red."

57407. No. 125.

For a description of this plant, see S. P. I. No. 56959.

57395 to 57424—Continued.

57408. "No. 140. A Big Wig seedling. Stems 18 to 30 inches long, leafy. Leaves 5 lobed and resembling the Big Wig variety, dark green; midribs red. The original seedling bore seven tubers weighing 1 pound 10 ounces. Tubers dark red; flesh pale yellow with sometimes a trace of red mottling."

57409. "No. 145. A Big Wig seedling. Stems bunching, 1 to 2 feet long. Leaves small, deeply cut, with long narrow lobes. The original seedling produced one tuber weighing 2 ounces. Tubers smooth, light red; flesh pale yellow."

57410. "No. 155. A Big Wig seedling. The original seedling yielded eight tubers weighing 1 pound 6 ounces. Stems bunching, 12 to 18 inches long. Leaves dark green, broad; midribs and veins green. Tubers dark red, long, spindle shaped; flesh yellow."

57411. "No. 192. A Black Rock seedling. Stems 12 to 18 inches long, bunching and leafy. Leaves 3 or 5 parted, not deeply cut; midribs green. The original seedling produced 10 tubers weighing 1 pound 9 ounces. Tubers light red; flesh pale yellow."

57412. No. 217.

For a description of this plant, see S. P. I. Nos. 56977 to 56980.

57413. "No. 220. A Key West 'yam' (Porto Rico) seedling. The original seedling bore three tubers weighing 12 ounces. Tubers smooth, coppery red or rose color; flesh a deep golden yellow."

57414. No. 223.

For a description of this plant, see S. P. I. Nos. 56981 and 56982.

57415. "No. 230. A Big Wig seedling. Original seedling produced 12 tubers weighing 1 pound 14 ounces. Tubers dark red, smooth, shining; flesh yellow."

57416. "No. 285. A Big Wig seedling. Tubers long, spindle shaped, dark red; flesh pure white."

57417. "No. 300. A Black Rock seedling. Tubers cream yellow, long, smooth, spindle shaped. Flesh yellow, sometimes mottled with a little red; cooks dry, dark yellow, sweet, and of good quality."

57418. No. 306.

For a description of this plant, see S. P. I. No. 56995.

57419. "Big Wig variety."

For a description of this variety, see S. P. I. Nos. 56996 and 56997.

57420. "Black Rock variety."

For a description of this variety, see S. P. I. Nos. 56998 to 57000.

57421. "Hug-me-tight variety."

For a description of this variety, see S. P. I. Nos. 57001 and 57002.

57422. "John Siddon variety."

For a description of this variety, see S. P. I. Nos. 57003 and 57004.

57423. "Key West 'yam' variety."

For a description of this variety, see S. P. I. Nos. 57005 to 57010.

57424. "Wrenchy variety."

For a description of this variety, see S. P. I. Nos. 57011 and 57012.

57425 to 57514. IPOMOEA BATATAS (L.)
Poir. Convolvulaceæ. Sweetpotato.

From St. Croix, Virgin Islands. Tubers presented by J. B. Thompson, agronomist in charge, Agricultural Experiment Station. Received May 23, 1923. Quoted notes by Mr. Thompson.

"Grown at the Virgin Islands Experiment Station in 1922."

57425 to 57436. "Big Wig seedlings."

57425. "No. 1. Vines short and bunching; stems rather slender, hairy, and dark chocolate red; leaves deeply cut, 5 parted; midribs and veins red; tuber dark red. Original seedling bore seven tubers weighing $1\frac{1}{2}$ pounds."

57426. "No. 10. Vines short, 2 to 3 feet long, and leafy; leaves large, 3 pointed; petioles 4 to 8 inches long, green with red blotch at juncture with leaf."

57427. "No. 12. Vines short, bunching, 12 to 18 inches long, stout, and leafy; leaves 5 parted; petioles 6 to 12 inches long, green to wine colored; tubers dark red. Original seedling yielded three tubers weighing 1 pound and 1 ounce."

57428. "No. 21. Vines 1 to 2 feet long, of average leafiness; leaves medium sized, deeply lobed, blade narrow, variable in pattern, some 3 and others 5 parted; midribs amber to green and not very thrifty in appearance as grown in nursery; tubers red. Original seedling bore six tubers weighing in all 13 ounces."

57429. "No. 23. Vines 24 to 30 inches long, moderately stout, green, and bearing a rank growth of large, broad, 3-parted dark-green leaves; midribs and veins green; tubers dark red. Original seedling bore three tubers weighing 5 ounces."

57430. "No. 27. Vines 3 feet long; leaves dark green, 5 parted; tubers light red. Original seedling bore seven tubers weighing 1 pound 3 ounces."

57431. "No. 32. Vines stout, 24 to 30 inches long with an abundance of foliage; leaves small to medium sized, very dark green; midribs and veins red. Original and usually 3 parted; tubers red. Original seedling bore one tuber weighing 1 ounce."

57432. "No. 33. Vines very long, slender, reaching out 10 to 15 feet on either side of the row; leaves not numerous, small, cordate, dark green; tubers red. Original seedling bore 18 tubers weighing a total of 2 pounds."

57433. "No. 34. Vines stout, 2 to 3 feet long; leaves large, lobed, 8 and 5 parted, light green; midribs and veins wine colored; tubers red blotched with white, flesh yellow."

57434. "No. 44. Vines 12 to 18 inches long, bunching; leaves small to medium sized, dark green, cordate; midribs amber to wine colored; tubers smooth, light red. Original seedling bore four tubers weighing an aggregate of 12 ounces."

57435. No. 45.

For a description of this plant, see S. P. I. No. 56941.

57436. "No. 46. Vines short and bunching; leaves medium sized, 5 parted; tubers white; flesh pale yellow, sometimes mottled with a little red."

57425 to 57514—Continued.

57437 to 57442. "Black Rock seedlings."

57437. "No. 48. Vines 24 to 30 inches long, leafy; leaves light green, cordate-pointed; midribs and veins light wine colored; tubers light red, flesh yellow, sometimes mottled with red. Original seedling bore four tubers weighing 12 ounces."

57438. "No. 49. Vines 3 feet long, covering bank completely; leaves numerous, dark green, cordate; midribs and veins red; tubers red, flesh yellow. Original hill bore 18 tubers with a total weight of 2 pounds 5 ounces."

57439. "No. 53. Vines 1 to 2 feet long, bunching; leaves very numerous, large, dark green, 3 or 5 parted; midribs and veins red; tubers red, flesh yellow. Original seedlings bore one tuber weighing 2 ounces."

57440. "No. 54. Vines 1 to 2 feet long, leafy; leaves rather light green, medium sized, and relatively broad, 3 parted; midribs and veins red; tubers peculiar frosty or glaucous red, flesh pale yellow, sometimes mottled with a little red. Original seedling bore five tubers weighing a total of 3 ounces."

57441. "No. 64. Vines 18 to 24 inches long, very leafy, covering bank and interspaces between rows; leaves dark green, deeply cut and lobed, 5 parted with long narrow blade and narrow sharp-pointed lobes; midribs and veins red; tubers red, flesh pale yellow. Original seedling bore no tubers."

57442. "No. 71. Vines 1 to 2 feet long; leaves small, 3 to 5 parted; midribs and veins amber to wine colored; tubers red, flesh pale yellow."

57443 to 57472. "Big Wig seedlings."

57443. No. 74.

For a description of this plant, see S. P. I. No. 56946.

57444. No. 75.

For a description of this plant, see S. P. I. No. 56947.

57445. "No. 78. Vines 3 feet long, leafy; leaves dark green, deeply cut and lobed, blades narrow; midribs and veins wine colored; tubers dark red, flesh pale yellow. Original seedling matured 10 tubers with a total weight of 1 pound 15 ounces."

57446. "No. 85. Vines 1 to 2 feet long, leafy; leaves dark green, 3 parted, long with a broad pointed blade; midribs and veins red; tubers dark red, flesh yellow. Original seedling yielded three tubers weighing 7 ounces."

57447. "No. 94. Vines are about 3 feet long; leaves 3 to 5 parted; midribs and veins amber; tubers red, flesh yellow."

57448. "No. 99. Vines 12 to 18 inches long, stout, leafy; leaves 3 parted; midribs red; tubers glaucous or frosty red, flesh very pale yellow to almost white. Original seedling bore three tubers weighing 5 ounces."

57449. "No. 101. Vines 1 to 3 feet long; leaves deeply cut with long narrow lobes; midribs and veins red; tubers red, flesh yellow. Original seedling bore four tubers weighing 13 ounces."

57425 to 57514—Continued

57450. "No. 104. Vines bunching, with dense foliage; leaves large, dark green, 5 parted, blade long and broad; midribs green to amber. Tubers dark red, flesh yellow and mottled with red. Original seedling bore three tubers weighing 7 ounces."

57451. "No. 107. Vines green, short and bunching; leaves green and cordate, resembling those of Black Rock in form, but with margins of younger leaves wine colored as in the Key West 'yam'; midribs and veins green; tubers coppery red to rose, flesh pale yellow. Original seedling bore two tubers weighing 6 ounces."

57452. No. 112.

For a description of this plant, see S. P. I. No. 56956.

57453. "No. 114. Vines short, plants bunching in habit; leaves dark green, large, 5 parted; midribs and veins red; tubers glaucous, frosty red, flesh pale yellow and mottled with red. Original seedling bore three tubers weighing 15 ounces."

57454. "No. 115. Vine short, bunching; leaves numerous, light yellow, 5 parted with narrow lobes; midribs wine colored with veins usually green; tubers with yellow skin and deep golden yellow flesh."

57455. "No. 117. Vines 1 to 2 feet long; leaves small, 3 to 5 parted; midribs and veins green; tubers glaucous red, flesh pale yellow."

57456. "No. 120. Vines 2 to 3 feet long, stout; leaves dark green, cordate; midribs wine colored; tubers red, flesh pale yellow, sometimes mottled with red."

57457. No. 122.

For a description of this plant, see S. P. I. No. 56957.

57458. No. 123.

For a description of this plant, see S. P. I. No. 56958.

57459. "No. 127. Vines small, bunching, erect; leaves very small, deeply cut, ragged in outline, 5 parted; midribs and veins green; tubers pale yellow, flesh deep golden yellow. Original seedling bore seven tubers weighing 1 pound."

57460. "No. 130. Vines 4 to 10 feet long; leaves lanceolate, shouldered; midribs green; tubers white, flesh pale yellow. Original seedling bore two tubers weighing 8 ounces."

57461. "No. 132. Vines low growing, bunching, and leafy; leaves small, dark green, cordate, pointed; midribs and veins red; tubers light coppery red or rose, flesh yellow and mottled with red. Original seedling yielded four tubers weighing 1 pound 2 ounces."

57462. "No. 135. Vines short and stout; 12 to 18 inches long, green; leaves cordate, pointed; midribs and veins green; tubers red, flesh yellow."

57463. "No. 143. Vines stout, hairy, 1 to 2 feet long, erect or ascending in habit; leaves comparatively small, cordate; midribs and veins wine colored; tubers dark red, flesh white, sometimes mottled with a little red. Original seedling bore three tubers weighing 1 pound 3 ounces."

57425 to 57514—Continued

57464. "No. 147. Vines short, 12 to 18 inches long; leaves small; midribs and veins red; tubers red, flesh pale yellow badly mottled with red. Original seedling bore two tubers weighing 2 ounces."

57465. "No. 148. Vines 2 to 5 feet long; leaves sparse, usually 3 parted; midribs and veins amber; tubers light red, flesh dark yellow. Original seedling bore five tubers weighing 9 ounces."

57466. "No. 149. Vines 2 to 3 feet long, leafy; leaves dark green, 5 parted; midribs and veins wine colored; tubers dark red, flesh yellow and mottled with red. Original seedling bore one tuber weighing 1 ounce."

57467. "No. 150. Vines 12 to 30 inches long; leaves very dark green, 3 parted, favoring those of Key West 'yam' but darker; midribs and veins green; tubers red, flesh yellow."

57468. No. 153.

For a description of this plant, see S. P. I. Nos. 56964 to 56966.

57469. "No. 154. Vines small, bunching, leafy; leaves light green, 5 parted, blade broad; midribs light wine colored; tubers dark red, flesh yellow. Original seedling bore four tubers weighing 9 ounces."

57470. "No. 159. Vines 12 to 18 inches long, bunching; leaves small to medium sized, dark green, relatively broad; midribs and veins green; tubers red, flesh yellow. Original seedling bore eight tubers weighing 1 pound 10 ounces."

57471. "No. 160. Vines 1 to 2 feet long, leafy; leaves small to medium sized, dark green; midribs and veins dark wine colored; tubers red, flesh yellow. Original seedling bore seven tubers weighing 1 pound 5 ounces."

57472. "No. 164. Vines 1 to 2 feet long; leaves cut in five' long narrow lobes; midribs and veins amber; tubers red. Original seedling produced red roots without tubers."

57473 to 57485. "Black Rock seedlings."

57473. "No. 167. Vines short and bunching; stems 1 to 2 feet long; leaves cordate, medium sized; midribs and veins red; tubers red, flesh pale yellow."

57474. No. 169.

For a description of this plant, see S. P. I. Nos. 56968 to 56970.

57475. "No. 179. Vines 12 to 30 inches long; leaves medium to large, lanceolate; midribs amber to wine colored; tubers dark red, flesh pale yellow to almost white. Original seedling produced 16 tubers that weighed 1 pound 2 ounces."

57476 and 57477. No. 188.

For a description of this plant, see S. P. I. No. 56971.

57476. (No. 1.) 57477. (No. 2.)

57478. "No. 189. Vines 2 to 6 feet long, slender; leaves 5 parted but not deeply cut; midribs amber to wine colored; tubers red, flesh pale yellow. Original seedling bore seven tubers weighing 1 pound 7 ounces."

57425 to 57514—Continued.

57479. "No. 194. Vines stout, 1 to 3 feet long; leaves large, cordate or cordate-lanceolate; midribs and veins red; tubers pale yellow, flesh yellow. Original seedling bore seven tubers weighing 1 pound."

57480. "No. 202. Vines bunching, leafy; 12 to 30 inches long; leaves dark green, 3 parted; midribs and veins red; tubers dark red, flesh yellow. Original seedling bore seven small tubers having a total weight of 13 ounces."

57481. "No. 203. Vines short and stout, 1 to 2 feet long; leaves dark green, medium sized, 5 parted; midribs and veins red; tubers red, flesh yellow. Original seedling bore seven tubers weighing 1 pound 13 ounces."

57482. "No. 207. Vines short, 12 to 24 inches long, leafy; leaves large, 5 parted; midribs and veins light wine colored; tubers yellow, flesh yellow. Original seedling produced white roots without tubers."

57483. "No. 208. Vines short and leafy, 12 to 30 inches long; leaves 5 parted; blades large and broad, petioles 8 to 12 inches; midribs wine colored, veins amber; tubers red, flesh yellow. Original seedling bore seven tubers weighing 11 ounces."

57484. "No. 209. Vines 3 to 4 feet long, moderately stout; leaves entire, cordate-lanceolate, immature ones wine colored, as in Key West 'yam,' especially on margins; midribs and veins amber; tubers light red, flesh yellow. Original seedling bore 10 tubers weighing 2 pounds 11 ounces."

57485. "No. 212. Vines up to 5 feet long; leaves large, dark green, ornamental, broad, shouldered; midribs and veins red; tubers yellow, flesh yellow mottled with red. Original seedling bore seven tubers weighing 14 ounces."

57486 to 57490. "Key West 'yam' seedlings."

57486. "No. 219. Vines short, bunching, 1 to 2 feet long; leaves small to medium sized, 5 parted; midribs and veins amber to wine colored; tubers red, flesh yellow. Original seedling bore one tuber weighing 11 ounces."

57487. "No. 224. Vines stout, 3 to 4 feet long; leaves large, broad, triangular; midribs and veins red; tubers yellow with a very light rose tint, flesh yellow. Original seedling produced four tubers weighing 1 pound 9 ounces."

57488. "No. 225. Vines short, 1 to 2 feet long, green; leaves medium sized, variable in form; midribs and veins green. Tubers light red, flesh pale yellow. Original seedling bore 13 tubers weighing 1½ pounds."

57489. No. 226.

For a description of this plant, see S. P. I. Nos. 56983 to 56985.

57490. "No. 227. Vines stout, 12 to 30 inches long, green; leaves large, dark green, cordate, and occasionally marginally notched; midribs and veins green; tubers dark yellow with rose tint; flesh yellow, badly mottled with red. Original seedling bore seven tubers weighing 2 pounds."

57425 to 57514—Continued.

57491 and 57492. Big Wig seedlings."

57491. "No. 228. Vines 12 to 30 inches long, hairy, and red; leaves medium to large, deeply cut and lobed, 5 parted; midribs and veins dark wine colored, tubers red with a thick red under-skin, flesh yellow and mottled with red. Original seedling bore five tubers weighing 8 ounces."

57492. "No. 229. Vines 2 to 5 feet long, leafy; leaves 5 parted; midribs and veins wine to amber; tubers yellow, flesh deep yellow. Original seedling bore eight tubers weighing 10 ounces."

57493 to 57498. "Black Rock seedlings."

57493. "No. 234. Vines short, 1 to 2 feet long, stout; leaves cordate, triangular, or variably cut on margins; midribs and veins red; tubers light red, flesh yellow."

57494. No. 235.

For a description of this plant, see S. P. I. Nos. 56986 to 56988.

57495. "No. 244. Vines bunching, 1 to 2 feet long; leaves 5 parted; midribs and veins dark red; tubers red, flesh pale yellow or almost white. Original seedling bore four tubers weighing 1 pound 3 ounces."

57496. No. 247.

For a description of this plant, see S. P. I. Nos. 56991 to 56993.

57497. "No. 249. Vines 12 to 30 inches long; leaves large, shouldered, blades broad; midribs and veins wine colored. Original seedling bore four tubers weighing 5 ounces."

57498. "No. 252. Vines slender, ascending, 12 to 30 inches long; leaves small, entire or notched at shoulder, the younger leaves wine colored at the margins; midribs and veins red; tubers red, flesh yellow and mottled with red. Original seedling bore 10 tubers weighing 1¼ pounds."

57499 to 57505. "Big Wig seedlings."

57499. "No. 253. Vines bunching, stout, 1 to 2 feet long, leafy; leaves large, 3 or 5 parted, broad blade; midribs and veins red; tubers red, flesh pale yellow. Original seedling bore light-red roots but no tubers."

57500. "No. 254. Vines 2 to 4 feet long; leaves deeply cut in five long narrow parts; midribs and veins red; tubers red, flesh white. Original seedling bore dark-red roots without tubers."

57501. "No. 255. Vines 12 to 30 inches long; leaves lanceolate, sometimes shouldered or 3 parted, pea green; midribs and veins green; tubers red, flesh yellow. Original seedling bore dark-red roots but no tubers."

57502. "No. 256. Vines bunching, leafy, 1 to 2 feet long; leaves dark green, 5 parted, resembling Big Wig parent; midribs and veins red; tubers red, flesh yellow and mottled with red. Original seedling bore 17 tubers weighing 2 pounds 2 ounces."

57503. "No. 258. Vines 1 to 2 feet long, stout; leaves large, irregularly cut and variable in pattern; midribs and veins red; tubers light red, flesh white. Original seedling bore two tubers weighing 1 pound 6 ounces."

57425 to 57514—Continued.

57504. "No. 262. Vines slender, hairy, 8 to 9 feet long; leaves light green, large, cordate; midribs and veins wine colored; tubers red, flesh yellow. Original seedling bore two tubers weighing 12 ounces."

57505. "No. 264. Vines short, 1 to 3 feet long; leaves large, dark green, cordate; midribs and veins amber to wine colored; tubers red, flesh pale yellow, occasionally mottled with a little red. Original seedling bore four tubers that weighed 1 pound 13 ounces."

57506 to 57508. "Parentage unknown."

57506. "No. 272. Vines bunching, 1 to 2 feet long; leaves small, 5 parted; midribs wine colored; tubers red, flesh pale yellow. Original seedling bore light-red roots without tubers."

57507. "No. 274. Vines 1 to 3 feet long, red, ascending; leaves triangular or 3 parted; midribs wine colored; tubers dark red, flesh yellow. Original seedling bore four tubers weighing 4 ounces."

57508. "No. 277. Vines stout, 2 to 3 feet long; leaves large, shouldered or 3 parted, blades broad; tubers red, flesh yellow. Original seedling bore nine tubers weighing 2¼ pounds."

57509 and 57510. "Volunteer seedlings from a Big Wig plat."

57509. "No. 290. Vines stout, ascending, 1 to 2 feet long; leaves light green, lanceolate or shouldered; midribs and veins amber to red; tubers yellow, flesh yellow and mottled with red. Eleven hills in the nursery yielded 6 pounds of tubers."

57510. "No. 292. Vines 1 to 2 feet long; leaves large, dark green, cordate-pointed; midribs green to amber; tubers red, flesh white and mottled with red. Eight hills in the nursery produced 5¼ pounds."

57511 and 57512. "Volunteer seedlings from a Key West 'yam' plat."

57511. "No. 295. Vines 2 to 4 feet long; leaves medium sized, cut in five long, narrow lobes; midribs and veins amber to wine colored; tubers red, flesh yellow. In the nursery 14 hills bore 18¼ pounds of tubers."

57512. "No. 297. Vines from 2 to 4 feet long, stout and leafy; leaves light green, large, cordate; midribs and veins amber to green; tubers red, flesh yellow. Seven hills in the nursery row yielded 8 pounds of tubers."

57513 and 57514. "Volunteer seedlings from a Black Rock plat."

57513. "No. 299. Vines 1 to 3 feet long; leaves large, long; midribs and veins amber to green; tubers yellow with a tint of rose, flesh yellow. Eight hills in the nursery row produced 10¼ pounds of tubers."

57514. "No. 305. Vines 1 to 2 feet long, stout and leafy; leaves 3 parted, blades broad; midribs and veins red; tubers coppery red or rose, flesh white and mottled with red."

57515 to 57611.

From Ekaterinoslav, Russia. Seeds presented by the Russian Bureau of Applied Botany, through D. Borodin, New York, N. Y. Received June 14, 1923. Quoted notes by Mr. Borodin.

A collection of seeds from the Ekaterinoslav Agricultural Experiment Station, introduced for department specialists.

57515. *BROMUS Squarrosus* L. Poaceae.
Grass.

"No. 188. 1916 crop."

57516 and 57517. *Festuca ovina sulcata* Hack. Poaceae.
Grass.

57516. "No. 459. 1915 crop. Originally from Turgai."

57517. "No. 463. 1915 crop. Originally from Samara."

57518 to 57523. *Hordeum* spp. Poaceae.
Barley.57518. *Hordeum distichon nudum* L.
Naked barley.

"No. 0155. 1920 crop."

57519 to 57521. *Hordeum distichon palmella* Harlan. Two-rowed barley.

57519. "No. 02. 1919 crop."

57520. "No. 0254. 1920 crop."

57521. "No. 0255. 1920 crop."

57522. *Hordeum vulgare pallidum* Seringe.
Six-rowed barley.

"No. 0108A. Originally from Petrograd Bureau of Applied Botany."

57523. *Hordeum vulgare pallidum* Seringe.
Six-rowed barley.

"Groushetka 6-rowed barley."

57524. *Medicago platycarpa* (L.) Trautv. Fabaceae.

"No. 535. 1916 crop. Originally from Tomsk."

57525 to 57535. *Medicago sativa* L. Fabaceae.
Alfalfa.

57525. "1918 crop."

57526. "1914-15 crop. 'Arabian.'"

57527. "No. 511. 1918 crop. Originally from Fergana, Turkestan."

57528. "No. 513. 1914-15 crop. Originally from Altai Mountains."

57529. "No. 514. 1914-15 crop. Originally from Gokcha, Erivan."

57530. "No. 742. 1914-15 crop."

57531. "No. 743. 1914-15 crop."

57532. "No. 744. 1914-15 crop."

57533. "No. 745. 1914-15 crop."

57534. "No. 746. 1914-15 crop."

57535. "No. 749. 1916 crop. Originally from Kherson."

57536. *Trifolium ducocum* Schrank. Poaceae.
Emmer.

"No. 1466. 1916 crop."

57515 to 57611—Continued.

57537 to 57610. TRITICUM DURUM Desf.
Poaceæ. Durum wheat.

"All the 1920 crop, taken from Marinopol varieties."

57650. "(No. 98. Amria. May 8, 1923.) Barley spikes from the field."

57651. "(No. 99a. El Faish, Amria. May 8, 1923.) Spikes from the field of Sheik Abdel Halim, who has grown it 12 years. Supposed to be the original Mariout variety."

57652. "(No. 100a. Amria. May 8, 1923.) Spikes from the field of Ali Abdel Sal-sun, who has grown it 25 years. Supposed to be the original Mariout variety. Although badly mixed with barley from the delta and from Asia Minor, he was able to pick out what he thought the original form. It was similar to the California Mariout."

57612 to 57664—Continued.

57653 to 57664. TRITICUM spp. Poaceæ.

57653 to 57658. TRITICUM AESTIVUM L. (*T. vulgare* Vill.) Common wheat.

57653. "(No. 63. Matay, Minia Province. May 5, 1923.) Spikes from an unusually pure field of wheat. It is possible that the field was seeded to one of the varieties distributed by the Ministry of Agriculture, Gibson or Hindi D. Sample from the field irrigated from canal."

57654. "(No. 64. Istal, district of Minieh. May 5, 1923.) Spikes selected in a field near Istal village. The field was of the type called Hindi. The Hindi was a variety from India. Sample from the field irrigated from a canal."

57655. "(No. 66. Quatocha, district of Minieh. May 5, 1923.) Spikes selected in a field of Hindi wheat irrigated from a canal."

57656. "(No. 68. West Sarla, district of Minieh. May 5, 1923.) Spikes selected in a field irrigated from a canal."

57657 to 57660. TRITICUM DURUM Desf. Durum wheat.

57657. "(No. 65. Kom Wali, district of Minieh. May 5, 1923.) Spikes from a field near Kom Wali. The field was irrigated from a canal."

57658. "(No. 70. Minieh. May 4, 1923.) Selections from a canal-irrigated field of Hindi. One dark spike from a roadside."

57659. "(No. 72. Minieh. May 4, 1923.) Spikes from a field of Beladi irrigated from a canal."

57660. "(No. 95. District of Mariut. May 7 and 8, 1923.) Wheat spikes from barley fields. The two smaller spikes do not look like the Hindi of the delta when growing. The Romans must have grown some wheat in Mariut. There is none now. There are other wheat spikes in some of the barley samples."

57661 to 57664. TRITICUM TURGIDUM L. Poulard wheat.

57661. "(No. 67. Shousha, district of Minieh. May 5, 1923.) Spikes from a field of the Beladi type irrigated from a canal."

57662. "(No. 69. Minieh. May 4, 1923.) Spikes selected from a field of Beladi. Field irrigated from a canal."

57663. "(No. 73. Minieh. May 4, 1923.) Sample obtained at a threshing ground. Grown under a canal."

57664. "(No. 75. Shousha, near Minieh. May 5, 1923.) Wheat from the same threshing ground as the barley under No. 74 [S. P. I. No. 57629]. Also basin grown."

57665 to 57675.

From Algeria. Seeds collected by Hilton Simpson. Received June 12, 1923. Quoted notes by Mr. Simpson.

Introduced for department cerealists.

"From Oued Abdi, Aures Mountains."

57665 to 57667. *HORDEUM VULGARE* PAL-LIDUM Seringe. Poaceæ. Six-rowed barley.

57665. "(Menaa.) *Sefra* (yellow)."

57666. "(Menaa.) *Sefra* (yellow). Best seed of its kind."

57667. "(Teniet el Abed.) *Sheir Telli*."

57668 to 57674. *TRITICUM DURUM* Desf. Poaceæ. Durum wheat.

57668. "(Menaa.) *El Hamara* (the red)."

57669. "(Menaa.) *Nab el bel* (tooth of the camel)."

57670. "(Menaa.) *Shetta*."

57671. "(Teniet el Abed.) *Ajini*."

57672. "(Teniet el Abed.) *El Hamara*. Said to be old."

57673. "(Teniet el Abed.) *El Hethba*."

57674. "(Teniet el Abed.) *El Kahala*."

57675. *ZEA MAYS* L. Poaceæ. Corn.

"(Menaa.) Arabic: *Mestora*; Shawiya: *Tarkisht*."

57676. *LILIUM SULPHUREUM* Baker. Liliaceæ. Lily.

From Darjiling, India. Bulbs presented by G. H. Cave, curator, Lloyd Botanic Garden, through Harold Shantz, American vice consul in charge, Calcutta, India. Received June 9, 1923.

A large and handsome lily, native to northern Burma, with an erect green stem 6 or 7 feet high and numerous scattered, linear, bright-green leaves, the longest of which are about 4 inches long and near the base of the plant. The flowers, usually in clusters of two or three, are pendent on long peduncles, fragrant, and sulphur yellow, tinged outside with light red. (Adapted from *Curtis's Botanical Magazine*, pl. 7257.)

57677 to 57679.

From Moron, Buenos Aires, Argentina. Seeds presented by José M. Scasso, district agronomist, Argentine Ministry of Agriculture. Received June 29, 1923. Quoted notes by Sr. Scasso.

57677. *AVENA STERILIS* L. Poaceæ. Oats

"*Avena amarilla del país*. Common yellow oats, cultivated throughout the country. It is fairly hardy and resistant to trampling. While it is susceptible to rust (*Puccinia coronifera* forma *avenae*), it is not so much so as the other varieties commonly cultivated here. If sown in March it will give two cuttings of green forage and a medium-sized crop of seed in November or December. Instead of cutting for forage, this can be used as pasture, in which case, as mentioned above, it resists trampling."

57678. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

"*Alfalfa saludina*. A variety from the Province of Santiago del Estero. It is very hardy and resistant to trampling and after cutting grows up again with much vigor. On the other hand, it has the defect of losing its leaves when ripe, for which reason it is cut for hay when it is just beginning to flower. If not cut frequently it has a tendency to become woody. Under irrigation it gives seven or eight cuttings of green forage per year in Santiago del Estero. It is called 'saludina' because it is more resistant to alkali and saltpeter than the ordinary variety."

57679. *TRITICUM AESTIVUM* L. Poaceæ. Common wheat.

"*Trigo tipo Hungaro*. A semihard type, rather rich in gluten, cultivated in this country for 25 or 30 years. It is one of the varieties most grown here and is moderately rust resistant, but is sensitive to late frosts. The yield is medium. The variety is comparatively early, maturing in about 140 days, and is resistant to trampling. The grain does not shake out easily."

INDEX OF COMMON AND SCIENTIFIC NAMES

Issued February, 1926

SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN SEED AND PLANT INTRODUCTION, BUREAU OF PLANT INDUSTRY, DURING THE PERIOD FROM JULY 1 TO SEPTEMBER 30, 1923 (S. P. I. NOS. 57680 TO 58023)

CONTENTS

Introductory statement.....	Page 1
Inventory.....	5
Index of common and scientific names.....	21

INTRODUCTORY STATEMENT

AS WITH the preceding inventory (No. 75), the present number contains numerous locally developed strains of cereals and other crop plants. These have been obtained either directly by representatives of the department traveling abroad or through the ever-widening avenues of exchange with foreign agricultural and botanical institutions. The explorations of H. V. Harlan in the Mediterranean region and India were discussed at some length by David Fairchild in the introductory statement to Inventory No. 75. In May, 1923, Doctor Harlan was in Egypt. From that country he sent a number of varieties of barley (*Hordeum vulgare pallidum*; Nos. 57750 to 57755) and also an Abyssinian emmer (*Triticum dicoccum*; No. 57756). By the end of the month he had reached India, where he sent from Poona a collection of seeds, including several legumes for trial as cover crops, and eight local varieties of sorghum (*Holcus sorghum*; Nos. 57835 to 57842). Early June found him in northern India and Kashmir, where several barleys (*Hordeum vulgare pallidum*, Nos. 57892 to 57898) were collected, in addition to a number of varieties of wheat (*Triticum* spp.; Nos. 57901 to 57911) and several leguminous plants.

In addition to the cereals and forage crops which have been obtained through this channel, the present inventory describes a collection of 14 varieties of rice (*Oryza sativa*; Nos. 57868 to 57881) from the Philippines, sent through the courtesy of Adrian Hernandez, Director of the Bureau of Agriculture; a species of clover from high altitudes in Africa (*Trifolium johnstoni*; No. 57698), presented by our valued correspondent, Dr. J. Burt Davy; 25 varieties of alfalfa (*Medicago sativa*; Nos. 57705 to 57729) developed by plant breeders at the Bathurst Experiment Station in South Africa; a wild red clover (*Trifolium pratense*; No. 57939) from Scotland; and seeds of several hardy crop plants from Ekaterinoslav, Russia.

The urgent desirability of breeding disease-resistant varieties of sugar cane (*Saccharum officinarum*) has led to the introduction of many strains of this plant from the Orient, the West Indies, and other regions; Nos. 57757 to 57769 represent a series of crosses which have been obtained from the Sugar Experiment Station at Pasoeroean, Java; and Nos. 57781 to 57794 a number of standard Javanese varieties, as well as crosses, from the same place.

The tropical world, far from being explored horticulturally, still continues to yield new species of fruits for cultivation in regions such as Florida, southern California, Hawaii, Porto Rico, and the Philippines. From the temperate re-

gions of the globe, however, it is difficult to obtain edible fruits unknown to horticulture. Pomological varieties of real merit may be introduced, and it is worthy of note that in recent years more and more of these are coming from the newly developed regions of the globe rather than from Europe, as was the case in the early days of American horticulture. Salvador Izquierdo, of Chile, who has assembled at his place near Santiago one of the finest collections of fruit trees in South America, sends seven new peaches (*Amygdalus persica*; Nos. 57686 to 57692) which he thinks worthy of cultivation in the United States. H. R. Wright, whose New Zealand fruits have already shown much promise in this country, sends from Auckland seven new peaches (*Amygdalus persica*; Nos. 57912 to 57918), several interesting plums (*Prunus* spp.; Nos. 57919 to 57926), and a new pear (*Pyrus communis*; No. 57927), obtained as a seedling of the Bon Chrétien. The King Cole apple (*Malus sylvestris*; No. 57937), sent by its originator, C. F. Cole, of Melbourne, Victoria, Australia, is recommended as resistant to the woolly aphis, and its fruit is of good quality and excellent for shipping. Specimens which Mr. Cole sent from Melbourne by parcel post reached Washington after a journey of six weeks in excellent condition for eating.

In the field of tropical and subtropical fruits this inventory contains a number of promising acquisitions. From Shanghai, China, Col. Clyde S. Ford has sent trees of the large, loose-skinned Swatow orange (*Citrus* sp.; No. 57693), well known and highly appreciated in China. In line with the effort to obtain good stock plants on which to graft the best varieties of the Japanese persimmon cultivated in the United States, Rev. A. S. Cooper has sent from Hupeh Province in central China seeds of the wild *Diospyros kaki* (No. 57733). Attention was directed to this plant three years ago by E. H. Wilson, of the Arnold Arboretum, who believes, from having observed its habits and requirements in its native home, that it will prove one of the best stock plants for the cultivated varieties of the same species.

Nos. 57701 and 57771 represent two lots of plants of the true breadfruit (*Artocarpus communis*), the first lot coming from the Hawaiian Islands and the second from the Canal Zone. Efforts to establish this classic tree of Polynesia in southern Florida have not been successful up to the present, but they will be continued. Its congener, the jack fruit (*A. integra*), has in recent years come into bearing at Coconut Grove, near Miami, Fla.

It seems strange that we should be introducing superior varieties of the cherimoya (*Annona cherimola*), a native American fruit, from a region as distant as Australia. It appears, however, that this tree has found a congenial home in Queensland and that seedling forms of superior merit have originated there. Pink's Mammoth (No. 57799), from the description given by A. H. Benson, seems to be a finer variety than any which has been grown either in California or Florida.

The giant raspberry of Hawaii (*Rubus macraei*; No. 57849), to which attention was called by Mr. Rock several years ago, has been reintroduced for the benefit of North American plant breeders. Experience indicates that this species may not prove adapted for open-air culture in any part of the continental United States. Like numerous other species of *Rubus* which we have introduced from tropical and subtropical regions, it is exacting in its requirements and withstands little cold.

From the Philippines P. J. Wester sends a rare citrus fruit, the tizon (*Citrus nobilis papillaris*; No. 57854), believed to be a natural hybrid between the mandarin and the pomelo. Dr. A. Robertson Proschowsky forwards from Nice seeds of a primitive form of the plantain (*Musa paradisiaca seminiifera*; No. 57859), desired by plant breeders in the American Tropics for use in connection with the attempt to breed new forms of bananas resistant to the Panama disease (*Fusarium cubense*). Henry Pittier's peculiar variety of avocado (*Persea americana*; No. 58019) from Venezuela and Frère J. Gillet's wild *Strychnos* from the Belgian Congo (*Strychnos gilletii*; No. 58020) will both be interesting for trial in southern Florida and the West Indies.

The introduction of Manila hemp, or abaca (*Musa textilis*; Nos. 57694 to 57696) is in line with the department's attempt to establish this valuable fiber plant in tropical America. From western Java Carl Hartley has sent an edible chestnut (*Castanopsis argentea*; No. 57732) which will be tested alongside the other subtropical species of *Castanopsis* and *Castanea* which Mr. Rock has recently obtained in Yunnan. Señor Tamayo, of Ecuador, who has done much to advance the work of plant introduction in that country, sends seeds of several ornamental plants; a tomato (*Lycopersicon esculentum*; No. 57744) which will be tested by breeders

in this country; and a wild potato (*Solanum* sp., No. 57747), also for the use of breeders.

Our efforts to introduce wild South African species of gladiolus for the use of American lovers of this handsome flower have been somewhat discouraging, because of the prohibitive prices which the bulbs command, but it is hoped eventually to obtain many species on a basis of exchange with plantsmen in South Africa who desire material from this country. *Gladiolus psittacinus* (No. 57797) has been forwarded by E. Percy Phillips, of Pretoria, and will be propagated for distribution as rapidly as possible. With his customary generosity, G. H. Cave, of Darjiling, has sent a number of ornamental plants of the Himalayan region, which are described under Nos. 57882 to 57890.

The botanical determinations of seeds introduced have been made and the nomenclature determined by H. C. Skeels, and the descriptive notes have been prepared by Paul Russell, who has had general supervision of this inventory.

WILSON POPENOE,

Agricultural Explorer, Acting in Charge.

OFFICE OF FOREIGN SEED AND PLANT INTRODUCTION,
Washington, D. C., August 31, 1925.

INVENTORY¹

57680. PRUNUS CERASOIDES D. Don. (*P. puddum* Roxb.). Amygdalaceæ. Cherry.

From Benenden, Kent, England. Seeds presented by Collingwood Ingram. Received September 17, 1923.

"The pendulous flowers are campanulate and deep rosy red. They are said to appear before the foliage, which is a bright glossy green. The tree, native to the highlands of Burma, is said to endure some frost in its native country." (*Ingram*.)

57681. OPSIANDRA MAYA O. F. Cook. Phœnicaceæ. Palm.

From Washington, D. C. Plants presented by O. F. Cook, Bureau of Plant Industry. Received September 21, 1923.

A new genus and species from Peten, Guatemala, discovered and described by O. F. Cook. This palm has a slender, tapering trunk about 6 inches in diameter at the base; it grows to a height of 60 feet or more and is supported on a conical mass of thick roots. The leaves are few, usually about five or six, 8 to 9 feet long with about 90 pinnæ on each side of the midrib. The flowers appear several joints below the leaves. The fruit is red and borne in clusters.

The palm is of special interest as having been discovered growing on the ruins of one of the ancient Maya cities. It is a tropical species, of value mainly for botanic gardens and private collections. Adapted from *The Journal of the Washington Academy of Sciences*, vol. 13, p. 182.)

57682. MILLETTIA THONNINGII (Schum. and Thonn.) Baker. Fabaceæ.

From Loanda, Angola, Africa. Seeds presented by John Gossweiler. Received September 18, 1923.

"A beautiful avenue tree of Loanda; it is easily cultivated here, since it grows well with an annual rainfall of only 300 mm. (12 inches) and can readily be propagated by cuttings 2 meters (6 feet) in length. It evidently is a poisonous species." (*Gossweiler*.)

"A very handsome tree, with large drooping racemes of pale-lilac flowers. It grows to a height of 30 to 40 feet, has compound leaves about 6 inches in length, and very narrow woody pods. (Adapted from *Oliver, Flora of Tropical Africa*, vol. 2, p. 128.)

Introduced for department drug-plant specialists in response to a request for fish-poisoning plants.

¹ It should be understood that the varietal names of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Seed and Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their identity fully established, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized American codes of nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the specific identifications must necessarily rest with the person sending the material until the plants are grown. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

57683. RUBUS sp. Rosaceæ.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received September 29, 1923.

"(No. 9502. August 11, 1923.) Seeds of three species of edible-fruited *Rubus*, accidentally mixed, collected on the Likiang Snow Range at an altitude of 14,000 feet. These were sent separately last year." (*Rock*.)

57684 and 57685.

From Ekaterinoslav, Russia. Seeds presented by the Russian Bureau of Applied Botany, through D. Borodin, New York, N. Y. Received June 14, 1923. Numbered July, 1923. Quoted notes by Mr. Borodin.

From the Ekaterinoslav Agricultural Experiment Station. Introduced for department agronomists.

57684. CHAETOCHLOA ITALICA (L.) Scribn.
(*Setaria italica* Beauv.). Poaceæ. Millet.

"1914 crop. Originally from Gergana."

57685. ELYMUS SIBIRICUS L. Poaceæ. Grass.

"1921 crop."

57686 to 57692. AMYGDALUS PERSICA L. (*Prunus persica* Stokes). Amygdalaceæ. Peach.

From Santiago, Chile. Trees presented by Salvador Izquierdo. Received July 9, 1923. Quoted notes by Señor Izquierdo, unless otherwise stated.

"These are my best canning varieties."

57686. "Selection No. 1. A variety originated at Señor Izquierdo's nursery, Santa Ines. It is described as a large white cling, round in form, very sweet, and of pleasant flavor. It ripens there in February and is considered excellent both for table use and for preserving." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 54622.

57687. "Selection No. 2. A variety originated very recently at Señor Izquierdo's nursery, Santa Ines, and not yet named. It is a cling of somewhat elliptical form with a sharp point at the apex, white fleshed, and weighing up to 450 grams. It ripens in February at Santa Ines and is considered to be a promising new sort." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 54623.

57686 to 57692—Continued.

57688. "No. 273. *Aurora*. An excellent variety maturing in March at Santa Ines. It is good for table use and suitable for commercial purposes."

57689. "No. 518. *Pomona Mejorada* (improved *Pomona*). Flesh yellow, sweet and juicy. A vigorous and hardy variety."

57690. "No. 520. *Reina Elena*. Famous for its fine sweet flavor, yellow color, and perfect form; keeps well for a long time and is especially good for shipping."

57691. "No. 520-b. *Rey Alberto*. Large, red skinned, yellow fleshed, sweet and juicy, with the pit not colored, maturing early in April. An excellent variety for preserving."

57692. "No. 522. *Transparente de Conservas*. The first white peach to ripen. Flesh white, very transparent; pit not colored; especially fragrant; excellent for preserving. Resistant to disease."

57693. *CITRUS* sp. Rutaceæ.

From Shanghai, China. Trees presented by Col. Clyde S. Ford, United States Postal Agency. Received July 24, 1923.

"These are trees of the large loose-skinned Swatow orange so highly appreciated in China." (Ford.)

Introduced for department citriculturists.

57694 to 57696. *MUSA TEXTILIS* Nee. Musaceæ. Abaca.

From the Philippine Islands. Seeds obtained by L. H. Dewey, Bureau of Plant Industry. Received July 7, 1923.

The plants grow in the Philippine Islands, chiefly in volcanic soils of rather loose texture where there is an abundant rainfall but excellent natural drainage. The abaca will probably grow only in warm, moist tropical regions, and it is possible that it will succeed in the Canal Zone." (Dewey.)

Seeds to be grown for department specialists engaged in fiber-plant investigations.

57694. No. 1. 57696. No. 3.

57695. No. 2.

57697. *SCLEROSPERMA* sp. Phœnicæ Palm.

From Kisantu, Belgian Congo. Seeds presented by Frère J. Gillet. Received July 11, 1923.

"A superb stemless palm with large entire leaves which should be of interest as a greenhouse plant." (Gillet.)

Received as *Sclerosperma ueddlandi*, for which a place of publication has not been found.

57698. *TRIFOLIUM JOHNSTONI* Oliver. Fabaceæ. Clover.

From Kew, England. Seeds presented by Dr. J. Burtt Davy. Received July 11, 1923.

"At high altitudes in East Africa clover is one of the prominent forage plants. It grows where the temperature probably never exceeds 85° F. and where for the greater part of the year it is much below this point. However, no frosts occur in this region." (H. L. Shantz.)

A smooth perennial clover with the habit of white clover (*Trifolium repens*), found at an altitude of 10,000 feet on Kilimanjaro, Tanganyika Territory. The leaves are long stemmed, with membranous leaflets and globose flower heads about an inch in diameter. (Adapted from *Transactions of the Linnean Society*, ser. 2, vol. 2, p. 331.)

For previous introduction, see S. P. I. No. 56458.

57699. *Dioscorea* sp. Dioscoreaceæ. Yam.

From Oneroa, Mangaia Island, Cook Islands. Tubers presented by Geoffrey Henry. Received July 5, 1923.

"Maararau. Plant the same as ordinary yams; prepare the soil and put the tubers 1 or 2 inches underground." (Henry.)

"The rather small tubers received are more or less globose and have a slightly pink inner skin and white flesh. The quality of this yam when cooked is very good." (R. A. Young.)

57700. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceæ. Six-rowed barley.

From Egypt. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received July 17, 1923.

"(No. 101. Markaz of Hehia, Province of Sharqiyh, May 14, 1923.) A threshed sample from the threshing floor, Soheich Estate." (Harlan.)

Introduced for department cerealists.

57701. *ARTOCARPUS COMMUNIS* Forst. Moraceæ. Breadfruit.

From Honolulu, Hawaii. Trees presented by W. T. Pope, horticulturist, Agricultural Experiment Station. Received July 19, 1923.

"There is but one kind of breadfruit in Hawaii; while there are slight variations, due probably to local conditions, there are no true varietal differences." (Pope.)

This variety, which now grows wild throughout the Hawaiian Islands, was originally introduced from Tahiti. It has large, rough, ovate, deeply lobed leaves, and the staminate flowers appear in large yellow catkins. The large-stemmed fruit is either round or oblong and varies from 5 to 8 inches in diameter. The thick, tough rind, brownish at maturity, incloses a firm, very starchy, and somewhat fibrous pulp which becomes mealy when cooked, slightly resembling a dry sweetpotato, and is much esteemed as an article of diet. The tree is propagated by suckers or by layering. (Adapted from G. F. Wilder, *Fruits of the Hawaiian Islands*, p. 100, pl. 48, under *Artocarpus incisa*.)

For previous introduction, see S. P. I. No. 57224.

57702 and 57703.

From Burringbar, New South Wales. Seeds presented by B. Harrison. Received July 2, 1923.

57702. *MICROCITRUS AUSTRALASICA* (F. Muell.) Swingle (*Citrus australasica* F. Muell.). Rutaceæ. Finger lime.

"The finger lime is one of the most curious and interesting of the citrus fruits. The young plants have more or less horizontally arranged branchlets, with very short internodes and small oval young leaves, these much shorter than the stiff, erect spines. The flowers are small, and the fruits are long and slender, 2½ to 4 inches long, with a loose pulp filled with a sour, rather strongly pungent juice. The shrub is native to the mountain scrubs of the coastal region of northern New South Wales and Queensland." (W. T. Swingle.)

For previous introduction, see S. P. I. No. 55388.

57703. *RANDIA* sp. Rubiaceæ.

"A shrub 6 feet high with white sweet-scented flowers resembling those of orange blossoms." (Harrison.)

57704. *BERBERIS BEALEI* Fortune. Berberidaceæ. Barberrry.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received July 2, 1923

An evergreen shrub of a stiff, erect habit, with thick unbranched stems 10 feet or more in length bearing a few leaves at the top. The leaves, over a foot in length, are composed of 7 to 13 leaflets, which in this variety at times reach a length of 8 inches and a width of 6 inches. The flowers, lemon yellow and delightfully fragrant, are in numerous slender racemes 6 to 9 inches long, terminating the stems, and the oblong purple berries are about half an inch in length. Native to China. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 244.)

57705 to 57729. MEDICAGO SATIVA L.
Fabaceae. Alfalfa.

From Bathurst, Cape of Good Hope, Union of South Africa. Seeds presented by the manager, Bathurst Experiment Station. Received July 2, 1923. Quoted notes by the manager.

57705. "No. 1. Plat 19, subplat H, rows 2 and 3. I consider this the best of the root selections from the Chinese variety, as it is very early and a quick grower."

57706. "No. 2. Selection from *Tamworth*."

57707. "No. 3. Plat 19, subplat B, row 7. Selection from *Chinese*."

57708. "No. 4. Plat 15. Selection from *Arabian*."

57709. "No. 5. Selection from *Chinese*."

57710. "No. 6. Plat 19, subplat A, row 3. Selection from *Chinese*."

57711. "No. 7. Plat 15, subplat 4. Selection from *Chinese*."

57712. "No. 8. Plat 19, subplat D, row 5. *Medicago falcata* × *Hansen*."

57713. "No. 9. Plat 19, subplat C, row 3."

57714. "No. 10. Selection from *Turkestan*."

57715. "No. 11. Plat 19, subplat A. Selection from *Chinese*."

57716. "No. 12. Plat 19, subplat A, row 12. Selection from *Chinese*."

57717. "No. 13. *Cossack* × *Hansen*."

57718. "No. 14. Hybrid flower, '*Falcata*' × *Hansen*."

57719. "No. 15. Plat 19, subplat A, row 11. Selection from *Chinese*."

57720. "No. 16. *Egyptian*."

57721. "No. 17. From three plants of *Arabian*."

57722. "No. 18. Plat 19, subplat C, row 15. Selection from *Chinese*."

57723. "No. 19. Plat 19. Selection from *Chinese*."

57724. "No. 20. Mixed."

57725. "No. 21. Plat 19, subplat H, row 9. Selection from *Chinese*."

57726. "No. 22. *Chinese*."

57727. "No. 23. Selection from *Chinese*."

57728. "No. 24. Plat 19, subplat A, row 3. Selection from *Chinese*."

57729. "No. 25. Plat 19, subplat C, row 14. Selection from *Chinese*."

57730. PANDANUS TECTORIUS Park-
ins. Pandanaceae.

From Honolulu, Hawaii. Seeds presented by Dr. H. L. Lyon, in charge, Department of Botany and Forestry, Experiment Station of the Sugar Planters' Association. Received July 5, 1923.

This "pandan" is widely distributed throughout the Philippine Islands, being abundant along the seashores, where under favorable circumstances it

reaches a height of 15 to 20 feet. The size and length of the leaves vary greatly. The leaves are split into strips and used for making mats or, when bleached, for weaving hats. The lower part of the ripe fruit is covered by a yellowish red pulp, which is of excellent flavor, although not commonly eaten. (Adapted from *Brown, Philippine Fiber Plants*, p. 29.)

57731. PHOENIX RECLINATA Jacq.
Phœnicaceae. Palm.

From Pretoria, Union of South Africa. Seeds presented by C. P. Lounsbury, Chief, Division of Entomology. Received July 7, 1923.

A bushy or arborescent palm found native in the coastal districts of South Africa, where it sometimes becomes as much as 40 feet in height. The reclinate pinnate leaves are 6 to 9 feet long, with 30 to 50 pairs of leaflets. The elongate berries, about half an inch long, are yellowish when ripe, with a sweetish pulp. (Adapted from *Marloth, Flora of South Africa*, vol. 4, p. 49.)

For previous introduction, see S. P. I. No. 51734.

57732. CASTANOPSIS ARGENTEA
(Blume) A. DC. Fagaceae.
Evergreen chestnut.

From Buitenzorg, Java. Seeds presented by H. J. Wigman, jr., administrator, Botanic Garden. Received July 10, 1923.

"Seeds of an edible chestnut collected in western Java." (Carl Hartley.)

An evergreen tree 50 to 60 feet high, with narrow thin leaves 5 to 7 inches long and very dense clusters of spiny burs; each bur is about 2 inches wide and contains normally a single nut an inch in diameter. (Adapted from *Hooker, Flora of British India*, vol. 5, p. 621, and from *Annals of the Royal Botanic Garden*, vol. 2, p. 479.)

For previous introduction, see S. P. I. No. 56461

57733. DIOSPYROS KAKI L. f. Dios-
pyraceae. Kaki.

From Ichang, China. Seeds presented by Rev. A. S. Cooper, American Church Mission. Received July 6, 1923.

"Collected on the mountains back of Patung Hupeh, China, at an altitude of 6,000 to 8,000 feet." (Cooper.)

Introduced for use as stocks for cultivated varieties of the kaki.

57734 to 57741. PHASEOLUS spp.
Fabaceae.

From Balboa, Canal Zone. Seeds presented by R. D. Rands, Bureau of Plant Industry. Received July 6, 1923.

Introduced for department pathologists studying bean diseases.

57734. *PHASEOLUS ACUTIFOLUS LATIFOLUS* G. F. Freeman. Tepary bean.
Chimbalito.

57735. *PHASEOLUS LUNATUS* L. Lima bean.
Habitas del pais.

57736 to 57741. *PHASEOLUS VULGARIS* L. Common bean.

57736. *Frijoles rosados*.

57737. *Porotos bayos*.

57738. *Porotos colorados*.

57739. *Porotos caballeros*.

57740. "*Triguitos*; from Chile." (Rands.)

57741. *Porotos bayos*.

57742 to 57748.

From Ibarra, Ecuador. Seeds presented by J. F. Tamayo. Received July 11, 1923. Quoted notes by Señor Tamayo, unless otherwise stated.

57742. *DATURA* sp. Solanaceæ.

"*Floripondio*. In general appearance this resembles the garden floripondio, but its fruits profusely, and the white flowers are somewhat smaller."

57743. *LUPINUS* sp. Fabaceæ. Lupine.

"*Wild altramuz*. From the Pinllar Ridge. I believe this is an annual and might be suitable as a cover crop in semiarid regions."

57744. *LYCOPERSICON ESCULENTUM* Mill. Solanaceæ. Tomato.

"The plant from which these seeds were taken produced two crops."

57745. *PSIDIUM* sp. Myrtaceæ.

"*Guayabilla*. A wild guava which grows in the hacienda La Victoria, near Ibarra. In the wild state it is a shrub 4 feet high, while under cultivation it becomes 10 feet or more in height. The leaves and flowers are like those of the cultivated guava. It may prove valuable as a stock."

57746. *SALVIA* sp. Menthaceæ. Sage.

"A wild salvia with sky-blue flowers a half inch in diameter, found on waste land and on the edges of cultivated fields. It is herbaceous, about a foot high, and roots at the nodes."

57747. *SOLANUM* sp. Solanaceæ.

"Seeds of a wild potato from La Rinconada."

"A wild solanum which grows abundantly in certain places, preferring the protection of shrubby vegetation along ravines on the paramo. The plant resembles that of the cultivated potato; the tubers, however, are rarely more than an inch long by half an inch in thickness, and they are whitish brown with white flesh. They are attacked by late-blight, as are cultivated potatoes in the same region." (*Wilson Popenoe*.)

57748. *TRIFOLIUM* sp. Fabaceæ. Clover.

"A wild clover with white flowers, collected at La Rinconada."

57749. *DIOSCOREA ALATA* L. Dioscoreaceæ. Greater yam.

From Barbados, British West Indies. Tubers presented by John R. Bovell, Director of Agriculture. Received July 5, 1923.

"*Barbados Red*. There are two varieties of this red yam, one darker than the other, and I am forwarding tubers of the darker one." (*Bovell*.)

"These tubers of the darker strain of the *Barbados Red* yam weigh from 1½ to 2 pounds each and are club shaped. The inner skin is deep purple, and except near the tip of the tuber, where it is pale purple, the flesh is moderately deep purple with scattered fibers of deeper color. This yam cooks mealy and rather dry and is of very good flavor. The color fades somewhat during cooking, leaving the yam an attractive light reddish purple." (*E. A. Young*.)

57750 to 57756.

From Egypt. Spikes collected by H. V. Harlan, Bureau of Plant Industry. Received July 12, 1923. Quoted notes by Doctor Harlan.

57750 to 57755. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceæ. Six-rowed barley.

"From the Province of Sharqiyh."

57750. "(No. 102. Shershema, Markaz of Hehia. May 14, 1923.) Spikes from a field of the delta type of barley."

57750 to 57756—Continued.

57751. "(No. 103. Markaz of Kop Lahr. May 14, 1923.) From the field of Ahmid Selim."

57752. "(No. 104. Markaz of Kop Lahr. May 14, 1923.) Spikes selected from two fields."

57753. "(No. 105. Markaz of Kop Lahr. May 14, 1923.) From the estate of Baron Menase."

57754. "(No. 106. Markaz of Kop Lahr. May 14, 1923.) From a field."

57755. "(No. 107. Markaz of Kop Lahr. May 14, 1923.) From a field."

57756. *TRITICUM DICOCUM* Schrank. Poaceæ. Emmer.

"(No. 108. Gizeh. May 12, 1923.) Spikes of an Abyssinian emmer sent at this time because a severe storm has since damaged the plats and better spikes may not be obtainable."

57757 to 57769. *SACCHARUM OFFICINARUM* L. Poaceæ. Sugar cane.

From Pasoeroean, Java. Seeds presented by Dr. J. Kuyper, Assistant Director, Sugar Experiment Station. Received July 17, 1923. Quoted notes by Doctor Kuyper.

"These are all self-crosses."

57757. "1499 P. O. J. Of Chunnee blood."

57758. 1407 P. O. J.

57759. "*Katha*. A British Indian cane resembling Chunnee."

57760 to 57769. "All of Kassoer blood."

57760. No. 2721. 57765. No. K 44.

57761. No. 2727. 57766. No. K 89.

57762. No. 2734. 57767. No. K 262.

57763. No. 1117. 57768. No. K 1349.

57764. No. 1177.

57769. "*Kassoer*. Kassoer blood is resistant to the yellow-stripe disease."

57770. *ILEX PARAGUARIENSIS* St. Hil. Aquifoliaceæ. Yerba maté.

From Buenos Aires, Argentina. Seeds presented by Edward F. Feely, commercial attaché, through E. R. Hart, Bureau of Foreign and Domestic Commerce. Received July 19, 1923.

Seeds of yerba maté introduced for the purpose of establishing this interesting beverage plant in the United States.

For previous introduction, see S. P. I. No. 55621.

57771. *ARTOCARPUS COMMUNIS* Forst. Moraceæ. Breadfruit.

From Summit, Canal Zone. Plants presented by Holger Johansen, agronomist, Introduction Garden. Received July 30, 1923.

"The jack fruit (*Artocarpus integra*) has been grown successfully in southern Florida. The closely allied breadfruit, however, has not yet received an adequate trial in that State, and the department is now attempting to introduce seedless forms, which are the only ones worthy of extensive cultivation. These are propagated by cuttings which, as P. J. Wester, of the Philippine Bureau of Science, has shown, can readily be rooted in sand if made in the proper manner. While it is not anticipated that the breadfruit tree will ever become of economic importance in the continental United States, it is thought that it may prove an interesting addition to the list of tropical economic plants which can be grown in the gardens of southern Florida." (*Wilson Popenoe*.)

For previous introduction, see S. P. I. No. 57701.

57772 and 57773. COLOCASIA ESCULENTA (L.) Schott. Araceae. Taro.

From Honolulu, Hawaii. Seedlings presented by Gerrit P. Wilder, Honolulu, through Willis T. Pope, horticulturist, Hawaii Agricultural Experiment Station. Received July 20, 1923. Quoted notes by R. A. Young.

57772. Wilder seedling No. 351.

"A taro with light-green petioles; the lower part of the petiole is slightly shaded with greenish bronze, and the sinus wing is margined with pale pink."

57773. Wilder seedling No. 354.

"The petioles are plain light green. The plants tend to flower when very young; the inflorescences of the small plants are very small, the total length of the spathe being only about $2\frac{1}{2}$ inches and that of the spadix $1\frac{1}{2}$ inches."

57774 to 57780.

From Berlin, Germany. Seeds purchased from Dr. A. F. Merkel, Deutsche Landwirtschaftsgesellschaft. Received July 9, 1923. Quoted notes by Doctor Merkel.

57774. *LOTUS CORNICULATUS* L. Fabaceae.

"From Hans Kofahl, agricultural adviser, Zernikow, near Glöwen."

Sent in response to a request for a variety free from hydrocyanic acid.

57775 to 57780. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

Locally grown seed introduced for department forage-crop specialists.

57775. "From Holstein. This Province has an ocean climate, with ample rainfall."

57776. "The Rhine country, where this clover has been raised for many years, has mild winters and a heavy yearly precipitation. The soil conditions are favorable, sometimes stony, and sometimes diluvial loam."

57777. "This locality is in southern Germany, and the clover is grown on the extensive plains and slopes of the Wasgau and Odenwalder forests and the northern Black Forest. The precipitation is quite heavy."

57778. "Polish red clover, grown under an east-continental climate."

57779. "From Bohemia, where there is a rather dry east-continental climate with severe winters."

57780. "From Silesia, which has rather severe winters. The precipitation is medium and the soil conditions good, being mostly diluvial sandy loam with a loess subsoil. Red clover has been grown here for many years."

57781 to 57794. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Pasoeroean, Java. Cuttings presented by Dr. J. Kuyper, assistant director, Sugar Experiment Station. Received July 19, 1923. Quoted notes by E. W. Brandes.

57781. "D. I. 52. Equals cross between Cheribon and Batjan."

57782. "E. K. 28. This variety produces nearly 90 per cent of the sugar cane in Java. It was developed by Edward Karthouse, a private grower."

57783. "2221 P. O. J. Cross between Black Cheribon and Kassoer."

57784. "2222 P. O. J. Cross between Black Cheribon and Kassoer."

57785. "2345 P. O. J. Cross between 100 P. O. J. and Kassoer."

57781 to 57794—Continued.

57786. "2364 P. O. J. Cross between 100 P. O. J. and Kassoer."

57787. "2747 P. O. J. Cross between Lahaina and 2628 P. O. J."

57788. "2752 P. O. J. Cross between 2364 P. O. J. and 1410 P. O. J."

57789. "S. W. 3. Cross between Cheribon and Batjan. This cane was developed at a private mill, the Sempal Wadak."

57790. "Ardjoena. This variety is also an old original cane, not a hybrid."

57791. "Batjan. This is an old standard variety of Java."

57792. "Fidji. This variety has been grown for many years in Java, according to the records, but probably was imported from Fiji."

57793. "Gestreebt Preanger. Similar to Louisiana Striped and possibly identical."

57794. "Lahaina. This variety is supposed to be the old Bourbon of the West Indies. It was formerly widely grown in Hawaii."

57795. PANCRACTIUM TORTUOSUM Herbert. Amaryllidaceae.

From Aden, Arabia. Bulbs presented by Raymond Davis, American consul. Received July 19, 1923.

"The leaves remain green throughout most of the season even in the arid deserts around Aden, but the flowers appear only after one of the rare rainy periods, generally within four to seven days. The plants grow abundantly on cliffs and rocky wastes of Arabia and Egypt." (Davis.)

A relative of the well-known American spiderlily (*Hymenocallis*), with beautiful white flowers 3 to 6 inches long and a handsome toothed crown within the corolla, as in *Narcissus*. The long linear leaves are spirally twisted.

57796. PROTEA ARGENTEA L. (Leucadendron argenteum R. Br.). Proteaceae.

From Pretoria, Transvaal, Union of South Africa. Seeds presented by the chief conservator of forests, Forest Department. Received July 20, 1923.

Introduced for department specialists experimenting with acid-soil plants.

The *witteboom*, or *silver-leaf pine*, is a beautiful tree found native only in the immediate vicinity of Cape Town, Cape Province, where it grows up to 50 feet in height. The numerous white silky leaves, which are lanceolate and up to 7 inches long, are now an article of commerce, being used for curios, mats, bookmarks, etc.; when dry they take ink or paint and are then sold with texts or small scenes depicted on them. (Adapted from *Slim, Forests and Forest Flora of Cape Colony*, p. 294.)

For previous introduction, see S. P. I. No. 51623.

57797. GLADIOLUS PSITTACINUS Hook. Iridaceae.

From Pretoria, Transvaal, Union of South Africa. Bulbs presented by E. Percy Phillips, Chief, Division of Botany. Received July 20, 1923.

A South African gladiolus with a large globose corn, a stem 3 feet or more in length, and usually four rigid, swordlike leaves 1 or 2 feet long. The many-flowered spike is very lax, reaching a foot or more in length. The upper segments of the flower are dark crimson, while the much smaller lower segments reflexed at the top are red and yellow mixed. (Adapted from *Thielsen-Dyer, Flora Capensis*, vol. 6, p. 158.)

57798. Gossypium sp. Malvaceæ.
Cotton.

From Ceiba, Honduras. Seeds presented by Alexander K. Sloan, American consul. Received June 16, 1922. Numbered July, 1923.

Seeds of a supposedly wild cotton from the Aguan Valley, near Trujillo, Honduras, introduced for department cotton specialists.

57799. ANNONA CHERIMOLA Mill.
Annonaceæ. Cherimoya.

From Brisbane, Queensland. Trees presented by A. H. Benson, director of fruit culture. Received July 27, 1923.

"*Pink's Mammoth*. Our best variety, raised from seed imported from Central America many years ago. It is of superb quality and large size, frequently weighing 5 or 6 pounds or more, and contains only five or six seeds, most of which are infertile. It is the finest of the family which I have seen in any part of the world." (Benson.)

57800. COLOCASIA ANTIQUORUM Schott.
Araceæ. Taro.

From Aitutaki, Cook Islands. Tubers presented by W. T. Hewett. Received July 30, 1923.

"*Niue*. A taro with red inner skin and white flesh and of excellent quality when cooked. It is slightly acid when raw." (R. A. Young.)

57801. ELAEIS MELANOCOCCA Gaertn.
Phenicææ. Palm.

From Balboa Heights, Canal Zone. Seeds presented by Holger Johansen, agronomist, Plant Introduction Garden, Summit. Received July 31, 1923.

A large spreading low palm which grows in low moist land. It is closely related to the African oil palm (*Elaeis guineensis*), and a clear oil is extracted from the fruits in small quantities by the natives, who prize it highly for cooking.

For previous introduction, see S. P. I. No. 50480.

57802. PHASEOLUS LUNATUS L. Fabaceæ.
Lima bean.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received July 31, 1923.

"A Lima bean perennial in Cuba." (Towns.)

Introduced for department horticulturists.

57803 to 57810. PHASEOLUS spp. Fabaceæ.

from Port of Spain, Trinidad, British West Indies. Seeds presented by R. D. Rands, Bureau of Plant Industry. Received August 1, 1923. Quoted notes by Doctor Rands.

Locally grown varieties introduced for department specialists engaged in bean-disease investigations. Nos. 57803 to 57809 are Venezuelan varieties which were purchased in the market at Caracas.

57803 to 57805. PHASEOLUS LUNATUS L.
Lima bean.

57803. *Tapiramos blancos*.

57804. *Guaracaros blancos*.

57805. *Guaracoles coloradas*.

57806 to 57810. PHASEOLUS VULGARIS L.
Common bean.

57806. *Guaracaro ballo*.

57807. *Guaracolas guacamayas*.

57808. *Ponchas blancas*.

57809. *Ponchas coloradas*.

57810. "A Trinidad variety obtained here."

57811. ANNESLIA PORTORICENSIS (Willd.) Donn.-Smith (Calliandra portoricensis Benth.). Mimosaceæ.

From Rio Piedras, Porto Rico. Seeds presented by E. Murray Bruner, forester, Porto Rico Forest Service. Received July 7, 1923.

A very handsome white-flowered shrub or small tree, native to the West Indies, which is cultivated as an ornamental in Honolulu, Hawaii. The branches are slender and erect, and the leaves have 10 to 30 pairs of narrow leaflets. (Adapted from Rock, *Leguminous Plants of Hawaii*, p. 21.)

57812 to 57818.

From India. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received July 23, 1923. Quoted notes by Doctor Harlan.

57812 and 57813. HORDEUM VULGARE PALLIDUM Seringe. Poaceæ. Six-rowed barley.

57812. "(No. 122. Delhi. June 4, 1923.) Purchased in the market."

57813. "(No. 127. Simla. June 7, 1923.) Barley of the new crop secured from a farmer in the river valley northeast of Simla at an altitude of about 5,700 feet."

57814 to 57818. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceæ. Common wheat.

57814. "(No. 123. Delhi. June 4, 1923.) Purchased in the market."

57815. "(No. 124. Delhi. June 4, 1923.) Purchased in the market."

57816. "(No. 125. Simla. June 7, 1923.) Local wheat purchased in the market."

57817. "(No. 126. Simla. June 7, 1923.) Local wheat of new crop purchased in the market."

57818. "(No. 128. Simla. June 7, 1923.) Wheat of new crop secured from a threshing floor in the river valley northeast of Simla at an altitude of about 5,700 feet."

57819. TALINUM TRIANGULARE (Jacq.) Willd. Portulacaceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received July 31, 1923.

An erect, branching herbaceous plant, about 3 feet high, native to the West Indies and recently introduced from Java into the Philippine Islands. The flowers are pink and produced in great profusion. In the Philippines the fleshy, tender leaves are boiled like spinach and served with meat, for which purpose they are excellent. The plant is easily propagated by cuttings. (Adapted from the *Philippine Agricultural Review*, vol. 14, p. 365.)

57820. CARYOPHYLLUS MALACCENSIS (L.) Stokes (Eugenia malaccensis L.). Myrtaceæ. Ohia.

From Honolulu, Hawaii. Seeds presented by Willis T. Pope, horticulturist, Agricultural Experiment Station. Received August 1, 1923.

"The fruit is most esteemed, and while in Panama I had the pleasure of tasting preserves made from it which seem to have a characteristic flavor of some merit. When in bloom, the branches of this tree are gorgeous, covered as they are with masses of large flowers an inch or so across, composed of hundreds of beautiful deep rose-pink or crimson stamens. The tree itself is a beautiful ornamental, and it would seem as though more work in the selection of this species should be attempted. The remarkable structure of the seeds suggests a high degree of polyembryony. When the seed germinates (as many of them were doing under the tree) the whole large brilliant-green mass seemed to break up into fragments." (David Fairchild.)

For previous introduction, see S. P. I. No. 54530.

57821 to 57826.

From India. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received July 31, 1923.

57821 and 57822. HORDEUM VULGARE PALLIDUM Seringe. Poaceae. **Six-rowed barley.**

57821. "(No. 129. Solan. June 10, 1923.) This barley was grown near Rauari under irrigation. It is the best brewing barley of India. There are few broken kernels and less than 2 per cent of 'still' kernels. Secured from the Solan brewery."

57822. "(No. 136. Garhi Kashmiria. June 12, 1923.) Seed of the new crop."

57823. LENTILIA LENS (L.) W. F. Wight (*Lens esculenta* Moench.). Fabaceae. **Lentil.**

"(No. 133. Solan. June 10, 1923.) *Masoor Dhol*. Secured from H. E. J. Peake, of the Solan brewery. Grown in the hills at an altitude of 4,800 feet."

57824. PHASEOLUS MUNGO L. Fabaceae. **Urd.**

"(No. 132. Solan. June 10, 1923.) *Oorad Dhol*. Secured from H. E. J. Peake, of the Solan brewery. Grown in the hills at an altitude of 4,800 feet."

57825 and 57826. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceae. **Common wheat.**

57825. "(No. 134. Garhi Kashmiria. June 12, 1923.) New crop just threshed."

57826. "(No. 135. Garhi Kashmiria. June 12, 1923.) A second grade of wheat from the new crop."

57827. LYCOPERSICON ESCULENTUM Mill. Solanaceae. **Tomato.**

From Tucuman, Argentina. Seeds presented by Dr. W. E. Cross, Estacion Experimental Agrícola. Received August 6, 1923.

"Seeds from blight-resistant plants of Parana grown at the Tucuman Experiment Station in 1921. This variety is the most extensively planted in Tucuman, especially in the Lules region. It is generally regarded as the most blight-resistant variety, but my own experience has led me to the conclusion that it is not completely resistant, although there are always a number of plants which do not suffer at all when the rest of the plants have died from the disease." (*E. F. Schultz*.)

For previous introduction, see S. P. I. No. 55591.

57828. PSIDIUM GUAJAVA L. Myrtaceae. **Guava.**

From Dominica, British West Indies. Seeds presented by A. Keys, Botanic Gardens. Received August 13, 1923.

"*Large Indian guava*. This is a round variety, flattened at each end, and about $3\frac{1}{2}$ inches in greatest diameter. The fruit, which is said to be of very good quality, weighs about 12 ounces. The variety was introduced into Dominica from India several years ago." (*Keys*.)

57829. IPOMOEA PAPILIO Hall. f. Convolvulaceae. **Morning-glory.**

From Italian Somaliland, Africa. Seeds presented by Dr. G. Soassellati Sforzolini, Direttore Agrario e Zootecnico, Villaggio Duca Abruzzi. Received August 6, 1923.

A long trailing vine, with smooth, green, deeply toothed leaves half an inch long and rose-red flowers over an inch long and wide. The vine is native to several parts of South Africa. (Adapted from *Thielton-Dyer, Flora Capensis*, vol. 4, sect. 2, p. 167.)

57830 and 57831. CROTALARIA spp. Fabaceae.

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, director, General Experiment Station, Department of Agriculture. Received August 13, 1923. Quoted notes by Doctor Cramer.

57830. CROTALARIA ANAGYROIDES H. B. K.

"This species is now given preference here in Java as green manure; it produces more vegetation and does not layer so easily. It is especially satisfactory in higher altitudes and is in such great demand for the tea plantations in the higher mountains that we have to limit our seed distributions to small quantities."

57831. CROTALARIA USARAMOENSIS Baker f.

"Although I introduced this from East Africa as a fiber plant, it does not seem to be very promising as such. It has proved very successful, however, as a green manure, when grown in alternation with corn, producing large quantities of vegetation rich in nitrogen. In the cinchona plantations it is very satisfactory, as it endures partial shade and forms a dense low growth which keeps the edges of the terraces together."

57832. DIOSCOREA ALATA L. Dioscoreaceae. **Greater yam.**

From Summit, Canal Zone. Tuber presented by Holger Johansen, agronomist, Introduction Garden. Received August 13, 1923.

"This yam is white fleshed and remains perfectly white when cooked. It is slightly fibrous but otherwise is of very good quality. The tuber received was somewhat elongated and of good shape for handling; it weighed about 5 pounds." (*E. A. Young*.)

57833 to 57844.

From Poona, India. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received August 15, 1923. Quoted notes by Doctor Harlan.

57833. CYAMOPSIS TETRAGONOLOBA (L.) Taub. (*C. psoraloides* DC.). Fabaceae. **Guar.**

"(No. 120. May 29, 1923.) Secured from the Poona Agricultural College. Seeded in June and harvested in October."

57834. DOLICHOS LABLAB L. Fabaceae. **Hyacinth bean.**

"(No. 121. May 29, 1923.) Secured from the Poona Agricultural College. Seeded in September and harvested in February."

57835 to 57842. HOLCUS SORGHUM L. (*Sorghum vulgare* Pers.). Poaceae. **Sorghum.**

"(Nos. 109, 111 to 117. May 29, 1923.) Selected from heads in the Poona collection of over 100 varieties. Especial attention was paid to the time of seeding and ripening. Most varieties here ripen in the winter months, but several of those sent ripen from September to November and therefore may find the proper length of day in the States."

57835. "(No. 109.) An agricultural variety known as *Aispuri*. Possibly the *Elichpuri* of Bulletin 30, page 92, by Gamina, 1908. It is grown in the district of Khandesh in rotation with cotton on black cotton land of low rainfall. Sown in June and harvested in the latter part of November. Loose panicle 10 inches long."

57836. "(No. 111. District of Khandesh.) *Garya*. Sown the latter part of June and harvested the latter part of October and the first of November. Compact panicle 7 inches long."

57833 to 57844—Continued.

57837. "(No. 112. Dharwar.) *Nandyal*. Seeded the latter part of July and harvested the latter part of December. Panicle slender, 9 inches long."

57838. "(No. 113.) *Muddi Nandyal*. The season the same as for No. 112 [S. P. I. No. 57837]. Panicle rather compact and 5 inches in length."

57839. "(No. 114. District of Sholapuri.) *Sholapuri*. A tall-growing variety. Panicle 7½ inches long. Seeded the middle of June and harvested in December."

57840. "(No. 115. Dekkan.) *Nilwa*. Sown in June and harvested in September. Panicle 5 inches and medium dense. This is a very early variety, but the grain is not so good. It is also used for fodder, for which purpose it is seeded thick."

57841. "(No. 116. Dekkan.) *Utavali*. Similar to No. 115 [S. P. I. No. 57840], but sown later (end of July). It ripens in 9 or 10 weeks. This is also largely used for fodder."

57842. "(No. 117. District of Gujrot.) *Sundhia*. This variety, which is the best for fodder, has a loose panicle and a fine stalk. It matures in 60 days and is seeded either early or late."

57843. *PHASEOLUS ACONITIFOLIUS* Jacq. Fabaceae. Moth bean.

"(No. 119. May 29, 1923.) A small-leaved finet-stalked variety from Dekkan secured from the Poona Agricultural College. Several crops of forage are cut. It is seeded in June, and the cutting is not finished until January."

57844. *VIGNA SINENSIS* (Torner) Savi. Fabaceae. Cowpea.

"(No. 118. Dekkan. May 29, 1923.) Received from the Poona Agricultural College."

57845 to 57848. *IPOMOEA BATATAS* (L.) Poir. Convolvulaceae. Sweet potato.

From Buitenzorg, Java. Tubers presented by Dr. P. J. S. Cramer, director, General Experiment Station, Department of Agriculture. Received August 13, 1923.

"These are considered the best sweetpotato varieties at our plant-breeding station." (Cramer.)

57845. No. 2. *Boled*.

57846. No. 1. *Bolevak*.

57847. No. 4. *Menes moder*.

57848. No. 3. *Menes 19*.

57849. *RUBUS MACRAEI* A. Gray. Rosaceae. Akala.

From Honolulu, Hawaii. Seeds presented by Willis T. Pope, horticulturist, Agricultural Experiment Station. Received August 17, 1923.

"The Hawaiian giant raspberry, occurring at an altitude of about 6,000 feet. It is a straight bush with the older branches thornless. The fruits, borne at the drooping tips of the branches, are very numerous, about 2 inches in diameter and exceedingly juicy; the seeds are comparatively small. The flesh is slightly bitter but otherwise delicious. This berry is of great promise, as it grows in a region where frost is not uncommon in the winter months. It may succeed in some sections of California. (J. F. Rock.)

For previous introduction, see S. P. I. No. 57226.

57850. *PRUNUS* sp. Amygdalaceae.

Cherry.

From Szemao, Yunnan, China. Seeds presented by J. D. Fullerton. Received August 15, 1923.

Seeds of a wild cherry from southwestern China, introduced for testing as a stock for cultivated varieties.

57851 to 57853. *PLUMERIA* spp. Apocynaceae.

From Honolulu, Hawaii. Seeds presented by Willis T. Pope, horticulturist, Agricultural Experiment Station. Received August 17, 1923. Quoted notes by Mr. Pope unless otherwise stated.

"Few tropical shrubs are more highly esteemed than the *Plumerias*. Though they are not particularly graceful in habit, the beauty and fragrance of their star-shaped flowers make them worthy of cultivation in every tropical garden. They succeed in southern Florida, where several species are already grown, though not so extensively as they deserve. From the white flowers of *Plumeria alba* the rare and costly frangipani perfume is distilled." (Wilson Popenoe.)

57851. *PLUMERIA* sp.

"Seeds of a pink *Plumeria* from slender pods."

57852. *PLUMERIA* sp.

"Seeds of a pink *Plumeria* from broad spreading pods."

57853. *PLUMERIA* sp.

"Seeds of a pink *Plumeria* from pods attached at an angle."

57854. *CITRUS NOBILIS PAPILLARIS* (Blanco) Wester. Rutaceae.

From Manila, Philippine Islands. Budwood presented by P. J. Wester, Bureau of Agriculture. Received August 11, 1923.

"A spreading, small tree, attaining a height of 6 meters or more, in habit similar to the pomelo; spines small or wanting; leaves 10 to 14 centimeters long, 5 to 6 centimeters broad, ovate to elliptical-oblong, crenate, dark green and shining above, crinkly, base broadly acute, apex narrowly acute to almost acuminate and caudate; petioles 17 to 20 millimeters long with narrow-winged margin; flowers not seen; fruit large, from 6 to 10 centimeters in diameter, 170 to 580 grams in weight, somewhat compressed at basal half, usually ending in a more or less conspicuous nipple, which, however, is sometimes wanting; apex flattened or even depressed; surface smooth, pale greenish turning to orange-yellow; skin medium thin; locules 10 to 11, separable from each other, and the skin like the mandarin; pulp yellowish, subacid, very juicy, and of good flavor with marked 'quinine' taste; juice cells large; seeds very few, rarely more than seven.

"The tizon is extremely rare and only a few trees are found in cultivation, confined to the citrus district of Batangas, Luzon. The trees are said to be quite prolific, and the fruit matures from September to December. This fruit, on account of its scarcity, is of no commercial importance. However, it would be an acceptable dessert or breakfast fruit, being a little more acid than the orange. It is said to be an introduction from Spain. The tizon is without doubt the *Citrus papillaris* described by Blanco in 'Flora Filipinas.'

"The tizon is believed to be a natural hybrid between the mandarin and the pomelo. It has inherited the loose-skinned character, large juice cells, partial absence of spines, and leaf character of the first-named species to which it is (without the writer having had the opportunity to examine the flowers) unquestionably more closely related than to any other species in the genus." (Wester.)

57855. TRIFOLIUM MEDIUM Huds.
Fabaceæ. Clover.

From Waverley, New Zealand. Seeds presented by the manager, Mounahaki Experimental Farm. Received August 17, 1923.

Seeds of a type of clover which is said to spread by means of underground stolons. Introduced for department clover specialists.

57856. QUERCUS DISCOCARPA Hance.
Fagaceæ.

From Buitenzorg, Java. Seeds presented by the director, Botanic Garden. Received August 3, 1923.

A lofty tree, 100 to 130 feet in height, with leathery narrowly oval leaves about 5 inches in length and small spiny hemispherical or roundish acorns about half an inch long. The tree is native to the Federated Malay States. (Adapted from *Annals of the Royal Botanic Garden, Calcutta*, vol. 2, p. 76.)

57857 to 57860.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received August 22, 1923.

57857. BERBERIS BEALEI Fortune. Berberidaceæ.
Barberry.

For previous introduction and description, see S. P. I. No. 57704.

57858. GLADIOLUS SEGETUM Ker. Iridaceæ.

"One of the most beautiful wild flowers around here; it might be very valuable for hybridizing." (*Proschowsky*.)

A European gladiolus of free habit, fond of warm dry soil and a sunny situation, with rather small rose-purple flowers. It is an admirable species for mixed borders. (Adapted from *Robinson, English Flower Garden*, p. 577.)

For previous introduction, see S. P. I. No. 56629.

57859. MUSA PARADISIACA SEMINIFERA (Lour.) Baker. Musaceæ. Plantain.

A wild seed-bearing form of the plantain, with small oblong greenish fruits full of seeds. These fruits are about a third of the size of the common banana and are of pleasant taste, although encumbered by numerous seeds. The plant is quite ornamental and harder than the common banana, so that it may be possible, by selection or hybridization, to extend the range of banana culture into cooler regions. (Adapted from *Bailey, Standard Cyclopedia of Horticulture*, vol. 4, p. 2079, and letter of *Doctor Proschowsky, June 30, 1917*.)

For previous introduction, see S. P. I. No. 45007

57860. VERONICA HULKEANA F. Muell. Scrophulariaceæ.

One of the handsomest and most graceful of all the New Zealand veronicas. It is easily distinguished from others of the group by its shining dark-green, coarsely toothed leaves about 2 inches long and its long sprays of lilac-colored flowers which are in panicles sometimes a foot in length.

57861 to 57867.

From Ekaterinoslav, Russia. Seeds presented by the Russian Bureau of Applied Botany, through D. Borodin, New York, N. Y. Received June 14, 1923. Numbered July, 1923. Quoted notes by Mr. Borodin.

From the Ekaterinoslav Agricultural Experiment Station; introduced for department agrostologists.

57861 to 57866. BROMUS spp. Poaceæ.**Bromegrass.****57861. BROMUS HORDEACEUS L. Soft chess.**

"No. 412. 1915 crop. Originally from Khar-kof."

57861 to 57867—Continued.**57862 to 57865. BROMUS INERMIS Leyss.**

57862. "1918 crop."

57863. "No. 190. 1916 crop."

57864. "No. 193. 1916 crop."

57865. "No. 814. 1918 crop. Originally from Amur, Siberia."

57866. BROMUS STERILIS L.

"No. 444. 1917 crop. Originally from Turkestan."

57867. ECHINOCHLOA CRUSGALLI (L.) Beauv. Poaceæ. Barnyard millet.

"No. 214. 1916 crop. Originally from Bakhmut."

57868 to 57881. ORYZA SATIVA L. Poaceæ. Rice.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received August 21, 1923. Quoted notes by S. Youngberg, acting director, Bureau of Agriculture.

"The following were grown at the Lamao Experiment Station, Lamao, Bataan."

57868. "(No. 2.) *Bincol I*. Tested eight years under upland conditions; matures usually in 140 days. Average yield per hectare 1,662 kilograms (approximately 1,480 pounds per acre)."

57869. "(No. 5.) *Calonod*. Tested seven years under upland conditions; matures usually in 143 days. Average yield per hectare 1,835 kilograms (approximately 1,635 pounds per acre)."

57870. "(No. 6.) *Pileng Baybay*. Tested one year under upland conditions; matures usually in 139 days. Average yield per hectare 1,780 kilograms (approximately 1,560 pounds per acre)."

57871. "(No. 14.) *Saguboy*. Tested one year under upland conditions; matures usually in 129 days. Average yield per hectare 1,000 kilograms (approximately 890 pounds per acre)."

57872. "(No. 11.) *Bonquet*. Tested six years under upland conditions; matures usually in 127 days. Average yield per hectare 2,062 kilograms (approximately 1,840 pounds per acre)."

57873. "(No. 10.) *Catalong*. Tested six years under upland conditions; matures usually in 141 days. Average yield per hectare 2,176 kilograms (approximately 1,940 pounds per acre)."

57874. "(No. 1.) *Inantipolo II*. Tested six years under upland conditions; matures usually in 137 days. Average yield per hectare 2,184 kilograms (approximately 1,950 pounds per acre)."

57875. "(No. 3.) *Kinastila IV*. Tested five years under upland conditions; matures usually in 129 days. Average yield per hectare 1,939 kilograms (approximately 1,730 pounds per acre)."

57876. "(No. 12.) *Himirang*. Tested six years under upland conditions; matures usually in 130 days. Average yield per hectare 3,496 kilograms (approximately 3,100 pounds per acre)."

57877. "(No. 4.) *Calibug*. Tested four years under upland conditions; matures usually in 133 days. Average yield per hectare 2,010 kilograms (approximately 1,800 pounds per acre)."

57878. "(No. 8.) *Casulig*. Tested three years under upland conditions; matures usually in 142 days. Average yield per hectare 1,714 kilograms (approximately 1,500 pounds per acre)."

57879. "(No. 13.) *Kinandang Kumpol*. Tested three years under upland conditions; matures usually in 132 days. Average yield per hectare 1,853 kilograms (approximately 1,650 pounds per acre)."

57868 to 57881—Continued.

57880. "(No. 7.) *Pinellia*. Tested three years under upland conditions; matures usually in 162 days. Average yield per hectare 1,816 kilograms (approximately 1,170 pounds per acre)."

57881. "(No. 9.) *Capongul*."

57882 to 57890.

From Darjiling, India. Seeds presented by G. H. Cave, Curator, Lloyd Botanic Garden. Received August 21, 1923.

57882. *AGBOCARPUS FRAXINIFOLIUS* Wright and Arn. *Celastraceae*.

A lofty tree, native to the eastern Himalayas at altitudes of 4,000 feet and less, used by the natives for making tea boxes and also for planking. The sapwood is white and the heartwood light red and moderately hard. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 1, p. 104.)

57883. *AMERINDON PINNATUM* (Lour.) Kunze. *Dalbergia tamarindifolia* Roxb. *Fabaceae*.

A climbing plant with leaves resembling those of the tamarind, found as high as 4,000 feet in the eastern Himalayas. The leaves are eaten by cattle. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 3, p. 16.)

57884. *Berberis napolensis* (DC.) Spreng. *Berberidaceae*.

A shrub or small tree, common in eastern India at altitudes above 5,000 feet. The wood is bright yellow and hard, and because of its hardness and handsome color it might be useful for inlaying. It is used to a small extent by the natives of India in making a yellow dye. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 1, p. 448.)

For previous introduction, see S. P. I. No. 53672.

57885. *Buddleia asiatica* Lour. *Loganiaceae*.

A very graceful evergreen shrub or small tree, common throughout India and the Malay Peninsula, with narrow leaves up to 3 inches in length. For three months in India the long slender racemes of white sweet-scented flowers fill the air with delightful fragrance. (Adapted from *Curtis's Botanical Magazine*, pl. 682.)

For previous introduction, see S. P. I. No. 45064.

57886. *CHONEMORPHA MACROPHYLLA* Roxb. Don. *Apocynaceae*.

A large climber, native to Bengal and Burma, with milky sap from which a kind of caoutchouc is obtained. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 2, p. 71.)

57887. *EDGEWORTHIA GARDNERI* Wall. Meisn. *Typhelaceae*.

A handsome shrub whose branches are covered with dense clusters of yellow sweet-scented flowers before the leaves appear. The strong, rough fiber which is obtained from the long straight twigs seems very promising as paper-making material. (Adapted from *Watt, Dictionary of the Economic Products of India*, vol. 3, p. 84.)

For previous introduction, see S. P. I. No. 39642.

57888. *LEUCOSCHISTUM CANTU* J. E. Smith. *Menispermaceae*.

A stout-branched densely hairy tree, commonly about 30 feet in height, with large narrowly ovate leaves, silvery hairy beneath and at times 3 feet long. The small white or pinkish flowers are in spikes. (Adapted from *Hooker, Flora of British India*, vol. 4, p. 101.)

For previous introduction, see S. P. I. No. 39646.

57889. *MACHILUS GAMBLI* King. *Lacnaceae*.

An evergreen tree, native to northern Bengal, India, with thin leathery leaves, pale beneath

57882 to 57890—Continued.

silky flower clusters, and small globular fruits. (Adapted from *Hooker, Flora of British India*, vol. 5, p. 136.)

57890. *TETRASTEMA BRACTEOLATUM* (Wall.) Planch. (*Vitis bracteolata* Wall.). *Vitaceae*.

A slender-branched shrub which has the habit of producing long runners. The greenish flowers are very small, and the round black fruits are the size of peas. Native to Bhutan and Assam, India. (Adapted from *Hooker, Flora of British India*, vol. 1, p. 634.)

For previous introduction, see S. P. I. No. 47811.

57891. (Undetermined.)

From Bluefields, Nicaragua. Seeds presented by Y. R. Heath, Moravian Mission. Received August 31, 1923.

"*Tubi*. The unripe fruits of this plant, in which no seeds have formed, may be boiled and eaten; they resemble the Irish potato in taste. But the fully formed seeds, such as I am sending, are better. When raw they taste somewhat peppery. They are boiled with ashes, after which the skin is easily rubbed off, and then they are reboiled in ordinary water. The *Tubi* usually grows in swamps, although sometimes on dry land, one in prefers a rather swampy location. According to the Indians the roots are hard and woody." Heath.

57892 to 57911.

From Kashmir, India. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received August 17, 1923. Quoted notes by Doctor Harlan.

57892 to 57895. *HORDEUM VULGARE PALLIDUM* Serling. *Poaceae*. Six-rowed barley.

57892. "(No. 128, June 13, 1923.) A winter barley collected in a field near Brahmoala. Altitude about 3,900 feet."

57893. "(No. 141, June 14, 1923.) Head selections of winter barley from fields in Sonwar. Altitude about 5,400 feet."

57894. "(No. 151, Garden of Lalla Rukh, Muzarbal, Kashmir, June 15, 1923.) Barley selected in a plot on one of the terraces beside the lake."

57895. "(No. 153, June 15, 1923.) Head selections from fields about Shadipur."

57896. "(No. 154, Shadipur, June 15, 1923.) Head selections from the field from which the type of No. 152 [S. P. I. No. 57900] was secured."

57897. "(No. 155, June 17, 1923.) Head selections from fields about Ganderbal."

57898. "(No. 164a, Rambir Bagh vineyard, June 19, 1923.)"

57899. *MEDUNGA MINIMA* (L.) Griseb. *Fabaceae*.

"No. 157, Ganderbal, June 17, 1923.) Found growing plentifully on a dry mountain side."

57900. *SECALE CEREALE* L. *Poaceae*. Rye.

"No. 152, Shadipur, June 15, 1923.) Spikes of rye from a field of barley. These are from the only rye plants I have seen in Kashmir. They were widely scattered and contain few seeds as a consequence. Apparently rye is not grown here."

57901 to 57909. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). *Poaceae*. Common wheat.

57901. "(No. 137, June 13, 1923.) This sample contains five or more types of wheat from a field near Uppul. Altitude about 5,000 feet."

57902. "(No. 139, June 14, 1923.) Head selections with white glumes from fields in Sonwar."

57892 to 57911—Continued.

57903. "(No. 140. June 14, 1923.) Head selections with red glumes from fields in Sonawar."

57904. "(No. 143. June 15, 1923.) Head selections made in fields at Sumbal."

57905. "(No. 155. June 17, 1923.) Head selections from fields near Ganderbal."

57906. "(No. 156. June 17, 1923.) Head selections in fields about Ganderbal."

57907. "(No. 163. Ranbir Bagh. June 19, 1923.) Head selections made from wheat grown between the rows of grapes."

57908. "(No. 164b. Ranbir Bagh vineyard. June 19, 1923.) Awnless white wheat."

57909. "(No. 165. Ranbir Bagh vineyard. June 19, 1923.) Selections of an awned red-chaffed wheat."

57910 and 57911. *TRITICUM DURUM* Desf. Poaceae. Durum wheat.

57910. "(No. 144. June 15, 1923.) Head selections made in a field near Sumbal."

57911. "(No. 166. Ranbir Bagh vineyard. June 19, 1923.) Selections of durum wheat from the same vineyard as No. 165 [S. P. I. No. 57909]."

57912 to 57929.

From Avondale, Auckland, New Zealand. Plants presented by H. R. Wright. Received August 13, 1923. Quoted notes by Mr. Wright.

57912 to 57918. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

57912. "Bennett's Perfection. A very late yellow freestone variety."

57913. "Early Gem. A very early variety with a splendid flavor; raised from the same parent as *Sunrise* [S. P. I. No. 57916]."

57914. "Golden Prolific. A yellow freestone variety of excellent flavor. Season medium."

57915. "Lord Kitcheners. A late yellow freestone variety of fine flavor."

57916. "Sunrise. A very early variety of splendid flavor. The tree is sturdy and a good cropper."

For previous introduction, see S. P. I. No. 55740.

57917. "Watt's Early. A seedling from *Flat China*, claimed by O. E. Vessey, of Australia, to be the earliest of all peach varieties."

For previous introduction, see S. P. I. No. 55741.

57918. "White Cling. A white clingstone variety, with very juicy fruits of excellent flavor."

For previous introduction, see S. P. I. No. 55742.

57919 to 57926. *PRUNUS* spp. Amygdalaceae.

57919 to 57921. *PRUNUS CERASIFERA* Ehrh. Cherry plum.

57919. "Anderson's Early. A glorified cherry plum about twice the size of the ordinary type. It is probably a cross between the cherry plum and the Japanese cherry."

57920 and 57921. "Palmer's Early. A yellow variety which we believe to be the earliest plum known. Because of its extreme earliness this plum should have great commercial possibilities."

57922. *PRUNUS DOMESTICA* L. Plum.

"Jenkin's Seedling. A European variety, very early, which bears large crops of fine-flavored fruits."

57912 to 57929—Continued.

57923. *PRUNUS SALICINA* Lindl.

Japanese plum.

"Early Blood. The earliest blood plum we have raised; it ripens before the cherry plum. The fruit is of good flavor but too soft for long shipment."

57924 to 57926. *PRUNUS SALICINA* × *CERASIFERA*. Hybrid plum.

57924. "Fuller's Seedling. A cherry plum and Satsuma cross. A red-fleshed cherry plum, splendid for cooking and for jam. Propagated easily from cuttings."

57925. "Ford's Early. A cross between the cherry plum and Japanese plum. A heavy cropper, ripening early. The flavor strongly suggests the Japanese plum."

For previous introduction, see S. P. I. No. 55716.

57926. "Norris Early. A cross between the cherry plum and Japanese plum. The crop is good and the season early."

57927. *PYRUS COMMUNIS* L. Malaceae. Pear.

"Ruby. A *Bon Chrétien* seedling raised in Victoria. The tree is a good bearer, resembling *Bon Chrétien* in growth, and the ripening season in Australia is the latter end of March. The fruit is medium to large and of splendid quality."

57928. *MALUS PRUNIFOLIA* (Willd.) Borkh. Malaceae. Apple.

Introduced for testing as a stock for cultivated apple varieties.

57929. *VITIS LABRUSCA* × *VINIFERA*. Vitaceae. Grape.

"Albany Surprise. A large-fruited sport of *Isabella*."

57930. *EPHEDRA ALTISSIMA* Desf. Gnetaceae.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received September 4, 1923.

"This is a strikingly ornamental climber, attractive at all times, but especially so when covered with its small red fruits." (*Proschowsky*.)

57931 to 57936.

From Montevideo, Uruguay. Seeds presented by the Director, Dirección General de Paseos Públicos. Received September 4, 1923.

57931. *CELTIS SELLOVIANA* Miquel. Ulmaceae.

A much-branched spiny shrub, native to southern Brazil, with narrow, membranous, light-green, sharp-pointed leaves less than an inch long and inconspicuous flowers. (Adapted from *Martius, Flora Brasiliensis*, vol. 4, pt. 1, p. 179.)

57932. *EUGENIA GLAUDESCENS* Cambess. Myrtaceae.

A large shrub, native to southern Brazil, with rather short, very narrow leaves up to 2½ inches in length and small white flowers borne singly in the axils of the leaves. (Adapted from *St. Hilaire, Flora Brasiliæ Meridionalis*, vol. 2, p. 368.)

For previous introduction, see S. P. I. No. 50392.

57933. *MANIHOT TWEDIEANA* Muell. Arg. Euphorbiaceae.

A wild Brazilian species from which the Indians are said to obtain edible varieties by cultivating the plants for a few years.

For previous introduction, see S. P. I. No. 48678.

57931 to 57936.—Continued.

57934. *POECILANTHE PARVIFLORA* Benth. Fabaceae.

The *lapachillo*, as it is called in its native home on the Uruguay River, is a tree of great beauty, with its finely divided leaves and small but dense clusters of pink flowers. The heartwood is dark brown, very hard, heavy, and durable. (Adapted from *Journal of the Linnean Society*, vol. 4, suppl., p. 80, and Lillo, *Contribución al Conocimiento de los Árboles de la Argentina*, p. 107.)

57935. *POMADERIS APETALA* Labill. Rhamnaceae.

A tree occasionally 60 feet in height, but usually smaller; native to southeastern Australia. The foliage is eaten readily by stock, often in preference to their customary feed. (Adapted from *Mueller, Select Extra-Tropical Plants*, p. 416.)

For previous introduction, see S. P. I. No. 48684.

57936. *PROSOPIS NANDUBEY* Lorentz. Mimosaecae.

A tree of moderate height which is common in the mountainous regions of Uruguay. The numerous small yellowish flowers appear in the spring, and the sickle-shaped pods inclose a pulp of acid flavor. Because of its great durability the wood is prized for industrial purposes. (Adapted from *Arcechazleta, Flora Uruguayana*, vol. 1, p. 419.)

For previous introduction, see S. P. I. No. 48685.

57937 and 57938. *MALUS SYLVESTRIS* Mill. (*Pyrus malus* L.). Malaceae.
Apple.

From Melbourne, Victoria, Australia. Presented by C. F. Cole, orchard supervisor, Department of Agriculture. Received September 6, 1923.

"*King Cole*. Fruit medium sized, roundish, inclined to oblate, pretty uniform in shape and size. Stem short, slender. Cavity rather deep, acute, symmetrical. Calyx small. A beautiful apple, highly colored and with a fine aroma. The apple gives evidence of being a good keeper and a good shipper. A specimen of this fruit forwarded by Mr. Cole in April reached us in good condition six weeks later although packed in an ordinary small wooden box. Other specimens forwarded July 13, 1923, reached us August 21 in excellent condition. If this variety proves resistant to woolly aphids, as claimed, it will prove a valuable acquisition to our apple collections." (B. T. Galloway.)

"This is a chance seedling supposed to be a cross between *Jonathan* and *Dutch Mynone*. The original seedling is still standing upon the property of R. G. Cole, orchardist, Lang Lang, Victoria, where the seed germinated. The producer first exhibited this apple at the fruit carnival held in the Exhibition Buildings, Melbourne, in 1912, and won the silver medal for a Victoria-raised seedling. The seedling was registered with the Royal Horticultural Society of Victoria under the name *R. G. Cole's Champion*. The writer submitted it under the name of *Cole's Champion* to the committee of the Australia Pomological Society, but owing likely to confusion the word *Champion* has been dropped and *Cole* accepted as the future name of this apple.

"The tree is very productive and a strong upright grower. The wood is dark, becoming reddish with age and lightly speckled with grey dots; the buds are moderately prominent; the foliage is medium sized and dark green. During the 1920 fruit season 22 cases of salable fruit were gathered from the original seedling tree. The flowers are not bold and are medium sized. The blossoming period is from the 12th to the 20th of October in Victoria.

"The apple, which has been tested under cool storage conditions, is a handsome dessert type of medium size, roundish conical, or tapering to the eye; the skin is thin and smooth; the ground clear pale yellow, splashed with lively red narrow broken stripes. The whole of the exposed surface is a light red, becoming deeper in color where exposed to the sun. The flesh is firm, white, crisp, juicy, sweet,

with a slightly perfumed aromatic flavor; the core is compact, the stalk thin and averaging three-quarters of an inch in length, inserted in a deep, rather fairly regular cavity. The calyx is small and closed; the segments pointed, slightly recurved, and set in a deep, rather narrow and corrugated basin. Its season in Victoria is April to September. It has been proved to be a very good keeper in cool storage and while stored it emits a strong aroma. It could be gathered in some districts about the middle of March. This variety is being largely planted, and it promises to become one of the best late apples introduced." (*Journal of the Department of Agriculture, Victoria*, p. 492.)

57937. Trees. Budded on *Northern Spy*.

57938. Budwood.

57939. *TRIFOLIUM PRATENSE* L. Fabaceae.
Red clover.

From Ayr, Scotland. Seeds presented by McGill & Smith. Received September 8, 1923.

"A very hardy and permanent strain of wild red clover with which we are experimenting. It grows slightly the first year and by the third year produces quite a lot of foliage." (McGill.)

Introduced for department agronomists.

57940. *NYPA FRUTICANS* Wurmb. Phœnicaceae.
Nipa palm.

From Lameo, Philippine Islands. Seeds presented by H. H. Boyle, of the Columbian Rope Co., Manila, through the Bureau of Agriculture, Manila. Received September 6, 1923.

From an economic standpoint this palm is one of the most important in the Philippines. It occurs along tidal streams throughout the archipelago and thrives only in brackish swamps. The "*nipa*," as it is called, has a stout, creeping, underground stem, and the pinnate leaves, which are in erect clusters, are 7 meters (23 feet) or more in length. The flat fruits, 5 inches long, 4 inches wide, and 2 inches thick, are crowded in a large, round head which is borne on a special, erect stalk. The juice obtained by cutting this stalk just below the fruiting head is a very promising source of sugar and alcohol. Probably 85 per cent of the 3,000,000 gallons of proof alcohol produced annually in the Philippines comes from the "*nipa*" palm. The leaves of this palm are extensively used for thatching and for making baskets and mats, and the immature seeds are boiled in sugar to form a confection. The tree is also a pleasing ornamental. (Adapted from *Brown and Merrill, Philippine Palms and Palm Products*, p. 98.)

57941 and 57942.

From Barberton, Transvaal. Seeds presented by George Thorncroft. Received September 8, 1923. Quoted notes by Mr. Thorncroft.

57941. *NATHUSIA* sp. (*Schrebera* sp.) Oleaceae.

"A tree about 20 feet high with sweet-scented flowers resembling those of the jasmine."

57942. *WATSONIA FLAVIDA* Bolus. Iridaceae.

"This is very closely allied to the *gladiolus*, but the flowers are smaller and creamy white. It grows on stony hills in this region at an altitude of 4,000 feet."

57943. *HEVEA BRASILIENSIS* (H. B. K.) Muell. Arg. Euphorbiaceae.

From Dominica, British West Indies. Seeds presented by the Botanic Garden. Received September 13, 1923.

"The Para rubber tree (*Hevea brasiliensis*), native to Brazil and now extensively cultivated in the East Indies, has always ranked as the principal and most important rubber-producing tree of the world

"In 1922 the world's production of rubber amounted to 379,200 tons, of which 354,980 tons, or 93 per cent of the world's output, came from this source.

"In connection with the investigations now being undertaken by the department for the development of the rubber industry in the Western Hemisphere, this important plant will receive the attention it deserves with a view to establishing plantations in Porto Rico and other tropical dependencies of the United States." (*Alfred Keys.*)

57944 to 58012.

From Kashmir, India. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received August 28 and September 6, 1923. Quoted notes by Doctor Harlan.

"(Nos. 205 to 358. Lyallpur. July 16, 1923.) Secured from the botanical section of the Lyallpur Agricultural College. The barleys and wheats are pure lines descendant from single plants."

57944. *CROTALARIA JUNCEA* L. Fabaceæ.
Sunn hemp.

"(No. 237.) Used as a fiber plant and for green manure."

57945. *ERUCA SATIVA* Hill. Brassicaceæ.
Roquette.
"(No. 232.) A cruciferous weed which grows wild in the drier parts of the Punjab. Sixty thousand tons of seeds are collected annually for the extraction of oil."

57946 to 57965. *HORDEUM* spp. Poaceæ.

57946 to 57948. *HORDEUM VULGARE COELESTE* L.
Six-rowed barley.

57946. "(No. 146. June 15, 1923.) Head selections made in a field near Sumbal. Probably fall seeded."

57947. "(No. 167. June 24, 1923.) From the highest terraces on the west side of the Sind Valley. Altitude between 6,500 and 6,700 feet. Only the upper terraces were planted to this variety."

57948. "(No. 216.) *Gujar Khan.*"

57949 to 57963. *HORDEUM VULGARE PALLIDUM* Seringe.
Six-rowed barley.

57949. "(No. 145. June 15, 1923.) Head selections made near Sumbal."

57950. "(No. 147. June 14, 1923.) Spikes selected in a field in Samwar near Srinagar."

57951. "(No. 168. Mountain side, Sind Valley. June 24, 1923.) Barley grown at a slightly lower altitude than No. 167 [S. P. I. No. 57947]."

57952. "(No. 183. June 24, 1923.) Barley from a bench on the south side of the Sind Valley."

57953. "(No. 205.) *Rewari.* Originally from Rewari."

57954. "(No. 206.) *Lyallpur.* This is the standard or cheek variety used in the tests at Lyallpur."

57955. "(No. 207.) *Mianwali.* From a town of that name."

57956. "(No. 208.) *Multan.* From a town of that name."

57957. "(No. 209.) *Giyarkhan.* Originally from a nonirrigated district near Rawalpindi."

57958. "(No. 210.) *Hoshiarpur.* From a non-irrigated area."

57959. "(No. 211.) *Lyallpur.* A new selection of dense 6-rowed barley."

57960. "(No. 212.) *Ludhiana*"

57944 to 58012—Continued.

57961. "(No. 213.) *Baluchistan.* From near Quetta."

57962. "(No. 214.) *Nushera.* A good brewing barley."

57963. "(No. 215.) *Gujrat.* From a district of that name in the Punjab."

57964. *HORDEUM DISTICHON NUDUM* L.
Naked barley.

"(No. 217.) *Black barley* from Lyallpur. Two-rowed naked purple."

57965. *HORDEUM VULGARE COELESTE* L.
Six-rowed barley.

"(No. 218.) *Kulu.* A short-awned naked barley from the Kangro Valley."

57966. *LATHYRUS SATIVUS* L. Fabaceæ.
Bittervetch.

"(No. 236.) Found wild and under cultivation."

57967. *LOTUS CORNICULATUS* L. Fabaceæ.

"(No. 162. Raipur. June 18, 1923.) A yellow-flowered low-growing legume growing spontaneously in an orchard."

57968 to 57976. *MEDICAGO* spp. Fabaceæ.

57968. *MEDICAGO HISPIDA APICULATA* (Willd.) Urban.
Bur clover.

"(No. 233.) This legume grows wild in many places in the Punjab. Once established it comes up as a secondary growth in wheat."

57969 and 57970. *MEDICAGO LUPULINA* L.
Black medick.

57969. "(No. 149. June 15, 1923.) A low-growing legume from the orchard in the old garden of Lallā Rukh at Manarbal, Kashmir. Not cultivated."

57970. "(Nos. 188 to 190. Votler. June 26, 1923.) This is a form with branches 4 to 5 feet long."

57971 to 57976. *MEDICAGO SATIVA* L. Alfalfa.

57971 and 57972. "(Nos. 169 and 170. Nacimbagh. June 23, 1923.) Alfalfa was found growing in nonirrigated wheat fields where it had never been seeded as far as the peasants knew. I have seen no cultivated alfalfa in Kashmir. Both samples are immature, but some seed may grow. They were the ripest obtainable. Altitude 5,400 feet, rainfall 20 inches, winter mild."

57971. No. 169. 57972. No. 170.

57973. "(No. 195. Aishmakan. July 1, 1923.) Seeds of several plants found growing in a wheat field. No cultivated alfalfa in this region."

57974. "(No. 196. Aishmakan. July 1, 1923.) Seeds of a different type, later than No. 195 [S. P. I. No. 57973]."

57975. "(No. 197. Aishmakan. July 1, 1923.) Seeds of a single plant later than Nos. 195 and 196 [S. P. I. Nos. 57973 and 57974]. Probably too immature to grow."

57976. "(No. 235.) A local strain."

57977. *MELILOTUS ALBA* Desr. Fabaceæ.
White sweetclover.

"(No. 187. Votler. June 26, 1923.) This seed is immature and may not germinate, but it was the largest on the plants. This is the white-flowered tall sort."

57978. *MELILOTUS INDICA* (L.) All. Fabaceæ.
Sweetclover.

"(No. 238.) Occurs as a weed in many places in the Punjab."

57944 to 58012—Continued.

57979. *TRIFOLIUM PRATENSE* L. Fabaceae.
Red clover.
“(No. 161. Raipur. June 18, 1923.) Apparently ordinary red clover but not cultivated.”
57990. *TRIFOLIUM REPENS* L. Fabaceae.
White clover.
“(No. 150. June 15, 1923.) From the orchard in the old garden of Lalla Rukh at Manarbal, Kashmir. Apparently ordinary white clover.”
57981. *TRIGONELLA FOENUM-GRÆCUM* L. Fabaceae.
Fenugreek.
“(No. 234.) Used for fodder and green manure. Does not look as vigorous here as in Tunisia.”
- 57982 to 58009. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.
Common wheat.
57982. “(No. 148. Simla. June 7, 1923.) Spikes from a threshing floor.”
57983. “(No. 160. Raipur. June 18, 1923.) Selections made in fields about Raipur.”
57984. “(No. 171. Nacimbagh. June 23, 1923.) Head selections of wheat that seemed to differ from the rest of the field.”
- 57985 and 57986. “(Nos. 172 and 173. Nacimbagh. June 23, 1923.) Variations of two types of wheat.”
57985. No. 172. 57986. No. 173.
57987. “(No. 174. Sind Valley. June 24, 1923.) Three spikes of wheat found growing in No. 168 [S. P. I. No. 57951].”
- 57988 to 57995. “(Nos. 175 to 177, 179, 180, and 182. June 24, 1923.) Wheat types on bench on south side of the Sind Valley.”
57988. No. 175. 57992. No. 180.
57989. No. 176. 57993. No. 182.
57990. No. 177. 57994. No. 184.
57991. No. 179. 57995. No. 185.
57996. “(No. 186. Ganderbol. June, 1923.) Consists of a single spike, but no others of this type were found in the immediate locality of this specimen.”
57997. “(No. 219.) *Wheat 17 B*. A selection not yet distributed. A red wheat of good milling and baking quality.”
57998. “(No. 220.) *Type XI wheat*. Has done well in the colony. Profitable for export but poor for milling and baking.”
57999. “(No. 221.) *Lyallpur 8 A wheat*. Good on both dry and irrigable lands. A good milling wheat.”
58000. “(No. 222.) *Lyallpur 8 wheat*. Similar to No. 221 [S. P. I. No. 57999].”
58001. “(No. 223.) *Lyallpur 16 A wheat*. Likely to do well in a dry area.”
58002. “(No. 224.) *Lyallpur 17 wheat*. Try in a dry area.”
58003. “(No. 225.) *Lyallpur No. 14 wheat*. A typical dry-area wheat.”
58004. “(No. 226.) *Lyallpur No. 9 wheat*. This is the check or standard variety at Lyallpur. Good for milling and baking.”
58005. “(No. 227.) *Lyallpur No. 15 wheat*. A dry-land variety.”
58006. “(No. 228.) *Lyallpur 9 C wheat*. A selection from No. 9 wheat [S. P. I. No. 58004].”
58007. “(No. 229.) *Lyallpur Cron III wheat*. A hybrid selection which has done well.”

57944 to 58012—Continued.

58008. “(No. 230.) *Lyallpur Cron II wheat*. The same as No. 229 [S. P. I. No. 58007].”
58009. “(No. 231.) *Lyallpur Cron C 121 wheat*. A hybrid resistant to yellow rust.”
- 58010 to 58012. *TRITICUM DURUM* Desf. Poaceae.
Durum wheat.
58010. “(No. 159. Raipur. June 18, 1923.) Selections from the only field of pure durum wheat I have seen so far in Kashmir.”
58011. “(No. 178. June 24, 1923.) A type on bench on the south side of Sind Valley.”
58012. “(No. 181. June 24, 1923.) A type on bench on the south side of Sind Valley.”
- 58013 and 58014.
From Likiang, Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received September 10, 1923. Quoted notes by Mr. Rock.
58013. *PRUNUS MAJESTICA* Koehne. Amygdalaceae.
“(No. 8793. Talifu. June 30, 1923.) Var. *taliensis*. Seeds from the same trees as that collected in April, 1922 [S. P. I. No. 55498]. This is a very vigorous and healthy early-fruited wild cherry, which grows at an altitude of about 8,000 feet.”
58014. *ZEA MAYS* L. Poaceae.
Corn.
“(No. 8795. Taku. June, 1923.) This variety is cultivated on the plateau of Taku, by Nashi (Moso) tribesmen, and, next to wheat, is one of their most important crops. The plants are 8 to 10 feet high, and the ears are large and uniformly yellow.”
58015. *MEDICAGO FALCATA* L. Fabaceae.
Alfalfa.
From Ekaterinoslav, Russia. Seeds presented by the Russian Bureau of Applied Botany, through D. Borodin, New York, N. Y. Received June 14, 1923. Numbered July, 1923.
“No. 841. 1919 crop.” (Borodin.)
Introduced for department agronomists.
58016. *FLACOURTIA INDICA* (Burm. f.) Merr. (*F. ramontchi* L'Herit.). Flacourtiaceae.
Ramontchi.
From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received July 31, 1923.
A shrub or small tree, armed with scattered slender spines, native to many parts of the Philippine Islands. The white flowers are borne singly or in pairs in the leaf axils or at the ends of short branchlets. The rounded dark-purple fleshy fruits are nearly half an inch in diameter and contain edible fleshy pulp of an agreeable flavor. (Adapted from *Brown, Wild Food Plants of the Philippines*, p. 126.)
For previous introduction, see S. P. I. No. 53576.
58017. *VIGNA SINENSIS* (Torner) Savi. Fabaceae.
Cowpea.
From Port of Spain, Trinidad, British West Indies. Seeds presented by R. D. Rands, Bureau of Plant Industry. Received August 1, 1923.
“*Frijoles ballos*. This variety was obtained from the public market in Caracas, Venezuela.” (Rands.)
Introduced for department pathologists studying bean diseases.

58018. ATTALEA sp. Phœnicaceæ. Palm.

From Tepic, Nayarit, Mexico. Seeds presented by M. Bandala, Agrónomo Regional, Dirección General de Agricultura. Received August 17, 1923.

A genus of tropical American palms, some members of which produce valuable oil-yielding fruits, while others are prized for the fiber obtained from the leaves and leafstalks. All are of great ornamental value because of their long graceful pinnate leaves.

58019. PERSEA AMERICANA Mill. (P. gratissima Gaertn. f.). Lauraceæ.

Avocado.

From Caracas, Venezuela. Seeds presented by H. Pittier. Received September 12, 1923.

"The fruits from which these seeds were taken were obtained from a peddler here in Caracas. They are pear shaped, of uniform size, about 4 inches long and 2 inches in diameter. The rather tough skin is light yellow, and the flesh, rather well developed in proportion to the seed, has a peculiar but agreeable flavor." (Pittier.)

58020. STRYCHNOS GILLETII Wildem. Loganiaceæ.

From Kisantu, Belgian Congo. Seeds presented by Frère J. Gillet. Received September 12, 1923.

"The fruits of this species are edible." (Gillet.)

A spiny shrub, related to the Kafir orange (*Strychnos spinosa*) which grows wild in thickets in the Belgian Congo. The leathery shining leaves are oblong-oval, deeply notched at the apex, and the fruits are about 2 inches in diameter. (Adapted from *Annales du Musée du Congo, sér. 5, vol. 1, p. 176.*)

58021. POPULUS sp. Salicaceæ. Poplar.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received September 17, 1923.

"(No. 9501. June, 1923.) A large and handsome tree 60 to 80 feet tall with a trunk 2 to 3 feet in diameter growing at the foot of Kintzu Shan along streams at an altitude of 8,500 feet. The very large dark-green heart-shaped leaves are silvery beneath, and the branches are straight and ascending." (Rock.)

58022. LAPAGERIA ROSEA Ruiz and Pav. Liliaceæ.

From Valparaiso, Chile. Seeds presented by F. L. Crouse, Instituto Agrícola Bunster, Angol, through C. F. Deichman, American consul general, Valparaiso. Received September 4, 1923.

"*Copihue*. This, the national flower of Chile, has been occasionally grown in northern greenhouses, where it creates a genuine sensation when in bloom. It is a climbing plant of slow growth, with slender wiry stems and bright-crimson tubular flowers about 3 inches in length. In southern Chile huge bunches of these blossoms are brought to the railway stations and sold to passing travelers. The plant requires an acid soil." (Wilson Popenoe.)

For previous introduction, see S. P. I. No. 54621.

58023. PRUNUS TOMENTOSA Thunb. Amygdalaceæ. Bush cherry.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received September 17, 1923.

"(No. 8794. Tsehchung. June, 1923.) A shrub about 4 feet high, found in the mountains on the upper Mekong at an altitude of about 10,000 feet. The oval, serrate leaves are densely hairy beneath and the short-stalked fruits also are hairy." (Rock.)

INDEX OF COMMON AND SCIENTIFIC NAMES

- Abaca, *Musa textilis*, 57694-57696.
Acrocarpus fraxinifolius, 57882.
Akala, *Rubus macraei*, 57849.
Alfalfa, *Medicago falcata*, 58015.
Medicago sativa, 57705-57729, 57971-57976.
Amerimnon pinnatum, 57883.
Amygdalus persica, 57686-57692, 57912-57918.
Annesia portoricensis, 57811.
Annona cherimola, 57799.
Apple, *Malus prunifolia*, 57928.

UNITED STATES DEPARTMENT OF AGRICULTURE

INVENTORY No. 77

Washington, D. C.

Issued August, 1926

SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN PLANT INTRODUCTION, BUREAU OF PLANT INDUSTRY, DURING THE PERIOD FROM OCTOBER 1 TO DECEMBER 31, 1923 (S. P. I. NOS. 58024 TO 58454)

CONTENTS

Introductory statement.....	Page 1
Inventory.....	3
Index of common and scientific names.....	19

INTRODUCTORY STATEMENT

The introduction of hardy plant material from northeastern Asia has long been one of the main objects of the Office of Foreign Plant Introduction of the Bureau of Plant Industry.

Disturbed political conditions since the outbreak of the Great War have made it impracticable to send agricultural explorers into that region, else the work in Siberia, Mongolia, and Turkestan, which was commenced by Frank N. Meyer in 1909, would have been pursued with vigor. It therefore is with great satisfaction that announcement is made that Prof. T. D. A. Cockerell, of the University of Colorado, has sent to this office a large collection of seeds obtained by him during a recent journey through parts of southeastern Siberia. These seeds, which are listed in this inventory under Nos. 58153 to 58357, represent numerous varieties of oats, buckwheat, barley, flax, proso, rye, timothy, wheat, soy beans, corn, and other field crops, as well as a few vegetables. They have been distributed to specialists of the department for preliminary testing.

H. V. Harlan, of the Office of Cereal Crops and Diseases, Bureau of Plant Industry, who left Washington early in 1923 to study barley and other cereal crops in the Mediterranean region, India, and Abyssinia, sent from Spain a collection of seeds, including 8 varieties of oats (*Avena sativa*; Nos. 58042 to 58049), 19 of barley (*Hordeum vulgare pallidum*; Nos. 58050 to 58068), and 12 of wheat (*Triticum aestivum*; Nos. 58074 to 58085).

For use in connection with studies of the host plants of wheat rust which the department is conducting, a large number of species and varieties of *Berberis* have been assembled from time to time. The present inventory records a number of additions, including 3 from Rochester, N. Y. (Nos. 58088 to 58090), 34 from the Arnold Arboretum at Jamaica Plain, Mass. (Nos. 58093 to 58126), 3 from the Botanic Gardens at Glasnevin, Ireland (Nos. 58131 to 58133), and 8 from the Royal Botanic Gardens at Kew, England (Nos. 58136 to 58143).

J. F. Rock's travels in the remote Province of Yunnan, China, continue to yield interesting plants. Among his introductions listed in this inventory some of the most promising seem to be the white-flowered *Prunus* (No. 58040), the wild apple from Likiang (*Malus* sp.; No. 58087), and nine species of *Primula* (Nos. 58368, 58375, 58398 to 58402, 58405, and 58426). His new *Castanopsis*

(*C. delavayi*; No. 58394) is described as one of the finest and hardest timber trees of its region, and it bears in addition a sweet edible nut.

The Chilean strawberry (*Fragaria chilensis*; No. 58024), of which several earlier introductions have been made by this office, is proving of much interest to plant breeders in the United States, who are using it to cross with North American strawberries in the hope of producing new forms having their excellent color and flavor combined with the firm texture of the Chilean berry.

Agati tomentosa (No. 58377), received from the Hawaiian Islands through C. S. Judd, should be especially interesting for trial in the Southern States where *Sesbania macrocarpa* succeeds. If it is as palatable to stock as Mr. Judd's note indicates and should prove as resistant to nematodes as is *S. macrocarpa* in the South, it may prove to be quite worth while.

An unusually large number of promising tropical fruits have been received during the period covered by this inventory. The marang (*Artocarpus odoratissima*; No. 58025), which P. J. Wester considers a fruit of unusual promise, has again been introduced for trial in the American Tropics. A new lot of mango-steen seeds (*Garcinia mangostana*; No. 58027), supplied through Vilmorin-Andrieux & Co., of Paris, will be used to provide plants for establishing small orchards of this excellent fruit in the Canal Zone and other parts of tropical America where a few scattered tests have shown that it can be cultivated with success. The ilama of Mexico (*Annona diversifolia*) has fruited at the United States Plant Introduction Garden, Miami, Fla., from seeds introduced by this office several years ago. Its behavior indicates that it may prove a valuable acquisition for southern Florida; plants grown from the seed presented by Dr. C. A. Purpus (Nos. 58030 and 58408) will therefore be used to test this species further in the warmest parts of that State. Mango growers in Florida and the American Tropics generally should devote special attention to the Carabao variety (*Mangifera indica*; No. 58031), which has proved to be a more dependable bearer than most of the Indian sorts at the Miami garden and is at the same time a fruit of excellent quality. The wild avocado of Costa Rica, which may possibly be an ancestor of some of the cultivated avocados, was originally introduced by this office in 1920 for trial as a stock on which to graft the cultivated plants. Though preliminary tests indicate that it may not prove suitable for this purpose, it has seemed advisable to procure an additional lot of seed (*Persea americana*; No. 58365) in order to test the matter thoroughly. The Winslowson avocado (*Persea americana*; No. 58444), a seedling grown at the garden at Miami, has been planted commercially in a number of Florida orchards, where it is proving valuable because of its vigor, its productiveness, its late season of ripening, and the good quality of its fruit. The langsat (*Lansium domesticum*; No. 58382) is probably too tropical in its requirements for cultivation anywhere in the continental United States, but it should succeed in the Canal Zone, Porto Rico, and elsewhere in the American Tropics.

The director of the Royal Botanic Gardens, Kew, England, has sent a number of promising ornamental plants, including seven Cotoneasters (Nos. 58145 to 58151), one Cornus (No. 58144), and one Hydrangea (No. 58152). The American consul at Teheran, Persia, has sent seeds of the best Persian tobacco (*Nicotiana tabacum*; No. 58029). A variety of sugar cane (*Saccharum officinarum*), considered by the director of the Insular Experiment Station, Porto Rico, the most valuable seedling at present planted on the island, is represented by No. 58034. S. K. Mitra, economic botanist to the Government of Assam, sends a broomcorn mutant (*Holcus sorghum*; No. 58129) which will be tested in this country with interest. *Eremochloa ophiuroides* (No. 58389) is being tried as a lawn grass. Tests with earlier introductions of this grass have shown that it is suited for this purpose in Florida and the Gulf coast area of the Southern States. Varietal differences have been observed and further introductions may give better adapted or more valuable strains. A valuable strain of *Lespedeza striata* (No. 58397), originally collected by J. B. Norton in 1919 near Kobe, Japan, has been numbered, so that its history will become a matter of record. Its strong-growing quality makes it superior to common lespedeza.

The botanical determinations of these introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND McKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., January 7, 1926.

INVENTORY¹

58024. FRAGARIA CHILOENSIS (L.) Duchesne. Rosaceae.

Chilean strawberry.

From Honolulu, Hawaii. Seeds presented by Dr. H. L. Lyon, in charge, Department of Botany and Forestry, Experiment Station of the Sugar Planters' Association. Received October 1, 1923

Seeds sent to Doctor Lyon from Ecuador by Francis X. Williams.

Although the fruit of the Chilean strawberry is inferior in flavor to that of our best cultivated strawberries, it is remarkable for its excellent shipping and keeping qualities, and it seems that varieties might be produced by selection that would merit cultivation on a commercial scale. The berry is much used for canning and preserving and is also eaten fresh. The ripening season of *Fragaria chiloensis* in the highlands of southern Peru and central Chile extends approximately from the latter part of October to January.

For previous introduction see S. P. I. No. 56023.

58025. ARTOCARPUS ODORATISSIMA Blanco. Moraceae. Marang.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received October 3, 1923.

The marang has been brought recently to the attention of horticulturists by P. J. Wester, who considers it a fruit of unusual promise. It resembles the jack fruit and the seeded breadfruit in appearance but is superior in quality to either of these. The tree, which grows wild in the southern Philippine Islands and the Sulu Archipelago, is medium sized, with large dark-green entire or 3-lobed leaves 18 to 24 inches long. Wester (Food Plants of the Philippines, ed. 3, p. 129) describes the fruit as roundish oblong in form, about 5 inches in length, with the surface thickly studded with soft greenish yellow spines one-third of an inch long. The rind is thick and fleshy, the flesh white, sweet, juicy, aromatic, and of pleasant flavor; it is separated into segments (about the size of a grape) which cling to the core, and each segment contains a whitish seed nearly half an inch long. When the fruit is ripe, by passing a knife around and through the rind, with a little care the halves may be separated from the flesh, leaving this like a bunch of white grapes. In the Philippines it ripens in August.

The tree is strictly tropical in its requirements and probably will not succeed in regions where the temperature falls below 32° to 35° F. It likes a moist atmosphere and abundant rainfall.

For previous introduction see S. P. I. No. 46635.

58026. CUCUMIS MELO L. Cucurbitaceae. Melon.

From Bareilly, United Provinces, India. Seeds presented by Rev. N. L. Rockey. Received October 3, 1923.

Seeds of a melon bought in Alighur but evidently imported from the borders of Afghanistan or Baluchistan. The native name is *Zarda*. The fruit was yellowish green, weighed 5½ pounds, and the flesh was 1¼ inches thick. (Rockey.)

The culture of the superior kinds of melon requires considerable attention, but there is hardly a fruit that better deserves it. The kind which ranks as finest of all, called the Surdah, is a native of Kabul and has not, that I am aware, been cultivated with success in any part of India. The fruits are brought occasionally to the Punjab for the wealthy natives, and a friend told me that when at Mooltan an offer of 6 rupees which he made for a single one was refused, so highly are they prized. I have several times raised plants in my garden at Firzpur. They thrived moderately well but bore only one or two fruits, which always rotted on the under side before beginning to ripen. From a portion of one which remained partially sound I was enabled to discover how delicious this fruit must be when raised in perfection. The seeds of this kind are at once to be distinguished from those of any other, being fully four times larger. (Firminger's Manual of Gardening, ed. 5, p. 225.)

58027. GARCINIA MANGOSTANA L. Clusiaceae. Mangosteen.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received October 4, 1923.

For more than 20 years the Office of Foreign Plant Introduction has been interested in the establishment of the Asiatic mangosteen, reputed to be the "queen of fruits," in the tropical American dependencies of the United States. It was believed for many years that the mangosteen could not be made to bear fruit outside of the Asiatic tropics. There is now a fruiting orchard of more than a dozen trees on the island of Dominica in the West Indies and another of nearly the same size near Guayaquil, Ecuador. Fruit has also been produced in Trinidad, Jamaica, and the Hawaiian Islands. It is evident therefore that when given the proper conditions of climate and soil and appropriate cultural treatment the mangosteen can be grown successfully in many regions. The seeds of this fruit are among the most difficult in the world to transport long distances. In 1922 it was found that seed obtained through Vilmorin-Andrieux & Co., of Paris, reached Washington in better condition than any which had been received previously from any source.

For previous introduction see S. P. I. No. 56822

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the specific identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in, so that definite identification can be made.

58028. HYPHAENE CRINITA Gaertn.
Phœnicaceæ. Palm.

From Pretoria, Union of South Africa. Seeds presented by C. P. Lounsbury, Chief, Division of Entomology. Received October 4, 1923.

A South African fan palm which in some sections of its native country reaches a height of 30 feet. The leaves are used by the natives to make matting, basketware, and rope. From the sap, obtained by tapping the trunk, a native beverage is prepared. (Adapted from *Marloth, Flora of South Africa*, vol. 4, p. 50.)

58029. NICOTIANA TABACUM L. Solanaceæ. Tobacco.

From Teheran, Persia. Seeds presented through Bernard Gottlieb, American consul. Received October 4, 1923.

Seeds of the finest grade of the Persian tobacco variety known as *Shiraz Tumbac*. (Gottlieb.)

Introduced for tobacco specialists.

58030. ANNONA DIVERSIFOLIA Safford.
Annonaceæ. Ilama.

From Chiapas, Mexico. Seeds presented by Dr. C. A. Purpus, Zacuapan, Huatusco, Vera Cruz. Received October 6, 1923.

It is now several years since the Office of Foreign Plant Introduction undertook an investigation of this little-known relative of the cherimoya and decided that it is a species worthy of wide cultivation in the Tropics. In these few years several thousand seedlings have been distributed, not alone in America but also in southern Asia and elsewhere. A young tree growing in the United States Plant Introduction Garden at Miami, Fla., came into bearing in 1923. So far as known, this is the first time ilamas have been produced in the United States. The tree has always been very limited in its distribution. It is native to southern Mexico, Guatemala, and Salvador, where it is found usually in foothill regions at elevations not greater than 2,000 feet. In some parts of Mexico it is called "ilama," in Chiapas "papauca," and in Guatemala and Salvador "anona blanca."

The climatic requirements of this tree are similar to those of the sugar-apple and the custard-apple. It will withstand light frost and often grows in regions where the rainfall is light. Seedling trees come into bearing when 4 or 5 years old. The species is not as robust as the cherimoya, rarely reaching more than 20 feet in height and being of somewhat slender growth. The fruit is conical, oval, or round, and weighs from half a pound to a pound or more. The surface is rough, with the carpellary areas indicated by deeply incised lines. The color varies from pale green to magenta pink, overspread with a whitish bloom, whence the common name "anona blanca," or "white anona." In pale-green varieties the flesh is pure white; in pink kinds it is tinged with that color. The flavor is similar to that of the sugar-apple but with more acid. The seeds are about as numerous as in the cherimoya but slightly larger than those of the latter.

58031. MANGIFERA INDICA L. Anacardiaceæ. Mango.

From Manila, Philippine Islands. Budwood presented by Adn. Hernandez, director, Bureau of Agriculture. Received October 6, 1923.

"*Carabao*." Average weight 230 grams; form oblong, asymmetrical, with full cheeks; ventral shoulder usually prominent; dorsal shoulder short; stem inserted squarely or obliquely; base rounded; beak rather indistinct and variable, sometimes coinciding with apex; nak about 15 to 25 millimeters above apex, usually not prominent; surface smooth; color yellowish tinged with green; lentils light yellow, usually sparse at basal end of fruit, abundant on apical portion; skin medium thin, tough; flesh yellowish, paler than the *Pico*,

very tender and melting; flavor very delicate, aromatic, and spicy; fiber medium coarse, short, confined almost entirely to edges of seed; seed oblong, medium large; polyembryonic. The similarities in the fruit and trees of the *Carabao* and the *Cambodiana*, introduced into Florida from Saigon, Cochín China, are so many and great that the two types would seem to have a common parentage or to have sprung one from the other; this fact perhaps may also indicate the original home of the *Carabao* mango.

"The tree is of vigorous growth, with fruit mostly ripening from the latter part of May through June and the early part of July; by smoking the trees (the physiological effect of which is not quite understood) and by chopping the bark of the trunk the Filipinos force the trees to bear fruit early in March, but this fruit is not so well flavored as that produced later. In some sections a few mangos are found in the markets during nearly all the months of the year." (P. J. Wester, *Bulletin No. 18, Bureau of Agriculture, Manila*, pp. 23 and 24.)

58032. STRYCHNOS SUBEROSA Wildem.
Loganiaceæ.

From Kisantu, Belgian Congo. Seeds presented by Frère J. Gillet. Received October 1, 1923.

The fruit of this species is edible. (Gillet.)

A spiny shrub or small tree, with oval leathery dull-green leaves. It is very similar to *Strychnos gillettii* [S. P. I. No. 58020]. (Adapted from *Annales du Musée du Congo*, ser. 5, vol. 1, p. 177.)

58033. AVENA STERILIS L. Poaceæ. Oats.

From Lincoln, New Zealand. Seeds presented by Dr. F. W. Hilgendorf, biologist, Canterbury Agricultural College. Received October 10, 1923.

"*College Algerians*. This strain, also known as A 86, is characterized by high tillering power, a creeping habit, quick recovery after feeding off, and a high yield. Under our conditions of climate and soil it has yielded about 10 bushels per acre more than commercial varieties sown under the same conditions." (*New Zealand Journal of Agriculture*, vol. 26, p. 147.)

58034. SACCHARUM OFFICINARUM L. Poaceæ. Sugar cane.

From Rio Piedras, Porto Rico. Cuttings presented by R. Menendez Ramos, director, Insular Experiment Station. Received October 10, 1923.

B. H. 10 (12). This Barbados hybrid is, in my opinion, the most valuable cane seedling at present planted on this island. It is a vigorous cane, giving high tonnage in a variety of soils; it is a heavy stooler and good in ratoon crops. At this station it has yielded as high as 22 per cent sucrose in crusher juice at the age of 13 months. It is tolerant to both mosaic and gumming diseases. (Ramos.)

58035. HIBISCUS ROSA-SINENSIS L. Malvaceæ.

From Manila, Philippine Islands. Cuttings presented by Adn. Hernandez, director, Bureau of Agriculture. Received October 17, 1923.

The Chinese Hibiscus is an exceedingly popular ornamental plant in southern Florida, where the single scarlet variety is practically the only one which has been commonly planted up to this time. The department has undertaken to introduce the best forms from other parts of the world, in the hope of diversifying somewhat the ornamental plantings of Florida gardens. The scarlet variety, though a handsome and useful plant, is in danger of becoming monotonous. An excellent collection of new varieties has recently been introduced from the Hawaiian Islands, where much has been done to improve this genus by breeding.

58036. KENNEDIA RUBICUNDA
(Schneev.) Vent. Fabaceæ.

From Richmond, Victoria. Seeds presented by F. H. Baker. Received October 11, 1923.

A very attractive twining shrub, sometimes 5 or 6 feet in length, with dark-green oval leaflets 3 to 4 inches long and numerous large showy dark-red flowers which occur in pairs in the leaf axils. This species is native to New South Wales. (Adapted from Sulman, F., *Wild Flowers of New South Wales*, p. 130.)

For previous introduction see S. P. I. No. 49487.

58037. PENNISETUM SETOSUM
(Swartz) L. Rich. Poaceæ. Grass.

From Entebbe, Uganda, Africa. Seeds presented by T. D. Maitland, botanist, Botanic Gardens. Received November 9, 1923.

A robust perennial grass, 2 to 4 feet high, distributed through the Tropics of both hemispheres and often used for forage.

Introduced for forage-crop specialists.

58038. CICER ARIETINUM L. Faba-
ceæ. Chick-pea.

From Guadalajara, Mexico. Seeds presented by Frank S. Furnivall, horticulturist, through Anthony Sherman, American vice consul in charge. Received October 17, 1923.

Seeds of a small-seeded chick-pea from Jalisco, introduced for forage-crop specialists.

58039 and 58040.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received October 19, 1923. Notes by Mr. Rock.

58039. *MAPPIA* sp. Icacinaceæ.

(No. 8711. Tschchung. August, 1923.) A tree 25 feet high which grows on the banks of the Mekong in a region having a rather warm climate. When in flower the tree is very handsome; the flowers, usually white, are in spikes 4 inches long in the leaf axils.

58040. *PRUNUS* sp. Amygdalaceæ.

(No. 9929. July, 1923.) A white-flowered tree about 25 feet in height from the slopes of Peima Shan (white-horse mountain), two days' journey southeast of Atuntze, at an altitude of 13,000 feet. The oblong red fruits are scarcely edible, although the Tibetans eat them. The region where this tree grows is quite cold, being covered with snow for a large part of the year.

58041. TRIFOLIUM INCARNATUM L.
Fabaceæ. Crimson clover.

From Paris, France. Seeds purchased from Vil-morin-Andrieux & Co. Received October 22, 1923.

Locally grown crimson clover from the Department of Loire, France. Introduced for cultural and comparison tests.

58042 to 58072.

From Spain. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received October 13, 1923. Notes by Doctor Harlan.

(September, 1923.) Purchased in agricultural villages from growers.

58042 to 58049. *AVENASATIVA* L. Poaceæ. Oats.

58042. (No. 248. Yuncos.)

58043. (No. 255.)

58044. (No. 257.)

58042 to 58072—Continued.

58045. (No. 265. Duenas.)

58046. (No. 269. Villacastin.)

58047. (No. 276. Monasterio de Bodilla.)

58048. (No. 280. Uzguiano.) Spring oats.

58049. (No. 284. Villar de Arnero.)

58050 to 58068. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceæ. Six-rowed barley.

58050. (No. 246.) Purchased in the village of Parla.

58051. (No. 249. Yuncos.)

58052. (No. 250. Yuncos.)

58053. (No. 252. Arevalo.)

58054. (No. 254.)

58055. (No. 256.)

58056. (No. 258.)

58057. (No. 260.)

58058. (No. 261.)

58059. (No. 263. Duenas.)

58060. (No. 266. Ameyugo.)

58061. (No. 268. Villacastin.)

58062. (No. 278. Uzguiano.) Winter barley.

58063. (No. 279. Uzguiano.) Spring barley.

58064. (No. 281. Villar de Arnero.)

58065. (No. 282. Villar de Arnero.)

58066. (No. 285. Ribofarda.)

58067. (No. 287. Alagon.) Secured from Mariano Argur.

58068. (No. 288.)

58069. *LATHYRUS SATIVUS* L. Fabaceæ. Bitter vetch.

(No. 271. Monasterio de Bodilla.)

58070. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

(No. 275. Monasterio de Bodilla.)

58071. *SECALE CEREALE* L. Poaceæ. Rye.

(No. 274. Monasterio de Bodilla.)

58072. *TRIGONELLA FOENUM-GRÆCUM* L. Fabaceæ. Fenugreek.

(No. 273. Monasterio de Bodilla.)

58073. TRITICUM AESTIVUM L. (T. vulgare Vill.) Poaceæ.
Common wheat.

From Montgomery, Punjab, India. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received October 13, 1923.

(No. 239. July 19, 1923.) Wheat as it comes to the assembling warehouses from the farms about Montgomery, India. (Harlan.)

58074 to 58085. TRITICUM AESTIVUM L. (T. vulgare Vill.) Poaceæ.
Common wheat.

From Spain. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received October 13, 1923. Notes by Doctor Harlan.

(September, 1923.) Purchased in agricultural villages from growers.

58074. (No. 247. September 20, 1923.) Purchased in the village of Parla.

58075. (No. 251. Arevalo.)

58076. (No. 253. Arevalo.)

58074 to 58085—Continued.

58077. (No. 259.)
 58078. (No. 262.)
 58079. (No. 264. Duenas.)
 58080. (No. 267. Ameyugo.)
 58081. (No. 270. Villacostin.)
 58082. (No. 272. Monasterio de Bodilla.)
 58083. (No. 277. Uzguiano.)
 58084. (No. 283. Villar de Arnero.)
 58085. (No. 286. Alagon.)

58086. *CICER ARIETINUM* L. Fabaceae. **Chick-pea.**

From Gizeh, Egypt. Seeds purchased from the botanical section, Ministry of Agriculture. Received October 31, 1923.

Seeds of the small-seeded chick-pea, introduced for forage-crop specialists.

58087. *MALUS* sp. Malaceae. **Apple.**

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received October 31, 1923.

(Likiang, August, 1923.) A tree about 30 feet high growing wild in the Likiang district. The small, attractive, uniformly red, oblong, cherry-like fruits have yellowish white acid flesh and are sold in the markets of Likiang. (Rock.)

58088 to 58090. *BERBERIS* spp. Berberidaceae. **Barberry.**

From Rochester, N. Y. Cuttings presented by W. L. G. Edson, in charge of the herbarium, Highland Park. Received November 9, 1923.

Introduced for pathologists studying leaf rusts.

58088. *BERBERIS ACUMINATA* Franch.

An evergreen shrub of open spreading habit with bright-red young growth and stout 3-parted spines 3 to 6 inches long. The brownish yellow flowers, three-quarters of an inch broad, are in clusters of four to eight in the axils of the previous year's shoots. The oblong black fruits are half an inch long. Native to central China. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 234.)

58089. *BERBERIS CONCINNA* Hook. f.

A low, bushy barberry which was discovered in the mountains of Sikkim, India, at an altitude of about 12,000 feet. It is of compact habit, with obovate leaves shining green above and white beneath. The deep-yellow flowers are about half an inch across, and the red oblong berries are a little more than half an inch long. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 238.)

58090. *BERBERIS CRATAEGINA* DC.

A deciduous shrub 5 feet high with 6 to 10 flowered racemes 1 to 2 inches long and bluish black fruits. Native to Asia Minor.

For previous introduction see S. P. I. No. 53089.

58091 and 58092.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, agricultural adviser, Bureau of Agriculture. Received November 9, 1923. Notes by Mr. Wester.

58091. *CAPSIUM ANNUUM* L. Solanaceae. **Red pepper.**

A long, slender, very hot pepper found in Siasi, Sulu Archipelago. It is said to be grown on a commercial scale near Singapore. It is very productive and might be useful for chili growers in the United States.

58091 and 58092—Continued.

58092. *FLACOURTIA EUPHLEBIA* Merr. Flacourtiaceae.

Lanagon. A small tree, native to these islands, bearing in profusion fruits very similar in appearance and flavor to those of *Flacourtia cataphracta*. They can probably also be used for jelly making.

For previous introduction see S. P. I. No. 54691.

58093 to 58126. *BERBERIS* spp. Berberidaceae. **Barberry.**

From the Arnold Arboretum, Jamaica Plain, Mass. Cuttings collected by H. C. Skeels, Bureau of Plant Industry. Received October 31, 1923.

A collection of barberries introduced for pathologists studying leaf rusts.

58093. *BERBERIS AEMULANS* C. Schneid.

A purple-twigged shrub 3 or 4 feet high, with oval-oblong leaves, yellow flowers, and yellowish berries. Native to western Szechwan, China. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 3, p. 434.)

58094. *BERBERIS AGGREGATA* C. Schneid.

A Chinese shrub 3 to 5 feet high which has yellowish brown spines, small oblong leaves, yellow flowers in dense racemes, and salmon-red fruits. (Skeels.)

For previous introduction see S. P. I. No. 54061.

58095. *BERBERIS AGGREGATA PRATII* C. Schneid.

A hardy shrub 6 to 10 feet in height, with slender 3-parted spines, oval leaves, narrow panicles of yellow flowers, and egg-shaped salmon-red fruits about one-fourth of an inch in length. It is a native of western China and grows very freely under cultivation at Kew, England. (Adapted from *Curtis's Botanical Magazine*, pl. 3549.)

For previous introduction see S. P. I. No. 55071.

58096. *BERBERIS AGGREGATA RECURVATA* C. Schneid.

A variety differing from the type only in having the fruiting pedicels recurved. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 3, p. 443.)

58097. *BERBERIS BRACHYPODA* Maxim.

A shrub from western China, 4 to 7 feet high, with ovate, serrate leaves, long slender panicles of yellow flowers, and scarlet fruits often half an inch in length. (Skeels.)

For previous introduction see S. P. I. No. 54064.

58098 and 58099. *BERBERIS BUXIFOLIA* Lam.

58098. A barberry 1 to 3 feet high, with wedge-shaped leaves, solitary orange-yellow flowers on long stems, and blackish purple berries. Native to Chile.

58099. Var. *nana*. A variety which forms compact tufts about a foot high.

58100. *BERBERIS CIRCUMSERATA* C. Schneid.

A bush from central China, up to 7 feet high, with roundish oval leaves having very numerous slender spine-tipped serrations. The spines are 3-parted, about half an inch long, and the bright-yellow flowers, half an inch wide, are solitary or in twos or threes on a common stalk. The scarlet fruits are oblong, slightly bloomy, and nearly half an inch long. In autumn the leaves turn scarlet. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, pt. 3, p. 354, and from *Rehder, in Bailey, Standard Cyclopedia of Horticulture*, vol. 1, p. 491.)

For previous introduction see S. P. I. No. 43819.

58101. *BERBERIS CONCINNA* Hook. f.

For previous introduction and description see S. P. I. No. 58089.

58093 to 58126—Continued.

58102. *BERBERIS DASYSTACHYA* Maxim.

A bush up to 5 feet in height, native to Hupeh and Shensi, western China. The flowers are yellow and the fruits coral red. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 3, p. 442.)

58103. *BERBERIS DIELSIANA* Fedde.

A spreading, loosely branched Chinese shrub often 10 feet high, with elliptic leaves that are whitish beneath. The beauty of the red fruits is accentuated by the bronze color of the leaves in the fall. (Skeels.)

For previous introduction see S. P. I. No. 54066.

58104. *BERBERIS FRANCISCI-FERDINANDI* C. Schneid.

A shrub 6 to 10 feet in height, with deciduous, papery, dull-green leaves, yellow flowers, and ovoid scarlet berries. Native to western China. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, p. 368.)

58105. *BERBERIS GILGIANA* Fedde.

A native of central China, this ashy barked shrub has somewhat coriaceous lanceolate leaves and dense racemes of yellow flowers. (Skeels.)

For previous introduction see S. P. I. No. 54067.

58106. *BERBERIS HENRYANA* C. Schneid.

A Chinese shrub resembling the common barberry (*Berberis vulgaris*) but having purplish or brown branches. It is about 8 feet high with membranous, elliptical leaves, pale beneath, and racemes of 10 to 20 yellow flowers, followed by red fruits. (Skeels.)

For previous introduction see S. P. I. No. 54068.

58107. *BERBERIS INTEGERRIMA* Bunge.

A Siberian barberry which forms a shrub up to 6 feet high, with grayish green leaves, dense racemes of small flowers, and black fruits. (Adapted from *Schneider, Illustriertes Handbuch der Laubholzkunde*, vol. 1, p. 505.)

58108. *BERBERIS JULIANAE* C. Schneid.

A shrubby barberry up to 7 feet high, native to western China. It has thick 3-cleft spines about an inch and a half long, narrowly oval leathery leaves, and small yellow flowers. (Adapted from *Sargent, Plantae Wilsonianae*, pt. 1, p. 561, 1913.)

For previous introduction see S. P. I. No. 43820.

58109. *BERBERIS KOREANA* Palibin.

A Korean shrub, often 6 feet high, with obovate leaves 2 to 3 inches long, dense lax racemes of yellow flowers, and round scarlet fruits. (Skeels.)

For previous introduction see S. P. I. No. 54069.

58110. *BERBERIS NOTABILIS* C. Schneid.

A large handsome shrub up to 8 feet in height, with papery blue-green leaves, rather dense clusters of yellow flowers, and purple fruits. Probably a hybrid of *Berberis heteropoda*. (Adapted from *Journal of the Arnold Arboretum*, vol. 4, p. 203.)

58111. *BERBERIS OTTAWENSIS* C. Schneid.

A spreading-erect shrub 3 or 4 feet high, with very variable foliage, long-stalked yellow flowers, and red berries. A hybrid, one of whose parents is *Berberis vulgaris* f. *atropurpurea*. (Adapted from *Journal of the Arnold Arboretum*, vol. 4, p. 221.)

58112 and 58113. *BERBERIS POIRETI* C. Schneid.

58112. A shrub up to 5 feet in height, with slender, arching branches and deep blood-red berries. Native to northern China.

For previous introduction see S. P. I. No. 50404.

58093 to 58126—Continued.

58113. *Forma weichangensis*. A form of the above species from Weichang, Chihli, China; it differs slightly from the type in the size of the bracts and in spine characters.

For previous introduction see S. P. I. No. 55073.

58114. *BERBERIS POLYANTHA* Hemsl.

A Chinese shrub, 6 to 9 feet high, with deep-yellow flowers and salmon-red fruits. Native to western Szechwan. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, p. 376.)

For previous introduction see S. P. I. No. 53638.

58115. *BERBERIS REHDERIANA* C. Schneid.

This barberry is supposed to be a native of Japan; it is a shrub with weak spines, oblanceolate or ovate-oblong leaves about 1 inch in length, racemes of small yellow flowers, and yellowish red globose fruits. (Adapted from *Bulletin V Herbar Boissier*, ser. 2, vol. 5, p. 659.)

For previous introduction see S. P. I. No. 49063.

58116. *BERBERIS SIEBOLDII* Miquel.

A Japanese shrub about 3 feet high, with reddish brown branches and obovate leaves 1 to 2 inches long, which turn deep red in the fall. The yellow flowers, in small racemes, are followed by light-red fruits one-fourth of an inch long. (Skeels.)

For previous introduction see S. P. I. No. 54072.

58117. *BERBERIS SILVA-TAROUCANA* C. Schneid.

A shrub 3 to 6 feet high, native to thickets in western China, with papery, narrowly oblong leaves, sessile racemes of yellow flowers, and roundish scarlet berries. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, p. 370.)

58118. *BERBERIS SINENSIS* Desf.

A slender-branched shrub 4 to 6 feet high, with ovoid purplish berries. Native to the Caucasus. (Rehder.)

58119. *BERBERIS STENOPHYLLA* Lindl.

A slender shrub 1 to 3 feet in height, with narrow, spiny pointed, dark-green leaves and nodding umbels of yellow flowers. A hybrid of garden origin. (Rehder.)

58120. *BERBERIS SUBCAULIALATA* C. Schneid.

A thickly branched shrub from Tibet, up to 4½ feet high, with spines up to an inch in length, thick, lance-shaped leaves about an inch long and globular reddish yellow fruits one-fourth of an inch in diameter. (Adapted from *Schneider, Illustriertes Handbuch der Laubholzkunde*, vol. 2, p. 319.)

For previous introduction see S. P. I. No. 43824.

58121. *BERBERIS THUNBERGHII* MAXIMOWICZII Regel.

A Japanese barberry which is larger than the ordinary form and has more arching branches, while the leaves are green beneath. It has the same autumn color of the leaves as the common form and has larger flowers and fruits. (Skeels.)

For previous introduction see S. P. I. No. 54073.

58122. *BERBERIS THUNBERGHII* MINOR Rehder.

A variety of the well-known species which forms a very low, dense shrub up to 2 feet in height.

58123. *BERBERIS TISCHLERI* C. Schneid.

A shrub from western China, 7 to 14 feet high, with spines in threes, papery spine-tipped leaves up to 2 inches in length, and yellow flowers in dense racemes. The somewhat pruinose egg-shaped red fruits appear in October. (Adapted from *Sargent, Plantae Wilsonianae*, pt. 1, p. 556, 1913.)

For previous introduction see S. P. I. No. 43825.

58093 to 58126—Continued.

58124. *BERBERIS TRIACANTHOPHORA* Fedde.

An evergreen shrub, up to 5 feet high, with very narrow leaves, which are sometimes spiny toothed, and black ovoid berries. Native to central China.

58125. *BERBERIS VERNAE* C. Schneid.

A low shrub, native to Kansu, China, with spatulate leaves in small fascicles and small yellow flowers followed by round red berries one-fourth of an inch in diameter. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 1, p. 372.)

For previous introduction see S. P. I. No. 54074.

58126. *BERBERIS VERRUCULOSA* Hemsl. and Wils.

This attractive Chinese barberry is found as an evergreen shrub in western Szechwan, where it becomes 3 or 4 feet in height. The yellow flowers and ovoid purplish blue fruits are borne among the small, very spiny leaves. (Adapted from *Curtis's Botanical Magazine*, vol. 133, pl. 8454.)

For previous introduction see S. P. I. No. 49129.

58127. *EUCALYPTUS DELEGATENSIS* R. T. Baker.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received December 3, 1923.

These seeds were produced at Tyenna, which has an altitude of over 700 feet and an annual rainfall of over 40 inches. (Evans.)

"The gum-topped stringbark is an erect tree, often assuming the largest dimensions. The branches are usually short and ascending, and the bark is thin and fibrous." (L. Rodway, *Tasmanian Eucalypts*, p. 15.)

58128. *TRICHILIA EMETICA* Vahl.
Meliaceae.

From Uganda, British East Africa. Seeds presented by Frank H. Rogers, through H. L. Shantz, Bureau of Plant Industry. Received November 9, 1923.

These seeds are known in Mozambique under the native names *Umkuhlu*, *Marba*, *Marwa-Maawa*, *Guande*, *Mafoureira*, *Mafura*, or *Mafurrera*, where they have long been known as the source of *Mafura* tallow, a vegetable fat used by the natives for greasing the skin. The fat consists of about 55 per cent oleic acid and 45 per cent palmitic acid and has been used in the manufacture of soap. (W. W. Stockberger, Bureau of Plant Industry.)

For previous introduction see S. P. I. No. 52811.

58129. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.) Poaceae. Broomcorn.

From Assam, Jorhat, India. Seeds presented by S. K. Mitra, economic botanist to the Government of Assam. Received November 15, 1923.

This broomcorn was picked out as a mutant in my standard broomcorn plat. I received the seed from the United States Department of Agriculture in 1921. (Mitra.)

58130. *PENTAGONIA PHYSALODES* (L.) Hiern. (*Nicandra physaloides* Gaertn.) Solanaceae.

From Ures, Sonora, Mexico. Seeds presented by Roberto A. Morales, forest inspector. Received November 15, 1923.

A blue-flowered solanaceous plant with the fruit inclosed in the husk, as in *Physalis*. The campanulate flowers, an inch or more in diameter, are light blue with a lighter throat; they are produced singly in the axils of the leaves.

For previous introduction see S. P. I. No. 48922.

58131 to 58135.

From Glasnevin, Dublin, Ireland. Seeds presented by the director, Royal Botanic Gardens. Received November 8, 1923.

58131 to 58133. *BERBERIS* spp. Berberidaceae.
Barberry.58131. *BERBERIS AETNENSIS* Presl.

A low, dense, deciduous shrub with numerous spines, from Sicily.

58132. *BERBERIS ALKSUTHIENSIS* Hort.

[Place of publication of name not yet found.]

58133. *BERBERIS THIBETICA* C. Schneid.

A deciduous shrub 3 to 4 feet tall, with purplish glaucous branches, entire leaves which are whitish beneath, and yellow flowers, followed by red berries. Native to China. (Adapted from *Schneider, Handbuch der Laubholzkunde*, vol. 2, p. 920.)

For previous introduction see S. P. I. No. 53642.

58134. *COTONEASTER HARROVIANA* Wilson.
Malaceae.

An evergreen shrub with a loose, spreading habit, about 6 feet in height, with shining, dark-green, bristle-tipped leaves, dense corymbs of white flowers, and red fruits. Native to Yunnan, China. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 410.)

58135. *HEMEROCALLIS FORRESTII* Diels. Liliaceae.

A very handsome plant about 2 feet high, with a thick rootstalk, narrow lanceolate leaves, and deep golden orange tubular flowers, 2 to 3 inches long, borne in many-flowered spikes. It flowers only in very early spring and is suited only for pure limestone soil. (J. F. Rock, note under S. P. I. No. 55933.)

58136 to 58152.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received November 10, 1923.

58136 to 58143. *BERBERIS* spp. Berberidaceae.
Barberry.58136. *BERBERIS AGGREGATA* PRATT C. Schneid.

For previous introduction and description see S. P. I. No. 58095.

58137. *BERBERIS BEANIANA* C. Schneid.

A shrub with vigorous shoots, yellow spines, small yellow flowers, and purple plum-shaped fruits. (Adapted from *Sargent, Plantae Wilsonianae*, vol. 3, p. 439.)

For previous introduction see S. P. I. No. 49925.

58138. *BERBERIS GAGNEPAINI* C. Schneid.

An evergreen shrub 3 to 6 feet high, with leathery leaves, spiny on the margins, and delicate yellow flowers on red pedicels. The ellipsoid berries are glaucous purple. Native to China.

For previous introduction see S. P. I. No. 53634.

58139. *BERBERIS LYCIUM* Royle.

A shrub native to the western Himalayas at altitudes of 3,000 to 9,000 feet, with narrow bright-green leaves and pale-yellow flowers, followed by ovoid violet berries. (Adapted from *Collett, Flora Simlensis*, p. 22.)

For previous introduction see S. P. I. No. 53636.

58136 to 58152—Continued.

58140. BERBERIS POLYANTHA Hemsl.

A deciduous shrub 6 to 10 feet high, with simple or 3-pronged thorns, obovate leaves, mostly rounded at the apex, and yellow flowers, which are produced during June and July in drooping panicles. The berries are red. Native to China. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 246.)

For previous introduction see S. P. I. No. 53638.

58141. BERBERIS SOULIEANA C. Schneid.

An evergreen shrub 3 to 6 feet high, with leathery, lanceolate, spiny serrate leaves 2 to 4 inches long and brownish yellow flowers in clusters of 2 to 15. The black ellipsoid berries are about five-eighths of an inch long. Native to China. (Adapted from *Curtis's Botanical Magazine*, vol. 134, pl. 8185, under *Berberis acuminata* Stapf.)

For previous introduction see S. P. I. No. 49930.

58142. BERBERIS STAFFIANA C. Schneid.

A partly evergreen shrub, 5 to 6 feet high with spreading arching stems, pale-yellow flowers, and carmine-red berries. Native to western China.

For previous introduction see S. P. I. No. 53640.

58143. BERBERIS SUBCAULIALATA C. Schneid.

For previous introduction and description see S. P. I. No. 58120.

58144. CORNUS BRETSCHNEIDERI J. Henry. Dogwood.

A shrub up to 12 feet in height, with green or purplish branches, oval, hairy leaves, and dense clusters of bluish black berries.

For previous introduction see S. P. I. No. 42188.

58145 to 58151. COTONEASTER spp. Malacæ.

58145. COTONEASTER AFFINIS OBTUSA (Wall.) C. Schneid.

An upright slender-branched shrub, with bright-green leaves and globose dark-brown fruits. Native to the Himalayas. (Adapted from *Schneider, Illustriertes Handbuch der Laubholzkunde*, vol. 1, p. 757.)

58146. COTONEASTER HARROVIANA Wilson.

For previous introduction and description see S. P. I. No. 58134.

58147. COTONEASTER HEBEPHYLLA Dicks.

A very ornamental deciduous shrub, 10 to 18 feet in height. It has long, rambling branches, white flowers, and dark-carmine fruits. (*J. F. Rock, note under S. P. I. No. 55875.*)

58148. COTONEASTER HUPEHENSIS Rehd. and Wils.

A strong-growing, shrubby, black-fruited species, with graceful spreading branches, attractive white flowers, and crimson globose fruits. (*Arnold Arboretum, Bulletin of Popular Information*, No. 19.)

For previous introduction see S. P. I. No. 44079.

58149. COTONEASTER LINDLEYI Steud.

A large shrub or small tree, with semideciduous dark-green leaves, corymbs of white flowers, and bluish black fruits. Native to the northwestern Himalayas. (Adapted from *Schneider, Handbuch der Laubholzkunde*, vol. 1, p. 757.)

For previous introduction see S. P. I. No. 53683.

58136 to 58152—Continued.

58150. COTONEASTER MELANOCARPA LAXIFLORA (Jacq.) C. Schneid.

A spreading shrub which becomes about 12 feet high, with oval dark-green leaves, grayish white beneath, gracefully pendulous clusters of pinkish white flowers, and black globose fruits. This Siberian species is one of the most attractive of the black-fruited cotoneasters. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 412.)

For previous introduction see S. P. I. No. 53685.

58151. COTONEASTER RACEMIFLORA (Desf.) Koch.

A low shrub from northern Africa and western Asia, with roundish leaves, slightly hairy beneath, and short-stalked cymes of white flowers, followed by red fruits. Received as *Cotoneaster fontanæsi*, for which *C. racemiflora* is the earlier name.

For previous introduction see S. P. I. No. 53690.

58152. HYDRANGEA BRETSCHNEIDERI Dipp. Hydrangeaceæ.

A stout bushy shrub 8 or 10 feet high, with dull-green slender-pointed leaves and flattened corymbs, 4 or 5 inches wide, of white flowers, which become rosy. This hardy hydrangea was first discovered in the mountains near Peking, China, and thrives best in a sunny position in good soil. (Adapted from *Bean, Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 624.)

For previous introduction see S. P. I. No. 42189.

58153 to 58357.

From Siberia. Seeds presented by Prof. T. D. A. Cockerell, University of Colorado. Received November 2, 1923.

58153. ACTINIDIA KOLOMIKTA (Maxim.) Rupr. Dilleniaceæ.

Razdolnoe. From Nikolsk Ussuriiskii.

58154. ALLIUM CEPA L. Liliaceæ. Onion.

Sweet onion. From Okeanskaja, Olshin.

58155 to 58189. AVENA SATIVA L. Poaceæ. Oats.

58155. *Blagodatnoe*. From Nikolsk Ussuriiskii.

58156. *Bogatirka*. From Nikolsk Ussuriiskii.

58157. *Chernigovka*. From Spassk.

58158. *Chernishevka*. From Spassk.

58159. *Chorol*. From Nikolsk Ussuriiskii.

58160. *Grodekovo*. From Nikolsk Ussuriiskii.

58161. *Innokentievka*. From Spassk.

58162. *Ivanovka*. From Nikolsk Ussuriiskii.

58163. *Kabarga*. From Spassk.

58164. *Krasnoe*. From Posetski.

58165. *Kremovo*. From Nikolsk Ussuriiskii.

58166. *Kuchuki*. From Nikolsk Ussuriiskii.

58167. *Margaritovo*. From Olshin.

58168. *Nizhni Janchich*. From Posetski.

58169 to 58177. From Nikolsk Ussuriiskii.

58169. *Novo-Belmanovka*.

58170. *Novojatkovo*.

58171. *Novo-Kashalinsk*.

58172. *Novo-Nikolaevka*.

58173. *Novo-Troitzkoe*.

58174. *Osinovka*.

58153 to 58357—Continued.

58175. *Pavlovka*.
 58176. *Platonovo Aleksandrovskoe*.
 58177. *Popovka*.
 58178. *Sikilsk*. From Posetski.
 58179 to 58183. From Nikolsk Ussuriiskii.
 58179. *Sofie-Alekseevskoe*.
 58180. *Strugovka*.
 58181. *Tarasovka*.
 58182. *Vladimirovskoe*.
 58183. *Vozdrizhenka*.
 58184 to 58186. From the city of Spassk.
 58184. *Beliak*.
 58185. *Grivan*.
 58186. A Swedish variety.
 58187. From Goschoz, Spassk.
 58188. From Goschoz, Nikolsk Ussuriiskii.
 58189. From Nikolsk Ussuriiskii.
 58190 to 58197. From Okeanskaia, Olshin.
 58190 and 58191. *BETA VULGARIS* L. Chenopodiaceæ. Beet.
 58190. An Egyptian variety.
 58191. *Korshovaia*.
 58192. *BRASSICA OLERACEA CAPITATA* L. Brassicaceæ. Cabbage.
 Braunschweig cabbage.
 58193 and 58194. *CUCUMIS SATIVUS* L. Cucurbitaceæ. Cucumber.
 58193. Seeds of mixed varieties: *Nejinski*, *Muromski*, and *Akselski*.
 58194. *Nejinski*.
 58195. *CUCURBITA MAXIMA* Duchesne. Cucurbitaceæ. Squash.
 A Canadian variety.
 58196. *CUCURBITA PEPO* L. Cucurbitaceæ. Gourd.
 Bottle gourd.
 58197. *Daucus carota* L. Apiaceæ. Carrot.
Nantski.
 58198 to 58220. *FAGOPYRUM VULGARE* Hill. (*F. esculentum* Moench.) Polygonaceæ. Buckwheat.
 58199. *Chernigorka*. From Spassk.
 58199. *Chernisherka*. From Nikolsk Ussuriiskii.
 58200. *Duchorskoe*. From Nikolsk Ussuriiskii.
 58201. *Granaturka*. From Nikolsk Ussuriiskii.
 58202. *Innokentierka*. From Spassk.
 58203. *Kabarga*. From Spassk.
 58204. *Konstantinovka*. From Nikolsk Ussuriiskii.
 58205. *Kremoro* from Nikolsk Ussuriiskii.
 58206. *Krasnoe*. From Posetski.
 58207 to 58218. From Nikolsk Ussuriiskii.
 58207. *Michailovka*.
 58209. *Nesterovskoe*.
 58209. *Noro-Belmanovka*.
 58210. *Noro-Deritza*.

58153 to 58357—Continued.

58211. *Noropsatkovo*.
 58212. *Noro-Troitzkoe*.
 58213. *Osipovka*.
 58214. *Popovka*.
 58215. *Pushkino*.
 58216. *Strugovka*.
 58217. *Tarasovka*.
 58218. *Vozdrizhenko*.
 58219. From Goschoz, Spassk.
 58220. From Goschoz, Nikolsk Ussuriiskii.
 58221 to 58223. *HELIANTHUS ANNUUS* L. Asteraceæ. Sunflower.
 58221. *Iranovka*. From Nikolsk Ussuriiskii.
 58222. *Sofie-Alekseevskoe*. From Nikolsk Ussuriiskii.
 58223. From Goschoz, Spassk.
 58224 to 58233. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceæ. Six-rowed barley.
 58224 to 58228. From Nikolsk Ussuriiskii.
 58224. *Chernisherka*.
 58225. *Furmanovo*.
 58226. *Granaturka*.

58353. *Table maize*. From Okeanskaia, Olshin.
58354. (Turkish.) From the city of Spassk.
58355. From the city of Spassk.
58356. From Nikolsk Ussuriiskii.
58357. From Razdolvinskaia Volost, Nikolsk Ussuriiskii.

58358. *JATROPHA* sp. Euphorbiaceae. Chilte.

From San Jacinto, Mexico. Seeds presented by Samuel Torres Elorduy, Chief, Department of Agriculture. Received December 12, 1923.

Introduced for testing as a possible source of rubber.

58359 to 58361.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received December 15, 1923. Notes by Mr. Rock.

58359. *ANEMONE* sp. Ranunculaceae.

(October 8, 1923.) A plant about 3 feet high, which grows in moist alpine meadows at the edge of fir forests on the Litiping-Yangtze-Mekong watershed at an altitude of about 11,000 feet. The large dark-green glossy leaves form globose cushions, and the umbels of white flowers are on stalks 3 feet or more in length.

58359 to 58361—Continued.

58360. *CEPHALOTAXUS* sp. Taxaceae.

(No. 10891. October 7, 1923.) A small coniferous tree, 20 to 25 feet tall, growing in dense clumps above Lutien on the eastern slope of the Yangtze-Mekong watershed at an altitude of 9,600 feet. The rather long, broad needles are bluish green, and the maroon-colored fleshy fruits, the size of small plums, contain almond-shaped thin-shelled stones.

58361. *IRIS* sp. Iridaceae.

Iris.

(October 8, 1923.) A plant a foot to a foot and a half in height, growing in clumps in the moist alpine meadows of Litiping, north of Lutien, at an altitude of about 11,000 feet. It is very handsome, with deep indigo-blue flowers.

58362 to 58364.

From Ibarra, Ecuador. Seeds presented by J. Felix Tamayo. Received December 8, 1923.

58362. *DATURA ROSEI* Safford. Solanaceae.

Huantuc. A yellow-flowered form of the common arborescent *Datura* which is cultivated about the huts of the Indians all through the Ecuadorian highlands. The plant sometimes grows to 15 or 18 feet; its tubular flowers are about 6 inches long, 2 inches broad at the mouth, and of a rich deep-yellow color. The plant is worthy of trial as an ornamental in protected situations throughout southern California and in southern Florida.

For previous introduction see S. P. I. No. 54049.

58363. *PHASEOLUS VULGARIS* L. Fabaceae.

Common bean.

Nuya. The best variety of pole bean which we have in cultivation. (*Tamayo*.)

58364. *ZEA MAYS* L. Poaceae.

Corn.

Guandango. The best variety of corn cultivated here. The ear is large, sometimes 30 centimeters (a foot) long, with 8 to 12 rows of kernels. The cob is very slender. These seeds are not of a pure strain. (*Tamayo*.)

58365. *PERSEA AMERICANA* Mill. (*P. gratissima* Gaertn. f.) Lauraceae.

Avocado.

From San Jose, Costa Rica. Seeds purchased from Otón Jimenez, through the United Fruit Co., Limon, Costa Rica. Received December 7, 1923.

While carrying on agricultural explorations in Costa Rica in 1920, Wilson Popenoe, in company with Mr. Jimenez, discovered a wild avocado which, in the opinion of Mr. Popenoe, may possibly be the ancestor of some of the cultivated varieties. At that time budwood and seeds were sent in under S. P. I. Nos. 50585 and 51031, respectively, under which numbers detailed notes will be found. This material failed to survive, however.

The seeds now received from Mr. Jimenez are presumably of this wild type of avocado, and they will be grown for trial as stock plants.

58366. *SCHIZOCENTRON ELEGANS* (Schlecht.) Meisn. Melastomaceae.

From New York, N. Y. Plants presented by Dr. N. L. Britton, director, New York Botanical Gardens, Bronx Park. Received December 28, 1923.

A very charming little creeper, native to eastern Mexico, which roots at the joints and forms a dense carpet. The leaves are small, opposite, and short stemmed, and the comparatively large purplish flowers appear at the ends of short branches. The plant deserves to be more widely cultivated and would probably grow in the open in the southern part of the United States. (Adapted from note by J. N. Rose in *Addisonia*, pl. 266.)

58367 and 58368.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received December 28, 1923. Notes by Mr. Rock.

58367. *PINUS ARMANDI* Franch. Pinaceæ. Pine.

(September 23, 1923.) This is one of the largest conifers in Yunnan. It is a tree 70 to 90 feet high, with a trunk 4 feet in diameter, which grows on well-drained, moist mountain slopes from central to northern Yunnan, at altitudes of 8,000 to 10,000 feet. The edible seeds are sold in the markets.

58368. *PRIMULA SIKKIMENSIS* Hook. Primulaceæ.

(No. 8995. September, 1923.) This primrose which is 1 or 2 feet high, with the habit of *Primula secundiflora*, grows in moist meadows and along stream beds on the Likiang Snow Range at an altitude of 13,000 feet. The lanceolate drooping leaves are dull green on both sides, and the rich yellow flowers, which appear in June, are large and bell shaped.

58369. HEDYSCEPE CANTERBURYANA
(F. Muell.) Wendl. and Drude.
Phœnicaceæ. Palm.

From Sydney, New South Wales. Seeds presented by J. H. Maiden, director and government botanist, Botanic Gardens. Received November 17, 1923.

This very handsome palm is known in a wild state only on Lord Howe Island, over 400 miles east of Australia, where it is called the "umbrella palm." It is a tall spineless palm with a comparatively short, thick stem, from the end of which arise the dense graceful leaves, composed of long, narrow segments. In habit and foliage it resembles a *Kentia*, and in general its cultural requirements are the same.

58370. BYRSONIMA SPICATA (Cav.)
DC. Malpighiaceæ.

From Dominica, British West Indies. Seeds presented by Joseph Jones, curator, Botanic Gardens. Received November 22, 1923.

A tropical American tree 30 to 40 feet high, known in Dominica as *bois tan*. The narrow leaves are shining green above and rusty brown beneath, and the yellow flowers, followed by acid edible fruits of the same color, make the tree a showy ornamental. The tough, light wood is useful for general construction, and the bark is a source of tannin.

58371. ZEA MAYS L. Poaceæ. Corn.

From Bawlf, Alberta, Canada. Seeds presented by A. W. Petrick. Received November 22, 1923.

A yellow flint corn, originally grown in north-western Manitoba by the Mennonites. It is a very early variety, earlier than squaw corn, with a very short growing season. (Petrick.)

58372 and 58373.

From Cambridge, England. Seeds presented by H. Gilbert-Carter, director, The University Botanic Garden. Received November 23, 1923.

58372. *LYCOPERSICON ESCULENTUM* Mill. Solanaceæ. Tomato.

Var. *racemigerum*. The fruits of this variety, which are in racemose clusters, are edible, but too small for domestic use.

Introduced for pathologists studying tomato diseases.

58372 and 58373—Continued.

58373. *MECONOPSIS CAMBRICA* Viguier. Papaveraceæ.

The Welsh poppy, native to the British Isles, is a very desirable garden perennial. The typical form, about a foot high, has single bright-yellow flowers. Very attractive double forms with orange-colored flowers also have been produced. (Adapted from *Gardeners' Chronicle*, ser. 3, vol. 52, p. 54.)

58374 and 58375.

From Likiang, Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received November 23, 1923. Notes by Mr. Rock.

58374. *MECONOPSIS INTEGRIFOLIA* (Maxim.) Franch. Papaveraceæ.

(September, 1923.) This is a larger species than *Meconopsis ruda*s and grows wild on the Likiang Snow Range in alpine meadows at altitudes of 12,000 to 14,000 feet. The handsome yellow flowers are often 4 inches across.

For previous introduction see S. P. I. No. 56326.

58375. *PRIMULA SECUNDIFLORA* Franch. Primulaceæ.

(No. 9838.) A primrose about a foot in height, growing in alpine meadows on the Likiang Snow Range at an altitude of about 14,000 feet. The drooping, deep reddish purple flowers, with campanulate corollas, are borne at the apex of the spike. This species is always found associated with *Primula pseudosikkimensis* and *P. pinnatifida*.

For previous introduction see S. P. I. No. 55336.

58376. PAULOWNIA FORTUNEI (Seem.)
Hemsl. Scrophulariaceæ.

From Taihoku, Formosa, Japan. Seeds presented by R. Kanehira, director, Experimental Station of Forestry. Received December 3, 1923.

This species, although closely allied to *Paulownia imperialis*, which is so well known as an ornamental tree in this country, has whitish, spotted flowers which are larger than those of *P. imperialis*. The leaves also are much longer and are covered below with a short, dense, white pubescence. (Adapted from *Bulletin Dendrologique de France*, 1908, p. 162.)

For previous introduction see S. P. I. No. 52268.

58377. AGATI TOMENTOSA (Hook. and Arn.) Nutt. (*Sesbania tomentosa* Hook. and Arn.) Fabaceæ.

From Honolulu, Hawaii. Seeds presented by C. S. Judd, superintendent of forestry, Board of Commissioners of Agriculture and Forestry. Received November 26, 1923.

This plant is now almost extinct in this part of the Hawaiian Islands because the foliage is such an attractive forage for cattle and goats. The brilliant-red flowers make the plants very ornamental. From the twigs the frigate birds make their nests. (Judd.)

For previous introduction see S. P. I. No. 54516.

58378. CORYLUS sp. Betulaceæ. Hazel.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received November 26, 1923.

(No. 10760. Likiang, 1923.) Received without notes.

**58379. ACACIA SCORPIOIDES (L.) W. F. Wight. (*A. arabica* Willd.) Mimosa-
sacae.**

From Gizeh, Egypt. Seeds presented by the director, horticultural section, Ministry of Agriculture. Received November 28, 1923.

A large proportion of the gum arabic of commerce is furnished by this tree, which is native to northern Africa and southwestern Asia. True gum arabic, however, is said to come only from another species, *Acacia senegal*. The pods and bark of *A. scorpioides* are used for tanning, and the leaves and young pods are sometimes fed to cattle. The wood is hard and durable and is used in India for making tools. (Adapted from *Holland, Useful Plants of Nigeria*, pt. II, p. 288.)

For previous introduction see S. P. I. No. 48063.

58380 and 58381. PHELEUM PRATENSE L. Poaceae. Timothy.

From Malaga, Spain. Seeds presented by Luis Liró Ortiz, director, Agricultural Station, Torrox, through Donald D. Shepard, American consul. Received November 28, 1923.

Local strains introduced for cultural and comparison tests.

58380. From the Estación de Ensayo de Semillas, Madrid.

58381. From the grounds of the Agricultural Experiment Station, La Coruna.

58382. LANSIUM DOMESTICUM Jack. Meliaceae. Langsat.

From Los Banos, Philippine Islands. Seeds presented by J. E. Higgins, professor of agronomy and head of the department, College of Agriculture. Received December 5, 1923.

The langsat or lanzon is reckoned one of the best fruits of the Malayan region. As far as can be ascertained there is no reason why it should not do well in the West Indies, Mexico, Central America, and on the continent of South America as far southward as Ecuador and southern Brazil.

The tree reaches 40 feet in height and has pinnate leaves composed of five to seven elliptic leaflets each 4 to 8 inches long. The fruit varies in form and character, but is generally oval or round, 1 to 2 inches in diameter, velvety and straw colored, with a thick leathery skin inclosing five segments of white, translucent, juicy aromatic flesh and one to three large seeds.

Two distinct kinds are known, one termed langsat and the other duku, or doekoe. Choice seedling forms occur in both and should be propagated by some vegetative means.

58383. AMYGDALUS PERSICA L. (*Prunus persica* Stokes.) Amygdalaceae.

Peach.

From Yihhsien, Shantung, China. Seeds presented by K. M. Gordon, South Shantung Industrial School. Received December 28, 1923.

The Chinese call this peach *Chiu tao*, or "autumn peach." The fruit is small and very bitter, and the variety is used as a stock on which to graft and bud better varieties. (Gordon.)

58384 and 58385. CASIMIROA spp. Rutaceae.

From Duarte, Calif. Budwood presented by W. A. Spinks. Received December 5, 1923.

58384. *CASIMIROA* sp.

Coleman. This has been considered for a number of years the best-flavored sapote of this region. The parent tree grows in the rear of the old Coleman residence in Monrovia, Calif. Some years ago A. L. Smith, of Monrovia, propagated several

58384 and 58385—Continued.

trees from the parent tree. He has a specimen 20 feet high which bears prolifically and regularly. The fruit is attractive in shape, and the tree has sapotes on it nearly all the year. (*Spinks*.)

58385. *CASIMIROA* sp.

Spinks. A seedling sapote growing on the grounds of W. A. Spinks at Duarte, Calif.

58386 to 58388. PHASEOLUS VULGARIS L. Fabaceae. Common bean.

From Georgetown, British Guiana. Seeds presented by R. D. Rands, United States Department of Agriculture. Received December 3, 1923.

Introduced for pathologists studying bean diseases.

58386. Madeira butter beans.

58387. Madeira spot beans.

58388. Trinidad beans.

58389. EREMOCHLOA OPHIUROIDES (Munro) Hack. Poaceae. Grass.

From Canton, China. Seeds presented by Prof. G. Weidman Groff, Canton Christian College. Received November 26, 1923.

This is the second most common lawn grass in southern China and is recommended as the best lawn grass for that region. Its usual height is 3 or 4 inches, the blades are smooth and soft, and the seed stalks insignificant. The attractive deep-green color is maintained during the winter in southern China if the grass gets a good hold during the summer. Propagation is easily effected by means of runners. (Adapted from *Bulletin No. 25, Canton Christian College*.)

For previous introduction see S. P. I. No. 48566.

58390. ALSTONIA MACROPHYLLA Wall. Apocynaceae.

From Peradeniya, Ceylon. Seeds presented by H. F. Macmillan, superintendent, botanic gardens. Received December 21, 1923.

A shrub or small tree, native to the East Indies and the Philippines, introduced for testing by rubber specialists. Most of the members of the family to which this species belongs contain milky latex.

58391 and 58392. LARIX spp. Pinaceae. Larch.

From Dorpat, Estonia. Seeds presented by Franz Boerner, botanic garden, University of Dorpat. Received December 21, 1923.

58391. *LARIX DAURICA* Turcz.

A larch from Manchuria and southeastern Siberia, sometimes as much as 70 feet in height. In many sections it is superior to the common European larch as a park tree. In the spring the young cones are very attractive because of their bright-pink color.

58392. *LARIX SIBIRICA* Ledeb.

A very tall larch, at times reaching a height of 120 feet, native to northeastern Russia and Siberia. It has a straight slender trunk and short, rather ascending branches. It is closely related to the common European larch.

58393 to 58396.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received December 3, 1923. Notes by Mr. Rock.

58393 to 58396—Continued.

58393. *ANEMONE DEMISSA* Hook. f. and Thoms.
Ranunculaceæ.

(Saba. September, 1923.) A lovely alpine plant common in limestone soil on all of the mountain meadows of the Likiang Snow Range at altitudes of 11,000 to 13,000 feet and higher. The leaves are in basal rosettes, and the large white flowers are in many-flowered umbels.

58394. *CASTANOPSIS DELAVAYI* Franch.
Fagaceæ.

(No. 10798. September, 1923.) A semideciduous tree 50 to 70 feet tall, with a trunk 4 to 6 feet in diameter, which grows on a limestone range north of Likiang at an altitude of 8,200 feet. It is also quite common on the Yangtze north of Likiang at Tungshan, Shiku, and Hgaza. The glaucous, glabrous leaves are serrate on the upper halves. The fruits are borne in axillary spikes, with 10 to 20 in each spike, and the burs are covered with concentric bands bearing short sharp spines. The fruits are small, with a single ovate to conical nut about half an inch long, inclosing a sweet, edible kernel. This is one of the finest and hardest timber trees of this region.

58395. *INCARVILLEA GRANDIFLORA BREVIFES*
Sprague. Bignoniaceæ.

(No. 8991. Saba. September, 1923.) A stemless plant found in limestone soil on all of the mountain meadows of the Likiang Snow Range at altitudes of 9,500 to 12,000 feet, where it is the first to flower in early spring. The dark-green glossy leaves are lyrate and pinnately cut, and the large flowers, 2 to 3 inches across, are deep magenta purple with yellow throats.

58396. *MECONOPSIS RUDIS* Prain. Papaveraceæ.

(No. 9840. September, 1923.) A plant 1 or 2 feet tall which thrives in loose limestone gravel, in company with *Meconopsis integrifolia*, on the Likiang Snow Range at an altitude of about 13,000 feet.

58397. *LESPEDEZA STRIATA* (Thunb.)
Hook. and Arn. Fabaceæ.

Numbered December, 1923.

In 1919 J. B. Norton visited Japan as an agricultural explorer of the United States Department of Agriculture. Among the seeds he brought back were those of a strain of *Lespedeza striata* collected near the city of Kobe. This strain proved to be an unusually strong grower and in tests at Hartsville, S. C., has outgrown both the common *lespedeza* (*L. striata*) of the South and the newly introduced Korean *lespedeza* (*L. stipulacea*). At Arlington Experiment Farm, Rosslyn, Va., the growth of the Kobe and of the Korean varieties has been about the same, but the former makes a finer, more leafy growth and is therefore probably the better forage crop.

The Kobe *lespedeza* does not seed as early as the Korean and at Arlington farm has made a smaller seed crop than the latter. It will therefore probably not reproduce in the North. In habit, leaf shape, and size the Kobe strain is just like the common *lespedeza*, but it grows to a larger size. (A. J. Pieters, Bureau of Plant Industry.)

58398 to 58402. *PRIMULA* spp. Primulaceæ.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received December 3, 1923. Notes by Mr. Rock.

58398. *PRIMULA BULLEYANA* Forrest.

(No. 8988. Heshwe. September, 1923.) A very striking species 2 to 3 feet high, found only in boggy meadows at Heshwe, on the eastern slope of the Likiang Snow Range, at an altitude of about 11,000 feet. The deep reddish orange flowers, brownish crimson in bud, are slightly fragrant.

58398 to 58402—Continued.

58399. *PRIMULA POISSONT* Franch.

(September, 1923.) One of the hardiest primroses from this region; it is confined to swampy meadows or even to the gravelly beds of shallow brooks on the Likiang Snow Range at altitudes of 8,000 to 10,000 feet. The flowers, with crimson-lake corollas and yellow throats, are in candelabralike spikes.

58400. *PRIMULA PULCHELLA* Franch.

(No. 8682. Saba. September, 1923.) A handsome primrose growing in limestone soil in rather moist meadows on the eastern slopes of the Likiang Snow Range at an altitude of 11,000 feet. The lanceolate leaves are yellowish beneath, and the large flowers are bluish purple.

58401. *PRIMULA SINOPURPUREA* Balf. f.

(September, 1923.) A very ornamental species about 2 feet in height, found in moist meadows on the western slopes of the Likiang Snow Range at an altitude of 13,000 feet or more. The linear leaves are bright green above and golden yellow beneath, and the purplish red flowers are borne in dense umbels. The flowers appear in May and June and the fruits in early September.

58402. *PRIMULA VINCIFLORA* Franch.

(No. 8394. September, 1923.) A plant about 15 inches high which loves moist meadows and shady situations on the edges of fir and spruce forests on the eastern slopes of the Likiang Snow Range at an altitude of about 12,000 feet. The leaves are elliptical and dull green, and the large flowers, resembling those of *Vinca*, are a deep indigo blue.¶

58403 and 58404.

From Para, Brazil. Seeds presented by Godfrey Davidson. Received December 13, 1923. Notes by Mr. Davidson.

58403. *ARISTOLOCHIA* sp. Aristolochiaceæ

This appears to be a new species.¶

58404. *NYMPHAEA* sp. Nymphaeaceæ.

Water lily.

A very attractive water lily; the flowers are white, shaded with pink, and delightfully fragrant.

58405. *PRIMULA SINO-DENTICULATA*
Balf. f. Primulaceæ.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received December 7, 1923.

(No. 9617. September, 1923.) One of the earliest primroses of this vicinity, flowering in February on dry grassy slopes of the Likiang Snow Range at altitudes of 7,000 to 11,000 feet. It is likewise distributed from the Tengyueh Mountains to north of Likiang and beyond the Yangtze on Haba Shan. The flowers, in dense globose heads, are deep blue with a slight purplish tinge. (Rock.)¶

58406. *CUCUMIS* sp. Cucurbitaceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received December 12, 1923. ¶

Kondol-nak. I collected these seeds on a recent trip to Tanjay, island of Negros. The fruits are like miniature watermelons in shape and color, averaging 5 centimeters (2 inches) in length. The flesh is edible, though of little value, but the plant might be serviceable for plant breeders who are working to get wilt-resistant cucumbers and watermelons. The fruits remain in good condition on the vines for some weeks and so may be of ornamental value in Florida. (Wester.)

58407. *MICHELIA* sp. Magnoliaceæ.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received November 7, 1923.

(No. 10661. Nguluken. September 2, 1923.) A beautiful shrub trained to form an arbor at the Lama temple, which is at an altitude of 9,500 feet on the Likang Snow Range. The numerous white, fragrant flowers, about the size of a silver dollar, are in the leaf axils, the leaves are leathery and dark green, and the buds are silky brown. The black seeds, inclosed in a scarlet aril, are in capsules. (Rock.)

58408 to 58412.

From Vera Cruz, Mexico. Seeds presented by Dr. C. A. Purpus. Received December 12, 1923.

58408. *ANNONA DIVERSIFOLIA* Safford. *Annonaceæ*. *Llama*.

For previous introduction and description see S. P. I. No. 58030.

58409. *CERATODAMIA MEXICANA* Brongn. *Cycadaceæ*.

A handsome cycad from southeastern Mexico, with a short, thick, ovoid trunk, which is crowned with a whorl of rich dark-green pinnate leaves several feet in length. An excellent decorative plant, which is best grown in sandy loam.

58410 to 58412. *MIMOSA* spp. *Mimosaceæ*.

These are fine ornamental species growing in very sandy soil. (Purpus.)

58410. *MIMOSA SOMNIANS* Humb. & Bonpl.

A tropical American mimosa, usually herbaceous but often somewhat shrubby, armed with a few short spines and having white or pinkish flowers.

58411. *MIMOSA ASPERATA* L.
No. 6.

58412. *MIMOSA* sp.
No. 10.

58413 to 58424.

From Ladakh, Kashmir, India. Seeds collected by H. T. Cowling at the request of H. V. Harlan, Bureau of Plant Industry. Received December 7, 1923. Notes by Mr. Cowling.

58413. *BRASSICA* sp. *Brassicaceæ*.

(No. 4.) A plant from which the Ladakh natives obtain an oil; collected at 15,000 feet altitude.

58414. *ERUCA SATIVA* Hill. *Brassicaceæ*.
Roquette.
(No. 7.)

For previous introduction see S. P. I. No. 46501.

58415. *HORDEUM VULGARE PALLIDUM* Seringe. *Poaceæ*.
Six-rowed barley.

(No. 2.) Tibetan barley from an altitude of 10,000 to 13,500 feet.

58416 to 58418. *HORDEUM VULGARE COELESTE* L. *Poaceæ*.
Naked barley.

58416. (No. 12.) From Himsa Kharbu.

58417. (No. 1.) Collected at an altitude of 14,000 feet.

58418. (No. 13.) From Jhirla.

58419. *LATHYRUS SATIVUS* L. *Fabaceæ*.
Bitter vetch.

(No. 3.) Collected at an altitude of 11,000 to 13,000 feet.

58420 and 58421. *MEDICAGO SATIVA* L. *Fabaceæ*.
Alfalfa.

58420. (No. 5.) Collected at an altitude of 11,500 to 15,000 feet.

58413 to 58424—Continued.

58421. (No. 3.) A type raised in Ladakh for sheep and horses.

58422. *PISUM SATIVUM* L. *Fabaceæ*. *Pea*.
(No. 9.) Collected at an altitude of 11,500 to 13,000 feet.

58423. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.) *Poaceæ*.
Common wheat.

(No. 10.) Collected at an altitude of 11,500 to 14,000 feet.

58424. *VICIA FABA* L. *Fabaceæ*. *Broad bean*.
(No. 6.) Collected at an altitude of 11,500 to 13,000 feet.

58425 to 58427.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received December 12, 1923. Notes by Mr. Rock.

58425. *MECONOPSIS DELAVAYI* Franch. *Papaveraceæ*.

(No. 9377. September, 1923.) This is one of the prettiest blue poppies of the Likang Snow Range, where it grows in moist meadows and on gravelly slopes at altitudes of 11,000 to 12,500 feet, usually in small groups of 20 or more. The plants are 6 to 10 inches in height, with large drooping purplish indigo-blue flowers.

58426. *PRIMULA DRYADIFOLIA* Franch. *Primulaceæ*.

(No. 9362. September, 1923.) A very handsome, rather uncommon primrose which forms cushions in moist rocky places on the eastern slopes of the Likang Snow Range at an altitude of 15,000 feet. The plant is only 4 or 5 inches high, with spatulate leaves, golden below, and large rich-crimson purple-tinged flowers, which appear from June to August.

58427. *TROLLIUS* sp. *Ranunculaceæ*.

(No. 9651. September, 1923.) A very showy plant about 2 feet high which grows in moist alpine meadows on the eastern slopes of the Likang Snow Range at altitudes of about 12,000 feet, also on Haba Shan, north of the Yangtze bend. The leaves are basal, and each plant bears about 10 large deep golden-yellow flowers 2 inches or more in width.

58428 to 58431.

From Asnieres, Seine, France. Seeds presented by René Bourgeois. Received December 29, 1923.

58428. *PEUCEDANUM OSTRUTHIUM* (L.) Koch. *Apiaceæ*.

A perennial herb native to the French Alps. The acid aromatic root is utilized for the preparation of some kinds of Swiss cheese. (Adapted from Mueller, *Select Extra-Tropical Plants*, p. 366.)

For previous introduction see S. P. I. No. 52860.

58429 and 58430. *PHASEOLUS VULGARIS* L. *Fabaceæ*.
Common bean.

These are considered by Mr. Bourgeois to be the best stringless beans in France.

58429. Var. *Phoenix*. 58430. Var. *Progres*.

58431. *RUMEX ALPINUS* L. *Polygonaceæ*. *Sorrel*.

The leaves are eaten like spinach, according to Mr. Bourgeois, and an infusion of the roots is used as a cough remedy.

58432 to 58434. *MUSA* spp. *Musaceæ*.
Banana.

From Honolulu, Hawaii. Shoots presented by Willis T. Pope, horticulturist, Hawaii Agricultural Experiment Station. Received December 28, 1923.

58432 to 58434—Continued.

58432. *MUSA FEHI* Bert.

Fehi banana.

Fehi. An upright-fruiting Hawaiian variety with red fruits. The young shoots are very long and slender. (Pope.)

For previous introduction see S. P. I. No. 54673.

58433 and 58434. *MUSA PARADISIACA SAPIENTUM* (L.) Kuntze.

58433. *Lady's-Finger*. The Hawaii Experiment Station obtained its first offshoot of the Lady's-Finger variety March 21, 1912, from E. W. Rowell, since deceased, who lived on Vineyard Street, Honolulu. The station records give no information as to where the original plants in Hawaii came from. The plant is well known in Costa Rica, Jamaica, and British and French Guiana.

The Lady's-Finger banana is generally described as a variety of superior flavor, but on account of tenderness is a poor shipper. W. Fawcett in a recent publication, "The Banana," says that in British Guiana, where there has been great loss, ranging from 25 to 75 per cent of the Jamaica variety (Blue-fields), from the fungus disease known as "Panama disease," the Lady's-Finger has not been attacked.

Plant: At maturity of fruit the plant is about 20 feet tall, trunk rather slim; withstands considerable wind, indicating good root system. With good culture, offshoots are fairly abundant; outer trunk sheaths appear dark with reddish brown streaks. Foliage: Dark green, leaf petioles greenish with edges tinged light yellow; blade averages about 7 feet in length, 14 inches wide, dark green above, dull green below. Flowers: Terminal spike on long stout flower stalk, which begins to turn downward on emerging from the trunk; spathe greenish, bracts which cover undeveloped flower hands purplish and with frosted bloom outside, reddish brown inside; floral parts pale yellow with calyx split at margin into four or five parts which are bright yellow and curved outward. Fruits: Bunch long, slim, very compact. Average weight of Hawaiian-grown specimens 36 pounds, 10 to 12 hands; number of bananas to the hand vary from 13 to 20 from extreme to base; number of bananas to the bunch, usually over 200. Individual bananas 4 to 5 inches long, spindle shaped, apex beaked, attached end of stem three-fourths to 1 inch long, skin light yellow, thin, tender; pulp, yellow, melting, of good subacid flavor, placenta of 3-celled ovary very rudimentary. (Pope.)

58434. *Popoulu*. A well-known variety of cooking banana, common in the Honolulu markets. The plant is of medium height. The stem is green with a slight tendency to pinkish tints on the petioles. The scape is rather slender; the bunch itself is of medium size. There are 8 to 10 fruits per hand. The fruits are short, thick, rounded, and blunt at the ends. This banana is of good quality when cooked; the flesh is firm and sweet. Other members of the Popoulu group are: *Kaio*, *Hua moa*, *Moa*, *Nou*, and *Lahi*. (*Plant World*, vol. 21, p. 6.)

58435 to 58441.

From Tientsin, China. Seeds presented by J. C. Huston, American consul in charge. Received November 28, 1923. Notes by Mr. Huston.

58435. *GOSSYPIMUM* sp. *Malvaceae*. Cotton.

White cotton from Chihhsien, which is sown the latter part of April and ripens the latter part of October. The average yield per mow (about one-sixth of an acre) is 100 catties (approximately 800 pounds per acre).

58435 to 58441—Continued.

58436. *MEDICAGO SATIVA* L. *Fabaceae*. Alfalfa.

From Tientsin, where it is sown early in July. It matures the following June. The average yield per mow is 2,000 catties (approximately 7 long tons per acre).

58437. *NICOTIANA TABACUM* L. *Solanaceae*. Tobacco.

From Shaho. Planted the first part of April, transplanted and harvested late in September. The average yield per mow is 100 catties.

58438. *ORYZA SATIVA* L. *Poaceae*. Rice.

Large, white-bearded water rice, from Tientsin. This variety is sown the latter part of March and harvested the latter part of September. The average yield per mow is 2 piculs (approximately 1,600 pounds per acre).

58439. *SOJA MAX* (L.) Piper. (*Glycine hispida* Maxim.) *Fabaceae*. Soy bean.

Large black beans from Chinghaihsien; sown the latter part of April and harvested the first part of September. The average yield per mow is 1 picul (approximately 800 pounds per acre).

58440. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.) *Poaceae*. Common wheat.

From Feihsiang; sown late in September and harvested the following June. The average yield per mow is 1 picul (approximately 800 pounds per acre).

58441. *ZEA MAYS* L. *Poaceae*. Corn.

Yellow corn from Peking; sown the latter part of April and harvested the latter part of August. The average yield per mow is 1½ piculs (approximately 1,200 pounds per acre).

58442 and 58443. *GOSSYPIMUM* spp. *Malvaceae*.

From South America. Seeds presented by E. L. Prizer, Bureau of Plant Industry. Received December 5, 1923.

Collected in Para, Brazil, October 31, 1923. (Prizer.)

Introduced for cotton specialists.

58442. *GOSSYPIMUM* sp. Cotton.58443. *GOSSYPIMUM* sp. Kidney cotton.58444. *PERSEA AMERICANA* Mill. (*P. gratissima* Gaertn. f.) *Lauraceae*. Avocado.

Growing at the Plant Introduction Garden, Miami, Fla. Numbered December, 1923.

Alfred A. Winslow, consul general at Guatemala City, sent to this office in 1904 an avocado seed which was planted at the Miami Plant Introduction Garden [S. P. I. No. 10978]. It grew into a tree which bore its first fruits in 1911. A few fruits from the first crop were sent to P. H. Rolfs at Gainesville, Fla., with the suggestion that he save the seeds. This was done, and two seedlings were inarched on old trees at Buena Vista, near Miami, where Professor Rolfs owned property at that time. One of these two fruited in 1917 and was called Winslowson by Mr. Simmonds, superintendent of the Miami garden, and young trees of the variety were soon in the hands of nurserymen.

In all probability the variety is a cross between the Guatemalan and West Indian races. The seed parent, Winslow, is a typical Guatemalan, round, small, and having a very hard shell, rough on the exterior. The pollen parent was probably one of the West Indian varieties cultivated at the Miami garden. Winslowson ripens earlier in southern Florida than most of the true Guatemalans, November being its season, though the fruits may hang on the tree as late as January. It is a productive sort and a sturdy grower. The fruit is large, attractive, and of very satisfactory quality.

58445. SANDORICUM KOETJAPE (Burm. f.) Merr. (*S. indicum* Cav.). *Meliaceae*. **Santól.**

From Dominica, British West Indies. Seeds presented by Joseph Jones, Botanic Garden. Received December 22, 1923.

The santól is a Philippine tree which becomes 80 feet tall in its native country, with trifoliate, hairy leaves and greenish yellow or straw-colored flowers. The chief value of the tree resides in its yellowish fruit, which is rounded or flattened, about 2 inches in diameter, with rather large seeds inclosed in translucent, acid, edible pulp of good flavor. When peeled, quartered, and cooked in sirup the fruits make a delicious preserve. (Adapted from *Brown, Wild Food Plants of the Philippines*, p. 88.)

This tree is not suited for cultivation in the United States except perhaps in the warmest parts of Florida. It is of interest for trial in Porto Rico, the Canal Zone, and Hawaii. Its fruit is not rated very high among those which are eaten in the Asiatic Tropics.

58446 to 58454. MUSA PARADISIACA SAPIENTUM (L.) Kuntze. *Musaceae*. **Banana.**

From Honolulu, Hawaii. Shoots presented by Willis T. Pope, horticulturist, Hawaii Agricultural Experiment Station. Received December 22, 1923.

58446. The *Bluefields*, also known as the *Jamaica*, is one of the most important banana varieties from a commercial standpoint. It is the chief banana of the American trade. The plants are large, and the fruits are of fine appearance, of fair flavor, and well placed on the bunch for convenient handling. It is excellent for shipping. (Adapted from *Bulletin 7 of the Hawaii Agricultural Experiment Station*, p. 42.)

58447. The *Brazilian*, as it is known locally, is considered by some authorities as the finest variety in the Hawaiian Islands for eating raw. It was introduced into Hawaii from Tahiti about 1855 and probably is the same as the variety known in Java as *Pisang rajah* or *Pisang medji*, the "dessert banana" of Java. The plant is a vigorous grower, 25 to 35 feet high, roots firmly and withstands winds, ratsoons

58446 to 58454—Continued.

freely, and serves as a windbreak for more delicate varieties. The flower end of the fruit is drawn out into a kind of beak. The skin is yellow, easily separating from the fruit. The variety is not satisfactory for shipping because the fruit falls from the bunch. (Adapted from *Bulletin 7 of the Hawaii Agricultural Experiment Station*, p. 45.)

58448. Chamaluco. The plant is from 10 to 15 feet in height, with medium-sized leaves, and when grown in fertile soil the bunches of fruit are rather large. There are two types, one with green and the other with gray fruits. The greater part of these fruits are eaten cooked at the time when other varieties are ripe. (Adapted from *Bulletin 25, Departamento de Agricultura y Trabajo, Porto Rico*, p. 19.)

For previous introduction see S. P. I. No. 55246.

58449. Chinese. A variety introduced from Tahiti into the Hawaiian Islands about 1855. The plant is of very low growth, the fruit of good flavor, and the bunch of large size. It is an excellent variety for shipping, but will not stand as rough handling as the *Jamaica*. (Adapted from *Bulletin 7 of the Hawaii Agricultural Experiment Station*, p. 44.)

58450. Ice Cream.

For previous introduction see S. P. I. No. 55247.

58451. Largo. Introduced into Hawaii from Mexico. The plant is of medium height and the fruits, borne in long-stemmed bunches, have buttery pink flesh of fair flavor. (*J. E. Higgins, Bulletin 7, Hawaii Agricultural Experiment Station*.)

For previous introduction see S. P. I. No. 55250.

58452. Platano.

58453. Porto Rico.

For previous introduction see S. P. I. No. 55251.

58454. Red Cuban. This is the proper name of the largest sized variety of the various red bananas—large both as to plant and fruit. A well-grown bunch has 8 to 10 hands and individual fingers from 2 to 2½ inches in diameter. This is the red banana of commerce. (*Goldsmith H. Williams, Crescent City, Fla.*)

For previous introduction see S. P. I. No. 55252.

UNITED STATES DEPARTMENT OF AGRICULTURE

INVENTORY No. 78

Washington, D. C.

Issued November, 1926

SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN PLANT INTRODUCTION, BUREAU OF PLANT INDUSTRY, DURING THE PERIOD FROM JANUARY 1 TO MARCH 31, 1924 (S. P. I. NOS. 58455 TO 58930)

CONTENTS

	Page
Introductory statement.....	1
Inventory.....	5
Index of common and scientific names.....	32

INTRODUCTORY STATEMENT

IT IS ALWAYS a difficult matter to select from the large quantity of plant material listed in one of these inventories the introductions which claim special attention. A glance at the general character of the material introduced and the sources from which it has been obtained, however, may assist experimenters to form a clearer idea of the department's plant-introduction activities than will be obtained from a perusal of the vast amount of detailed information which must necessarily accompany a record of this sort.

The plants listed in this, the seventy-eighth Inventory of Seeds and Plants Imported, have been obtained through the two usual channels of plant introduction—the agricultural explorers of the bureau and correspondents abroad.

Few agricultural explorations of recent years have penetrated into such remote regions and have brought to light more promising material than that headed by H. V. Harlan, of the Office of Cereal Investigations, Bureau of Plant Industry. In the present inventory are listed a number of his Abyssinian introductions, obtained at the commencement of his stay in that country. Though Doctor Harlan's principal object was to collect rare types of barley for use in breeding work, his shipments include many other crop plants, such as teff (*Eragrostis abyssinica*, No. 58736), sorghum, wheat, cotton, beans, peas, and flax.

Joseph F. Rock, whose explorations in Yunnan, China, were commenced under the auspices of this office, but later transferred to the National Geographic Society, has continued to send in promising ornamental trees, shrubs, and herbaceous perennials from a region where climatic conditions much resemble those of the northern Pacific coast region of the United States. Among Mr. Rock's introductions which are listed in the present inventory are species of *Abies*, *Picea*, *Tsuga*, and other coniferous trees; rhododendrons, cotoneasters, and other ornamental shrubs; and such herbaceous plants as *Primula* and *Lilium*. Concerning one of the hemlocks (*Tsuga* sp., No. 58510) which he found on the Likiang Snow Range, northern Yunnan, at 10,000 feet altitude, he writes that the tree becomes 80 feet or more high, with a trunk 5 feet in diameter, and he considers it to be the finest of all the species of *Tsuga*.

The department's correspondents abroad, with their customary generosity, have contributed many promising lots of material. R. C. Ching, a young Chinese botanist, who accompanied a recent scientific expedition into Kansu Province, northwestern China, has sent a large collection of rare plants from that

region (Nos. 58518 to 58548). These include wild species of *Pyrus*, *Malus*, and *Prunus*, possibly valuable as stock plants on which to graft some of the cultivated varieties; also cotoneasters, species of *Elaeagnus*, *Berberis*, *Euonymus*, and other ornamental shrubs; and local strains of wheat and barley.

Vicary Gibbs, whose fame as an amateur exhibitor of rare plants is well known throughout the British Isles, has sent from his Aldenham House Gardens 21 species of ornamental shrubs (Nos. 58603 to 58623), many of them sufficiently hardy, in all probability, to permit their cultivation over wide areas in the United States. From the Royal Botanic Gardens, Kew, has come a collection of wild relatives of the onion, for the use of department plant breeders (*Allium* spp., Nos. 58868 to 58886); a similar collection (*Allium* spp., Nos. 58675 to 58691) was presented by the director of the botanic garden at Nancy, France. Prof. D. Bois, of Paris, has forwarded a large collection of leguminous plants and grasses, also for the use of department specialists (Nos. 58692 to 58718). G. H. Cave, curator of the Lloyd Botanic Garden at Darjiling, India, has again contributed seeds of numerous ornamental trees and shrubs of the Himalayan region (Nos. 58901 to 58930).

The Barouni olive (*Olea europaea*) has been reintroduced as No. 58661. Because of its large size and excellent quality for ripe pickling, this variety is meeting with favor among the olive growers of California. It deserves further consideration by commercial growers and also by plant breeders.

The ravages of chestnut blight in the eastern and southern United States and the need of finding a resistant species to replace the rapidly disappearing American chestnut have led to the introduction of numerous strains of the Chinese hairy chestnut, *Castanea mollissima* (Nos. 58602, 58659, 58719 to 58724).

Several new varieties of fig (*Ficus carica*, Nos. 58663 to 58668) have been introduced to enlarge the collection in California, where much attention has been given in past years to procuring the world's best varieties. In connection with the department's plan to test species and varieties of rubber-yielding plants for the purpose of ascertaining if any are suited for commercial cultivation in the southernmost parts of this country and in the American Tropics, *Ecdysanthera utilis* (No. 58496) has been obtained through the courtesy of the director of forestry of the island of Taiwan, and several species of *Landolphia* (*L. ovariensis*, No. 58517, *L. droogmansiana*, No. 58591, and *L. kirkii delagoensis*, No. 58899) have been obtained from Africa, the first two contributed by Frère Gillet, of Kisantu, Belgian Congo, and the last named from I. B. Pole Evans, chief of the division of botany at Pretoria, Transvaal. From New South Wales has been sent the so-called wild plum (*Sideroxylon australe*, No. 58478), which bears fruits containing rich, milky juice which may be a possible source of rubber.

Several valuable strains of wheat have been obtained for the use of American plant breeders, notably Doctor Akerman's varieties from Svalof, Sweden (*Triticum aestivum*, Nos. 58564 to 58567) and Professor Stapledon's collection (*T. aestivum*, Nos. 58559 to 58563) from Aberystwyth, Wales.

Crotalaria anagyroides (No. 58466), sent from the general experiment station at Buitenzorg, Java, should be tried in Florida and other Southern States for green manure. Its leafiness makes it especially desirable, and it is probably harder than some of the other *Crotalaria*s.

Paspalum notatum (No. 58644), a Brazilian forage grass, has been previously introduced under Nos. 37996, 51121, 51262, and 54904. It is proving valuable for pasturage in the South and, on account of its hardiness and sod-forming qualities, should receive increased attention.

The department's efforts to increase the cultivation of the true yams (*Dioscorea* spp.) in the Gulf States are yielding good results. In order to have the best varieties available, numerous introductions have been made in the past. Two varieties (*D. cayensis*, No. 58625, and *D. rotundata*, No. 58626) from Porto Rico have been reintroduced and are listed in this inventory.

Citrus growers in Florida and California will be glad to try Sir Percy Fitzpatrick's new grapefruit, the Cecily (*Citrus grandis*, No. 58457), a practically seedless variety which originated in South Africa as a sport from Walters, the well-known American variety. A tree of *C. ichangensis*, established at New Orleans from an early introduction, is serving as a source of propagating material for the use of plant breeders who are attempting to develop harder varieties of citrus fruits, since this is considered one of the hardiest species of *Citrus* known. Seeds from this tree have now been obtained (No. 58480) for further use by citrus breeders.

A Mexican relative of the iris (*Tigridia pavonia*, No. 58573) presented by Mrs. Zelia Nuttall, of Coyoacan, should appeal to those who care for delicate flowers; although the latter are somewhat short lived, in mass planting the effect of successive flowering is very striking.

Special attention should be directed to *Populus maximowiczii* (No. 58483), a hardy and stately tree from Manchuria, which is proving of great value in the colder and drier areas of the United States where poplars are particularly desirable. The distinctive rugose character of its foliage, which appears more than a week before that of other trees, makes it unique among poplars. Budwood has been presented by A. D. Woeikoff, director of the experiment farm at Echo, Manchuria.

The botanical determinations of introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., February 19, 1926.

INVENTORY ¹

58455. JUGLANS REGIA L. Juglanda- ceæ. Walnut.

From Spain. Seeds presented by Howard Spence, The Red House, Ainsdale, Southport, England. Received January 18, 1924.

These walnuts are from Huelva, Spain, and are supposed to represent the best quality of that region. (Spence.)

58456. MANGIFERA INDICA L. Ana- cardiaceæ. Mango.

From Nueva Gerona, Isle of Pines, West Indies. Budwood presented by W. H. Snider. Received February 14, 1924.

Bacas. The fruits of this variety weigh about a pound, and the skin is dark, with a lighter cheek, tough and free from blemishes. The flesh is firm, free from fiber, and of rich, pleasing flavor. The seed is of medium size and flat. The tree is not an unusually heavy bearer. (Snider.)

Introduced for trial in the warmest parts of the United States.

58457. CITRUS GRANDIS (L.) Osbeck. Rutaceæ.

From Amanzi, Uitenhage, Cape of Good Hope. Plants presented by Alan Fitzpatrick, Amanzi, at the request of Sir Percy Fitzpatrick, London, England. Received February 12, 1924.

Cecily. This variety originated at Amanzi, as a sport or mutation from the Walters grapefruit. The latter originated in Florida, where it was formerly one of the principal commercial sorts.

Sir Percy in his letter of December 20, 1923, describes this mutant as differing from its parent in being "practically devoid of seeds." If it retains this characteristic in the United States, it will be of much interest to test it alongside our own seedless variety, the Marsh. The transplantation of the Walters grapefruit to South Africa, the development there of a form superior in being nearly seedless, and its return to the United States in this improved condition forms an interesting tale. In

regard to a name for this mutant, Sir Percy writes: "Among ourselves we call it 'Cecily,' after my daughter who had the good fortune to discover it."

58458. TRIFOLIUM PRATENSE L. Fa- baceæ. Red clover.

From Lausanne, Switzerland. Seeds purchased from G. Martinet, chef, Établissement Fédéral d'Essais et de Contrôle de Semences. Received March 12, 1924.

(No. 1171. A good Mont-Calme selection, derived from a perpetual Berne clover from Ruti (Mattenklee). (Martinet.)

58459 and 58460.

From Port of Spain, Trinidad, British West Indies. Seeds presented by W. G. Freeman, director of agriculture. Received January 28, 1924.

58459. BARRINGTONIA ASIATICA (L.) Kurz. Lecy- thidaceæ.

A large, handsome East Indian tree with thick, leathery, shining bright-green leaves and very conspicuous flowers with four white petals and numerous crimson-tipped stamens, resembling a brush. The fruit is large and is the shape of a 4-sided pyramid; it is smooth on the outside and contains one seed. The tree forms extensive forests along the shores of some of the Pacific islands. In the Moluccas an illuminating oil is extracted from the seeds, and the dry fruits are gathered by the natives and used as floats for their fish nets. (Adapted from Rock, *The Ornamental Trees of Hawaii*, p. 663.)

For previous introduction, see S. P. I. No. 54963.

58460. COLVILLEA RACEMOSA Boj. Cæsalpini- aceæ.

A leguminous tree 40 or 50 feet high, native to Mauritius and Madagascar, with the general aspect of *Poinciana regia* but with a thicker trunk, reddish gray bark, and more ample foliage. In early spring it bears large, erect racemes of bright-scarlet flowers which make the tree a very showy ornamental.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or related genera. The responsibility for the specific identifications, therefore, must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

58461. AMARANTHUS GANGETICUS L.
Amaranthaceae.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received February 13, 1924.

With its multicolored tops, ranging from pale yellow to dark red in various shades, this variety, known here as haum, is one of the most gorgeous ornamental plants I have ever seen. It is rare in Manila, but it is common in Cebu, where the tender leaves are eaten like spinach. It ought to do well in Florida and possibly in southern California. (Wester.)

For previous introduction, see S. P. I. No. 53896.

58462. RHUS CORIARIA L. Anacardiaceae.

From Palermo, Italy. Seeds presented through Edward I. Nathan, American consul. Received March 22, 1923. Numbered January, 1924.

Immense groves of this species are cultivated in Sicily for the purpose of extracting tannin from the leaves. The product is light and free from discolorations and therefore commands a high price in the world's markets. Large quantities of sumac extract are imported annually into the United States, since it is difficult to obtain from American sumacs extracts which are as clear and as light colored as the Sicilian product. The establishment of commercial plantings of *Rhus coriaria* in this country seems worthy of serious consideration.

58463. BERBERIS REPLICATA W. W. Smith. Berberidaceae. **Barberry.**

From Wisley, Ripley, Surrey, England. Plants presented by Fred J. Chittenden, director, Royal Horticultural Society Gardens. Received February 16, 1924.

An evergreen barberry originally collected by George Forrest in thickets on the Shweli-Salwin Divide, southwestern China, at an altitude of 11,000 feet. The rather small leaves have recurved margins and are gray beneath. It is an early and profusely flowering species, bearing its blossoms all along the branches in a very attractive fashion, and the deep-crimson berries make it handsome in the fruiting stage. It appears to be quite hardy in England. (Adapted from *The Garden*, vol. 87, p. 186.)

58464. MALUS SYLVESTRIS Mill. (*Pyrus malus* L.). Malaceae. **Apple.**

From Simla Hills, Punjab, India. Scions presented by S. E. Stokes. Received February 16, 1924.

A russet apple of good size and excellent flavor, greatly appreciated in Simla by the English. The tree, which is a strong grower and heavy cropper, ripens its fruit in October, and we have often been able to keep it until April or May. While in storage the fruit turns to a golden yellow. At the altitude of 7,000 feet in Kotgarh, where this tree grows, many other temperate crops are also grown, such as potatoes, corn, and barley, and such fruits as cherries, plums, and apricots. (Stokes.)

58465. DIOSPYROS DECANDRA Lour. Diospyraceae.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received February 13, 1924.

A wild persimmon from Cochin China, whose yellow, edible, sweet fruits, about an inch in diameter, are sold in the native markets of the small towns. The tree is large, with spreading branches, and produces excellent heavy timber, which is white marked with black veins; the heartwood is sometimes black.

58466. CROTALARIA ANAGYROIDES H. B. K. Fabaceae.

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, director, general experiment station, Department of Agriculture, at the request of Charles L. Hoover, American consul, Batavia, Java. Received February 14, 1924.

The crotalarias are tropical leguminous plants, of value for cover crops and green manure, for which purposes they are used in the same manner as cowpeas and velvet beans. Doctor Cramer, in his letter of transmittal, writes that *Crotalaria anagyroides* has proved more desirable than other species in Java, mainly because it produces a larger amount of foliage and the plants remain erect. He says: "It is especially satisfactory at high altitudes and is in such great demand for the tea plantations in the higher mountains that we have to limit our seed distributions to small quantities."

Though cultivated in Java, this species is not native to that part of the world. It is widely distributed in tropical America, where it occurs, according to Grisebach (*Flora of the West Indies*), from Mexico to Peru, and in the West Indies. The same authority states that it is somewhat shrubby in character, with erect puberulous stems and leaves composed of three ovate-lanceolate leaflets.

58467. SPATHODEA NILOTICA Seem. Bignoniaceae.

From Entebbe, Uganda. Seeds presented by the chief forestry officer, forestry department. Received February 14, 1924.

Spathodea campanulata is proving to be an ornamental tree of unusual value for southern Florida. For this reason the arrival of another member of this genus is a matter of considerable interest. *S. nilotica*, which is native in the upper Nile Valley and the Belgian Congo, is a bushy tree reaching about 20 feet in height. The leaves, which are opposite and composed of 9 to 15 leathery leaflets, are covered beneath with dense, short hairs. The scarlet flowers, produced in short, compact terminal clusters, are said to resemble closely those of *S. campanulata*, which means that they are strikingly beautiful. The behavior of this tree in southern Florida will be watched with interest.

For previous introduction, see S. P. I. No. 47502.

58468 to 58470.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received February 18, 1924. Notes by Mr. Rock.

58468. ABIES FORRESTII Craib. Pinaceae. **Fir.**

(No. 10673. December, 1923.) A handsome tree 70 to 80 feet in height with a trunk 2 feet or more in diameter, common on moist mountain meadows and steep limestone slopes of the Likiang Snow Range at altitudes ranging from 10,000 to 13,500 feet. The needles are white beneath, and the cones are purplish blue to black.

58469. ABIES sp. Pinaceae. **Fir.**

(No. 10887. December, 1923.) A tree 60 to 80 feet high with a trunk 2 to 3 feet in diameter, found along meadows below Ladsakodjo, on the eastern slopes of the Likiang Snow Range, at an altitude of about 13,000 feet. The needles are silvery beneath, the large, ovoid cones are bluish black, and the scales have a central pointed spur which is absent in *Abies forrestii*.

58470. PICEA sp. Pinaceae. **Spruce.**

(No. 10888. December, 1923.) A tree 60 to 80 feet with long drooping branches, found back of Nguluke, growing wild around the village temple, at an altitude of 9,600 feet in the Likiang Snow Range. The needles are short, the cones are larger, and the scales broader than No. 10890 [S. P. I. No. 58498].

58471. SOLANUM DEMISSUM × TUBEROSUM. Solanaceæ.

From Wolverhampton, England. Tubers presented by F. W. Keay, Wolverhampton, through William Stuart, Bureau of Plant Industry. Received February 2, 1924.

A cross between *Solanum demissum* and the Paterson's Victoria variety of the potato.

For use in potato-breeding experiments.

58472. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Valence, Rhone, France. Seeds purchased from Tézier Frères. Received March 12, 1924.

Locally grown clover from Nîmes, Gard. Introduced for testing by clover specialists.

58473. VIBURNUM HANCEANUM Maxim. Caprifoliaceæ.

From Ottawa, Canada. Seeds presented by J. Adams, botanist, Central Experimental Farm, Department of Agriculture. Received February 18, 1924.

A hardy, bushy, deciduous shrub from southeastern China, where it becomes 6 to 10 feet in height. The branches are mostly horizontal, and the roundish, slightly toothed, sharp-pointed leaves are dull dark green above and pale grayish beneath. The inflorescence consists of a flat umbel 2 to 4 inches across; the center is filled with small, perfect, inconspicuous flowers, surrounded by a few large white imperfect flowers about an inch wide. The roundish egg-shaped fruits are at first coral red and finally blue-black.

Introduced for horticulturists engaged in small-fruit breeding.

58474. AMYGDALUS COMMUNIS × PER-SICA. Amygdalaceæ.**Peach-almond hybrid.**

From Benenden, Kent, England. Budwood presented by Collingwood Ingram. Received February 20, 1924.

This "peach-almond" hybrid is very vigorous. The original scion came from Quinta de Seixo in the upper Douro District, Portugal. The fruit appears to be intermediate in characters between the peach and the almond. (Ingram.)

58475. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Wellington, New Zealand. Seeds presented by A. L. Cockayne, director of the fields division, Department of Agriculture. Received February 20, 1924.

"*Runciman's* red clover. This has been thoroughly tested and may be regarded as the only true perennial strain of red clover in New Zealand." (New Zealand Journal of Agriculture, vol. 22, p. 290.)

Introduced for testing by clover specialists.

58476 and 58477. TRIFOLIUM PRATENSE L. Fabaceæ. Red clover.

From Copenhagen, Denmark. Seeds purchased from L. R. M. Larsen, Danish Royal Agricultural Society. Received February 23, 1924.

Both of these are Danish strains which in this country have given considerably greater yields than foreign seeds. (Larsen.)

Introduced for agronomists engaged in clover breeding.

58476. *Tystofte* No. 40, an early strain.

58477. *Hersnap*, a late strain.

58478. SIDEROXYLON AUSTRALE (R. Br.) Benth. and Hook. Sapotaceæ.

From Sydney, New South Wales. Seeds presented by J. H. Maiden, director, botanic gardens. Received February 12, 1924.

A tree, sometimes becoming of considerable size, from southeastern Australia, where it is called "wild plum" or "black apple" because of the fruit. The latter is the size of a small apple; the rich, milky juice resembles cream in taste, but the flesh is coarse and insipid. The pale-yellow wood is close grained, handsomely veined, and suitable for cabinetwork, although it requires careful seasoning. This species is now introduced for testing the sap as a possible source of rubber.

For previous introduction, see S. P. I. No. 44072.

58479. COLOCASIA ESCULENTA (L.) Schott. Araceæ. Taro.

From Canton, China. Tubers presented by F. A. McClure, Canton Christian College. Received May 22, 1922. Numbered January, 1924.

Pan Long Oo. Introduced for cultural and comparison tests.

58480. CITRUS ICHANGENSIS Swingle. Rutaceæ.

From New Orleans, La. Seeds presented by E. Foster. Received February 19, 1924.

These seeds are from a tree sent to New Orleans from the Arnold Arboretum, Jamaica Plain, Mass. The trees at the arboretum were raised from seeds collected in China several years ago from trees which appeared to show unusual frost resistance. The general character of the fruit is much like the bitter Seville orange used in the manufacture of Scotch marmalade, being very rough, with a thick, reddish skin. It is not very juicy, and the seeds are large. The species, because of its unusual hardness, will be useful for breeding purposes. (Foster.)

A spiny shrub or small tree, 5 to 15 feet high, native to central and southwestern China. It differs from other members of the genus chiefly in its very large, thick seeds and its slender leaves, which are four to six times longer than broad. It is also one of the hardiest species of Citrus known.

58481. ATLANTHUS VILMORINIANA Dode. Simaroubaceæ.

From Paris, France. Plant purchased from Vil-morin-Andrieux & Co. Received February 26, 1924.

Although this species is closely related to the tree of heaven (*A. altissima*), well known in many parts of the United States, it is distinguished by the numerous soft spines on the young branchlets and by the very downy leaflets. The main leaf-stalk is often rich red and occasionally spiny like the leaflets. The inflorescence is sometimes a foot or more across, and the samara, or key, is 2 inches long. The tree is native to Szechwan, western China.

58482. RUMEX ABYSSINICUS Jacq. Polygonaceæ.

From Java. Seeds presented by W. A. Orton, Bureau of Plant Industry. Received February 23, 1924.

As a source of greens during the hot summer months, the Abyssinian Rumex appears to have merit. Seeds may be sown in the greenhouse or hotbed in early spring and the plants set out as soon as the soil can be worked. The plants grow 7 or 8 feet in height and continue to yield greens until cut down by frost in late autumn. The leaves are cooked and served in the same manner as spinach, but care must be taken to change the water, in cooking, to eliminate excessive acidity.

For previous introduction, see S. P. I. No. 56486.

58483 to 58487.

From Echo, Kirin Province, Manchuria. Bud-wood presented by A. D. Woeikoff, director, experimental farm. Received March 3, 1924.

58483. *POPULUS MAXIMOWICZII* A. Henry. Salicaceae. Poplar.

A handsome, stately, Manchurian poplar, which is said to reach enormous size in its native country. According to John Dunbar, assistant superintendent, department of parks, Rochester, N. Y., it thrives on dry gravelly soil, where Norway spruce and white ash fail to survive, and is one of the few large deciduous exotic trees which can be recommended for general planting in the Northern States. It is a rapid grower, increasing in height 3 to 5 feet a year for the first eight years, and has rugose leaves resembling those of *Rosa rugosa*. The foliage appears about 10 days before that of other trees, and in Manchuria it remains green throughout the summer.

For previous introduction, see S. P. I. No. 51877.

58484. *POPULUS SUAVEOLENS PRZEWALSKII* (Maxim.) C. Schneid. Salicaceae. Poplar.

This is a rather common tree in the towns and villages throughout northern China; it is easily distinguished by its close, compact habit. (Woeikoff.)

For hot, dry climates this poplar is said to be especially valuable; although it is comparatively slow growing, eventually it becomes a large tree and it also has distinct merit as an ornamental. The rather small, oval leaves are prominently whitened beneath.

58485 to 58487. *SALIX* spp. Salicaceae. Willow.

58485. *SALIX RORIDA* Lacksch.

This is a giant among willows. In the river valleys of Manchuria it reaches a height of 150 feet, with an enormous circumference. (Woeikoff.)

58486. *SALIX* sp.

A hybrid of *Salix rorida*. (Woeikoff.)

58487. *SALIX* sp.

A small willow up to 30 feet in height, growing on rocky slopes. (Woeikoff.)

58488 to 58495.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received February 1, 1924.

58488. *CORYLUS FEROX* Wall. Betulaceae. Hazel.

A wild hazel from Sikkim, India, whose small nuts, closely resembling the common hazelnut in taste, are much prized by the natives. The tree, 20 feet in height, grows at altitudes of 8,000 to 10,000 feet. The wood is pinkish white, even grained, and moderately hard.

For previous introduction, see S. P. I. No. 49626.

58489. *FRAGARIA DALTONIANA* J. Gay. Rosaceae. Himalayan strawberry.

A wild relative of the cultivated strawberries which comes from alpine pastures of the Sikkim Himalayas at altitudes of 10,000 to 15,000 feet. It is a stoloniferous perennial with solitary white flowers and bright-scarlet, insipid fruits an inch long and half as broad.

Introduced for testing by strawberry specialists.

For previous introduction, see S. P. I. No. 52679.

58490. *LILIUM THOMSONIANUM* (D. Don.) Lindl. (L. *roseum* Wall.). Liliaceae. Lily.

A lily of unusual appearance, suggesting in habit *Fritillaria*, *Ornithogalum*, and *Hosta*. The erect stem is a foot and a half high, and the nar-

58488 to 58495—Continued.

row, grasslike leaves are mostly crowded at the base of the stem. The pale mauve or rosy bell-shaped drooping flowers, with deep-purple anthers, are an inch and a half long and are in a terminal raceme containing 8 or 10 flowers. The species is native to mild-wintered regions of the Himalayas from western China to northern India.

58491. *MALUS SIKKIMENSIS* (Hook. f.) Koehne (*Pyrus sikkimensis* Hook. f.). Malaceae.

The Sikkim crab is a small tree, rather bushy in habit, which grows wild in the interior of Sikkim, India, at altitudes up to 10,000 feet. The narrowly oval leaves are very woolly beneath, and the white flowers, rosy in the bud, are about an inch across and are borne very freely in 4 to 8 flowered clusters. The pear-shaped fruits are dark red with paler dots and are about half an inch wide. This species is distinguished from the Siberian crab (*Malus baccata*) by its low, spreading habit, excessive development of spurs on the stems, the more woolly leaves, and the smaller fruits.

For previous introduction, see S. P. I. No. 52684.

58492. *PANAX PSEUDOGINSENG* Wall. (*Aralia pseudoginseng* Benth.). Araliaceae.

An herbaceous perennial from the subtropical mountainous regions of Nepal. The tuberlike rootstock is mucilaginous and slightly aromatic, and the erect, purplish stem bears three or four palmate radical leaves and a number of roughly hairy upper leaves. The small, white flowers, in umbellate heads, are followed by globose berries which are half black, half red, or entirely red. The above note is taken from Wallich, *Plantæ Asiaticæ Rariores*, vol. 2, p. 30.

For previous introduction, see S. P. I. No. 49644.

58493. *PRUNUS RUTA* Hook. f. Amygdalaceae.

A Himalayan wild cherry tree 15 to 20 feet high, with small pink flowers and red, ellipsoid, fleshy fruits.

Introduced for pomologists engaged in the breeding of stone fruits.

58494. *RIBES GRIFFITHII* Hook. f. and Thoms. Grossulariaceae.

A wild currant from the subtropical Himalayas, where it grows at altitudes of 10,000 to 13,000 feet, forming an erect shrub about 8 feet in height. The leaves are broadly heart-shaped and 5-lobed, and the red, sour berries are in long, pendent clusters about 9 inches in length.

Introduced for pomologists engaged in small-fruit breeding.

For previous introduction, see S. P. I. No. 49651.

58495. *RUBUS CALYCINUS* Wall. Rosaceae.

A wild raspberry from the temperate slopes of the Himalayas and of the Khasi Hills, India, where it grows as a creeping herbaceous perennial with kidney-shaped leaves and small scarlet fruits containing normally but a few drupelets.

Introduced for pomologists engaged in small-fruit breeding.

For previous introduction, see S. P. I. No. 41675.

58496. *ECDYSANTHERA UTILIS* Hay. and Kaw. Apocynaceae.

From Taihoku, Taiwan, Japan. Seeds presented by R. Kanehira, director, experimental station of forestry. Received March 19, 1924.

This plant, a climbing shrub of northern Taiwan, does not appear to be very well known outside of its native habitat. If its value may be judged by the results of an analysis made at the Imperial Institute, London, of a sample of rubber from that region, it would appear to be a promising acqui-

tion. Not only on account of its economic value is this true but also because the climatic conditions of Taiwan more closely resemble those of southern Florida than do those of the native countries of many other of the better known rubber plants now being assembled for experimental purposes at the Chapman Field Plant Introduction Garden in southern Florida.

Analyses of sample from Taiwan (per cent): Moisture, 1.3; caoutchouc, 85.3; resin, 5.0; proteid, 2.1; insoluble matter, 6.3. (*Alfred Keys, Bureau of Plant Industry.*)

58497. COFFEA LIBERICA Bull. Rubiaceæ.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, bureau of agriculture. Received March 19, 1924.

Introduced for horticulturists engaged in coffee-growing experiments.

For previous introduction, see S. P. I. No. 53460.

58498 to 58511.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received February 27, 1924. Notes by Mr. Rock.

58498. PICEA sp. Pinaceæ. Spruce.

(No. 10890. Mahaongputze. December, 1923.) A handsome tree 50 to 70 feet, sometimes taller, found in rich, black soil in moist meadowlands on the eastern and western slopes of the Likang Snow Range, at an altitude of 12,000 feet. This species is less graceful and not so slender as *Picea likiangensis*; it has brown, ovoid cones.

58499. ABIES sp. Pinaceæ. Fir.

(No. 10886. December, 1923.) A fine tree 60 feet or more in height, with a trunk 2 or 3 feet in diameter, which grows along stream beds on the eastern slopes of the Likang Snow Range at an altitude of about 11,000 feet. The needles are not silvery beneath, and the greenish white cones are erect.

58500. KETELEERIA sp. Pinaceæ.

(No. 10892. Sungkwe. December, 1923.) A pale-green tree 30 to 40 feet high, with stiff branches and large needles. The straw-colored cones are 10 to 20 centimeters (4 to 8 inches) long. This species grows in dry regions south of Likang at about 10,000 feet altitude.

58501. PICEA LIKIANGENSIS (Franch.) E. Pritz. Pinaceæ. Spruce.

(No. 10889. Zinako. December, 1923.) A tree 60 to 80 feet tall, with long, slender, drooping, very graceful branches and brown oblong cones, found in moist meadowland on the western slopes of the Likang Snow Range at 12,000 feet altitude. Above this altitude it is replaced by *Abies*, while *Tsuga* occurs lower down.

58502. PICEA sp. Pinaceæ. Spruce.

(No. 10888. December, 1923.) A tree 60 to 80 feet tall, with long, drooping branches, found back of Nguluke, growing wild around the village temple, at an altitude of 9,600 feet, Likang Snow Range. The needles are short, the cones are larger, and the scales broader than No. 10890 [S. P. I. No. 58498].

For previous introduction, see S. P. I. No. 58470.

58503. PRIMULA sp. Primulaceæ. Primrose.

(Mount Kenichunpu. October, 1923.) An herbaceous plant about 1 foot high, from alpine meadows of the Salwin-Irrawaddy Divide, Tibetan border, at about 13,000 feet altitude. The leaves are elliptical and the flowers small and yellow.

58498 to 58511—Continued.

58504. PYRUS sp. Malaceæ. Pear.

(Nos. 8946 and 11347. Litiping. November, 1923.) A very handsome tree 15 feet high, from alpine meadows, at an altitude of 12,000 feet. It has small, elliptic-oval, acute, crenate, pubescent leaves, large umbels of white flowers, and red fruits the size of a pea.

58505 to 58509. RHODODENDRON sp. Ericaceæ.

58505. RHODODENDRON OLEIFOLIUM Franch.

(No. 11219. Chanyutang. October, 1923.) A pink-flowered, shrubby species 1 or 2 feet high, which grows in the Salwin Valley at about 7,000 feet altitude. The narrowly elliptical, glaucous leaves are punctate beneath.

58506. RHODODENDRON sp.

(No. 11228. Mount Kenichunpu. October, 1923.) A red-flowered, shrubby species over 2 feet high, from the Salwin-Irrawaddy Divide, Tibetan border, at an altitude of 13,000 feet. The elliptical, dark pigeon-gray leaves are punctate beneath.

58507. RHODODENDRON sp.

(No. 11229. Mount Kenichunpu. October, 1923.) A very curious creeping plant which grows on rocky slopes, Salwin-Irrawaddy Divide, at about 11,000 feet altitude. The leaves are very small, glossy, and dark green, and the flowers are white with a pinkish tinge.

58508. RHODODENDRON SINO-GRANDE Balf. f. and Smith.

(No. 11239. Mount Kenichunpu. October, 1923.) A tree, 25 to 30 feet in height, found in a fir forest on the Salwin-Irrawaddy Divide, Tibetan border, at an altitude of 13,000 feet. The obovate-oblong leaves, silvery beneath, are 1 or 2 feet long, and the very large, cream-colored flowers are in huge corymbs.

58509. RHODODENDRON sp.

(No. 11241. Sila Pass. October and November, 1923.) A shrub about 2 feet high, found among rocks on the Salwin-Mekong Divide at an altitude of 13,000 feet. The oval, glabrous leaves are glaucous beneath, and the flowers are reddish pink.

58510. TSUGA sp. Pinaceæ. Hemlock.

(No. 10891. December, 1923.) A tree 80 feet or more in height, with a trunk about 5 feet in diameter and spreading branches, which grows at an altitude of 10,000 feet on the eastern slopes of the Likang Snow Range, in dense forests where there is heavy rainfall. The needles are dark green, and the rather large ovoid cones are pale brown. I consider this the finest of all *Tsugas*.

58511. GAULTHERIA sp. Ericaceæ.

(No. 11230. Mount Kenichunpu. October, 1923.) A shrub 2 feet high which grows on the Salwin-Irrawaddy Divide, Tibetan border, at an altitude of 11,000 feet. It has elliptical, serrate leaves and globose, rich-blue berries.

58512. PYRUS sp. Malaceæ. Pear.

From Simla Hills, Punjab, India. Seeds presented by S. E. Stokes. Received February 26, 1924.

This Himalayan wild pear is called "shegal" or "kanth" by the natives. The fruit is bronze colored, perfectly round, and the size of a large cherry. The tree grows extensively in the mountains at altitudes of 4,000 to 8,000 feet. (*Stokes.*)

Introduced for testing as a stock for our cultivated apples and pears.

58513. TELOPEA SPECIOSISSIMA (J. E. Smith) R. Br. Proteaceae. Waratah.

From Victoria, Australia. Seeds presented by William Laidlaw, acting director, Melbourne Botanic Gardens. Received February 28, 1924.

A very striking, evergreen Australian shrub, about 8 feet high, with irregularly toothed, dark-green leaves 6 inches long, and deep crimson, tubular flowers about an inch long, borne in a dense, globular head surrounded by blood-red bracts 2 or 3 inches in length. The waratah, as this shrub is known in its native land, has come to be recognized as the State flower of New South Wales.

58514 to 58516. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Bucharest, Rumania. Seeds presented by Dr. D. Andronescu, director, Ministerul Agriculturii, through Ely E. Palmer, American consul. Received February 28, 1924. Notes by Doctor Andronescu.

Introduced for testing by clover specialists.

These seeds came from the Government farms in Transylvania, the best clover region in the country.

58514. From Serecia, District of Fagaras.

58515. From Comana, District of Fagaras.

58516. From Boiu, District of Tarnava Mica.

58517. LANDOLPHIA OWARIENSIS Beauv. Apocynaceae.

From Kisanu, Belgian Congo. Seeds presented by Frère J. Gillet. Received February 28, 1924.

An enormous tropical creeper, found throughout the Belgian Congo, which attains a length of over 300 feet and a stem diameter of about 15 inches. The wedge-shaped elliptic leaves are 2 to 4 inches long. While the rubber-producing latex obtained from this species is often of good quality, frequently individual specimens yield latex which is practically useless. (Adapted from Wildeman and Gentil, *Lianes Caoutchoutifères du Congo*.)

Introduced for testing as a source of rubber.

58518 to 58548.

From Kansu, China. Seeds presented by R. C. Ching. Received February 16, 1924.

These seeds were collected on a botanical expedition into Kansu, northwestern China. (*Ching*.)

58518. *ACER* sp. *Aceraceae*. **Maple.**

No. 1009.

58519 to 58522. *BERBERIS* spp. *Berberidaceae*. **Barberry.**

No. 920.

58548. *TRITICUM TURGIDUM* L. *Poaceae*. **Poulard wheat.**

The Sinkiang wheat has just been introduced into western Kansu, and its yield has been much greater, I was told, than the native varieties. The head is somewhat triangular, being broad at the base. This variety is now growing in a very limited area at an altitude of about 7,000 feet and is sown either in the spring or fall. (*Ching*.)

58549 to 58551. ORNITHOGALUM spp.
Liliaceæ.

From Chilterns, Wynberg, Union of South Africa. Bulbs presented by J. B. Taylor. Received March 1, 1924. Notes by Mr. Taylor.

These bulbs, found in Caledon District, Cape Province, bear very beautiful flowers which keep fresh a long time. They do best in sandy soil.

58549. ORNITHOGALUM sp.

Bright-yellow flowers.

58550. ORNITHOGALUM sp.

A rare variety with deep-orange flowers.

58551. ORNITHOGALUM sp.

A very rare variety with pale-yellow flowers.

58552. EREMOCITRUS GLAUCA (Lindl.) Swingle. (Atalantia glauca Benth.).
Rutaceæ.**Australian desert kumquat.**

From Dundas, New South Wales. Seeds presented by Herbert J. Rumsey. Received February 29, 1924.

"This is one of the most interesting of all citrus fruits and one which, curiously enough, has never yet received adequate attention from botanists or horticulturists. It was first mentioned by Leichhardt, the German explorer, to whom we owe much of our knowledge concerning the interior of the deserts of northeastern Australia. It is a shrub or small tree from 12 to 15 feet high, with a trunk 2 to 6 inches in diameter. It has small but thick, leathery leaves of gray-green color, and one is struck by the scantiness of the foliage. The flowers are small and the fruits about half an inch in diameter. An agreeable beverage is made from the acid juice, and a fair preserve may be made out of the fruit. The peel has the sweetish flavor of the kumquat. It is known in Australia as the native lemon. The plant was described botanically in a footnote to Thomas Livingston Mitchell's 'Journal of an Expedition into the Interior of Tropical Australia in Search of a Route from Sydney to the Gulf of Carpentaria.' This plant was discovered on October 17, 1846, not far from Lieutenant Colonel Mitchell's camp, near the juncture of the Maranoa and Merivale Rivers, in the southern limit of Queensland, latitude 26° S. Decidedly cold weather was encountered near this point, in some cases the ice being so thick that it had to be broken in the morning before the horses could drink. It seems probable from this that the plant grows in a region where the temperature occasionally falls to 10° F. and in rare cases nearly to zero. It is the hardest of all evergreen citrus fruits and is very promising for use in breeding new and hardy types." (W. T. Swingle.)

For previous introduction, see S. P. I. No. 56700.

58553. LILUM DAURICUM Ker. Lilia-
ceæ.
Lily.

From Harbin, Manchuria. Seeds presented by B. W. Skvortzow. Received March 12, 1924.

Collected in Mavershan District, Kirin, Manchuria, in 1923. (Skvortzow.)

A plant about 3 feet in height, with a smooth or slightly furrowed stem which is green or tinged with brown or purple. The 20 to 50 horizontal leaves are 3 to 5 inches long, and the flowers, one to five in a cluster and 3 to 5 inches across, are orange-red, slightly spotted with purplish black, and tinged with yellow in the center; the anthers are red.

58554. MOMORICA COCHINCHINENSIS (Lour.) Spreng. Cucurbitaceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received January 13, 1924.

This is a very vigorous native Philippine vine with large, round, handsome, greenish yellow fruits which should make it popular as an ornamental vine in southern Florida, Porto Rico, and Panama. The immature fruits are boiled and eaten with meat by the natives, and the tender leaves also are boiled and eaten. The large seeds appear to be very rich in oil which, so far as I know, has never been investigated. (Wester.)

For previous introduction, see S. P. I. No. 52497.

58555 to 58558. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceæ.**Common wheat.**

From Paris, France. Seeds sent by A. Meunissier, Vilmorin-Andrieux & Co., Paris, at the request of E. C. Stakman, University Farm, St. Paul, Minn. Received January 4, 1924.

A collection of European wheats introduced for cerealists engaged in the study of stem rusts.

58555. (C. I. No. 7326.) Carlotta Strampelli.**58556. (C. I. No. 7327.) Chiddam Blanc de Mars.**

58557. ("C. I. No. 7328.) Hybride de la Pair is one of the introductions of Vilmorin-Andrieux & Co. It is a winter wheat which tests near Paris have shown to be of good yield." (C. E. Leighty, Bureau of Plant Industry.)

58558. (C. I. No. 7329.)

Hybride hâfif inversable was obtained in 1896 at Verrieres by Vilmorin-Andrieux & Co. by crossing Gros bleu and Chiddam d'automne à épi blanc. It can be seeded in the fall and in February and is resistant to cold and to rust. It is widely grown in France and to some extent in England and other countries. It is also known as Dreadnought, Steadfast, Monoplan, and Admiral Beatty. (Jacques de Vilmorin, *Quelques blés d'automne, Journal d'Agriculture Pratique*, August 28, 1919.)

58559 to 58563. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceæ.**Common wheat.**

From Aberystwyth, Wales. Seeds sent by R. G. Stapledon, department of plant breeding, University College of Wales, at the request of E. C. Stakman, University Farm, St. Paul, Minn. Received January 4, 1924.

A collection of locally developed European wheat varieties secured for testing by cereal breeders.

58559. (C. I. No. 7334.) Burgoyne Fife.**58560. (C. I. No. 7335.) Sealof.****58561. (C. I. No. 7336.) Cooks Wonder.****58562. (C. I. No. 7337.) April Bearded.****58563. (C. I. No. 7338.) Red Marvel.****58564 to 58567. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceæ.****Common wheat.**

From Svalof, Sweden. Seeds sent by Dr. Akerman, Svalof, at the request of E. C. Stakman, University Farm, St. Paul, Minn. Received January 4, 1924.

A collection of locally developed Swedish wheat varieties secured for cereal breeders.

58564. (C. I. No. 7330.) Pansar II**58565. (C. I. No. 7331.) Riddar.****58566. (C. I. No. 7332.) Host 0806.****58567. (C. I. No. 7333.) Thule II.**

58568. Musa sp. Musaceæ.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received November 22, 1923. Numbered January, 1924.

Introduced in response to a request for edible bananas producing viable seeds.

58569. TETRASTIGMA HARMANDI Planch. Vitaceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received January 21, 1924.

Agé. An attractive, perennial evergreen vine of vigorous growth, with palmately 5-foliate, shining dark-green leaves. The fruits are produced in small bunches like grapes and are of about the same size as a small Concord grape and of a dull-brown color. The flesh is semitranslucent, subacid, juicy, and of fair flavor. It is eaten by the Filipinos and could doubtless be used for making jelly and preserves. The plant makes a splendid climbing ornamental and is commonly so used in Manila. (See Plate XXIX, Philippine Agricultural Review, vol. XIV, No. 3, 1921.) (Wester.)

58570. HIBISCUS SABDARIFFA L. Malvacæ. Roselle.

From Kingston, Jamaica. Seeds presented by W. S. Goodman, acting superintendent, Hope Gardens. Received March 20, 1924.

The roselle or, as it is sometimes called, Jamaica sorrel is widely cultivated in the Tropics of both hemispheres for the sake of the fleshy red calyces, which, when cooked, make an excellent jelly or sauce with a flavor resembling that of the cranberry. The juice pressed from the calyces makes a pleasant acid beverage. The plant is a vigorous annual 5 to 7 feet high and grows best in hot, dry climates.

For previous introduction, see S. P. I. No. 51268.

58571. PHLEUM PRATENSE L. Poaceæ. Timothy.

From Glasnevin, Dublin, Ireland. Seeds presented by the director, Royal Botanic Gardens. Received March 20, 1924.

Locally grown seeds introduced for timothy-breeding tests.

58572. EHRHARTA ERECTA Lam. (E. panicea Smith.). Poaceæ.

From South Yarra, Victoria. Seeds presented by William Laidlaw, government botanist, National Herbarium of Victoria. Received January 5, 1924.

Panic Veldt grass. This was first introduced into Victoria in 1910 from South Africa, where it is native. It is a biennial or short-lived perennial and appears to be naturally adapted to regions having mild winters, where it springs up after the autumn rains and grows through the winter, maturing in early summer. It is not particular as to soil and seems to do best in partial shade, growing in places too dark for most grasses. It produces an abundance of foliage. (Laidlaw.)

58573. TIGRIDIA PAVONIA (L. f.) Ker. Iridacæ.

From Casa Alvarado, Coyoacan, Mexico. Seeds presented by Mrs. Zelia Nuttall. Received January 5, 1924.

Although this species, like the dahlia, is looked upon as a food plant in some quarters, it will in all probability be more often employed as an ornamental in the United States. Its beautiful, delicate flowers with their unique and peculiar markings, make it an object of great interest in the garden, especially since it is so seldom seen in this country. Although the flowers last but a short while, there

is a succession in a mass planting of them which prolongs the display of yellow, orange, scarlet, and various combinations of reds as satisfactorily as many more durable species.

The tiger flower is adapted to the same situation in the garden as the gladiolus, is similarly handled, and is as easily grown. The species deserves much more extensive culture than it is receiving. It can be treated like the gladiolus in cold climates, but it thrives best when planting or transplanting of the stocks takes place in the fall; in other words, where there is no danger of the corns being injured by low winter temperatures. (David Griffiths, Bureau of Plant Industry.)

58574. KOKIA DRYNARIODES (Seem.) Lewton. Malvacæ.

From Honolulu, Hawaii. Fruits presented by C. S. Judd, superintendent of forestry. Received January 4, 1924.

So far as I know, there is now only one tree of this species in existence. It is growing at Kauluawai and was raised from seeds obtained from a dead wild tree at Mahana, now dead, discovered and described by J. F. Rock. (Judd.)

An ornamental tree with long-stemmed, heart-shaped leaves and red, silky flowers, native to the Hawaiian Islands, but now become practically extinct because of the ravages of cattle, sheep, and goats, which eat the leaves and bark. (Adapted from Rock, *Indigenous Trees of the Hawaiian Islands*, p. 307.)

For previous introduction, see S. P. I. No. 50924.

58575 to 58581. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceæ. Common wheat.

From Bologna, Italy. Seeds sent by Dr. Pellegrini, University of Bologna, at the request of E. C. Stakman, University Farm, St. Paul, Minn. Received January 4, 1924.

A collection of Italian wheat strains which are said to be resistant to all rusts in Italy, according to C. E. Leighty, of the Bureau of Plant Industry. These have been obtained for the use of cereal breeders.

58575. (C. I. No. 7339.) Beardless, red, smooth.

58576. (C. I. No. 7340.) Beardless, red, rough.

58577. (C. I. No. 7341.) Beardless, white, smooth.

58578. (C. I. No. 7342.) Beardless, white, rough.

58579. (C. I. No. 7343.) Bearded, red, rough.

58580. (C. I. No. 7344.) Bearded, white, smooth.

58581. (C. I. No. 7345.) Bearded, red, smooth.

58582. PACHIRA INSIGNIS (Swartz) Sav. Bombacacæ.

From Kingston, Jamaica. Seeds presented by W. S. Goodman, acting superintendent, Hope Gardens. Received January 11, 1924.

A beautiful tropical tree, native to the West Indies and northern South America, which becomes about 30 feet tall, with a trunk up to a foot in diameter. The flowers, about a foot wide, are of extraordinary beauty with their crimson petals and white stamens, and a delightful perfume is given off by them. The fruit is a very large woody capsule which contains numerous edible seeds; these are of the size, appearance, and taste of chestnuts.

58583. MOMORDICA COCHINCHINENSIS (Lour.) Spreng. Cucurbitacæ.

From Santiago de las Vegas, Cuba. Seeds collected at the agricultural experiment station, Santiago de las Vegas, and presented by C. V. Piper, Bureau of Plant Industry. Received January 11, 1924.

A tall climber with ovoid, orange fruits, about 6 inches long. The numerous round, flat seeds are said to be rich in oil. (*Piper*.)

For previous introduction, see S. P. I. No. 58554.

58584. MUSA sp. Musaceæ.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received January 11, 1924.

A large number of the Musas are handsome ornamentals and are extensively cultivated in the warmer parts of the world for their gorgeous tropical effect. This unidentified species will be given a trial in the southernmost part of Florida.

58585 and 58586.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received January 12, 1924.

58585. ACACIA JONESSII Muell. and Maiden. Mimosaçæ.

A very handsome little shrub, native only to a small district of New South Wales, where it reaches a height of 2 to 3 feet, with a stem about three-fourths of an inch in diameter. The fine-cut foliage is a deep green, and the flower headlets are in simple racemes. (Adapted from *Proceedings of the Linnean Society of New South Wales*, vol. 8, ser. 2, p. 13.)

58586. INDIGOFERA AUSTRALIS Willd. Fabaceæ.

An erect branching shrub 2 to 4 feet high, with very attractive compound leaves and dense or loose clusters of showy red flowers. It is very variable in regard to habit and foliage, and in its various forms is found almost throughout Australia, except in the Northern Territory. (Adapted from *Bentham, Flora Australiensis*, vol. 2, p. 199.)

For previous introduction, see S. P. I. No. 56575.

58587. FICUS MYSORENSIS Heyne. Moraceæ.

From Lal Bagh, Bangalore, India. Seeds presented by G. H. Krumbiegel, superintendent, Government Botanic Gardens. Received January 15, 1924.

A large, broadly spreading tree, native to the forests of the subtropical Himalayas from Sikkim eastward. The aerial roots are few, embracing the trunk, and the ovate, leathery leaves, which are prominently veined, are up to 8 inches in length. (Adapted from *Hooker, Flora of British India*, vol. 5, p. 500.)

58588. TITHONIA DIVERSIFOLIA (Hemsl.) A. Gray. Asteraceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received January 15, 1924.

I have just seen this perennial composite at its best, and it far surpasses my expectations as an ornamental. Clumps of it are a blazing mass of yellow, and the flowers often reach a width of 4 inches. These are produced in great abundance during the autumn and early winter months, and the plant therefore might be a good ornamental for Florida during the early winter season. (*Wester*.)

For previous introduction, see S. P. I. No. 57093.

58589. GARCINIA MORELLA (Gaertn.) Desr. Clusiaceæ.

From Dominica, British West Indies. Seeds presented by Joseph Jones, curator, botanic gardens. Received January 17, 1924.

In connection with the department's effort to establish mangosteen culture in the tropical American dependencies of the United States, several species of *Garcinia* have been tested as stock plants. The mangosteen, when grown on its own roots, is a delicate subject indeed, and it has been thought

grafting on more vigorous species might solve one of the difficulties in the way of its culture. *Garcinia morella* has shown promise as a stock plant, and the seeds under this number will be used to produce plants for further experimentation.

58590. FUNTUMIA ELASTICA (Preuss) Stapf. Apocynaceæ.

Lagos rubber tree.

From Kisantu, Belgian Congo. Seeds presented by Frère J. Gillet. Received January 17, 1924.

The Lagos rubber tree is the most important source of rubber native to West Africa and is distributed throughout western tropical Africa from Sierra Leone to Cameroon, and also in British East Africa.

Introduced for rubber specialists.

58591. LANDOLPHIA DROOGMANSIANA Wildem. Apocynaceæ.

From Kisantu, Belgian Congo. Seeds presented by Frère J. Gillet. Received January 18, 1924.

A giant creeper from the Belgian Congo which becomes over 300 feet in length, with a stem about 8 inches in diameter. The leathery, oblong-rounded leaves are about 5 inches long. This species yields an excellent rubber-producing latex. (Adapted from *Wildeman and Gentil, Lianes Caoutchoutifères du Congo*, p. 59.)

Introduced for testing by rubber specialists.

58592. HYDNOCARPUS ANTHELMINTHICA Pierre. Flacourtiaceæ.

From Bangkok, Siam. Seeds presented by Dr. A. F. G. Kerr, director, botanical section, Ministry of Commerce. Received January 18, 1924.

The *maikrabao*, as this species is called in Siam, where it is native, is a vigorous, graceful tree 30 to 60 feet in height, with large leathery leaves up to a foot in length, pale yellowish above and shining green below. The rose-colored or purplish flowers are in few-flowered racemes, and the large, round fruits, about 3 inches in diameter, contain each about 80 oval seeds from which a fatty oil is expressed. In its physical characteristics and chemical composition this oil closely resembles chaulmoogra oil, which is used with great success in the treatment of leprosy. Like the true chaulmoogra oil (obtained from *Taraktogenos kurzii* King) this consists to a large extent of the glyceryl esters of chaulmoogric and hydnocarpic acids, and it may therefore be inferred that it possesses similar medicinal value.

Young trees of this species are doing well in Hawaii. The plant is likely to prove of value in that region as well as in tropical America.

58593. MARKHAMIA sp. Bignoniaceæ.

From Umтали, Rhodesia, South Africa. Seeds presented by Rev. E. H. Greely. Received January 23, 1924.

A native Rhodesian tree with yellow flowers 2 inches across. It resembles the central African species of *Spathodea*. (*Greely*.)

This is a genus of handsome tropical evergreen trees or shrubs, with large panicles of flowers which are usually yellow.

58594. VALLARIS HEYNEI Spreng. Apocynaceæ.

From Allahabad, India. Seeds presented by W. B. Hayes, horticulturist, Allahabad Agricultural Institute. Received January 22, 1924.

A climbing shrub with fragrant, white flowers three-fourths of an inch wide, often cultivated as an ornamental in India, where it is native. It has milky juice which is used medicinally in its native country. The plant is introduced for the use of specialists engaged in rubber investigations.

For previous introduction, see S. P. I. No. 53592.

58595 and 58596.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received January 23, 1924. Notes by Mr. Rock.

58595. *LILIUM* sp. Liliaceæ.

Lily.

(October, 1923.) A small lily 10 to 12 inches high, which grows on the alpine meadows of the Sila Pass, Mekong-Salwin Divide, at an altitude of about 12,000 feet. It is well worthy of cultivation on account of its drooping, rich purplish black, bell-shaped flowers, tinged with carmine, which are 1 or 2 inches long and broad.

58596. *MECONOPSIS* sp. Papaveraceæ.

(November 1, 1923.) An herbaceous plant 3 to 4 feet high, found on Francis Garnier Peak at an altitude of 14,500 feet, en route from the Salwin River to the Mekong River, via the Shondsungla-Tibet border. The flowers are probably yellow.

58597 to 58600.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received January 24, 1924. Notes by Mr. Rock.

58597. *JUGLANS REGIA* L. Juglandaceæ.

(October 25, 1923.) A tall, straight tree which forms dense forests below Shondsungla in the valley of the Dayonlumba, a tributary of the Salwin, on the Tibetan border, at an altitude of 9,500 feet. It is often associated with maples and rhododendrons. The fruits are usually oblong, rarely globose.

58598. *RHODODENDRON ARALIAEFORME* Balf. f. and Forrest. Ericaceæ.

(No. 10832. November, 1923.) A shrub 5 to 8 feet high which grows on the mountain slopes west of Atuntze at an altitude of about 12,000 feet. The rich, golden yellow flowers are in large terminal corymbs.

58599. *RHODODENDRON ARALIAEFORME* Balf. f. and Forrest. Ericaceæ.

(No. 10883. November 11, 1923.) A much-branched small tree 10 to 12 feet in height, which grows at an altitude of 13,500 feet on Mount Drungu, Tibetan border, overlooking the Mekong River. The leathery, dark-green, oblong leaves are brownish yellow beneath, and the flowers are deep red.

58600. *TUMION FARGESII* (Franch.) Skeels. (*Toreya fargesii* Franch.). Taxaceæ.

(October, 1923.) A tree 100 to 150 feet tall, with a trunk $4\frac{1}{2}$ feet in diameter and huge descending branches, which grows rarely in the deciduous and semideciduous forests of the Mekong-Yangtze Divide and also more commonly on the Mekong-Salwin Divide at an altitude of 10,000 feet. The fruits are the size of small walnuts. The tree prefers rich black soil and considerable rainfall.

58601. HYOSCYAMUS MUTICUS L. Solanaceæ.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received January 24, 1924.

Like the henbane (*Hyoscyamus niger*) this plant, which is native to Egypt and western Asia, is a source of hyoscyamin, an alkaloid used in the treatment of various nervous disorders. It is a thick-stemmed perennial with fleshy, ovate leaves about 4 inches long and violet-spotted, whitish flowers nearly an inch in length.

For previous introduction, see S. P. I. No. 53543.

58602. CASTANEA MOLLISSIMA Blume. Fagaceæ. Chestnut.

From Nanking, China. Seeds purchased from Prof. J. H. Reiser, College of Agriculture and Forestry, University of Nanking. Received January 26, 1924.

In the endeavor to relieve the situation caused by the rapid disappearance of our native chestnut due to the ravages of the chestnut-blight fungus, the Chinese hairy chestnut is being introduced into this country in considerable quantity. The size and quality of the nuts compare rather favorably with those of our native chestnut, although neither the size of the tree nor the tannin content measures up to those of our native species.

58603 to 58623.

From Elstree, Herts, England. Seeds presented by Vicary Gibbs, Aldenham House Gardens. Received January 25, 1924.

58603. *ACANTHOPANAX SESSILIFLORUM* (Rupr. and Maxim.) Seem. Araliaceæ.

A vigorous, deciduous shrub which forms a large spreading bush 10 feet high, with 3 or 5 lobed, irregularly toothed leaves. The flowers, brownish purple with yellow protruding stamens, are packed closely in a spherical, almost stalkless cluster about an inch in diameter and appear in July. The inky black berries are in round clusters about an inch thick. This is one of the hardest shrubs introduced from northern China, where it is native.

58604. *BERBERIS VEITCHII* C. Schneid. Berberidaceæ. Barberry.

A shrub with gracefully arching branches, leathery, pale-green leaves, and bronze-yellow flowers with reddish outer surfaces. The berries are black and broadly elliptic. Native to western Hupeh, China. (Adapted from Sargent, *Plantae Wilsonianae*, vol. 3, p. 438.)

For previous introduction, see S. P. I. No. 53646.

58605. *CHAENOMELES LAGENARIA WILSONII* Rehd. Malaceæ.

A bush 4 to 6 meters (approximately 13 to 20 feet) tall, found at an altitude of 1,800 meters (approximately 5,900 feet), in western Szechwan. The flowers vary in color from white to red, and the fruits are golden and red. This variety differs from the typical form in the dense yellowish wool which covers the lower surfaces of the leaves. (Adapted from Sargent, *Plantae Wilsonianae*, vol. 3, p. 298.)

For previous introduction, see S. P. I. No. 49664.

58606. *CLEMATIS TANGUTICA OBTUSUSCULA* Rehd. and Wils. Ranunculaceæ.

A handsome climbing shrub, native to Central Asia, with sharply cut compound leaves and very large, solitary, nodding flowers which are borne on erect stems 6 inches long and arched at the tip. The golden-yellow sepals are about 2 inches long, with recurved tips. (Adapted from Curtis's *Botanical Magazine*, pl. 7710.)

For previous introduction, see S. P. I. No. 52337.

58607. *COROKIA VIRGATA* Turrill. Cornaceæ.

A slender-branched shrub, 6 to 12 feet high, native to the most northern part of New Zealand, where mild weather prevails throughout the year. The shining-green, oblong-spatulate leaves are downy white beneath, and the yellow flowers, about half an inch across, are in 3-flowered clusters. (Adapted from Curtis's *Botanical Magazine*, pl. 8466.)

58603 to 58623—Continued.

58608 to 58611. COTONEASTER spp. Malacæ.

58608. COTONEASTER BULLATA Bois.

An ornamental hardy shrub, about 10 feet high, native to western China. The leaves are dark green and the flowers rosy white, but the greatest attraction of this shrub is the abundant crop of brilliant red fruits which are borne on the upper sides of the long arching branches toward the end of August. Some of the fruiting clusters are 2 inches across.

For previous introduction, see S. P. I. No. 53672.

58609. COTONEASTER FRIGIDA Wall.

Var. *vicari*. This is an improved form with deep-green leaves, grayish beneath, and large clusters of rich-red berries which are larger and brighter than those of the typical species. (Adapted from *Gardening Illustrated*, vol. 42, p. 721.)

For previous introduction, see S. P. I. No. 56450.

58610. COTONEASTER SALICIFOLIA RUGOSA (E. Pritz.) Rehd. and Wils.

A very handsome Chinese shrub with long pendulous branches and wrinkled, narrow leaves with the lower surfaces covered with down. The small, scarlet berries contrast very effectively with the autumnal tints of the foliage. (Adapted from *Journal of the Royal Horticultural Society*, vol. 38, p. cclii.)

For previous introduction, see S. P. I. No. 55083.

58611. COTONEASTER sp.

According to Mr. Gibbs this is closely related to *Cotoneaster francheti*, which is an evergreen shrub from western China, with lustrous green leaves, rosy white flowers, and oblong, orange-scarlet fruits.

58612. KALOPANAX DIVARICATUM (Sieb. and Zucc.) Miquel. Araliacæ.

A deciduous shrub of vigorous habit, forming a large, spreading bush 5 to 10 feet or more in height. It is native to the mountains of Kiushiu, Japan, and is closely related to *Acanthopanax sessiliflorum*, cultivated in European gardens for its handsome, dark-green leaves and spherical heads of inky-black fruits. Unlike the latter, this species has downy young shoots, and the lower surfaces of the leaves are also quite downy. It should probably prove hardy in all but the coldest parts of the United States.

58613. LIGUSTRUM DELAVAYANUM Hariot. Oleaceæ. Privet.

An evergreen shrub about 6 feet high with long graceful branches and dark, shining-green, oval leaves. The white flowers, borne in downy panicles, and the black fruits make the shrub very ornamental. It is native to the mountainous regions of Yunnan, China, and is probably suited for growing only in the southern United States.

For previous introduction, see S. P. I. No. 55089.

58614. LONICERA TRICHOPODA Franch. Caprifoliacæ. Honeysuckle.

A slender-branched shrubby honeysuckle from Yunnan, China, with narrowly oblong leaves which are covered with fine hairs. The yellowish white flowers are marked with red and are followed by bright-red berries.

58603 to 58623—Continued.

58615. LONICERA sp. Caprifoliacæ. Honeysuckle.

An undetermined species which, according to Gibbs, is related to *Lonicera henryi*, which is an evergreen climber native to western China, with dark-green leaves, purplish red flowers, and blackish purple fruits.

58616 to 58618. ROSA spp. Rosacæ. Rose.

58616. ROSA BRUNONII Lindl.

The Himalayan Musk rose is a tall shrub with arching branches short, stout, hooked prickles, and fragrant, single, white flowers about 2 inches across, borne in large many-flowered clusters. It is a native of the Himalayas and also of western China.

58617. ROSA DAVIDI Crepin.

A pink-flowered, orange-fruited rose 3 to 18 feet high, native to western Szechwan, China, at altitudes of 4,000 to 9,000 feet. It is the nearest Chinese relative of *Rosa macrophylla* of the western Himalayas. (Adapted from *Sargent, Plantæ Wilsonianæ*, vol. 2, p. 322.)

For previous introduction, see S. P. I. No. 53732.

58618. ROSA PRATTHI Hemsl.

A slender-branched, shrubby rose which becomes about 8 feet in height, with numerous bristles and slender prickles. The pink flowers, about three-fourths of an inch across, occur singly or in few-flowered clusters, and the scarlet fruits are about one-third of an inch long. This hardy species is a native of western China.

For previous introduction, see S. P. I. No. 43907.

58619. SCHIZANDRA RUBRIFLORA (Franch.) Rehd. and Wils. Magnoliacæ.

A climbing shrub, often 20 feet in height, which grows at high altitudes in the mountains of western China. The oblong or obovate, sharp-pointed leaves are dark green above and paler below, and the solitary dark-red flowers are about an inch across. (Adapted from *Sargent, Plantæ Wilsonianæ*, vol. 1, p. 412.)

58620. STRANVAESIA DAVIDIANA Decaisne. Malacæ.

This yellow-fruited form was raised from the same batch of seeds as S. P. I. No. 56695, but the fruits were found to have a distinct orange-yellow color. Seedlings may revert to the original type. (Edwin Beckett, superintendent, Aldenham House Gardens.)

For previous introduction, see S. P. I. No. 56696.

58621. STRANVAESIA DAVIDIANA UNDULATA (Decaisne) Rehd. and Wils. Malacæ.

A low, spreading, evergreen shrub, or occasionally a small tree, which is native to western China. The leathery, narrowly oval leaves are glossy green and 1 to 3 inches long, and the white flowers, about half an inch across, appear in terminal clusters. Its greatest charm as an ornamental is the abundant crop of bright-red fruits.

For previous introduction, see S. P. I. No. 40196.

58603 to 58623—Continued.

58622. *VIBURNUM DASYANTHUM* Rehder. Caprifoliaceae.

A hardy ornamental shrub about 7 feet high from the mountains of western Hupeh, China, where it grows at altitudes of 4,000 to 9,000 feet. The narrow, toothed leaves are dark metallic green above, paler beneath, and prominently veined. The flowers are in lax panicles, and the small red berries make the shrub a striking object of beauty in the fruiting season.

58623. *VIBURNUM PHLEBOTRICHUM* Sieb. and Zucc. Caprifoliaceae.

A deciduous shrub, native to Japan, which is very similar to *Viburnum wrightii*, from the same country. It becomes 6 to 10 feet in height, with rather small, narrowly oval, bright-green leaves, white flowers produced in cymes 2 to 4 inches across, and roundish red berries which give the shrub a very attractive appearance.

For previous introduction, see S. P. I. No. 40200.

58624. *BAUHINIA HETEROPHYLLA* Kunth. Caesalpinaceae.

From Santiago de las Vegas, Cuba. Seeds presented by Dr. Mario Calvino, director, Estación Experimental Agronómica. Received January 28, 1924.

This is called "bejuco tortuga (turtle vine)," because of the characteristic turtle-shaped swellings in the older parts of the vine. It grows in low, sandy places, chiefly on the edges of lagoons and marshes in western Cuba, where it climbs over trees and shrubs. The clusters of yellowish white flowers appear in December. The young vine is used by the natives for making rough baskets and rope. (Calvino.)

58625 and 58626. *DIOSCOREA* spp. Dioscoreaceae.

From Mayaguez, Porto Rico. Tubers presented by T. B. McClelland, horticulturist, Porto Rico Agricultural Experiment Station. Received January 31, 1924. Notes by R. A. Young, unless otherwise stated.

58625. *DIOSCOREA CAYENENSIS* Lam. Yellow Guinea yam.

Congo. In Mayaguez this is called Congo amarillo, but in the San Juan market, where it is found in greater abundance than other kinds, it is known as Yellow Guinea. It thrives much better in sandy soil than most yams. The large roots attain a length of a foot, are rather cylindrical, and average a weight of 4 or 5 pounds in favorable seasons. The interior of the starchy root is a rich light yellow and turns dark brown when exposed to the air. It is smoother and more even grained than the water yams and not less so than the roots of the White Guinea or the Potato yams. It is rich yellow and of good texture when cooked. The flavor is pleasant and compares favorably in richness with the best yams. The vines of this variety are not angled; they are small and very strong, and make a moderately vigorous growth. (Adapted from C. F. Kinman in Bulletin 27, Porto Rico Agricultural Experiment Station, pp. 20 and 21.)

In addition to the data on quality given by Kinman, it may be noted that this yam has a slightly bitter taste; on this account special methods of cooking may sometimes be required. It is said that the bitterness is more noticeable in immature tubers than in fully mature ones.

For previous introduction, see S. P. I. No. 54901.

58626. *DIOSCOREA ROTUNDATA* Poir. White Guinea yam.

Guinea yam. A white-fleshed yam of excellent quality and one of the most popular varieties grown in Porto Rico. The tubers are usually cylindrical and commonly weigh from 3 to 6 pounds each at maturity.

For previous introduction, see S. P. I. No. 53006.

58627. *CARICA CANDICANS* A. Gray. Papayaceae.

From Peru. Seeds presented by B. E. Dahlgren, Field Museum of Natural History, Chicago, Ill. Received January 31, 1924.

Collected by J. F. Macbride, in Peru. (Dahlgren.)

A wild relative of the papaya (*Carica papaya*), which is native to the mountainous region of Peru between Lima and Obrajillo, at an altitude of about 7,000 feet. It is a small tree, 6 to 10 feet high, with a few stout branches and a fruit said to be shaped like a cacao pod. It may be of use to horticulturists in southern Florida who are carrying on breeding experiments with the papaya.

58628. *EUCALYPTUS DELEGATENSIS* R. T. Baker. Myrtaceae.

From Tasmania. Seeds presented by Dr. J. G. Lipman, director, agricultural experiment station, New Brunswick, N. J. Received February 1, 1924.

This seems to be a valuable timber tree in Tasmania, where it is native. (Lipman.)

"The gum-topped stringybark is an erect tree, often assuming the largest dimensions. The branches are usually short and ascending, and the bark is thin and fibrous." (L. Rodway, *Tasmanian Eucalypts*, p. 15.)

For previous introduction, see S. P. I. No. 58127.

58629 and 58630. *JUGLANS REGIA* L. Juglandaceae.

From Srinagar, Kashmir, India. Seeds presented by R. K. Koul, Koul's Gardens. Received February 2, 1924.

Walnuts have been cultivated since remote times in the hilly portions of India, and in Kashmir especially the industry has been highly developed. These seeds are from superior varieties which are grown at an altitude of about 5,500 feet, in a region where mild winters and warm, but not hot, summers prevail.

58629. *Kaghzi*.

58630. A small variety.

58631 and 58632. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Valence, Rhone, France. Seeds purchased from Tézard Frères. Received March 12, 1924.

Locally grown strains introduced for clover specialists.

58631. Harvested in the southern Alps.

58632. Harvested in Drome, near Valence.

58633 and 58634. *RHODODENDRON* spp. Ericaceae.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received January 31, 1924. Notes by Mr. Rock.

58633. *RHODODENDRON* sp.

(No. 10884. Tsarong, Tibet. November 23, 1923.) A shrub or small tree, 10 to 15 feet high, collected on the banks of the Drossutong, at an altitude of 12,000 feet. All parts of the plant are extremely aromatic, with a peppermint-turpentine fragrance. The elliptical, thin, dark glossy green leaves are greenish brown beneath, densely dotted, and have red petioles. The flowers may be pink.

58634. *RHODODENDRON* sp.

(No. 10885. November, 1923.) A tree or shrub 15 to 25 feet in height, sometimes with a trunk 10 inches in diameter, found on the slopes of the sacred mountain Dokerla, Tibetan border, at an altitude of 11,000 feet, in a mossy forest along the banks of a stream. The lanceolate glabrous leaves are dull green, paler beneath, and the red flowers are in terminal umbels.

58635. CROTALARIA sp. Fabaceæ.

From Angola, Africa. Seeds presented by Merlin W. Ennis. Received February 2, 1924.

In our experiments with various plants introduced for cover crops we did not discover anything satisfactory, so we turned to the plants growing wild in this region. Among these was the "Elende clover," of which we are sending you seeds. This is a rather inconspicuous plant which grows in all sorts of places. I tried it first as a cover crop in the orange grove, in the hope that it might restrain the Bermuda grass. It not only smothered the Bermuda grass, but as it appears now in its second year it has made a very heavy stand. As the plant is well supplied with root nodules I believe that it will prove valuable as fertilizer. (Ennis.)

58636 to 58640.

From India. Seeds collected by Ralph R. Stewart. Received February 2, 1924. Field notes by Mr. Stewart.

58636 to 58639. RIBES spp. Grossulariaceæ.**58638. RIBES ALPESTRE Decaisne.**

(No. 7376½. Sonamarg. August 22, 1922.) Collected at an altitude of about 8,600 feet. This is the only prickly Ribes in Kashmir, and it has very large fruits.

58637. RIBES GLACIALE Wall.

(No. 6743. Sonamarg. August 22, 1922.) A very hardy species, collected at an altitude of 10,000 feet. The fruit is not used.

A shrub, 10 to 15 feet high, with reddish young shoots, rounded leaves, and small flowers which are maroon or purplish on the inside. The small, scarlet, currantlike fruits mature in July in the higher altitudes of the Himalayas, where the species is native. (Adapted from Janczewski, *Monographie des Groseilliers*, p. 467.)

58638 and 58639. RIBES ORIENTALE Desf.

Unarmed, deciduous shrubs about 6 feet high distributed from eastern Europe to the Himalayas. The leaves are shining green and bristly below, the flowers are greenish red, and the small red fruits are covered with viscid hairs.

58638. (No. 7309. Sonamarg. July and August, 1922.) A hardy species, usually on dry, open banks, at an altitude of 7,000 to 9,000 feet.

58639. (No. 7385½. Matayan Dras, Ladak. August 29, 1922.) From an altitude of 10,000 feet.

58640. RUBUS SAXATILIS L. Rosaceæ.

(No. 7467. Baltal. September 3, 1922.)

According to Sir Joseph Hooker (Flora of British India), *Rubus saxatilis* is distributed throughout the Himalayan region, commonly at altitudes of 10,000 to 11,000 feet. The stems are short, erect, annual from a stout woody rhizome. The leaves are composed of three ovate, somewhat lobed, acutely double-toothed leaflets, each 2 to 3 inches long. The white flowers, half an inch in diameter, are followed by fruits composed of a few large scarlet drupelets. Judging by its distribution in Asia, this species should prove sufficiently hardy for cultivation in many parts of the United States. It is of interest mainly to plant breeders who are working with this genus.

58641. ABIES FORRESTII Craib. Pinaceæ. Fir.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received February 5, 1924.

For previous introduction and descriptive note, see S. P. I. No. 58468.

58642. ABIES sp. Pinaceæ. Fir.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received February 9, 1924.

For previous introduction and descriptive note, see S. P. I. No. 58469.

58643. FICUS CARICA L. Moraceæ. Fig.

From Saonara, Padova, Italy. Plants purchased from Fratelli Sgaravatti. Received February 9, 1924.

Dotato. Dr. Gustavus Eisen, long with this department and instrumental in bringing about the introduction of many fig varieties into the United States, describes *Dotato* as the best-known fig of Tuscany. A large proportion of the figs exported from Italy are of this variety. The trees said to love rich, moist soils and is not suitable for dry lands. Under proper environmental conditions, it is a strong grower and heavy bearer of medium-sized fruits, oval-pyriform in shape, smooth, and yellowish green in color.

This well-known Italian variety is introduced for cultural and comparison tests by horticulturist engaged in fig-breeding experiments.

For previous introduction, see S. P. I. No. 56631.

58644. PASPALUM NOTATUM Fluegge. Poaceæ.

From San Jose, Costa Rica. Seeds purchased from J. Alfredo Quiros. Received January 30, 1924.

Bahia grass is a perennial grass forming a dense sward of leaves and with flowering culms about 1 foot high, two-branched at the top. It is native from Cuba and Mexico southward to Argentina. It is generally recognized as a very valuable pasture grass. The rootstocks are very stout, so that even on very sandy soil the grass makes a firm sod. At the Florida experiment station, Bahia grass is spreading year by year even into land already occupied by other grasses. In Florida the best germination has been obtained by sowing the seed the latter part of May and in June. A firm seed bed seems desirable.

Bahia grass has proved hardy throughout Florida and as far north as McNeill, Miss. It succeeds on nearly all types of soil, even on the sand hills, but best in fairly firm soils.

The ergot which attacks Dallis grass and many other species of Paspalum also affects Bahia grass. Indeed, in parts of Argentina where the pastures are largely of this grass the ergot causes a disease of cattle apparently the same as that caused by the same ergot on Dallis grass in Mississippi. It is not likely, however, that this ergot will ever be serious except perhaps in limited areas where Bahia grass or Dallis grass makes up the whole pasture. (C. V. Piper, *Bureau of Plant Industry*.)

For previous introduction, see S. P. I. No. 51121.

58645. CLITANDRA ARNOLDIANA Wildem. Apocynaceæ.

From Kisantu, Belgian Congo. Seeds presented by Frère J. Gillet. Received February 5, 1924.

One of the commonest rubber-producing plants of the Belgian Congo, being found throughout the entire territory. It is a vine which becomes a foot in diameter and 250 feet in length, with leathery, narrowly oblong leaves. The rubber obtained from the latex of this species is black and of first quality. (Adapted from Wildeman and Gentil, *Lianes Caoutchoutifères du Congo*, p. 80.)

Introduced for rubber specialists.

58646. X POPULUS GENEROSA A. Henry.
Salicaceæ. Poplar.

From Dublin, Ireland. Cuttings presented by Dr. Augustine Henry, College of Science for Ireland. Received March 22, 1924.

This hybrid poplar is, according to its originator, Augustine Henry, intermediate in characters between its parents (*Populus angulata* and *P. trichocarpa*). The leaves are coarsely serrate and pale gray beneath. The tree is a rapid grower and unusually vigorous.

58647 to 58658.

From Paris, France. Plants purchased from Vilmorin-Andrieux & Co. Received February 20, 1924.

58647. AMPELOPSIS MEGALOPHYLLA Diels and Gilg. (*Vitis megalophylla* Veitch.) Vitaceæ.

A vigorous, hardy, very interesting vine, becoming 20 to 30 feet in length, with long-stemmed, deeply lobed leaves often more than 3 feet in diameter. The bluish black fruits are in loose cymes. This species is native to western Hupeh, China, where it grows at an altitude of about 4,000 feet.

For previous introduction, see S. P. I. No. 39569.

58648. CHEIRANTHUS MUTABILIS L'Her. Brassicaceæ.

A half-woody ornamental from Madeira, about 3 feet high, with very narrow, pointed leaves. The flowers are white, cream colored, or yellowish, becoming darker and striped.

58649. EOMECON CHIONANTHA Hance. Papaveraceæ.

A hardy, herbaceous perennial, native to eastern China. The pearly white flowers, 2 inches across, are borne in a many-flowered cluster on a reddish scape a foot or more high. The contrast of the white flowers with the pale-green leaves is very striking. The root stalks run freely underground and increase rapidly.

58650. LAVATERA OLIVA L. Malvaceæ.

A shrubby perennial, native to southern Europe, about 6 feet in height. The 3-lobed or 5-lobed oblong leaves are softly hairy, and the solitary, reddish purple flowers are sometimes over 2 inches across.

58651. RUBUS FLAGELLIFLORUS Focke. Rosaceæ.

A climbing, evergreen, shrubby *Rubus* from central and western China, where it is found at an altitude of about 6,000 feet. The slender, graceful stems become 5 or 6 feet long in one season; when young they are covered with a whitish felt through which are scattered small recurved prickles. The broadly oval, long-pointed leaves are sometimes 7 inches long, with the lower surfaces covered with thick, yellowish felt. The shining black fruits, half an inch thick, are edible.

58652. RUBUS TRIFIDUS Thunb. Rosaceæ.

An erect, woody, Japanese species, 7 to 10 feet high, with large, palmately ribbed, serrate leaves, and medium-sized, scarlet, edible berries. Because of its bright autumn foliage this is sometimes called the "fire raspberry."

58653. SALVIA DICHROA Hook. f. Menthaceæ.

This perennial is considered by some authorities as one of the most beautiful of the more hardy sages. It comes from the Atlas Mountains in Morocco. The plant grows about 3 feet high, and the deeply cut leaves are 6 to 8 inches long. The flowers are very striking, with the upper lip bright blue, the lateral lobes light blue, and the pendulous midlobe white. The many-flowered racemes are a foot or more in length.

58647 to 58658—Continued.

58654. SISYRINCHIUM STRIATUM J. E. Smith. Iridaceæ.

A hardy, herbaceous perennial, 1 to 3 feet high, which is native to Chile and Argentina. It has sword-shaped leaves and lemon-yellow flowers in sessile clusters on long spikes. Each tuft develops 20 to 30 flower spikes, and throughout July this makes a very striking garden ornamental.

For previous introduction, see S. P. I. No. 33818.

58655. SPHAERALCEA MUNROANA (Dougl.) Spach. Malvaceæ.

A very attractive herbaceous perennial, 1 or 2 feet in height, found on dry plains in British Columbia and southward. The leaves are faintly 3-lobed, sometimes incised, and the scarlet or rose-colored flowers, an inch across, are in many-flowered terminal or axillary panicles.

58656. THLADIANTHA OLIVERI Cogn. Cucurbitaceæ.

A vigorous herbaceous vine, with annual, softly hairy stems sometimes 30 feet long and large, heart-shaped leaves about 8 inches long. Clusters of yellow, bell-shaped flowers an inch across appear in the leaf axils from July to September, making the vine very attractive. The native home of this species is central China.

58657. VACCINIUM URCEOLATUM Hemsl. Vacciniaceæ.

A handsome bush, 2 to 6 feet in height, common on red sandstone rocks in western Szechwan, China. It has leathery, narrowly oval leaves 2 to 4 inches long, small pink flowers in racemes, and small, black, urn-shaped berries.

58658. VERBASCUM WEIDEMANNIANUM Fisch. and Mey. Scrophulariaceæ.

A hardy herbaceous biennial, 1 to 3 feet high, covered with cobwebby, woolly hairs. The radical leaves are oblong and about 4 inches long; the stem leaves are sessile and very small. The purplish lilac flowers over an inch wide are either solitary or in a simple raceme or slightly branched panicle. This species is native to the Caucasus.

58659. CASTANEA MOLLISSIMA Blume. Fagaceæ.

From Yih sien, Shantung, China. Seeds presented by K. M. Gordon, South Shantung Industrial School of the American Presbyterian Mission (North). Received March 29, 1924.

These nuts, unusually sweet in flavor, came from the village of Yangchialou, about 3 miles north of Yih sien. (Gordon.)

The Chinese hairy chestnut has been introduced into this country several times and has been quite generally distributed. It is a promising immigrant, as the nut more closely resembles our American sweet chestnut than any other foreign species. Our own chestnut is rapidly disappearing, because of the chestnut blight which was introduced from the Orient about 20 years ago. *Castanea mollissima* is resistant to blight and has other characters that would seem to make it worthy of cultivation and study.

58660. CARICA sp. Papayaceæ.

From Lima, Peru. Seeds presented by Ing. Miguel U. Reátegui, Lima, through Dr. Mario Calvino, San Manuel, Oriente, Cuba. Received March 19, 1924.

Papaya aromática. An unidentified species from the highlands of Peru, which will be used in papaya-breeding experiments in southern Florida.

58661. OLEA EUROPAEA L. Oleaceae. Olive.

From Ariana, near Tunis, Tunisia, Africa. Cuttings presented by F. Boeuf, chief, botanical service. Received March 28, 1924.

Barouni. "This variety is described in a paper entitled 'L'Olivier en Tunisie,' by N. Minangoin, published by the Department of Agriculture and Commerce of Tunis in 1901. The leaves, fruits, and seeds are illustrated in Plate I, figure 1, of this publication. I translate what Minangoin says concerning it:

"This variety is found almost exclusively in the olive orchards of the Sahel (eastern coast of Tunis) and in particular at Kalaa Srira (11 km. from the town of Sousse).

"Foliage sparse, leaves 7 to 8 cm. long, narrow, light green on the upper surface, whitish on the lower surface. Fruits single, very large, shaped like a pear upside down, wine red when mature, ripening very early. Peduncle long and strong, flesh thick and white, seed one-sided, long and thick, ending in a point. Flowers at the end of February."

"Mr. Minangoin told me himself in 1904 that the variety is extremely rare and that he knew of only three trees, which were on the estate of M. Robert at Kalaa Srira. The word Barouni means foreign, and the variety is supposed to have been introduced by one of the Beys of Tunis from Greece or Turkey. He said that the trees in question were old and do not bear well. He stated that the fruits sometimes weighed as much as 20 grams.

"I met M. Robert, who was at that time vice president of the Municipality of Sousse, and he also stated that the Barouni variety is found only at Kalaa Srira. He said that it was not commonly grown, as it requires a good deal of water and must be irrigated.

"There are two varieties of olive in Tunis to which the name Barouni is applied. The large pickling olive is Barouni de Kalaa Srira, while the other variety is known as Barouni de Soliman and has a small fruit used for making oil." (T. H. Kearney, Bureau of Plant Industry; letter of February 7, 1924.)

58662. DIOSCOREA sp. Dioscoreaceae. Yampi.

From Mayaguez, Porto Rico. Tubers presented by T. B. McClelland, horticulturist, agricultural experiment station. Received March 26, 1924.

Mapuey morado. The yampi is usually of even form and somewhat club-shaped, and the tubers are commonly 4 to 10 ounces in weight; the inner skin is pink. The flesh is white, but often becomes slightly grayish when cooked. The flavor is much like that of the potato, but the yampi has in addition an agreeable sweetness. (R. A. Young, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 56660.

58663 to 58668. FICUS CARICA L. Moraceae. Fig.

From Malaga, Spain. Cuttings presented by Luis Liró Ortiz, director, Estación de Agricultura General de Torrox, through D. D. Shepard, American consul. Received March 4, 1924. Notes by Señor Ortiz.

58663. *Blanquilla*. A tree of medium size which does not produce early fruits (brevas), but bears only a large crop of small, very sweet, late fruits (higos).

58664. *Negra* or *Goen*. A large tree which bears both early and late fruits; these are sweet and of medium size.

58663 to 58668—Continued.

58665. *Pacueca*. A tree of medium size, bearing regular crops of early and late fruits, which are large and black.

58666. *Pardilla*. A tree which never becomes very tall, because of its spreading habit. When young it bears both early and late crops, but after several years it bears only the late fruits. These are large, brown, and very sweet. This is the best variety grown in the vicinity of Malaga; it yields well and the fruits are the best for drying.

58667. *Valenciana*. A large tree which produces only a late crop, which is regular and heavy. The fruits are large, white, and sweet.

58668. *Verdeja* or *Ojo de Perdiz*. A large tree which produces a late crop; the fruits are not so numerous as those of the *Blanquilla* [S. P. I. No. 58663], nor are they so sweet. The name "Ojo de Perdiz" is derived from the red eye of the fruit.

58669. JUGLANS REGIA L. Juglandaceae. Walnut.

From Simla, Punjab, India. Plant presented by Howard Spence, The Red House, Ainsdale, England. Received March 7, 1924.

In 1916 I received from Simla, India, a few walnuts of a variety superior in quality to any I have ever tasted, with a delicate coconut flavor. The long, narrow nut was particularly well filled with closely packed convolutions resembling those of a pecan more than of an ordinary walnut. The shell is rather thick, and the average length of the nut is a little less than 2 inches. The original tree is said to be in Bhujji (between Bilaspur and Rampur), 23 miles from Simla, in a hot, inclosed valley through which runs the Sutlej River. There may be a chance that the seeds will transmit the quality of the parent. (Spence.)

58670 to 58672.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received February 28, 1924. Notes by Mr. Wester.

58670. *AMPELOCISSUS MARTINI* Planch. Vitaceae.

Bika. A very attractive vine, with leaves dark green above and russet beneath. The vine dies to the ground when the fruits are ripe. The fruits are about the size of Delaware grapes, dark maroon to almost black, in bunches sometimes containing over 200. The flesh is juicy and acid, with a rather biting aftertaste. Although inedible raw, the Americans in Cebu and Iloilo say that an excellent jelly is made from them.

58671. *CARICA PAPAYA* L. Papayaceae. Papaya.

This is one of the most remarkable papayas I have ever seen. The fruit is oblong, obviously a hermaphrodite type, medium in size, with thick flesh, a small cavity, and few seeds. The flesh is very firm, pale-flesh color except for a distinct greenish yellow "rind" about an eighth of an inch thick, and of good quality. It will probably ship better than the average soft papaya.

58672. *CITRUS NOBILIS DELICIOSA* (Ten.) Swingle. Rutaceae. Mandarin orange.

This mandarin, imported from China, is the best flavored citrus fruit I ever have eaten.

58673 and 58674.

From Perth, Western Australia. Seeds presented by S. L. Kessell, conservator of forests. Received March 1, 1924.

58673. *BORONIA MEGASTIGMA* Nees. Rutaceæ.

A very slender bushy shrub about 2 feet high, from the swampy regions of Western Australia. The rather scanty foliage consists of small compound leaves having very narrow leaflets; the numerous axillary flowers are very fragrant, maroon-purple on the outside and greenish yellow within. (Adapted from *Curtis's Botanical Magazine*, pl. 6046.)

58674. *LESCHENAUTIA BILOBA* Lindl. Goodeniaceæ.

A low shrub, 2 to 3 feet high, with slender, scattered leaves half an inch in length. The flowers are either in small clusters in the upper axils or else borne in a large, leafy, terminal cluster. The corolla, about an inch long, has spreading, dark-blue wings marked with parallel, transverse veins, and the sepals are narrow like the leaves. This species is native to Western Australia. (Adapted from *Bentham, Flora Australiensis*, vol. 4, p. 42.)

58675 to 58691. *ALLIUM* spp. Liliaceæ.

From Nancy, France. Seeds presented by Prof. Edmond Gain, director, botanic garden. Received February 28, 1924.

Introduced for horticulturists studying the food possibilities of the genus.

58675. *ALLIUM ANGULOSUM* L.

A rather variable species, distributed from eastern Europe through Siberia in dry rocky places. It is usually a low plant, with narrow leaves and a hemispherical head of lilac-purple flowers.

58676. *ALLIUM CARINATUM* L.

The leaves of this European species are narrowly linear, and the lilac-purple flowers are produced in a comparatively large head. It is found throughout southern Europe, especially in the Alps.

58677 and 58678. *ALLIUM CEPA* L. Onion.

58677. Common onion.

58678. Var. *bulbellifera*. A form which has bulbels in the place of flowers.

58679. *ALLIUM FISTULOSUM* L. Welsh onion.

A Siberian species which differs from the common onion in having no distinct bulb, but only an enlarged base or crown; the leaves are usually more clustered.

58680. *ALLIUM GLOBOSUM* Bieb.

The bulbs of this species are almost cylindrical, with an oblique base, and the very narrow, almost filiform leaves are shorter than the scape, which is 8 to 12 inches high. The petals are pink or white marked with a red middle stripe. Native to southeastern Europe.

58681. *ALLIUM MOLY* L.

A bulbous species with broad, glaucous leaves and scapes 10 to 15 inches high. The bright-yellow flowers are in compact heads. Native to southern Europe.

58682. *ALLIUM NARCISSIFLORUM* Vill.

An elegant Italian species about 9 inches high with nodding heads of beautiful rose-colored flowers.

58683. *ALLIUM NUTANS* L.

A Siberian species with narrow leaves, all radical, and two nodding flower heads.

58675 to 58691—Continued.

58684. *ALLIUM OBLIQUUM* L.

A species cultivated in Siberia as a substitute for garlic.

58685. *ALLIUM PORRUM* L. Leek.

58686. *ALLIUM SATIVUM* L. Garlic.

58687. *ALLIUM SCHOENOPRASUM* L. Chives.

A European species with numerous, slender, awl-shaped leaves and a globular head of light-purple flowers.

58688. *ALLIUM SCORODOPRASUM* L.

Rocambold. This species grows wild in Greece and was formerly cultivated in England for the same purposes as garlic. Its bulbs are smaller than those of garlic, milder in taste, and are produced at the tip of the stem as well as at the base.

58689. *ALLIUM SPURIUM* Don.

A rather variable species, distributed from eastern Europe through Siberia in dry rocky places. It is usually a low plant, with narrow leaves and a hemispherical head of lilac-purple flowers.

58690. *ALLIUM URSINUM* L.

A wild European onion which grows in large masses in the open woods. When in flower it is very effective, clothing the ground with its broad green leaves, above which the numerous umbels of white flowers are borne on scapes a foot high.

58691. *ALLIUM VICTORIALIS* L.

One of the most distinct species of European *Alliums*, with stems about a foot and a half high and leaves resembling those of the lily-of-the-valley. The white or greenish white flowers are produced in May.

58692 to 58718.

From Paris, France. Seeds presented by Prof. D. Bois, Museum of Natural History. Received February 29, 1924.

A collection of leguminous plants and grasses obtained for forage-crop specialists.

58692 to 58694. *ASTRAGALUS* spp. Fabaceæ.

58692. *ASTRAGALUS ALOPECUROIDES* L.

An erect, pubescent, Siberian species 2 to 5 feet in height, with narrowly oval leaves and yellow flowers produced in thick, oblong spikes.

58693. *ASTRAGALUS BOEOTICUS* L.

An upright, often stout annual, with compound leaves usually composed of 9 to 15 pairs of very narrow leaflets, and 6 to 15 pale-yellow flowers in a crowded raceme. Native to the Mediterranean countries.

58694. *ASTRAGALUS PONTICUS* Pall.

A hairy stemmed species with dense, axillary flower heads. Native to southern Russia.

58695. *BRACHYPODIUM DISTACHYUM* (L.) Beauv. Poaceæ.

A low, tufted annual grass, native to the Mediterranean countries, which deserves trial in the Pacific Coast States.

58696. *CAMPYLOTROPIS MACROCARPA* (Bunge) Rehd. (*Lespedeza macrocarpa* Bunge). Fabaceæ.

A Chinese shrub closely allied to the *Lespedeza*, which becomes 6 feet in height, with long-stalked leaves, oval leaflets, and many-flowered racemes of purple flowers.

For previous introduction, see S. P. I. No. 43679.

58692 to 58718—Continued.

58697. *CORONILLA EMERUS* L. Fabacæ.
Scorpion-senna.

A dense, half-hardy, symmetrical shrub, native to southern Europe, 3 to 5 feet high, with deep glossy-green compound leaves and large, showy flowers which are yellow, tipped with red. In warm regions this species is evergreen.

58698. *CORONILLA MONTANA* Scop. Fabacæ.

An erect, smooth yellow-flowered perennial species, with the flowering stems twice as long as the leaves, found in the mountainous regions of the Caucasus.

58699. *DINEBRA ARABICA* Jacq. Poacæ. Grass.

A laxly caespitose, somewhat rigid annual, branched from the base, with the culms sometimes prostrate, sometimes ascending or obliquely erect, 1 to 18 inches long. Native to tropical Africa and the East Indies.

For previous introduction, see S. P. I. No. 49517.

58700. *FESTUCA AMETHYSTINA* L. Poacæ.
Grass.

A densely caespitose perennial grass with fibrous roots, stout culms, and very narrow leaves. Native to central and southeastern Europe.

58701. *HIPOCREPIS CILIATA* Willd. Fabacæ.

A low annual, with very narrow leaflets and small, pealike, yellow flowers. Native to the Mediterranean countries.

58702 to 58704. *LOTUS* spp. Fabacæ.

58702. *LOTUS EDULIS* L.

A more or less hairy annual with ascending or erect branched stems 4 to 16 inches long, short-stemmed grayish green leaflets, and large, yellow flowers in few-flowered heads. It grows only in sandy areas in the Mediterranean region.

For previous introduction, see S. P. I. No. 56668.

58703. *LOTUS ORNITHOPODOIDES* L.

A hairy annual with branched ascending or decumbent stems, mostly 4 to 12 inches long, native to grassy places in the Mediterranean region. The yellow flowers are in clusters of two to five.

For previous introduction, see S. P. I. No. 51866.

58704. *LOTUS SILIQUOSUS* L.

A perennial, herbaceous, hairy plant, with a compact base and slender runners. The stems, branched at the base, are mostly about a foot long and either decumbent or ascending. The solitary flowers are bright yellow. Native to northern and eastern Europe.

58705. *MEDICAGO TORNATA* Mill. Fabacæ.

An annual species, native to Italy, with several slender branching stems a foot and a half long, and small, solitary, yellow flowers. The broad, flat, lunate pods are filled with kidney-shaped seeds.

58706. *MELICA ALTISSIMA* L. Poacæ. Grass.

A climbing perennial grass with stout culms narrow long-pointed leaves, and racemelike, elongate panicles. Native to southeastern Europe and west-central Asia.

58707. *PISUM ELATIUS* Bieb. Fabacæ.

A hardy annual, about 5 feet high, with leaves composed of one to three pairs of narrow leaflets, and purple flowers. Native to woods and thickets in the alpine regions of Europe.

58692 to 58718—Continued.

58708. *POA CAESIA* J. E. Smith. Poacæ. Grass.

A densely caespitose perennial grass, native to Europe, with flowering stems 1 or 2 feet high and leaves resembling those of Kentucky bluegrass (*Poa pratensis*). It grows very freely, seeding itself.

For previous introduction, see S. P. I. No. 53156.

58709. *SCLEROPOA RIGIDA* (L.) Griseb. (*Festuca rigida* Kunth). Poacæ. Grass.

An annual tufted grass, up to a foot in height, with linear, sharp-pointed leaves and rigid panicles. Native to Asia Minor.

58710. *SCORPIURUS SUBVILLOSA* L. Fabacæ.

A decumbent or ascending annual with one to three stems up to 20 inches in length, long-stemmed, simple, grass-green narrow leaves, and small, yellow flowers. Native to the Mediterranean countries.

58711. *SCORPIURUS SULCATA* L. Fabacæ.

A species very similar to the preceding (*S. subvillosa*, S. P. I. No. 58710), differing chiefly in having mostly a 3-flowered umbel and in the sepals being shorter than the calyx tube. Native to the Mediterranean countries.

58712. *TRIFOLIUM BADIUM* Schreb. Fabacæ.
Clover.

An herbaceous perennial clover with flower-bearing stems and also leaf rosettes which do not bear flowers. The stems are mostly 4 to 8 inches long, upright, or ascending. The bright-yellow flowers become brown when dried. Native to rocky places in alpine regions of Europe.

58713. *TRIFOLIUM SQUARROSUM* L. Fabacæ.
Clover.

An upright or ascending robust annual, with branches up to 30 inches in length, native to the Mediterranean countries. The pink or white flower heads are oval when young, becoming more elongated later.

For previous introduction, see S. P. I. No. 56272.

58714 to 58717. *TRIGONELLA* spp. Fabacæ.

58714. *TRIGONELLA CORNICULATA* L.

An annual fodder plant, distributed from southern Europe to Africa and India. It is upright in habit, 4 to 20 inches high, with spreading branches. The elongate or obovate leaflets are greenish white beneath, and the yellow flowers are in racemes.

58715. *TRIGONELLA CRETICA* (L.) Boiss.

A yellow-flowered annual species with ascending stems, obovate leaves, and very short pods. Native to Asia Minor.

58716. *TRIGONELLA MONSPELIACA* L.

A rather low annual species, usually 2 to 8 inches high, with soft pubescence and with a pronounced coumarin odor. The leaflets are gray-green, and the sessile, yellow flowers are very small. Native to the Mediterranean countries.

58717. *TRIGONELLA POLYCEPATA* L.

A prostrate or ascending annual, usually 1 or 2 feet high, with obovate leaflets and yellow flowers in small umbellike clusters. Native to southern Europe and northern Africa.

58718. *VICIA DASYCARPA* Ten. Fabacæ. Vetch.

An annual species which is closely related to the hairy vetch (*V. villosa*); some varieties of it, however, have an earlier season than hairy vetch and are of special value for the Southern States.

For previous introduction, see S. P. I. No. 50318.

58719 to 58724. CASTANEA MOLLISSIMA
Blume. Fagaceæ.

From Nanking, China. Seeds presented by Prof. J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received March 11, 1924. Notes by Professor Reisner.

Introduced in connection with experiments to obtain a blight-resistant strain of chestnut.

58719 and 58720. Secured by Rev. S. Emmet Stephens, Tsingtao, Shantung.

58719. *Tsili*. From Taianhsien Kinkou, Shantung.

58720. From Chuchenghsien, Shantung.

58721 to 58723. Secured by Rev. H. G. Romig, Tanghsien, Shantung.

58721. From Tanghsien, Shantung.

58722. From Yencheng, Shantung.

58723. From Peihhsien, Shantung.

58724. Secured by Rev. J. E. Shoemaker, Kuyao, Chekiang, from Shanyu, Chekiang.

58725 to 58730.

From Addis Ababa, Abyssinia. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received February 26 and March 14, 1924. Field notes by Doctor Harlan.

Collected in Modjo, Abyssinia.

58725. *ANDROPOGON CERESIAEFORMIS* Nees. Poaceæ. Grass.

(No. 298. November 11, 1923.) Used for thatching.

A tufted perennial, erect or ascending grass with very slender stems 1 to 4 feet long. Native to South Africa.

58726. *ANDROPOGON* sp. Poaceæ. Grass.

(No. 305. November, 1923.) Seeds of a wild roadside grass.

58727. *AVENA ABYSSINICA* Hochst. Poaceæ. Oats.

(No. 292. November 11, 1923.) Selected in a field of mixed oats and barley; said to be seeded with the barley.

58728. *AVENA STRIGOSA* Schreb. Poaceæ. Oats.

(No. 304. November, 1923.) Panicles from a field of barley.

58729. *BRASSICA* sp. Brassicaceæ.

(No. 317. November, 1923.)

58730. *CAPSICUM ANNUM* L. Solanaceæ. Red pepper.

(No. 318. November, 1923.)

58731. CHLORIS sp. Poaceæ. Grass.

From Paris, France. Seeds presented by Prof. D. Bois, Museum of Natural History. Received February 29, 1924.

Introduced for forage-crop specialists.

58732 to 58802.

From Addis Ababa, Abyssinia. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received February 26 and March 14, 1924. Notes by Doctor Harlan.

58732 and 58733. *CICER ARIETINUM* L. Fabaceæ. Chickpea.

58732. (No. 312. Modjo, Abyssinia. November, 1923.)

58732 to 58802—Continued.

58733. (No. 352. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.

58734. *CORIANDRUM SATIVUM* L. Apiaceæ. Coriander.

(No. 316. Modjo, Abyssinia. November, 1923.) A plant esteemed because of its fragrant capsules.

58735. *CUCURBITA MAXIMA* Duchesne. Cucurbitaceæ. Squash.

(No. 323. Modjo, Abyssinia. November, 1923.)

58736. *ERAGROSTIS ABYSSINICA* (Jacq.) Schrad. Poaceæ. Teff.

(No. 375. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.

58737. *ERAGROSTIS ABYSSINICA* (Jacq.) Schrad. Poaceæ. Teff.

(No. 296. Modjo, Abyssinia. November 11, 1923.) Grown as a cereal crop; preferred to all others for bread making.

58738. *GOSSYPIUM* sp. Malvaceæ. Cotton.

(No. 289. Lake Zwai, Abyssinia. November 5, 1923.) From Hans Jammash's ostrich farm.

58739. *GOSSYPIUM* sp. Malvaceæ. Cotton.

(No. 290. Lake Zwai, Abyssinia. November 5, 1923.) From Hans Jammash's ostrich farm.

58740 and 58741. *GUIZOTIA ABYSSINICA* (L. f.) Cass. Asteraceæ.

An annual plant, 6 to 8 feet high, with showy yellow flower heads. The black, shining seeds furnish the Niger oil of commerce.

58740. (No. 314. Modjo, Abyssinia. November, 1923.)

58741. (No. 344. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.

58742 to 58746. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceæ. Sorghum.

58742. (No. 291. Modjo, Abyssinia. November 11, 1923.) A wild sorghum, 3 or 4 feet high, found growing in fields and grasslands.

58743. (No. 306. Modjo, Abyssinia. November, 1923.) A loose-panicled sorghum grown here for the seeds.

58744. (No. 338. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.

58745. (No. 353. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.

58746. (No. 394. Molu. November 19, 1923.) From the banks of the Muger River.

58747 to 58755. *HORDEUM* spp. Poaceæ.

58747 and 58748. *HORDEUM DEFICIENS* Steud. Deficient barley.

58747. (No. 293. Modjo, Abyssinia. November 11, 1923.)

58748. (No. 339. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.

58749 to 58754. (Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.

58749. *HORDEUM VULGARE COELESTE* L. Six-rowed barley.

(No. 368.)

58732 to 58802—Continued.

- 58750 to 58754. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 58750. (No. 349.) 58753. (No. 372.)
 58751. (No. 351.) 58754. (No. 376.)
 58752. (No. 370.)
58755. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 (No. 392. Molu. November 19, 1923.) On the road to Gojam, 20 miles northwest of Addis Ababa.
58756. *HYPARRHENIA* sp. Poaceæ. Grass.
 (No. 379. Molu. November 19, 1923.) Found at an altitude of 8,000 feet.
58757. *LATHYRUS SATIVUS* L. Fabaceæ. Bitter vetch.
 (No. 309. Modjo, Abyssinia. November, 1923.)
- 58758 to 58760. *LENTILLA LENS* (L.) W. F. Wight. (*Lens esculenta* Moench.). Fabaceæ. Lentil.
 58758. (No. 297. Modjo, Abyssinia. November 11, 1923.)
 58759. (No. 343. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.
 58760. (No. 371. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.
- 58761 to 58764. *LINUM USITATISSIMUM* L. Linaceæ. Flax.
 58761. (No. 302. Modjo, Abyssinia. November 11, 1923.)
 58762 to 58764. (Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.
 58762. (No. 346.) 58764. (No. 374.)
 58763. (No. 373.)
58765. *PENNISETUM* sp. Poaceæ. Grass.
 (No. 380. Molu. November 19, 1923.) Found along the Muger River at an altitude of 7,000 feet.
58766. *PENNISETUM* sp. Poaceæ. Grass.
 (No. 391. Molu. November 19, 1923.) Found at an altitude of 7,500 to 8,000 feet.
- 58767 to 58770. *PHASEOLUS VULGARIS* L. Fabaceæ. Common bean.
 (Modjo, Abyssinia. November, 1923.)
 58767. (No. 328.) Picked in a garden.
 58768. (No. 333.) 58770. (No. 335.)
 58769. (No. 334.)
- 58771 to 58774. *PISUM SATIVUM* L. Fabaceæ. Pea.
 58771. (No. 315. Modjo, Abyssinia. November, 1923.) The seeds are mixed, bright violet and slate gray.
 58772. (No. 325. Modjo, Abyssinia. November, 1923.) Mottled and white.
 58773. (No. 355. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market. Large, green and white.
 58774. (No. 367. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market. Large, mixed brown, gray and mottled, the mottled one striking.
- 58775 to 58777. *PISUM SATIVUM* L. Fabaceæ. Pea.
 58775. (No. 295. Modjo, Abyssinia. November 11, 1923.) Common variety grown in pure culture.
 58776. (No. 310. Modjo, Abyssinia. November, 1923.)
 58777. (No. 347. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market. Color green.

58732 to 58802—Continued.

58778. *SESAMUM ORIENTALE* L. Pedaliaceæ. Sesame.
 (No. 350. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market. Local name, saleet.
58779. *SPOROBOLUS* sp. Poaceæ. Grass.
 (No. 378. Molu. November 19, 1923.) Collected at an altitude of 8,000 feet. Seeds almost as big as those of teff.
58780. *TRICHOLAENA* sp. Poaceæ. Grass.
 (No. 390. Molu. November 19, 1923.) Found along the Muger River.
58781. *TRIGONELLA FOENUM-GRÆCUM* L. Fabaceæ. Fenugreek.
 (No. 369. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market. A small-seeded legume.
- 58782 to 58796. *TRITICUM* spp. Poaceæ.
 58782 to 58787. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Common wheat.
 58782. (No. 299. Modjo, Abyssinia. November 11, 1923.) This type of wheat is ripening now.
 58783. (No. 303. Modjo, Abyssinia. November 12, 1923.) Several types of spikes, two of which had bright-violet kernels.
 58784. (No. 326. Modjo, Abyssinia. November, 1923.)
 58785. (No. 340. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market. Color purple and white.
 58786. (No. 345. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.
 58787. (No. 366. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.
- 58788 and 58789. *TRITICUM DICOCCUM* Schrank. Emmer.
 58788. (No. 311. Modjo, Abyssinia. November, 1923.) Mostly white.
 58789. (No. 324. Modjo, Abyssinia. November, 1923.) Black.
- 58790 and 58791. *TRITICUM DURUM* Desf. Durum wheat.
 58790. (No. 313. Modjo, Abyssinia. November, 1923.) Including spikes with violet kernels.
 58791. (No. 348. Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.
58792. *TRITICUM POLONICUM* L. Polish wheat.
 (No. 320. Modjo, Abyssinia. November, 1923.)
- 58793 to 58796. *TRITICUM DURUM* Desf. Durum wheat.
 (Addis Ababa, Abyssinia. November 17, 1923.) Purchased in the market.
 58793. (No. 337.)
 58794. (No. 341.) White.
 58795. (No. 342.) Purple.
 58796. (No. 354.)
58797. (Undetermined.)
 (No. 377. Molu. November 19, 1923.) A wild leguminous plant collected on the banks of the Muger River at an altitude of about 7,000 feet.

58732 to 58802—Continued.

58798 and 58799. *Vicia faba* L. Fabaceæ.

Broad bean.

58798. (No. 294. Modjo, Abyssinia. November 11, 1923.) Plants found scattered in a maize field.

58799. (No. 321. Modjo, Abyssinia. November, 1923.)

58800. *Vigna cylindrica* (Stickm.) Skeels. Fabaceæ.

Catjang.

(No. 300. Modjo, Abyssinia. November 11, 1923.) An especially heavily seeded bean.

58801 and 58802. *Zea mays* L. Poaceæ. Corn.

58801. (No. 301. Modjo, Abyssinia. November 11, 1923.)

58802. (No. 332. Modjo, Abyssinia. November, 1923.)

58803 to 58808.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, regius keeper, Royal Botanic Garden. Received March 12, 1924.

Introduced for horticulturists experimenting with small fruits.

58803. *Berberis virescens* Hook. f. Berberidaceæ.

Barberry.

The outstanding features of this Himalayan barberry are its elegant habit and the red tinge of its stems in winter. It is a deciduous shrub 6 to 9 feet in height, with smooth, reddish, shining branches, slender spines sometimes three-fourths of an inch in length, bright-green leaves, pale sulphur-yellow flowers, and slender reddish berries.

58804. *Ribes petraeum* Wulf. Grossulariaceæ.

Var. *biebersteini*. This variety of red currant is from the Caucasus, where it forms an upright shrub about 8 feet in height, with 5-lobed, heart-shaped leaves, reddish flowers, and red or dark-purple, acid fruits.

For previous introduction, see S. P. I. No. 52708.

58805. *Ribes warszewiczii* Jancz. Grossulariaceæ.

This Siberian species is closely allied to the northern red currant (*Ribes rubrum*) and bears large, purplish black, very acid fruits. It is an unarmed shrub about 5 feet high, with pinkish flowers in pendent racemes 2 inches in length.

58806. *Rubus idaeus* L. Rosaceæ. Raspberry.

Var. *leesi*. A simple-leaved form of the European red raspberry.

58807. *Viburnum burejaeticum* Regel and Herd. Caprifoliaceæ.

A northern Chinese species allied to the Wayfaring tree (*Viburnum lantana*); the flowers are produced in dense cymes 2 inches across, and the fruits are ovoid and bluish black.

For previous introduction, see S. P. I. No. 57366.

58808. *Viburnum rhytidophyllum* Hemsl. Caprifoliaceæ.

A hardy evergreen shrub about 10 feet in height, which is one of the most striking of all the viburnums because of its bold, wrinkled, shining leaves and red fruits. The leaves are sometimes over 7 inches in length, and the dull-white flowers are in large terminal clusters 4 to 8 inches across. Native to central and western China.

For previous introduction, see S. P. I. No. 53750.

58809. *Prunus armeniaca* L. Amygdalaceæ. Apricot.

From Tripoli, Libia, North Africa. Seeds presented by E. O. Fenzi. Received March 13, 1924.

Ain thor (bull's eye); also bergsam. A very large tree, taller and more vigorous than any other kind; leaves thin, irregularly toothed; fruit globular, with hardly any groove, weight 40 grams, diameter 40 millimeters; skin scarcely tomentose, reddish yellow, adhering closely to the flesh; flesh more juicy than that of any other kind, with flavor more like that of a plum than an apricot, adhering closely to the smooth stone. Not common. (Fenzi.)

58810. *Juglans insularis* Griseb. Juglandaceæ. Cuban walnut.

From Santiago de las Vegas, Cuba. Seeds presented by Prof. Gonzalo M. Fortun, acting director, Estación Experimental Agronómica. Received March 13, 1924.

Nuts collected in our arboretum from trees grown from seeds obtained near Trinidad, San Juan de Letran. (Fortun.)

This interesting Cuban tree is found in the mountainous sections of the island, sometimes at considerable elevations. I have seen it in the mountains near Trinidad, on the south coast, at an elevation of about 2,000 feet, growing among numerous other trees along the banks of a small stream. It seems, however, to be comparatively rare and does not occur in great numbers. It is erect and slender in habit, growing to a height of 40 or more feet, with foliage somewhat finer than *Juglans nigra* of the United States. The nuts resemble those of *J. nigra* in size and appearance, though sometimes smaller. The kernels, however, are removed with difficulty, the septæ being very thick and woody. In its present wild state the Cuban walnut, as it is called, does not seem of great horticultural value, but with a little improvement by selection it might become an excellent nut for tropical regions. It has been suggested that it might serve as a stock for the Persian walnut, making possible the culture of this species in Cuba and other tropical regions where it is not now successfully grown. (Wilson Popenoe, Bureau of Plant Industry.)

For illustrations of the tree and fruit, see the Journal of Heredity, vol. 6, p. 561, December, 1915.

For previous introduction, see S. P. I. No. 43052.

58811 to 58813.

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received March 13, 1924.

Introduced for horticulturists engaged in small-fruit breeding.

58811. *Ribes* sp. Grossulariaceæ.

No. 2706. Hers. From China.

58812. *Viburnum buddleifolium* C. H. Wright. Caprifoliaceæ.

A deciduous shrub about 6 feet high, with narrowly oblong, shallow-toothed leaves, downy beneath, 3 to 5 inches long; white, funnel-shaped flowers in cymes about 3 inches wide, and oval, black fruits about one-third of an inch long. Native to central China.

58813. *Viburnum rhytidophyllum* Hemsl. Caprifoliaceæ.

For previous introduction and description, see S. P. I. No. 58808.

58814. *Trifolium pratense* L. Fabaceæ. Red clover.

From Warsaw, Poland. Seeds presented through Leo J. Keena, American consul general. Received March 15, 1924.

Locally grown seeds introduced for clover specialists.

58815. SOLANUM TUBEROSUM L. Solanaceae. Potato.

From Trujillo, Peru. Tubers presented by A. Martin Lynch. Received March 15, 1924.

These are considered the standard variety for northern Peru. They appear to be drought resistant. (Lynch.)

The yellow-fleshed potato is one of the most interesting varieties found in the Andean Region, home of many remarkable potatoes. The tubers are rather small and have deep eyes, so that they are not as easily prepared for the table as some other varieties; but in point of quality they yield to none that I have tasted. The flesh is the color of American butter and has a rich, nutty flavor suggesting that of the chestnut. It seems to me the variety might be improved, so as to do away with the objectionable deep eyes, and it would then be worth extensive cultivation. (Wilson Popenoe, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 56803.

58816. ZEA MAYS L. Poaceae. Corn.

From Addis Ababa, Abyssinia. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received February 26, 1924.

(No. 336. November 17, 1923.) Purchased in the market. (Harlan.)

58817 to 58839.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received March 15, 1924. Notes by Mr. Rock.

58817. ACER SP. Aceraceae. Maple.

(No. 11424. November, 1923.) A tree 60 to 80 feet tall, with a large crown and a trunk about 3 feet in diameter, which grows along watercourses at the foot of the Likiang Snow Range at an altitude of about 9,000 feet.

58818. BENZOIN SP. (Lindera sp.). Lauraceae.

(No. 11384. Champutung. November, 1923.) A tree 25 feet high from the Salwin Valley, Tibetan border, at 8,000 feet altitude. The oval, acute, pubescent leaves are brown beneath, and the red ovoid fruits are fragrant. This is similar to the Tengyueh species (S. P. I. No. 56292).

58819. CASTANOPSIS SP. Fagaceae.

(No. 11491. Lautchunshan. November, 1923.) A tree about 50 feet tall, which grows in forests at 8,000 feet altitude. The leathery, serrate leaves are oblong and acuminate, and the small nuts are in thick spikes.

58820. COTONEASTER SP. Malaceae.

(No. 11360. Karila. December, 1923.) A shrub or small tree, about 20 feet high, growing in a deciduous forest at 12,000 feet altitude. It has small, oval leaves and black fruits.

58821. COTONEASTER SP. Malaceae.

(No. 11431. November, 1923.) A shrub about 5 feet high from the drier slopes of the Likiang Snow Range at an altitude of about 10,000 feet. It has small, oval leaves, pale beneath, and globose, scarlet fruits.

58822. ERIOBOTRYA SP. Malaceae.

(No. 11451. Sungkwe. November, 1923.) An attractive shrub 4 feet high, found in rather dry places at 8,000 feet altitude. It has pale-green, roundish, serrate leaves and corymbs of carmine fruits.

58823. EUONYMUS SP. Celastraceae.

(No. 11394. Ganhaitze. November, 1923.) A tree about 40 feet high, from the eastern slopes of the Likiang Snow Range, where it grows at an altitude of 10,000 feet. The leaves are rich green, and the pink fruits, with dark-red seeds, are in large umbels.

58817 to 58839—Continued.**58824. JUNIPERUS SP. Pinaceae. Juniper.**

(No. 11353. November, 1923.) A tree 50 feet tall, with dark-green branches, which covers the eastern slopes of Peimashan at altitudes of 13,000 to 15,000 feet on the Yangtze-Mekong Divide. The glaucous fruits are deep bluish black.

58825. JUNIPERUS SP. Pinaceae. Juniper.

(No. 11475. November, 1923.) A shrub 8 feet high which grows in rocky limestone soil opposite the Likiang Snow Range at an altitude of about 9,000 feet. It has globose, orange-red fruits.

58826. MAGNOLIA SP. Magnoliaceae.

(No. 11215. Mount Kenichunpu. October, 1923.) A tree 30 feet high, from the Salwin-Irrawaddy Divide, where it grows at an altitude of 12,000 feet. It has large white flowers and very large leaves, 1 or 2 feet long and a foot broad, glaucous beneath.

58827. MAGNOLIA SP. Magnoliaceae.

(No. 11232. Mount Kenichunpu. October, 1923.) A very ornamental tree 35 feet high which grows at an altitude of 11,000 feet on the Salwin-Irrawaddy Divide, Tibetan border. It has small, oval, smooth leaves and large white flowers.

58828. MALUS YUNNANENSIS (Franch.) C. Schneid. (Pyrus yunnanensis Franch.). Malaceae.

(No. 11398. Ganhaitze. November, 1923.) A very attractive tree about 25 feet high, which grows in forests at an altitude of 11,000 feet. It has yellowish red fruits the size of cherries and large, crenate, hairy leaves.

58829. NOMOCHARIS PARDANTHINA Franch. Liliaceae.

(No. 10249. Champutung. October, 1923.) A beautiful liliaceous plant about 3 feet high, which grows on grassy slopes on the outskirts of forests in the Salwin Valley, at an altitude of about 9,000 feet. The leaves are ternate and the large flowers, white, pink, purple, or red, with deep irregular purple blotches, have salver-shaped corollas.

58830. OSMANTHUS SP. Oleaceae.

(No. 11444. November, 1923.) An exceedingly handsome shrub about 4 feet in height from an altitude of 10,000 feet on the Likiang Snow Range. It has small, oval, serrate leaves, numerous cream-colored flowers, and ovoid, blue-black fruits.

58831. PHOTINIA SP. Malaceae.

(No. 11479. Saba. November, 1923.) A small tree, 10 feet in height, growing in a forest on the Likiang Snow Range at 11,000 feet altitude. The oblong, glossy leaves have red midribs and petioles. The flowers are white and the rich-crimson fruits are in large corymbs.

58832. PRUNUS SP. Amygdalaceae. Cherry.

(No. 11221. Champutung. October, 1923.) A red-flowered tree 15 feet high, from an altitude of about 13,000 feet in the Salwin Valley. The fruits are ovoid and red.

58833. PRUNUS SP. Amygdalaceae. Cherry.

(No. 11237. Mount Kenichunpu. October, 1923.) A dwarf cherry which grows as a shrub 4 feet high at an altitude of about 13,000 feet on the Salwin-Irrawaddy Divide, Tibetan border. It has oval, serrate leaves, red flowers, and ovoid black fruits.

58834. PYRUS SP. Malaceae. Pear.

(No. 11480. November, 1923.) A tree 20 feet high, found along stream beds at the foot of and on the slopes of the Likiang Snow Range at about 10,000 feet altitude. It is a handsome species, with large crenate leaves white-tomentose beneath, white flowers, and yellowish red fruits the size of a cherry.

58817 to 58839—Continued.

58835. *Pyrus* sp. Malacææ.

Pear.

(No. 11492. Lauchunshan. November, 1923.) A handsome tree about 25 feet high, with leaves white hairy beneath and corymbs of red fruits. It grows at an altitude of about 10,000 feet.

58836. *SLOANEA* sp. (*Echinocarpus* sp.). Elæocarpaceæ.

(No. 11236. Mount Kenichunpu. October, 1923.) A very ornamental tree 30 feet high, which grows on the Salwin-Irrawaddy Divide, at 9,000 feet altitude. The oblong, crenate leaves are hairy beneath, and the fruit capsules are covered with pale, straw-colored bristles.

58837. *Sorbus* sp. Malacææ.

(Karla. December, 1923.) A deciduous tree 20 feet high which grows at an altitude of 13,000 feet. It has white fruits with a pinkish tinge.

58838. *TSUGA FUNNANENSIS* (Franch.) Masters. Pinacææ. Hemlock.

(No. 11493. November, 1923.) A tall tree, 80 feet or more in height, with a straight trunk about 5 feet in diameter and small cones, which grows in mixed forests on the western slopes of the Likiang Snow Range at 10,000 feet altitude.

58839. (Undetermined.)

(No. 11359. December, 1923.) A very handsome tree about 50 feet tall, which is common on rocky slopes of the Yangtze River embankments at Gohinda, north of Luku. It has glossy, dark-green, crenate leaves, large terminal corymbs of small white flowers, and very attractive crimson fruits.

58840. *CITRUS GRANDIS* (L.) Osbeck. Rutacææ. Grapefruit.

From Ancon, Canal Zone. Budwood presented by W. T. Robertson, Pedro Miguel, Canal Zone, through James Zetek, Ancon. Received March 21, 1924.

This is a rare and interesting variety of grapefruit, said to produce fruits with juicy flesh of blood-red color. Its origin is uncertain, but it seems probable that it was brought from Asia in the early days of trans-Isthmian travel. Red-fleshed grapefruits or pomelos are common in India, but they usually lack juice and are very different from the grapefruit of Florida in general character. Some of the Indian varieties have been introduced into the United States, where they have failed to become popular. A pink-fleshed grapefruit, which originated in Florida as a bud sport from one of the standard commercial sorts, has met with a more favorable reception, but has not attained commercial importance.

If the variety which Mr. Robertson has sent proves to be of good quality and at the same time has flesh of attractive red color, it should prove a novelty of much interest. In forwarding the budwood his letter states: "In one of the oldest towns of the Republic of Panama, about 8 miles from the canal, I found three trees of the blood-red grapefruit. I was told by one of the oldest inhabitants that these were the original trees, all the others in the vicinity being seedlings from them. These three trees have never been cared for, but were simply planted and allowed to grow up in the jungle, without pruning, spraying, or fertilizing. They appear to be at least 40 years old and are about 50 feet high."

58841. *FRAGARIA* sp. Rosacææ.

Strawberry.

From Woodbridge, England. Plants purchased from R. C. Notcutt. Received March 26, 1924.

"*Dreadnought*. Plant of close, compact growth; fruit large, of excellent flavor; season medium." (Notcutt, 1923-24 Catalogue, p. 10.)

Introduced for horticulturists engaged in strawberry breeding.

58842 to 58849. *FRAGARIA* spp. Rosacææ. Strawberry.

From Bedford, England. Plants purchased from Laxton Bros. Received March 26, 1924. Quoted notes from the catalog of Laxton Bros., unless otherwise stated.

58842. *FRAGARIA* sp.

"*Black Prince*. Very early, with small, dark-colored fruits of good flavor; much grown for earliest supplies for preserving."

For previous introduction, see S. P. I. No. 56160.

58843. *FRAGARIA* sp.

"*Elton Pine*. A very late, hardy variety which bears well. The somewhat acid fruits are useful for preserving."

58844. *FRAGARIA* sp.

"*Grove End Scarlet*. An old, well-known, midseason variety. The small, round fruits are preserved whole."

58845. *FRAGARIA* sp.

Ruskin. A variety said to be grown for jam making in the Clyde Valley, Scotland.

58846. *FRAGARIA* sp.

"*Sir Joseph Paxton*. The main-crop variety most widely grown for market. Fruit rich crimson, with firm flesh."

58847. *FRAGARIA* sp.

"*The Duke*. A very vigorous variety which will grow in almost any soil where strawberries can be cultivated. It is earlier and bears a heavier crop of better flavored fruits than the 'Royal Sovereign.' The fruit is brilliant scarlet, conically oval, and borne on long, erect trusses. The flesh is highly flavored and firm, so that the berries ship well. The variety is excellent for forcing."

58848. *FRAGARIA* sp.

"*The Earl*. This may be best described as a much-improved *Vicomtesse de Thury*, larger in size, more vigorous, and free cropping. Season late." (*Bunyard's Catalogue of Fruit Trees*.)

For previous introduction, see S. P. I. No. 56171.

58849. *FRAGARIA* sp.

"*Vicomtesse H. de Thury*. An early variety, with small, rich-flavored fruits; much grown for preserving."

58850. *ANNONA DIVERSIFOLIA* Safford. Annonacææ. Ilama.

From El Barranquillo, Guatemala. Seeds purchased from Fernando Carrera, through Philip Holland, American consul, city of Guatemala, Guatemala. Received March 20, 1924.

For several years this office has been engaged in establishing the ilama in southern Florida, where the first fruits were produced by trees at the Miami Plant Introduction Garden in the summer of 1923. Our experience up to the present indicates that this species seems likely to prove much better adapted to the climatic conditions of that region than the cherimoya (*Annona cherimola*).

The ilama may be termed the cherimoya of the lowlands. The cherimoya does not succeed in the Tropics unless grown at altitudes of 4,000 to 6,000 feet, where the climate is cool. The ilama, on the other hand, belongs to the lowlands, but is strikingly similar in character to a good cherimoya. It is a valuable recruit and one which can not be too strongly recommended for cultivation throughout the Tropics. (Wilson Popenoe, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 58030.

58851. CRYPTOSTEGIA GRANDIFLORA R.
Br. Asclepiadaceae. Palay rubber.

Growing at the Chapman Field Plant Introduction Garden, Coconut Grove, Fla., under P. I. G. No. 514. Numbered March, 1924.

Introduced for trial as a source of rubber.

An erect, woody climber of unknown nativity, but now cultivated in many places in the Tropics of both hemispheres as an ornamental, and occasionally growing as an escape from cultivation. The flowers, reddish purple becoming pale pink, are about 2 inches across and are produced in short spreading cymes. In India the plant is called palay and is cultivated for the rubber obtained from the juice.

58852 and 58853.

From Brooklyn, N. Y. Seeds presented by the curator of plants, Brooklyn Botanic Garden. Received March 20, 1924.

58852. LOTUS REQUIENI Mauri. Fabaceae.

A hairy leguminous perennial, of erect or ascending habit, native to Italy, introduced for forage-crop specialists.

58853. PHALARIS ARUNDINACEA L. Poaceae.
Ribbon grass.

Var. *picta*. The typical form of this species has proved a promising forage grass for wet land in the northern Pacific Coast States and also in the western Rocky Mountain region. This variety has been obtained for forage-crop specialists.

58854. TRIFOLIUM FRAGIFERUM L. Fabaceae.

From Sydney, New South Wales. Seeds presented by A. J. Bristol, Takoma Park, D. C., through A. J. Pieters, Bureau of Plant Industry. Received August, 1922. Numbered March, 1924.

Shearman's clover was accidentally discovered at Fullerton Cove near New Castle, New South Wales, by a man named Shearman. The Australian literature gives the information that it is a very rapidly growing plant and does well in moist situations. It appears to be a sport from *Trifolium fragiferum*, at least all its morphological characters point to such a conclusion. The variety is largely sterile, although not wholly so, since some seeds have been found at the Arlington Farm, Va., and in Oregon and Idaho.

The probable use of this plant will be as a leguminous grazing crop in permanent pastures. The lack of an abundant seed supply will prevent its use as a rotation crop. (Pieters.)

For previous introduction, see S. P. I. No. 56551.

58855 to 58858. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Warsaw, Poland. Seeds presented through Leo J. Keena, American consul general. Received March 27, 1924.

Locally grown seeds introduced for clover specialists.

58855. From Pultusk, near Warsaw.

58856. From Nowo Radomskie.

58857. From Bonskie.

58858. From Lomzynskie.

58859 to 58862. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Moravia, Czechoslovakia. Seeds presented by Dr. Rudolf Kuraz, agricultural attaché, Czechoslovak Legation, Washington, D. C. Received March 20, 1924.

Locally grown strains introduced for clover specialists.

58859 to 58862—Continued.

58859. From Hrotovicko.

58860. From Trebic.

58861. From Pribor.

58862. From Mor. Budejovice.

58863 to 58865.

From Glasnevin, Dublin, Ireland. Seeds presented by the director, Royal Botanic Gardens. Received March 20, 1924.

Introduced for forage-crop specialists.

58863. ERODIUM TRICHOMANEFOLIUM L'Her. Geraniaceae.

A low herbaceous perennial, 4 to 6 inches high, native to hilly places in Syria. The narrowly oblong leaves are deeply cut, and the flowers are flesh colored, marked with darker veins.

58864. ERODIUM sp. Geraniaceae.

Received as *Erodium willthominianum*, for which a place of publication has not been found.

58865. PIPTANTHUS NEPALENSIS (Hook.) Sweet. Fabaceae.

A fairly hardy evergreen climber, native to southwestern China and northeastern India, which becomes about 10 feet in height, with deep-green trifoliate leaves and handsome yellow flowers an inch or more in length.

For previous introduction, see S. P. I. No. 49645.

58866 to 58898.

From Kew, England. Seeds presented by Dr. Arthur W. Hill, director, Royal Botanic Gardens. Received March 20, 1924.

Introduced for agronomists experimenting with crop plants.

58866. AGROPYRON PUNGENS (Pers.) Roem. and Schult. Poaceae. Grass.

A wide-creeping grass, with stout, white runners and stems about a foot high. The leaf blades are compact and often bristly. Native to sandy places along the seacoast of southern Europe.

58867. AGROSTIS sp. Poaceae. Grass.

The genus *Agrostis* contains a number of species important as forage grass. This species was received as *Agrostis canina*, but does not agree with material in the National Herbarium; it will be tested by department agronomists.

58868 to 58896. ALLIUM spp. Liliaceae.

A collection of *Alliums* introduced for department horticulturists studying food possibilities of wild members of the genus.

58868. ALLIUM ALBOPHOSUM C. H. Wright.

A Transcasian species which has probably the largest flowers of the genus. The bulbs are large, and the strap-shaped leaves, 18 inches in length, have longitudinal lines of white hairs beneath and on the edges. The scape is nearly 2 feet high and bears large heads 9 inches across, each composed of from 60 to 80 deep-lilac flowers.

58869. ALLIUM CANADENSE L.

The well-known wild garlic, native to temperate North America. Because of its great variability and its rare seeding in the United States, seeds have been obtained from a foreign source.

58870. ALLIUM FISTULOSUM L. Welsh onion.

A Siberian species which differs from the common onion in having no distinct bulb, but only an enlarged base or crown; the leaves are usually more clustered.

For previous introduction, see S. P. I. No. 58679.

58866 to 58898—Continued.

58871. *ALLIUM GIGANTEUM* Regel.

One of the tallest members of the genus, becoming 4 feet in height. It is native to the Himalayas. The bulbs are large, and the fleshy leaves are about 18 inches in length. The bright-lilac flowers are in heads 4 inches in diameter.

58872. *ALLIUM GRANDE* Lipsky.

A Caucasian species with a scape 3 feet or more in height, wide-margined leaves 10 to 12 inches long, and many-flowered umbels of pinkish white flowers. (Adapted from *Acta Horti Petropolitani*, vol. 13, p. 343.)

58873. *ALLIUM HELDREICHII* Boiss.

A Grecian species, a foot or less in height, with thin terete leaves shorter than the scape and rosy flowers.

58874. *ALLIUM KARATAVIENSE* Regel.

A herbaceous plant with very broad, oval-oblong, flat leaves, and pink flowers borne in dense, convex umbels. The scapes are about 6 inches high. Native to Turkestan.

58875. *ALLIUM MACRANTHUM* Baker.

A handsome herbaceous perennial from the eastern Himalayas. The flat leaves are over a foot long, and the mauve-purple flowers are produced in clusters of 50 or more on scapes 2 feet high.

58876. *ALLIUM MONTANUM* F. W. Schmidt.

A rather variable species, distributed from eastern Europe through Siberia in dry rocky places. It is usually a low plant, with narrow leaves and a hemispherical head of lilac-purple flowers.

58877. *ALLIUM NEAPOLITANUM* Cirillo.

A southern European species, about a foot and a half high, with flat leaves and very ornamental white flowers.

58878. *ALLIUM NIGRUM* L.

A tall species, about 3 feet in height, native to southern Europe. The dull-violet or whitish flowers are produced in summer.

58879. *ALLIUM ODORUM* L.

This onion, which grows wild in Europe, is cultivated in Japan for its leaves, which are eaten as greens; in the spring the leaves are borne luxuriantly by the old bulbs, becoming about a foot in length.

For previous introduction, see S. P. I. No. 55442.

58880. *ALLIUM OSTROWSKIANUM* Regel.

This species, native to Turkestan, has rose-colored flowers produced freely in many-flowered umbels on scapes 6 inches high.

58881. *ALLIUM ROSEUM* L.

A plant about a foot in height, with strap-shaped leaves rolled inward at the top and pale lilac-rose flowers produced in umbels. Native to southern Europe.

58882. *ALLIUM SCORZONERAEFOLIUM* DC.

A species of unknown origin, cultivated in European gardens. It has very narrow concave leaves and small, yellow flowers in a few-flowered umbel.

58883. *ALLIUM SICULUM* Ucria.

A handsome biennial, native to Sicily, with broad, flat leaves and scapes 3 feet or more in height. The dull, purplish flowers are borne in drooping umbels. The species is characterized by a very strong odor when bruised.

58866 to 58898—Continued.

58884. *ALLIUM SIKKIMENSE* Baker.

A compact, neat little perennial 6 inches high or more, with grasslike leaves and loose umbels of deep-blue flowers. Native to Sikkim, India.

58885. *ALLIUM TUBERGENI* Freyn.

A species from Asia Minor with ovoid bulbs about an inch and a quarter long, oval or oval-lanceolate leaves about 10 inches long, and rosy red flowers produced on a scape nearly 2 feet high. (Adapted from *Mémoires de l'Herbier Bossier*, No. 13, p. 32.)

58886. *ALLIUM* sp.

Received as *Allium huteri*, for which a place of publication has not been found.

58887. *BETA TRIGYNA* Waldst. and Kit. Chenopodiaceæ.

Introduced for plant breeders.

A hardy herbaceous white-flowered perennial, about 3 feet in height, native to Hungary.

58888. *BETA VULGARIS* L. Chenopodiaceæ. Beet.

Seeds of what is said to be the wild form of the cultivated beet, introduced for cultural tests.

58889. *BRACHYPODIUM DISTACHYUM* (L.) Beauv. Poaceæ. Grass.

For previous introduction and description, see S. P. I. No. 58695.

58890. *BRACHYPODIUM PINNATUM* (L.) Beauv. Poaceæ. Grass.

A perennial grass native to Europe, having much the same general habits as timothy. It will probably prove a valuable plant for semiarid places.

58891 to 58893. Introduced for strawberry specialists.

58891. *DUCHESNEA INDICA* (Andrews) Focke (*Fragaria indica* Andrews.). Rosaceæ.

English-grown seed of an Eurasian plant common as a weed in the United States.

58892. *FRAGARIA CALIFORNICA* Cham. and Schlecht. Rosaceæ. Strawberry.

A wild strawberry from the Coast Range of California, with light-green, hairy leaflets, flowers in pairs, and globose white fruits about one-third of an inch in diameter.

58893. *FRAGARIA* sp. Rosaceæ. Strawberry.

Received as *Fragaria chinensis*, for which a place of publication has not been found.

58894. *LATHYRUS NIGER* (L.) Bernh. Fabaceæ.

An erect or ascending, slender, branched species 1 or 2 feet in height, with light-green leaflets and small, blue flowers. It has short rootstocks and succeeds well in partial shade. Native to central Europe.

58895. *PHALARIS BULBOSA* Jusl. Poaceæ. Grass.

A tufted, perennial grass, native to the Mediterranean countries, with coarse, stiff stems 3 to 4 feet in height. It makes good hay if cut as soon as the flower heads begin to appear and will stand a considerable amount of pasturing.

For previous introduction, see S. P. I. No. 55067.

58896. *RUBUS LASIOSTYLUS* Focke. Rosaceæ.

A wild raspberry from western China, with bluish white, bristly stems, small, pinnate leaves, silvery beneath, magenta flowers, and rose-colored, woolly fruits which are sweet but said to be of little use for eating.

58866 to 58898—Continued.

58897. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soybean.

An unknown variety from which desirable strains may be obtained.

58898. *STIPA* sp. Poaceæ. Grass.

Received as *Stipa papposa*, but does not agree with material in the National Herbarium.

58899. *LANDOLPHIA KIRKII* DELAGOENSIS Dewevre. Apocynaceæ.

From Pretoria, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, division of botany. Received March 12, 1924.

This vine appears to be confined more or less to the Delagoa Bay region, and probably resembles very closely the species *Landolphia kirkii*, whose distribution extends as far north as Abyssinia and as far south as Zululand. *Landolphia kirkii*, which is regarded as the most important rubber vine in East Africa, being the source of "Zanzibar rubber," assumes a low-growing habit in dry regions, whereas under a heavy rainfall this same species may attain a height of 100 feet or more, with a stem measuring up to 10 or 12 inches in diameter.

If the quantity and quality of the rubber in the variety *delagoensis* is equal to that of the species, a valuable addition will have been made to the collection of rubber plants now being brought together for investigational purposes in southern Florida. (Alfred Keys, Bureau of Plant Industry.)

58900. *EUPHORBIA FULVA* Stapf. Euphorbiaceæ.

Growing at the Chapman Field Garden, Coconut Grove, Fla., under P. I. G. No. 555. Numbered March, 1924.

Introduced for trial as a source of rubber.

The "Palo amarillo," as this tree is called in southwestern Mexico, produces latex which consists of a mixture of rubber and resin, and its value as a source of rubber appears to depend on the working out of a practical method for separating the resin from the rubber. This has already been done experimentally, both the rubber and resin proving to be of good quality.

The tree is about 30 feet high, with smooth, yellow bark, and grows in rocky soil in southern and western Mexico at altitudes of 5,000 to 6,000 feet. This information is based on an article appearing in the Kew Bulletin of Miscellaneous Information for 1907, page 294.

58901 to 58930.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received March 21, 1924.

58901 to 58903. *ACER* spp. Aceraceæ. Maple.

58901. *ACER CAMPBELLII* Hook. f. and Thoms.

The pleasing contrast of the bright-green leaves and red stalks of this Himalayan maple make it worthy of trial as an ornamental shade tree for the warmer parts of the United States. In its native country the grayish white, moderately hard timber is used for cabinetwork and for planking.

For previous introduction, see S. P. I. No. 55669.

58902. *ACER HOOKERI* Miquel.

A handsome tree 40 to 50 feet high, with deeply fissured brown bark, native to the Sikkim Himalayas at altitudes of 8,000 to 10,000 feet. The oval leaves, though usually

58901 to 58930—Continued.

green, are sometimes copper colored. The wood is gray with small pores and very numerous, fine, red, medullary rays.

For previous introduction, see S. P. I. No. 56454.

58903. *ACER LAEVIGATUM* Wall.

A Himalayan maple whose broad, low crown suggests it for planting as a park tree in mild-wintered regions of the United States. The bark is yellowish or dark ash colored, and the leaves are a pleasing green. The hard, close-grained wood is shining white and is popular in Nepal for building purposes.

For previous introduction, see S. P. I. No. 50360.

58904. *BUDDLEIA COLVILEI* Hook. f. Loganiaceæ.

With large, loose, terminal clusters of crimson flowers and dark-green leaves, this Himalayan relative of the well-known butterflybush has been called by some authorities the handsomest of the genus. It is a shrub or small tree, 30 to 40 feet high, and has proved hardy in some parts of England and Scotland.

For previous introduction, see S. P. I. No. 55675.

58905. *CALLICARPA RUBELLA* Lindl. Verbenaceæ.

The chief attraction of this small Chinese shrub is its appearance in the fruiting stage, with its dense cymes of small, purple berries. The flat, yellowish green leaves, 4 to 5 inches long, contrast pleasingly with the small, pink flowers.

For previous introduction, see S. P. I. No. 47651.

58906. *ENKIANTHUS DEFLEXUS* (Griffith) C. Schneid. (*E. himalaicus* Hook. f. and Thoms.). Ericaceæ.

The whorled branches of this Himalayan shrub are characteristic of the entire genus and give the plant a peculiar appearance. The margins and petioles of the young leaves are red. The flowers, produced in dense, drooping racemes, have yellow corollas, striped dark red with darker lobes.

For previous introduction, see S. P. I. No. 49634.

58907. *ERYTHRINA ARBORESCENS* Roxb. Fabaceæ.

When covered with its bright-scarlet flowers this small tree is very attractive and is often planted as an ornamental in the streets of Darjiling. There are but few prickles on its branches, and the thin, greenish leaves are often a foot in width. The strongly curved pods are about an inch wide and 6 to 9 inches long. The tree is found native in the central and eastern Himalayas at altitudes ranging up to 7,000 feet.

For previous introduction, see S. P. I. No. 55680.

58908 to 58910. *MICHELIA* spp. Magnoliaceæ.

58908. *MICHELIA CATHCARTII* Hook. f. and Thoms.

A lofty tree with magnolia-like foliage and terminal white flowers about an inch in diameter. It is native in the temperate forests of the Sikkim Himalayas, where the moderately hard, dark-brown heartwood is used for planking and for making tea boxes.

For previous introduction, see S. P. I. No. 55689.

58901 to 58930—Continued.

58909. *MICHELIA EXCELSA* Blume.

As ornamental plants for the warmer portions of the United States the various species of magnolias have acquired great and well-deserved popularity, and it may be expected that *Michelia excelsa*, which belongs to the same family, will some day be widely cultivated in the southernmost parts of this country. This tall tree is native in the temperate Himalayas of northeastern India at altitudes of about 5,000 feet. The large, narrow leaves are silky brown beneath, and the beautiful, white flowers are 4 or 5 inches across.

For previous introduction, see S. P. I. No. 55690.

58910. *MICHELIA LANUGINOSA* Wall.

This species is characterized by the white woolly lower surfaces of its long, narrow, magnolioid leaves. The white, solitary flowers are 3 to 4 inches across. Although this species is a spring-flowering tree in northern India, where it is native, in Sikkim it is said to form an autumn-flowering bush.

For previous introduction, see S. P. I. No. 55691.

58911. *NYSSA SESSILIFLORA* Hook. f. and Thoms. Cornaceæ.

An Asiatic relative of the black gum (*Nyssa sylvatica*), which is a tree 60 feet tall, with oblong, punctate leaves. The soft, gray, even-grained wood is used for building purposes.

For previous introduction, see S. P. I. No. 47741.

58912. *PICEA MORINDOIDES* Rehder. Pinaceæ. Spruce.

A Himalayan spruce of spreading habit, with slender pendulous branchlets. It becomes over 200 feet tall. The young cones are purple, turning to a pale brown when mature.

58913. *PICEA SMITHIANA* (Wall.) Boiss. (*P. morinda* Link.). Pinaceæ. Spruce.

The Himalayan spruce is a lofty tree found in the mountains of northwestern India at altitudes of 7,000 to 11,000 feet; the terminal, drooping, pale-green cones are 4 to 6 inches long. The stiff, sharp, spirally arranged green leaves are crowded into hanging, tail-like twigs when young. The wood is extensively used for rough furniture and planking.

For previous introduction, see S. P. I. No. 55694.

58914 to 58930. *RHODODENDRON* spp. Ericaceæ.58914. *RHODODENDRON ANTHOPOGON* Don.

A small shrub, 1 foot high, with rough, densely scaly branches and leaves which are $1\frac{1}{2}$ inches long, cinnamon brown beneath and, as it were, tomentose from the layer of glands. The yellow flowers are in numerous short terminal fascicles.

For previous introduction, see S. P. I. No. 47445.

58915. *RHODODENDRON BARBATUM* Wall.

The deep-red flowers of this arborescent rhododendron are borne in many-flowered heads. The bristly stemmed, oblong leaves are normally about 6 inches in length. In its native home in the temperate Himalayas this tree becomes 30 to 40 feet in height.

58916. *RHODODENDRON CAMELLIAEFLOREM* Hook. f.

A Himalayan rhododendron, 2 to 6 feet tall, with very thick, deep-green, leathery leaves and pure white or faintly pinkish flowers about $1\frac{1}{2}$ inches wide.

For previous introduction, see S. P. I. No. 47851.

58901 to 58930—Continued.

58917. *RHODODENDRON CAMPANULATUM* Don?

A large evergreen shrub of stiff, spreading habit, sometimes as much as 12 feet in height, with oval leaves which are densely covered beneath with a red-brown felt. The flowers, produced during April in rather loose clusters about 4 inches wide, are various shades of rosy purple and about 2 inches across. This species, native to Sikkim and Nepal, is one of the hardier Himalayan rhododendrons, and in England it thrives in the vicinity of London.

58918. *RHODODENDRON CAMPYLOCARPUM* Hook. f.

The foliage of this small, roundish bush is a bright, cheerful green, and contrasts splendidly with the numerous clusters of pale-yellow, slightly fragrant flowers. In Sikkim, India, where it is native, it grows at an altitude of 12,000 feet.

58919. *RHODODENDRON CILIATUM* Hook. f.

A Himalayan rhododendron, of somewhat dwarf habit, bearing many small, loose trusses of pinkish white flowers less than 3 inches wide. It rarely exceeds 6 feet in height.

For previous introduction, see S. P. I. No. 55698.

58920. *RHODODENDRON DALHOUSIAE* Hook. f.

This is said to be the finest rhododendron from northeastern India, chiefly because of the great size and beauty of the fragrant, white flowers, which resemble large lilies. It is a straggling shrub, 6 to 8 feet high, with smooth, dark-green leaves. The flowers, which occur in terminal clusters of three to five, are nearly 3 inches across.

For previous introduction, see S. P. I. No. 55699.

58921. *RHODODENDRON FALCONERI* Hook. f.

This shrub or tree, which sometimes attains a height of 30 feet, is native to northeastern India. The large, deep-green leaves, sometimes a foot long, and the whitish, densely clustered flowers make it a very fine ornamental.

For previous introduction, see S. P. I. No. 55700.

58922. *RHODODENDRON FULGENS* Hook. f.

A shrubby rhododendron, 6 to 12 feet high, from the alpine regions of the Himalayas, closely allied to *Rhododendron campanulatum*. It is chiefly distinguished by its blood-red flowers, about an inch wide and crowded in hemispherical trusses over 3 inches in width. It is native to Nepal and Sikkim, India, at altitudes of 10,000 to 14,000 feet.

58923. *RHODODENDRON GRANDE* Wight.

A handsome shrub about 15 feet high, native to the Himalayas. It bears numerous loose trusses of bell-shaped flowers about $2\frac{1}{2}$ inches in diameter. These are at first suffused with a faint rose tint which later changes to white.

For previous introduction, see S. P. I. No. 47775.

58924. *RHODODENDRON HODGSONII* Hook. f.

This is considered one of the finest rhododendrons for foliage; the leathery, dark-green leaves are up to 18 inches in length, glossy above and covered with a brownish red down beneath. The rosy lilac flowers, 2 inches across, are in dense rounded trusses about 6 inches wide.

58901 to 58930—Continued.

58925. RHODODENDRON LANATUM Hook. f.

This species grows wild on the rocky spurs of the humid mountains and in gullies of the Sikkim Himalayas at altitudes of 10,000 to 12,000 feet. It is a large shrub or small tree, with the trunk 6 inches in diameter at the stoutest part, irregularly and repeatedly branching. The branches are much gnarled and bare of leaves and are covered with a dark-colored rugged bark, very different from the prevailing beautiful papery clothing of the genus. The flowers are a pale sulphur color.

58926. RHODODENDRON LEPIDOTUM Wall.

A very distinct evergreen species from the Himalayas and western China. It grows about 1½ feet high, forming a compact bush which produces during May numerous curious flat, purple or reddish blossoms.

For previous introduction, see S. P. I. No. 49649.

58927. RHODODENDRON MADDENI Hook. f.

A shrub 6 to 8 feet high with red-stemmed, dark-green leaves. The large, delicately fragrant flowers, tinged with rose, are produced in trees at the ends of the branches. Native to the Himalayas.

For previous introduction, see S. P. I. No. 55701.

58901 to 58930—Continued.

58928. RHODODENDRON ROYLEI Hook. f. (*R. cinnabarinum* Hook. f.).

The flowers of this evergreen shrub, produced in terminal heads, are usually a dull, cinnabar red, but in some forms the corolla is orange-red on the outside and yellowish within. It is native to the mountainous regions of Sikkim and Bhutan, India.

For previous introduction, see S. P. I. No. 47777.

58929. RHODODENDRON THOMSONII Hook. f.

The rich, blood-red flowers of this shrubby Himalayan rhododendron are 2 to 3 inches across and are produced in loose clusters of six or seven flowers. The small, roundish oval, dark-green leaves have blue-white lower surfaces. This species is not able to withstand very low temperatures; it thrives in the extreme southwestern part of England.

58930. RHODODENDRON WIGHTII Hook. f.

This species has very handsome trusses of large, pale-yellow flowers. It grows abundantly in wooded valleys in the Himalayas and on the spurs of all the mountains at an altitude of 12,000 to 14,000 feet.

Introductory statement.....	1
Inventory.....	3
Index of common and scientific names.....	74

INTRODUCTORY STATEMENT

During the period covered by this, the seventy-ninth, Inventory of Seeds and Plants Imported, the actual number of introductions was much greater than for any similar period in the past. This was due largely to the fact that there were four agricultural exploring expeditions in the field in the latter part of 1923 and early in 1924, and the combined efforts of these in obtaining plant material were unusually successful.

Working as a collaborator of this office, under the direction of the National Geographic Society of Washington, D. C., Joseph L. Rock continued to carry on botanical explorations in the Province of Yunnan, southwestern China, from which region he has sent so much of interest during the preceding few years. The collections made by Mr. Rock, which arrived in Washington in the spring of 1924, were generally similar to those made previously in the same region, except that a remarkable series of rhododendrons, numbering nearly 500 different species, many as yet unidentified, was included. Many of these rhododendrons, as well as the primroses, delphiniums, gentians, and barberries obtained by Mr. Rock, promise to be valuable ornamentals for parts of the United States with climatic conditions generally similar to those of Yunnan.

While continuing his search for promising types of barley for the use of plant breeders in the United States, H. V. Harlan, of the Office of Cereal Crops and Diseases, journeyed through Abyssinia and Egypt. As a result of his visit to these countries a number of barley strains were collected (*Hordeum* spp., Nos. 60525 to 60551, 60675 to 60701), an interesting series of sorghums (*Holcus sorghum*, Nos. 60492 to 60524), and also local strains of oats, wheat, cotton, flax, peas, beans, and a number of forage grasses.

H. L. Shantz, of the Office of Plant Geography and Physiology, traveled through East Africa in 1924 for the African Educational Commission, under the auspices of the Phelps-Stokes Fund. In French Somaliland, Uganda, and Kenya, Doctor Shantz collected seeds of a large number of miscellaneous plants of economic interest, such as native grasses, cereals, cotton, and leguminous forage plants.

Fred D. Richey, of the Office of Cereal Crops and Diseases, and Prof. R. A. Emerson, of Cornell University, spent over three months in southern and western South America searching for varieties of corn likely to succeed in regions of low

summer temperature. A large series of promising types was obtained from the cool highlands of Argentina, Chile, Bolivia, and Peru (*Zea mays*, Nos. 59934 to 60167).

As in the past, many valuable introductions have been made through the courtesy of the numerous foreign correspondents of the office. Dr. N. I. Vavilov, director of the Bureau of Applied Botany and Plant Breeding, Leningrad, Russia, has sent in a large collection of seeds (Nos. 60744 to 60956) of native grasses and other forage plants and local strains of cereals, vegetables, and fiber plants. Since these come from regions where extreme conditions of cold and drought prevail, the collection should be of special value for the Great Plains area of the United States.

The shipment of seeds (Nos. 60335 to 60352) presented by Professor Murashinsky, of the Siberian Agricultural Academy, Omsk, Siberia, also promises to be of special interest for trial in the Great Plains area.

The 150 soy-bean samples from China and Japan will be of special interest to soy-bean specialists and others interested in this crop. When it is considered that the soy bean is a comparatively new crop in the United States, that new and better varieties have been displacing older varieties in rapid succession, and that this is due directly to new introductions or indirectly to selections from former introductions, the possibilities of the present collection are readily realized. Of the 34 leading commercial varieties of the United States, 27 are either direct introductions or selections from introductions. In 35 out of 38 States growing soy beans, introduced varieties lead all others in acreage and production.

Included in this inventory are several introductions of *Meibomia*, *Sesban*, and *Crotalaria*; these will be particularly interesting for testing in the Southern States for soil improvement and forage purposes. The recent favorable results in Florida with *Crotalaria striata* and the general satisfactory adaptation of species of *Meibomia* to the Southern States make these genera worthy of further attention.

New grasses of special interest are *Axonopus scoparius* (No. 58966), collected at Guayaquil, Ecuador, which is cultivated not only in that region but also in other parts of the high Andes; *Danthonia semiannularis* (No. 59361), the wallaby grass of Tasmania, where it provides good pasturage; and *Brachypodium mexicanum* (No. 59295), an annual Mexican grass with succulent leaves, which may prove of value in the southern United States.

The botanical determinations of introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., June 9, 1926.

INVENTORY¹

58931 and 58932. *CASTANOPSIS* spp. Fabaceæ.

From Buitenzorg, Java. Seeds presented by the Director of the Botanic Gardens. Received April 25, 1924.

58931. *CASTANOPSIS ARGENTEA* (Blume) A. DC.

This East Indian relative of the chestnut is an evergreen tree 50 to 60 feet in height, with narrow papery leaves and very dense clusters of spiny burs; each bur contains normally a single edible nut about an inch in diameter.

For previous introduction, see S. P. I. No. 57732.

58932. *CASTANOPSIS TUNGURRUT* (Blume) A. DC.

In Java, where this species is native, it is called "tungurrut" by the natives, who eat the small greenish nuts. The tree is very tall, becoming over a hundred feet in height, and the leathery greenish gray leaves are 5 to 8 inches in length. The burs, an inch and a half in diameter, are densely covered with tufts of curved spines and include one to three nuts.

58933. *SOLANUM TUBEROSUM* L. Sola- naceæ. Potato.

From Bogota, Colombia. Tubers presented by Hermano Apolinar Maria, Instituto de la Salle. Received June 6, 1924.

The yellow-fleshed potato is one of the most interesting varieties found in the Andean region, home of many remarkable potatoes. The tubers are rather small and have deep eyes, so that they are not as easily prepared for the table as those of some other varieties, but in point of quality they yield to none that I have tasted. The flesh is the color of American butter and has a rich, nutty flavor, suggesting that of the chestnut. It seems to me the variety might be improved so as to do away with the objectionable eyes and that it would then be worthy of extensive cultivation. (Wilson Popenoe, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 56803.

58934 to 58944. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

From Nanking, China. Seeds presented by T. S. Kuo, associate dean, College of Agriculture, National Southeastern University. Received June 9, 1924.

Introduced for soy-bean specialists.

58934. *I-ow* (green coat).

58934 to 58944—Continued.

58935. *I-ow* (white coat).

58936. *Nanking* (black).

58937. *Nanking* (green).

58938. *Nanking* (green coat).

58939. *Nanking* (large green).

58940. *Nanking* (small yellow).

58941. *Nanking* (tiger coat).

58942. A small bean used especially for sprouting and for curd.

58943. *Nanking Tea* (yellow).

58944. *Ver-nen* (green coat).

58945 to 58953. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

From Sapporo, Japan. Seeds presented by T. Abiko, agronomist, Hokkaido Agricultural Experiment Station. Received June 12, 1924.

Introduced for soy-bean specialists.

58945. *Chusei-Kuro-Daidzu*.

58946. *Gin-Daidzu*.

58947. *Kan-ro*.

58948. *Kuro-Saya*.

58949. *Kuro-Shoryu*.

58950. *Midzu-Kuguri*.

58951. *Nagaha-Saidzu*.

58952. *Ran-Koshi*.

58953. *Ishikari-Shiro*.

58954 to 58956. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

From Weihhsien, Shantung, China. Seeds presented by Arthur L. Carson, Point Breeze Academy. Received June 11, 1924. Notes by Mr. Carson.

Introduced for soy-bean specialists.

58954. *Black beans*. A tall variety, used largely for animal feed.

58955. *Common yellow variety*; one of the most popular in Weihhsien.

58956. *Green swamp beans*. A very tall variety adapted to swampy places.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the specific identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in, so that definite identification can be made.

58957. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ.**Soy bean.**

From Sapporo, Japan. Seeds presented by T. Abiko, agronomist, Hokkaido Agricultural Experiment Station. Received June 12, 1924.

Introduced for soy-bean specialists.

Hadaka-Daidzu.

58958. GARCINIA BINUCAO (Blanco) Choisy. Clusiaceæ. Binukao.

From Manila, Philippine Islands. Seeds presented by the Director of the Bureau of Agriculture. Received June 2, 1924.

The binukao, a relative of the mangosteen, is a handsome tree which is very common in certain parts of the Philippine Islands, notably in Luzon and the Visayan Islands. W. H. Brown, in "Wild Food Plants of the Philippines," states that the yellowish, rounded fruits, nearly 2 inches in diameter, with a very acid pulp and numerous seeds, are eaten with fish by the Filipinos. The small, red flowers are borne in dense clusters. The binukao will probably not endure low temperatures, since it comes from a tropical region.

58959 and 58960. HIBISCUS SABDA-RIFFA L. Malvaceæ.

From Kuala Lumpur, Federated Malay States. Seeds presented by the agriculturist, Department of Agriculture. Received June 9, 1924.

Variety *altissima*. A tall variety, first recognized in the Philippine Islands where it was grown from seed received from Senegal, West Africa. It is an annual plant with slender stalks 2 to 3 meters high. It differs from the more common rose in being taller and in having calyx lobes less fleshy and is of little value for making jellies, jams, etc.

Tall rose is cultivated to a limited extent in Senegal for fiber production, and during the past two or three years a syndicate has been trying to establish its cultivation in the Federated Malay States.

The fiber belongs to the jute group and is suitable for bags, burlaps, and twines. It is coarser and harsher than Indian jute. No efficient machinery has been devised for preparing bast fibers such as jute and rose, and it would be impossible to produce these fibers profitably by hand labor in this country.

Tall rose may be grown in the warmer parts of the Gulf States and in southern California. (*L. H. Dewey, Bureau of Plant Industry.*)

58959. Green form.

58960. Red form.

58961. CASTANOPSIS ARGENTEA (Blume) A. DC. Fagaceæ.

From Buitenzorg, Java. Seeds presented by Dr. J. J. Smith, 's Lands Plantentuin. Received June 12, 1924.

In the endeavor to establish in the United States blight-resistant chestnuts or related trees, Asiatic species of *Castanea* and *Castanopsis* are being introduced for trial. This species, from Java, is a large evergreen tree 50 to 60 feet tall, with dense clusters of spiny burs which inclose edible nuts about an inch in diameter.

For previous introduction, see S. P. I. No. 58931.

58962. MEIBOMIA OLDHAMI (Oliver) Kuntze (*Desmodium oldhami* Oliver). Fabaceæ.

From Leningrad, Russia. Seeds presented by W. I. Kousnetzoff, in charge of forage plants, Bureau of Applied Botany. Received June 12, 1924.

A slender, unbranched Japanese species, 2 to 4 feet high, with leaves 5 to 10 inches long.

58963. FUNTUMIA ELASTICA (Preuss) Stapf. Apocynaceæ.**Lagos rubber tree.**

From Akkra, Gold Coast Colony, Africa. Seeds presented by W. S. D. Tudhope, Director, Agricultural Department. Received April 2, 1924.

A large forest tree which is very widely distributed throughout central Africa and is the source of Lagos rubber, the quality of which is but little inferior to that of Para rubber.

Though of doubtful value for growing commercially even in the most favorable parts of the United States, this plant is being introduced with a view of including it in the collection of rubber plants now being brought together in southern Florida for investigation purposes.

For previous introduction, see S. P. I. No. 42367.

58964. LILIUM PHILIPPINENSE Baker. Liliaceæ. Benguet lily.

From Taihoku, Formosa, Japan. Bulbs presented by R. Kanehira, director, Experimental Station of Forestry. Received April 2, 1924.

A semihardy Philippine lily with a slender green stem, sometimes purple dotted, 1 to 2 feet high, 30 to 40 narrow horizontal, recurved leaves 3 to 5 inches long, and delicately fragrant, pure waxy white flowers, 8 inches long, tinged green near the base, with yellow anthers. This species is best suited for pot culture in cold regions.

For previous introduction, see S. P. I. No. 50311.

58965. NICOTIANA SUAVEOLENS Lehm. Solanaceæ.

From Sydney, New South Wales. Seeds presented by J. H. Maiden, director, Botanic Gardens. Received April 2, 1924.

This Australian relative of the common tobacco-producing species is a herbaceous annual or biennial, native to sandy, hilly regions throughout most of Australia. It is said that in former times the leaves were chewed by the natives. The plant is readily eaten by stock. It is now introduced for the use of specialists who are studying the narcotic properties of the Solanaceæ.

58966. AXONOPUS SCOPARIUS (Fluegge) Hitchc. (*Paspalum scoparium* Fluegge). Poaceæ.

From Guayaquil, Ecuador. Seeds collected by A. S. Hitchcock, Bureau of Plant Industry. Received April 2, 1924.

This South American grass is used at low altitudes for forage, being cut green and fed as is done with guinea grass. I saw it first on the estate of J. A. Cleveland, of Guayaquil, in the rain belt at the foot of the mountains near Bucay. The grass is set out from plants obtained by division of the roots. It is called there "gramalote." I suspect this name is the same as gamalote, which is used for a different species in some other countries. The grass appears to be looked upon with favor, as it is large and succulent and produces abundant forage. It is preferred to guinea grass, which grows under about the same conditions. I found the same grass again in the Perene Valley of central Peru at an altitude of about 2,000 feet. There it is called maicillo and is used in competition with guinea grass. It appeared again in the Yungas region of Bolivia. It is there called cachi. In the intermediate altitude from 5,000 to 8,000 feet it was the only forage obtained for our mules while traveling. Throughout the region the grass is native and has been transferred to cultivation. (*Hitchcock.*)

58967 and 58968. RUBUS spp. Rosa-ceæ.

From Chester, England. Plants purchased from Dicksons' Nurseries. Received April 2, 1924.

Introduced for horticulturists experimenting with small fruits.

58976. RUBUS BIFLORUS Buch.-Ham.

A rambling shrub, with large leaves, woolly beneath and subacid yellow berries about the size of a thimble.

58968. RUBUS FRUTICOSUS L. Blackberry.

Var. *rubra plena*. A blackberry with double red flowers.

58969 and 58970.

From Cairo, Egypt. Seeds purchased from the director, Egyptian Seed Co. Received April 3, 1924.

Introduced for forage-crop specialists.

58969. MEDICAGO SATIVA L. Fabaceæ.

Hegazi. A local strain grown in Egypt.

58970. TRIFOLIUM ALEXANDRINUM L. Fabaceæ.

Miskawi. One of the principal types of berseem grown in Egypt.

58971 and 58972. DIOSPYROS KAKI L. f. Diospyraceæ. Kaki.

From Weihhsien, Shantung, China. Scions presented by Ralph C. Wells, Point Breeze Academy. Received April 4, 1924. Notes by Mr. Wells.

These two varieties are from Tsingchowfu and were sent in by A. L. Carson, of Weihhsien, Shantung.

58971. *Tshihhtzu* (iron persimmon). A relatively nonastringent variety.

58972. *Toashihhtzu* (palm-of-the-hand persimmon).

58973. DIOSCOREA sp. Dioscoraceæ. Yam.

From Barbados, British West Indies. Tubers presented by John R. Bovell, Director of Agriculture. Received April 23, 1924.

Antigua white. This variety, which I believe is a sport, I consider one of the best of the white yams. Its history is as follows: A planter in the island of Antigua bought a yam for cooking purposes and, as it was rather large, only a portion of it was used for cooking. It proved to be of such good flavor that the remainder was planted and subsequently propagated for distribution. These tubers which I am sending are of this variety. (Bovell.)

58974. LUCUMA MULTIFLORA DC. Sapotaceæ.

From San Jose, Costa Rica. Seeds presented by Carlos Werckle. Received April 3, 1924.

This West Indian tree is a close relative of the lucuma (*Lucuma obovata*) whose bright-yellow, mealy-fleshed fruits are popular in the Andean regions of South America. The leaves of the West Indian species are leathery and oblong and the edible fruit is nearly an inch in diameter. It may prove to be adapted to the southern part of Florida.

58975 and 58976.

From Tripoli, Libia, North Africa. Bud wood presented by Dr. E. O. Fenzi. Received April 1, 1924. Notes by Doctor Fenzi.

58975. MALUS sp. Malaceæ. Apple.

Gurras, an extra early native variety. This is of good size and very juicy, and it ripens at the same time as the earliest apricots.

58975 and 58976—Continued.**58976. PRUNUS ARMENIACA L. Amygdalaceæ. Apricot.**

Ain thor (bull's eye); also *bergsam*. A very large tree, taller and more vigorous than any other kind; leaves thin, irregularly toothed; fruit globular, with hardly any groove, weight about 40 grams, diameter 40 mm.; skin scarcely tomentose, reddish yellow, adhering closely to the flesh; flesh more juicy than that of any other kind, with flavor more like that of a plum than an apricot, adhering closely to the smooth stone. Not common.

58977. DAVIDIA INVOLUCRATA Baill. Cornaceæ.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received April 23, 1924.

Nos. 11234 (fruit), 9067 (flowers). October, 1923. A handsome tree 30 to 40 feet high which grows on the slopes of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 10,000 feet. The flowers are between two very large, cream-colored bracts the size of one's hand. The fruits are deep-blue drupes. (Rock.)

58978 and 58979. SESBAN spp. Fabaceæ.

From Pretoria, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, Division of Botany. Received April 5, 1924.

58978. SESBAN ACULEATUM (Schreb.) Poir.

A tall-growing, annual, leguminous plant from tropical and subtropical Asia, which is used there as green manure and also for fodder. It is a vigorous grower and is said to thrive in semiarid regions. Introduced for forage-crop specialists.

58979. SESBAN AEGYPTIACUM Poir.

In Porto Rico and also in western Java the leaves and young branches of this yellow-flowered shrub are used for fodder, and it is now introduced for the use of forage-crop specialists.

For previous introduction, see S. P. I. No. 54894.

58980 to 58985. RUBUS spp. Rosaceæ. Raspberry.

From Orleans, France. Plants purchased from E. Turbat & Co. Received April 2, 1924. Quotations from catalogue of Millet & Fils.

Introduced for testing by horticulturists engaged in raspberry breeding.

58980. RUBUS sp.

"*All Summer*. An everbearing variety with large red fruits of good quality."

58981. RUBUS sp.

"*Améliorée de Congy*. A vigorous variety with red fruits of excellent quality."

58982. RUBUS sp.

"*Belle de Fontenay*. An everbearing variety, with sweet, red, round fruits of very good quality."

58983. RUBUS sp.

"*Perpétuelle de Ballard*. An everbearing variety which bears a large crop of very fine red fruits."

58984. RUBUS sp.

"*Superlative Perpétuelle*. Fruits red, very large, with an aromatic sweet flavor."

58985. RUBUS sp.

"*Surpasse merveille*. An everbearing variety with medium-sized white fruits."

58986. SPARTINA TOWNSENDI Groves. Poaceae. Grass.

From London, England. Seeds presented by Prof. F. W. Oliver, University College, London, through A. S. Hitchcock, Bureau of Plant Industry. Received April 4, 1924.

Professor Oliver regards *Spartina townsendi* as a probable hybrid between *Spartina stricta* and *S. alterniflora*. It appeared at Hythe, Southampton, England, about 1879, and has spread rapidly on the mud flats, reclaiming the land. Professor Oliver says that it is eaten eagerly by cattle and pigs and is also promising as a paper-making material, but the cost of harvesting is large at present. We consider this species to be the same as *S. alterniflora* Loisel., which is found on the shores of Nova Scotia and New Brunswick, south to Maine. (Hitchcock.)

58987. TRIFOLIUM AFRICANUM GLABELLUM Harv. Fabaceae. Clover.

From Cedara, Natal, Union of South Africa. Seeds presented by W. S. Hall, assistant experimentalist, School of Agriculture. Received April 5, 1924.

An indigenous Natal perennial clover which is a very vigorous grower, forming a thick sward which smothers adjacent plots of other clovers unless cut back. After three years the plot begins to deteriorate. In its native country this variety thrives in moist places. Introduced for agronomists engaged in breeding new types of clover.

58988. CEREUS VALIDUS Haw. Cactaceae.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received April 7, 1924.

A tall, picturesque plant, which produces fruit the size of a goose egg and of a beautiful magenta color. These fruits are absolutely without spicules and of very good taste. Doctor Proschowsky remarks that he knows of no other fruit which is so "melting," and it resembles much the "snows" sold in Latin-American countries, consisting of real snow mixed with fruit juice or sugar. (David Fairchild, Bureau of Plant Industry.)

58989 and 58990. CITRUS SINENSIS (L.) Osbeck. Rutaceae. Sweet orange.

From Soledad, Cienfuegos, Cuba. Bud wood presented by R. M. Grey, superintendent, Cuban Gardens. Received April 8, 1924. Notes by Mr. Grey.

58989. Harvard No. 1. This is one of the best seedlings we have ever raised here and has been in cultivation for many years. The tree forms a compact head, with deep rich-green foliage; it is drought resistant, and has borne splendid crops here every year. The fruit is medium to large, starts to ripen early in November, and remains firm and juicy until May. The skin is a rich orange color, of medium thickness; the flesh is of fine texture and quality, sweet in flavor and few seeded.

58990. Harvard No. 2. A late bud sport of Valencia. The tree is of spreading habit and a prolific bearer. The fruit is of good size, few seeded, does not ripen until February, but retains its firmness and juice until late October. The skin is pale yellow, quite thin and smooth; the flesh is of excellent quality and of pleasant, mild, sweet flavor.

58991 to 58996. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Coimbatore, Madras Presidency, India. Cuttings presented by T. S. Venkatraman, Government sugar-cane expert, Agricultural College. Received April 3, 1924.

These varieties have been found eminently suited for cultivation in northern India. (Venkatraman.)

58991 to 58996—Continued.

58991. Co. 205.	58994. Co. 214.
58992. Co. 210.	58995. Co. 232.
58993. Co. 213.	58996. Co. 281.

58997 to 58999. RUBUS spp. Rosaceae. Blackberry.

From Concepcion, Province of Chirique, Panama. Plants presented by J. R. Genuit. Received April 15, 1924.

These are wild species, likely to prove of interest in the warmest portions of the United States.

58997. RUBUS sp.	58999. RUBUS sp.
Black fruits.	Salmon-colored fruits.
58998. RUBUS sp.	
Pink fruits.	

59000 to 59268.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received April 4, 1924. Notes by Mr. Rock.

59000. ACONITUM sp. Ranunculaceae.

No. 11428. November, 1923. A plant 3 feet tall found growing in alpine meadows between 12,000 and 13,000 feet altitude in the Likiang Snow Range. The leaves are finely palmatisect, and the pale purplish, silky blue flowers are in dense spikes.

59001. ACONITUM sp. Ranunculaceae.

No. 11457. November, 1923. A plant 3 to 4 feet tall from alpine meadows in the fir forest at an altitude of 11,000 feet, Sungkwe Mountains. It has large leaves and long spikes of large, pale-blue flowers.

59002. ANDROSACE SPINULIFERA (Franch.) Knuth. Primulaceae.

No. 11411. November, 1923. Likiang Snow Range. A plant 1 to 2 feet high found growing in dry rocky limestone regions at about 11,000 feet altitude. The rosette of spatulate leaves and umbels of rich pink flowers make it very attractive.

For previous introduction, see S. P. I. No. 55253.

59003. BERBERIS DICTYOPHYLLA Franch. Berberidaceae.

No. 11462. Mahoangpatze. November, 1923. A spiny shrub 5 to 6 feet high, found in alpine meadows, Likiang Snow Range. The leaves are glaucous, the flowers yellow, and the fruits red.

For previous introduction, see S. P. I. No. 56293.

59004. BUDDLEIA FORRESTII Diels. Loganiaceae.

No. 11432. November, 1923. A very attractive shrub found only in limestone soil on the Likiang Snow Range at from 9,000 to 10,000 feet altitude. It has white woolly leaves and spikes of lavender-blue flowers.

For previous introduction, see S. P. I. No. 56294.

59005. CAMPANULA sp. Campanulaceae.

No. 11405. October, 1923. A plant 2 to 3 feet tall found growing in pine forests at Saba and also in meadows at about 12,000 feet altitude on the Likiang Snow Range. The leaves are lanceolate, and the drooping flowers are deep indigo blue.

59006. CARAGANA sp. Fabaceae.

Nos. 11330 (fruit), 9243 (flowers). November, 1923. A shrub 1 to 2 feet high which forms spiny cushions on rocky slopes at 15,500 to 16,000 feet altitude on the Yangtze-Mekong Divide. The branches are covered with gray pubescence, and the flowers are a rich pinkish purple.

59000 to 59268—Continued.

59007. *CORYLOPSIS* sp. Hamamelidaceæ.

No. 11226. October, 1923. A very handsome tree 20 feet high found at 10,000 feet altitude on the slopes of Mount Kenichunpu, Salwin-Irrawaddy Divide. The leaves are fan-shaped with prominent veins which radiate like segments of a fan.

59008. *CORYLUS TIBETICA* Batal. Betulaceæ. **Hazel.**

No. 11136. November, 1923. A small tree 30 to 40 feet high found at 10,000 feet altitude in the forests of Sila Pass on the Mekong-Salwin Divide. The thin green leaves are large and ovate serrate; the echinate fruits are in threes, and the nuts are small.

For previous introduction, see S. P. I. No. 46406.

59009. *CREMANTHODIUM* sp. Asteraceæ.

No. 11440. November, 1923. A plant about 1 foot high, found in alpine meadows on the Likiang Snow Range at an altitude of 12,000 feet. The oval leaves are in basal rosettes, and the large flower heads have drooping golden ray florets.

59010. *DELPHINIUM* sp. Ranunculaceæ.

No. 11407. November, 1923. A plant 2 to 3 feet high found in crevices of limestone boulders, Likiang Snow Range, at an altitude of 11,000 feet. The leaves are broadly palmatisect, and the flowers are purplish blue. The plant spreads from the base.

59011. *DELPHINIUM* sp. Ranunculaceæ.

No. 11458. November, 1923. A plant 1 foot high found on alpine slopes of the Likiang Snow Range at 14,000 feet altitude. The leaves form a basal rosette, and the large hairy blue-lavender flowers grow in dense globose spikes.

59012. *GENTIANA* sp. Gentianaceæ.

No. 11399. November, 1923. A handsome moisture-loving herb a foot tall found in alpine meadows at 11,000 feet altitude on the Likiang Snow Range. The very large flowers have long, tubular, salver-shaped corollas of deep indigo blue.

59013. *GENTIANA* sp. Gentianaceæ.

No. 11400. November, 1923. A very attractive species found covering acres of alpine meadows at Harakin in the Likiang Snow Range. The plant is prostrate and only 5 or 6 inches high; the urn-shaped flowers are Prussian blue with white stripes.

59014. *GENTIANA* sp. Gentianaceæ.

Nos. 11400 (fruit), 8907 (flowers). November, 1923. Plants found growing in limestone soil in meadows of Saba, Likiang Snow Range, at 11,000 feet altitude. The leaves are in linear rosettes, and the large flowers are deep indigo blue with paler stripes.

59015. *GENTIANA* sp. Gentianaceæ.

No. 11448. November, 1923. A small plant a foot high found in alpine meadows of the Likiang Snow Range at 12,000 feet altitude. The leaves are linear-lanceolate, and the bluish purple flowers grow in globose heads on long stems.

59016. *GENTIANA* sp. Gentianaceæ.

No. 11450. November, 1923. A prostrate plant 1 to 2 feet long found in alpine meadows of the Likiang Snow Range at 12,000 feet altitude. The flowers are yellow.

59017. *GENTIANA* sp. Gentianaceæ.

No. 11466. November, 1923. A small plant 10 inches high found in alpine meadows of the Likiang Snow Range at 13,000 feet altitude. The small, elliptic leaves clasp the stem; the flowers are blue with a purple tinge.

59000 to 59268—Continued.

59018. *GENTIANA* sp. Gentianaceæ.

No. 11474. November, 1923. A plant 2 inches high with deep-blue flowers found at 13,000 feet altitude in alpine meadows of the Likiang Snow Range.

59019. *GENTIANA* sp. Gentianaceæ.

No. 11477. November, 1923. A small herbaceous plant 8 to 10 inches high found in pine forests and meadows on the Likiang Snow Range at 10,000 feet altitude. The leaves are small and linear and the flowers tubular and blue.

59020. *GENTIANA* sp. Gentianaceæ.

No. 11478. November, 1923. A prostrate plant found in moist meadows of the Likiang Snow Range. The large erect flowers are dark blue striped with yellow, and the fleshy leaves are needle shaped.

59021. *IRIS* sp. Iridaceæ.

Nos. 11486 (fruit), 10209 (flowers). November, 1923. A plant 1 to 2 feet tall found growing in clumps in moist meadows on the Likiang Snow Range at 11,000 feet altitude. The flowers are dark blue.

59022. *PIERIS* sp. Ericaceæ.

* No. 11414. November, 1923. A handsome shrub 3 to 4 feet high which forms dense bushes; found growing in pine forest outskirts on the Likiang Snow Range at 10,000 feet altitude. The elliptical leaves are shining dark green, and the bell-shaped white flowers are in erect spikes.

59023. *POTENTILLA* sp. Rosaceæ.

No. 11464. November, 1923. A plant found in alpine meadows of the Likiang Snow Range at 9,000 to 10,000 feet altitude. The leaves are trifoliate, and the yellow flowers are in large racemes.

59024 to 59028. *PRIMULA* spp. Primulaceæ. **Primrose.**59024. *PRIMULA* sp.

Nos. 10895 (fruit), 8904 (flowers). November, 1923. A very handsome species found in moist alpine meadows of Londjre, southeastern Tibet, at 12,000 to 13,000 feet altitude. The large flowers are deep indigo blue.

59025. *PRIMULA CALLIANTHA* Franch.

Nos. 10962 (fruit), 9079 (flowers). November, 1923. Plants collected in the alpine meadows of the Mekong Valley at 12,000 feet altitude. The linear-lanceolate leaves are glabrous, and the large drooping flowers are rich purplish blue with large calyxes striped with white.

59026. *PRIMULA CALLIANTHA* Franch.

Nos. 11137 (fruit), 9967 (flowers). November, 1923. A plant found in the alpine meadows of the Peima Mountains at 14,000 feet altitude. The linear-lanceolate leaves are thin and green; the large flowers are rich purple.

59027. *PRIMULA INGENS* W. W. Smith and Forrest.

Nos. 11327 (fruit), 9291 (flowers). November, 1923. A plant about 2½ feet high found in the alpine meadows of the Peima Mountains at 13,000 feet altitude. The linear leaves are glabrous, and the bluish purple flowers are in globose heads.

59028. *PRIMULA* sp.

No. 11350. November, 1923. A plant 2 feet high found on mossy forest banks along the trail near the summit of Shundsangtu at 13,000 feet altitude. The leaves are lanceolate and the flowers are purple.

59000 to 59268—Continued.

59029. *RHODODENDRON CEPHALANTHUM* Franch. Ericaceae.

Nos. 11323 (fruit), 9074 (flowers). November, 1923. A shrub 2 feet high found among rocks in the alpine region of Yetché, on the Mekong River. The leaves are small and elliptical with brownish wool beneath; the tubular flowers are white.

59030 to 59263. *RHODODENDRON* spp. Ericaceae.

59030. *RHODODENDRON* sp.

No. 10895. November, 1923. A spreading shrub, 3 feet tall, found growing in masses in the moist open places in fir forests on the Tibetan border, northwestern Yunnan, at 13,000 feet altitude. The elliptical-oblong leaves are covered with fawn-colored tomentum beneath, and the flowers are a deep blackish carmine.

59031. *RHODODENDRON* sp.

Nos. 10894 (fruit), 8911 (flowers). November, 1923. A small shrub 2 to 3 feet high found growing on moist alpine slopes on the Londjre Mountains in southeastern Tibet. The elliptical leaves are fawn-colored beneath, and the large rich crimson flowers are on long pubescent pedicels.

59032. *RHODODENDRON* sp.

Nos. 10896 (fruit), 8880 (flowers). November, 1923. A large shrub 7 to 8 feet high found on the slopes of the Londjre Mountains, southeastern Tibet. The leaves are large, oblong, glabrous, and a yellowish brown. The deep rich pink flowers are in umbels.

59033. *RHODODENDRON* sp.

No. 10897. November, 1923. A small shrub from 2 to 3 feet high found on the alpine meadows of the Londjre Mountains, southeastern Tibet, at from 12,000 to 13,000 feet altitude. The small elliptic leaves are white beneath, and the flowers vary from rich crimson to carmine.

59034. *RHODODENDRON* sp.

Nos. 10899 (fruit), 10306 (flowers). November, 1923. A small shrub found growing on the alpine slopes of the Londjre Mountains, southeastern Tibet. The elliptical leaves are gray beneath, and the large purple flowers are yellowish at the base.

59035. *RHODODENDRON* sp.

Nos. 10900 (fruit), 10218 (flowers). November, 1923. A small shrub 1 to 2 feet high found growing on the alpine slopes of the Londjre Mountains, southeastern Tibet. The small elliptical leaves are brown beneath, and the large pink flowers grow in racemes.

59036. *RHODODENDRON* sp.

Nos. 10901 (fruit), 10272 (flowers). November, 1923. A small shrub 1 to 2 feet high found on the alpine slopes of the Londjre Mountains, southeastern Tibet. The small oblong leaves are brown beneath, and the deep reddish black flowers have carmine calyxes.

59037. *RHODODENDRON* sp.

Nos. 10902 (fruit), 8915 (flowers). November, 1923. A small shrub 2 to 3 feet high found on the alpine slopes of the Londjre Mountains, southeastern Tibet, Yunnan. The elliptical leaves are grayish green beneath, and the flowers are a rich yellow.

59038. *RHODODENDRON* sp.

Nos. 10903 (fruit), 10265 (flowers). November, 1923. A small shrub 2 to 3 feet high found growing on the alpine meadows of the Londjre Mountains, southeastern Tibet, Yunnan. The small elliptical leaves are white beneath, and the large flowers are yellowish red.

59000 to 59268—Continued.

59039. *RHODODENDRON* sp.

Nos. 10904 (fruit), 10277 (flowers). November, 1923. A small shrub 1 to 2 feet high found growing in masses on the alpine slopes of the Londjre Mountains in southeastern Tibet and northwestern Yunnan. The small, elliptical, glaucous leaves are gray beneath, and the deep-crimson flowers are on short hairy pedicels.

59040. *RHODODENDRON* sp.

Nos. 10905 (fruit), 8912 (flowers). November, 1923. A small shrub 2 to 3 feet high found growing in masses in moist places on the Londjre Mountains at from 12,000 to 13,000 feet altitude. The small, elliptical leaves are deep chocolate color beneath, and the blackish crimson flowers are on short pedicels.

59041. *RHODODENDRON* sp.

Nos. 10906 (fruit), 8914 (flowers). November, 1923. A small shrub 2 to 3 feet high found growing in masses in the Londjre Mountains, southeastern Tibet and northwestern Yunnan, at 13,000 feet altitude. The elliptical leaves are white tomentose beneath, and the flowers are a rich yellow.

59042. *RHODODENDRON* sp.

Nos. 10907 (fruit), 10285 (flowers). November, 1923. A low shrub from 1 to 2 feet high found growing in moist places on the Londjre Mountains in southeastern Tibet and northwestern Yunnan at altitudes between 12,000 and 13,000 feet. The small leaves are glabrous, and the flowers are pink.

59043. *RHODODENDRON* sp.

Nos. 10908 (fruit), 8879 (flowers). November, 1923. A tree 8 to 10 feet high found growing in a fir forest on the Londjre Mountains in southeastern Tibet and northwestern Yunnan at 12,000 feet altitude. The large leaves are subglabrous beneath and pale brown; the rich pink flowers are in large umbels.

59044. *RHODODENDRON* sp.

Nos. 10909 (fruit), 10268 (flowers). November, 1923. A small shrub 2 to 3 feet high found growing in masses on the alpine slopes of the Londjre Mountains in southeastern Tibet and northwestern Yunnan at 13,000 feet altitude. The elliptical-oblong leaves are brownish beneath, and the flowers are deep red.

59045. *RHODODENDRON* sp.

Nos. 10910 (fruit), 8886 (flowers). November, 1923. A shrub 4 feet high found growing in fir forests on the Londjre Mountains in southeastern Tibet and northwestern Yunnan at 12,000 feet altitude. The large glabrous green leaves are golden yellow beneath, and the large pink flowers, which grow in large umbels, have a purplish tinge.

59046. *RHODODENDRON* sp.

Nos. 10911 (fruit), 10276 (flowers). November, 1923. A small shrub 1 to 1½ feet high found growing in masses on the Londjre Mountains in southeastern Tibet and northwestern Yunnan at 12,000 feet altitude. The linear-lanceolate leaves are drab colored beneath, and the flowers are very dark crimson.

59047. *RHODODENDRON* sp.

Nos. 10912 (fruit), 8782 (flowers). November, 1923. A shrub 3 to 4 feet high found growing on the middle slopes of the Tschung Mountains, Mekong, northwestern Yunnan, at 10,000 feet altitude. The small ovate-elliptical leaves are drab colored beneath, and the branches are slender. The flowers are a beautiful pink.

59000 to 59268—Continued.

59048. RHODODENDRON sp.

Nos. 10913 (fruit), 8827 (flowers). November, 1923. A tree 8 to 10 feet high collected in a fir forest on the Tsechung Mountains at the Mekong watershed, 14,000 feet altitude. The large oblong leaves are drab colored beneath, and the very large pink flowers grow in dense umbels.

59049. RHODODENDRON sp.

Nos. 10914 (fruit), 10081 (flowers). November, 1923. A small shrub 1 to 2 feet high found growing on rocky alpine slopes of the Tsechung Mountains at 14,000 feet altitude. The very small oval leaves are one-half inch long, and the rich golden-yellow flowers are in dense clusters.

59050. RHODODENDRON sp.

Nos. 10915 (fruit), 8778 (flowers). November, 1923. A shrub 5 feet high found growing on the middle slopes of the Tsechung Mountains, Mekong Valley, at 10,000 feet altitude. The leaves are small, elliptical, and glabrous, and the medium-sized flowers are pale pink.

59051. RHODODENDRON sp.

Nos. 10916 (fruit), 9125 (flowers). November, 1923. A shrub 3 to 4 feet high found growing in rocky alpine regions of the Tsechung Mountains at 11,000 feet altitude. The oblong leaves are deep brown beneath, and the rich pink flowers are mottled with purple.

59052. RHODODENDRON sp.

Nos. 10917 (fruit), 8831 (flowers). November, 1923. A small shrub 2 to 3 feet high found growing in the alpine meadows of Tsechung at 12,000 feet altitude. The oblong leaves are small, and the small yellow flowers grow on long pedicels.

59053. RHODODENDRON sp.

Nos. 10919 (fruit), 9083 (flowers). November, 1923. A low shrub 2 feet high found on the slopes of the Tsechung Mountains at 10,000 feet altitude. The small elliptical leaves are glaucous greenish beneath, and the little yellow flowers are on long pedicels. This plant is very rare.

59054. RHODODENDRON sp.

Nos. 10925 (fruit), 10093 (flowers). November, 1923. A shrub 5 feet high found in the alpine regions of Tsechung at 11,000 to 12,000 feet altitude. The leaves are large, obovate, glabrous, and green on both sides, and the rich golden-yellow flowers are in large umbels.

59055. RHODODENDRON sp.

Nos. 10926 (fruit), 9131 (flowers). November, 1923. A low-growing shrub 1 to 2 feet high found in alpine regions of Tsechung at 12,000 feet altitude. The elliptic leaves are drab to white beneath, and the medium-sized flowers are a deep purple-carmine.

59056. RHODODENDRON sp.

Nos. 10927 (fruit), 9224 (flowers). November, 1923. A shrub 2 feet high found in alpine regions of Tsechung at 12,000 feet altitude. The elliptical leaves are white beneath with yellow veins, and the large flowers are a rich crimson.

59057. RHODODENDRON sp.

Nos. 10959 (fruit), 8769 (flowers). A shrub 3 to 4 feet high found in the alpine regions of Tsechung at 14,000 feet altitude. The linear-

59000 to 59268—Continued.

lanceolate leaves are covered beneath with a brown, deciduous wool, and the flowers are a rich crimson with a purple tinge.

59058. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10960 (fruit), 9106 (flowers). November, 1923. A large shrub 6 feet high found in a spruce forest on the slopes of the Tsechung Mountains at 10,000 feet altitude. The large, leathery leaves are oblong, acuminate, and nearly brown beneath, while the big flowers are cream colored.

59059. RHODODENDRON sp.

Nos. 10961 (fruit), 9152 (flowers). November, 1923. A shrub 4 to 5 feet high found growing in rocky alpine regions of the Tsechung Mountains. Its leaves are ovate acute and glabrous, and the pure pale-pink flowers grow in open umbels on slender pedicels.

59060. RHODODENDRON sp.

Nos. 10963 (fruit), 8834 (flowers). November, 1923. A shrub 3 to 4 feet high found in alpine meadows of the Tsechung Mountains at 12,000 feet altitude. The oval leaves are glabrous and the flowers a deep reddish purple.

59061. RHODODENDRON REPENS Balf. f. and Forrest.

Nos. 10964 (fruit), 9133 (flowers). November, 1923. A prostrate plant only a few inches tall which forms mats in the alpine regions of the Tsechung Mountains at 13,000 feet altitude. It has small elliptical leaves and rich carmine flowers.

59062. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10977 (fruit), 9144 (flowers). October, 1923. A shrub 5 feet high found on the slopes of the Tsechung Mountains at 10,000 feet altitude. The oblong-acuminate leaves are covered with a brown tomentum beneath, and the flowers are pink spotted with purple.

59063. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10978 (fruit), 9117 (flowers). October, 1923. A shrub 7 to 8 feet high found on the slopes of the Tsechung Mountains overlooking the Mekong Valley at 10,000 feet altitude. The oblong leaves are brownish tomentose beneath, and the flowers are pink.

59064. RHODODENDRON sp.

No. 10979. October, 1923. A shrub 5 feet high found in the alpine regions of the Tsechung Mountains at 11,000 feet altitude. The linear-oblong leaves are rufous beneath, and the flowers are pink.

59065. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10980 (fruit), 9136 (flowers). October, 1923. A shrub only 4 feet high found in the alpine region of Tsechung, Mekong Valley. The small leaves are ovate elliptical and covered with brown tomentum beneath; the flowers are white.

59066. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10981 (fruit), 9115 (flowers). October, 1923. A shrub 8 feet high found on the slopes of the Tsechung Mountains, Mekong Valley, at 10,000 feet altitude. The oblong leaves are a rich green and covered with yellow tomentum beneath; the white flowers are spotted with purple.

59000 to 59268—Continued.

59067. *RHODODENDRON IXEUTICUM* Balf. f. and Smith.

Nos. 10982 (fruit), 9135 (flowers). October, 1923. A shrub 6 feet high found on the slopes of the Tsechung Mountains, Mekong Valley, at 10,000 feet altitude. The leaves are linear-lanceolate and covered with yellow tomentum beneath; the large flowers are white.

59068. *RHODODENDRON IXEUTICUM* Balf. f. and Smith.

No. 10983. October, 1923. A shrub 5 feet high found in spruce forests on the slopes of the Tsechung Mountains, Mekong Valley, at 10,000 feet altitude. The oblong-acuminate leaves are rufous brown beneath, and the large white flowers are borne in large umbels.

59069. *RHODODENDRON* sp.

No. 10984. October, 1923. A shrub 3 feet high found on the alpine slopes of the Tsechung Mountains at 12,000 feet altitude. The obovate leaves are densely matted beneath with chocolate-colored tomentum; the flowers are deep blackish crimson.

59070. *RHODODENDRON* sp.

Nos. 10985 (fruit), 9140 (flowers). October, 1923. A shrub 3 feet high found in the alpine regions of the Tsechung Mountains at 12,000 feet altitude. The large obovate leaves are dull green above and chocolate colored beneath; the flowers are deep crimson.

59071. *RHODODENDRON* sp.

Nos. 10986 (fruit), 8789 (flowers). October, 1923. A small shrub 3 to 4 feet high found in the alpine regions of the Tsechung Mountains at 14,000 feet altitude. The oval leaves are glabrous and the flowers a rich lavender.

59072. *RHODODENDRON* sp.

Nos. 10987 (fruit), 8785 (flowers). October, 1923. A large shrub 5 feet high found in fir forests in the alpine regions of the Tsechung Mountains at 13,000 feet altitude. The leaves are large, oblong, acute, and glabrous, but brown beneath; the flowers are a rich reddish purple.

59073. *RHODODENDRON* sp.

Nos. 10989 (fruit), 9102 (flowers). October, 1923. A tall shrub 8 feet high found in the forests of Tsechung at 10,000 feet altitude. The leaves are large, oblong, acute, glabrous, and pale beneath; the white flowers have a slight pinkish tinge.

59074. *RHODODENDRON* sp.

Nos. 10989 (fruit), 9122 (flowers). October, 1923. A low shrub 3 feet high found in the alpine regions of Tsechung at 12,000 feet altitude. The leaves are obovate-acute at the base and chocolate colored tomentose beneath; the flowers are almost black.

59075. *RHODODENDRON* sp.

Nos. 10990 (fruit), 9127 (flowers). October, 1923. A shrub 5 to 8 feet high which grows on the forested slopes of the alpine regions of Tsechung at 11,000 feet altitude. The lanceolate leaves are dull green and glabrous; the flowers are purple-pink.

59076. *RHODODENDRON* sp.

No. 10991. October, 1923. A low-growing plant 2 feet high found on the slopes of the Tsechung Mountains at 10,000 feet altitude. The leaves are small, oval, glabrous, and glaucous, and the flowers are small and yellow.

59077. *RHODODENDRON IXEUTICUM* Balf. f. and Smith.

Nos. 10992 (fruit), 8767 (flowers). October, 1923. A shrub 5 to 6 feet high found in the

59000 to 59268—Continued.

alpine regions of Tsechung. The oblong, acute leaves are brown woolly beneath, and the white flowers grow in large umbels.

59078. *RHODODENDRON REPENS* Balf. f. and Forrest.

No. 10994. October, 1923. A small plant 1 foot high found growing in the rocky alpine slopes of the Tsechung Mountains at 13,000 feet altitude. It has small oval leaves and rich crimson flowers.

59079. *RHODODENDRON SEMNUM* Balf. f. and Forrest.

Nos. 10995 (fruit), 10060 (flowers). October, 1923. A tree 15 to 20 feet high found growing on the slopes of the Tsechung Mountains. The very large leaves, $1\frac{1}{2}$ feet long, are obovate-oblong and silvery gray beneath; the flowers are large and white.

59080. *RHODODENDRON REPENS* Balf. f. and Forrest.

Nos. 10997 (fruit), 9078 (flowers). October, 1923. A prostrate shrub found in the alpine regions of Tsechung. The small oval leaves are green on both sides, and the large flowers are dark red.

59081. *RHODODENDRON* sp.

Nos. 10999 (fruit), 9139 (flowers). October, 1923. A shrub 4 feet high found on the rocky slopes of the Tsechung Mountains at 11,000 feet altitude. The linear-elliptical leaves are brown beneath, and the large flowers are a rich crimson.

59082. *RHODODENDRON SALUENENSE* Franch.

No. 11001. October, 1923. A small shrub 2 feet high found on the rocky alpine slopes of the Tsechung Mountains. The leaves are very small and oval, and the deep purplish blue flowers have carmine calyxes.

59083. *RHODODENDRON* sp.

Nos. 11002 (fruit), 9118 (flowers). October, 1923. A low shrub 2 feet high found in the alpine regions of Tsechung at 13,000 feet altitude. It has elliptical-oval leaves, which are white beneath, and large carmine flowers.

59084. *RHODODENDRON* sp.

Nos. 11003 (fruit), 9278 (flowers). October, 1923. A low shrub 1 to 2 feet high found in the alpine regions of Tsechung. Its small oval leaves are glabrous on both sides, but paler and dull green beneath; the flowers are a rich carmine.

59085. *RHODODENDRON PRAESTANS* Balf. f. and Smith.

Nos. 11013 (fruit), 19095 (flowers). October, 1923. A tree 12 to 15 feet high found on alpine slopes at 13,000 feet altitude. This striking species has large leaves 1 to 2 feet long, subsessile and brownish gray beneath; the large flowers are purplish pink.

59086. *RHODODENDRON* sp.

Nos. 11014 (fruit), 9158 (flowers). October, 1923. A shrub 4 feet high found on the alpine slopes of Tsechung at 13,000 feet altitude. The leaves are small, oval, papery, glabrous, and the flowers pale lavender.

59087. *RHODODENDRON* sp.

Nos. 11015 (fruit), 8777 (flowers). October, 1923. A shrub or small tree 8 to 10 feet high found in forests on the slopes of the Tsechung Mountains at 10,000 feet altitude. This handsome species has leaves which are oblong, dull green, and glabrous; its pinkish purple flowers are in large umbels.

59000 to 59268—Continued.

59088. RHODODENDRON FULVIDES Balf. f. and Forrest.

Nos. 11016 (fruit), 8790 (flowers). October, 1923. A small tree 8 to 10 feet high found on the slopes of Tsehchung at 10,000 feet altitude. Its obovate-acute, oblong leaves are covered with brown tomentum beneath, and its large flowers are reddish purple.

59089. RHODODENDRON SP.

Nos. 11017 (fruit), 9108 (flowers). October, 1923. A shrub 8 feet high found on the alpine slopes of Tsehchung at 12,000 feet altitude. The oblong leaves are dark green above and smooth and brown beneath; the flowers are pink.

59090. RHODODENDRON SP.

Nos. 11018 (fruit), 9209 (flowers). October, 1923. A low-growing shrub 2 feet tall found in the alpine regions of Tsehchung at 12,000 feet altitude. This striking species has small oval leaves, which are white beneath, and very rich carmine flowers.

59091. RHODODENDRON FULVIDES Balf. f. and Forrest.

Nos. 11023 (fruit), 8738 (flowers). October, 1923. A shrub 5 to 6 feet high found at the Sila Pass on the Mekong-Salwin Divide at 14,000 feet altitude. The lanceolate leaves are brown tuberculate beneath, and the flowers are a handsome rich pink.

59092. RHODODENDRON SP.

Nos. 11024 (fruit), 9220 (flowers). October, 1923. A small shrub 2 to 3 feet high found at the Sila Pass on the Mekong-Salwin Divide at an altitude of 14,000 feet. The leaves are elliptical-oblong, mucronate, and drab to white beneath; the flowers are medium sized and a deep blackish crimson.

59093. RHODODENDRON SP.

Nos. 11026 (fruit), 9216 (flowers). October, 1923. A small shrub 4 feet high found at the Sila Pass on the Mekong-Salwin Divide at an altitude of 13,000 feet. The oval subcordate leaves are glabrous and pale beneath; the flowers are a pale yellowish pink.

59094. RHODODENDRON SP.

Nos. 11027 (fruit), 9231 (flowers). October, 1923. A shrub 6 feet high found at the Sila Pass on the Mekong-Salwin Divide at between 10,000 and 11,000 feet altitude. The obovate leaves are glabrous and paler beneath, and the flowers are pinkish purple.

59095. RHODODENDRON SP.

Nos. 11028 (fruit), 9203 (flowers). October, 1923. A small shrub 5 feet high found along a stream in the Sila Pass of the Mekong-Salwin Divide at 11,000 feet altitude. The oblong leaves are glabrous and paler beneath, and the large flowers are a rich pink spotted with purple.

59096. RHODODENDRON SP.

Nos. 11029 (fruit), 9214 (flowers). October, 1923. A low shrub 2 feet high found at the Sila Pass on the Mekong-Salwin Divide at 13,000 feet altitude. The elongate-elliptical leaves are dark green above and white beneath; the large flowers are a very dark carmine.

59097. RHODODENDRON SP.

Nos. 11030 (fruit), 8743 (flowers). October, 1923. A shrub or small tree 5 or 6 feet high found along the alpine brooks in the Sila Pass on the Mekong-Salwin Divide at 13,000 feet altitude. The obovate-glabrous leaves are golden yellow beneath, and the flowers are large and white.

59000 to 59268—Continued.

59098. RHODODENDRON SP.

Nos. 11031 (fruit), 9198 (flowers). October, 1923. A shrub 5 feet high found on the Sila Pass on the Mekong-Salwin Divide at between 12,000 and 13,000 feet altitude. The oval to obovate leaves are glabrous and golden yellow beneath; the flowers are a yellowish pink.

59099. RHODODENDRON SP.

Nos. 11032 (fruit), 8748 (flowers). October, 1923. A low shrub 4 to 5 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The oblong to obovate leaves are golden yellow and glabrous beneath. The flowers are pale pink.

59100. RHODODENDRON FULVIDES Balf. f. and Forrest.

Nos. 11034 (fruit), 9223 (flowers). October, 1923. A shrub or small tree 14 to 15 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The obovate leaves are dark green above and covered with brown tomentum beneath; the small rich-pink flowers are on slender pedicels.

59101. RHODODENDRON SP.

Nos. 11038 (fruit), 9207 (flowers). October, 1923. A shrub 7 to 8 feet tall found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The large obovate leaves are golden yellow beneath, and the very large flowers are a showy yellowish pink.

59102. RHODODENDRON SP.

Nos. 11041 (fruit), 8742 (flowers). October, 1923. A low shrub 3 to 4 feet high found on the Sila Pass on the Mekong-Salwin Divide. The obovate leaves are golden yellow beneath, and the flowers are a rich pink with a purplish tinge.

59103. RHODODENDRON SERFENS Balf. f. and Forrest.

Nos. 11042 (fruit), 9233 (flowers). October, 1923. A low shrub 1 to 2 feet high found on the Sila Pass on the Mekong-Salwin Divide. The obovate rounded leaves are glabrous and grayish green beneath; the flowers are carmine with a purplish tinge.

59104. RHODODENDRON SP.

Nos. 11043 (fruit), 8763 (flowers). October, 1923. A tree 18 feet high found on the Sila Pass on the Mekong-Salwin Divide at 13,000 feet altitude. The large oblong leaves are dark green above and deep brown tomentose beneath; the very striking large white flowers are on long pedicels.

59105. RHODODENDRON SP.

Nos. 11045 (fruit), 8746 (flowers). October, 1923. A small tree 8 to 10 feet high found growing on the Sila Pass on the Mekong-Salwin Divide at 11,000 feet altitude. The linear-elongate leaves are dark blackish gray beneath and dark green above, and the large flowers are a beautiful rose pink.

59106. RHODODENDRON SP.

Nos. 11047 (fruit), 9212 (flowers). October, 1923. A low shrub 2 feet high found growing in masses on the Sila Pass on the Mekong-Salwin Divide at 13,000 feet altitude. The elliptical leaves are grayish brown on top and chocolate color beneath; the flowers are dark crimson.

59107. RHODODENDRON SP.

Nos. 11050 (fruit), 9237 (flowers). October, 1923. A shrub or small tree 8 to 10 feet high found on the Sila Pass on the Mekong-Salwin Divide at about 11,000 feet altitude. The obovate leaves are golden yellow beneath, and the very large flowers are pinkish purple.

59000 to 59268—Continued.

59108. RHODODENDRON sp.

Nos. 11054 (fruit), 8741 (flowers). October, 1923. A small shrub 4 feet high found on the Sila Pass on the Mekong-Salwin Divide. The ovate-oblong leaves are glabrous and pale beneath, and the small flowers are a rich purple.

59109. RHODODENDRON sp.

Nos. 11055 (fruit), 9238 (flowers). October, 1923. A tall shrub 7 to 8 feet high found on the Sila Pass at 12,000 feet altitude. The oblong leaves are golden yellow beneath and glabrous, and the flowers are medium yellow.

59110. RHODODENDRON sp.

Nos. 11056 (fruit), 9205 (flowers). October, 1923. A shrub 6 to 8 feet high found on the Sila Pass at 12,000 feet altitude. The oval leaves are glabrous and pale yellow beneath, and the large flowers are rich yellow.

59111. RHODODENDRON sp.

Nos. 11057 (fruit), 9200 (flowers). October, 1923. A shrub 6 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The oblong leaves are a rich green, pale golden green beneath, and the flowers are pale pink.

59112. RHODODENDRON sp.

Nos. 11059 (fruit), 9204 (flowers). October, 1923. A shrub 6 to 8 feet high found on the Sila Pass on the Mekong-Salwin Divide at 13,000 feet altitude. The broad obovate-oblong leaves are glabrous and green on both sides; the flowers are a dark reddish purple.

59113. RHODODENDRON sp.

Nos. 11061 (fruit), 8744 (flowers). October, 1923. A low shrub only 3 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The ovate leaves are yellowish green beneath and glabrous; the flowers are deep purple carmine.

59114. RHODODENDRON sp.

Nos. 11063 (fruit), 9219 (flowers). October, 1923. A shrub 5 to 6 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The leaves are oval, pale green, and glabrous beneath; the large flowers are purple pink.

59115. RHODODENDRON sp.

Nos. 11064 (fruit), 9199 (flowers). October, 1923. A shrub 5 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The leaves are ovate-subcordate, green on both sides, and glabrous; the flowers are pale pink.

59116. RHODODENDRON sp.

Nos. 11065 (fruit), 9240 (flowers). October, 1923. A shrub 5 feet high found on the Sila Pass, Mekong-Salwin Divide. The elliptical leaves are glaucous green beneath, and the flowers are pale cream color.

59117. RHODODENDRON sp.

Nos. 11066 (fruit), 9213 (flowers). October, 1923. A shrub 5 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The oval leaves are green on both sides and glabrous; the flowers are orange-pink.

59118. RHODODENDRON sp.

Nos. 11068 (fruit), 8761 (flowers). October, 1923. A small tree 8 feet high found growing on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The large oblong leaves are covered beneath with a fine brown tomentum and the medium-sized flowers are rose-red.

59000 to 59268—Continued.

59119. RHODODENDRON sp.

No. 11069. October, 1923. A small tree 10 feet high found on the Sila Pass on the Mekong-Salwin Divide at 12,000 feet altitude. The large obovate leaves are covered with a chocolate-brown tomentum; the flowers are said to be white.

59120. RHODODENDRON sp.

Nos. 11072 (fruit), 10052 (flowers). October, 1923. A very aromatic shrub 7 feet high found in the mountains of Tseku between 10,000 and 12,000 feet altitude. The pink flowers have a purple tinge.

59121. RHODODENDRON sp.

Nos. 11073 (fruit), 8773 (flowers). October, 1923. A low shrub 4 feet high found on the mountains of Tseku and Tsechung, Mekong. The oblong-acute leaves are covered with a dense brown wool on the under side. The flowers are dark crimson.

59122. RHODODENDRON FORRESTII Balf. f.

Nos. 11074 (fruit), 8717 (flowers). October, 1923. A prostrate shrub collected on the alpine slopes of the Tseku Mountains at about 13,000 feet altitude. The small oval dark-green leaves are deep purple beneath, and the flowers are rich crimson.

59123. RHODODENDRON sp.

Nos. 11076 (fruit), 10053 (flowers). October, 1923. A low shrub only 1 foot high found on the alpine slopes of the Tseku Mountains at 13,000 feet altitude. The linear-coriaceous leaves have revolute margins and are covered with a dense rufous wool on the under side; the flowers are cream colored with purple spots.

59124. RHODODENDRON sp.

Nos. 11077 (fruit), 8719 (flowers). October, 1923. A low shrub 3 to 4 feet high found on the slopes of the Tseku Mountains, Mekong, at 10,000 feet altitude. The small oval leaves are green on both sides, but paler beneath, and the flowers are purplish pink.

59125. RHODODENDRON sp.

Nos. 11078 (fruit), 8715 (flowers). October, 1923. A shrub 4 feet high found on the Tseku Mountains at 10,000 feet altitude. The oval green leaves are glabrous on both sides, and the flowers are deep purplish red.

59126. RHODODENDRON sp.

Nos. 11080 (fruit), 8720 (flowers). October, 1923. A shrub 5 to 6 feet high collected in the Tseku Mountains at 12,000 feet altitude. The oblong-ovate leaves are pale green beneath and glabrous; the large flowers are pink red.

59127. RHODODENDRON sp.

Nos. 11081 (fruit), 8923 (flowers). October, 1923. A low shrub 3 feet high found in the alpine regions of the Tseku Mountains, Mekong. The under side of the obovate-oblong leaves is covered with chocolate-colored tomentum; the flowers are deep rich carmine.

59128. RHODODENDRON sp.

Nos. 11082 (fruit), 8725 (flowers). October, 1923. A small shrub 2 feet high found in the alpine regions of the Tseku Mountains at 13,000 feet altitude. The linear-oblong leaves are dark green above and silvery white beneath; the flowers are very dark carmine.

59129. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 11083 (fruit), 8921 (flowers). October, 1923. A shrub 5 feet high found in the mountains of Tseku-Lauchtung, Mekong Valley, at 10,000 feet altitude. The ovate leaves are rich brown tomentose beneath, and the flowers are snow white.

59000 to 59268—Continued.

59130. RHODODENDRON sp.

Nos. 11084 (fruit), 8922 (flowers). October, 1923. A low shrub $2\frac{1}{2}$ feet high found in the mountains of Lauchaitung, Mekong Valley, at an altitude of 12,000 feet. The narrow linear leaves have revolute margins and are covered with dense rufous wool beneath.

59131. RHODODENDRON sp.

November, 1923. A shrub 5 to 6 feet high found on the slopes of Aolaka, Salwin Valley, at 11,000 feet altitude. The oblong-acute leaves are dark green above, paler and glabrous beneath; the buds are very dark carmine and the petioles deep red.

59132. RHODODENDRON sp.

Nos. 11085 (fruit), 9263 (flowers). November, 1923. A tall shrub 8 feet high found in the Peima Mountains at 14,000 feet altitude. The oval leaves, acute at both ends, are covered with brown flaky tomentum, and the pink flowers are spotted with purple.

59133. RHODODENDRON sp.

Nos. 11089 (fruit), 8869 (flowers). November, 1923. A low-growing shrub 2 to 3 feet high found in the high alpine meadows of the Peima Mountains, Mekong-Yangtze Divide, at 15,600 feet altitude. The small oval leaves are brown tomentose beneath; the small flowers are white.

59134. RHODODENDRON sp.

Nos. 11092 (fruit), 8847 (flowers). November, 1923. A low shrub 1 to 2 feet high found in the high alpine regions of the Peima Mountains at from 15,000 to 16,000 feet altitude. The very small leaves are grayish above and brown beneath; the small flowers are blue.

59135. RHODODENDRON sp.

Nos. 11106 (fruit), 8855 (flowers). November, 1923. A shrub 5 to 6 feet high found in the Peima Mountains at 14,000 feet altitude. The leaves are linear lanceolate and covered with a brown tomentum beneath; the cream-colored flowers are spotted with purple.

59136. RHODODENDRON sp.

Nos. 11109 (fruit), 8849 (flowers). November, 1923. A low shrub 2 to 3 feet high found at 14,000 feet altitude in the Peima Mountains. The very small leaves are elliptical and brown beneath, and the small flowers are deep blue.

59137. RHODODENDRON sp.

Nos. 11110 (fruit), 8867 (flowers). November, 1923. A shrub 5 to 6 feet high found in the Peima Mountains at 13,000 feet altitude. The leaves are linear lanceolate, acute, and glabrous; the flowers are white and the bracts large.

59138. RHODODENDRON sp.

Nos. 11111 (fruit), 8846 (flowers). November, 1923. A low-growing shrub 4 feet high collected in the Peima Mountains at 13,000 feet altitude. The ovate-oblong leaves are glabrous and green on both sides; the flowers are pale pinkish purple.

59139. RHODODENDRON sp.

Nos. 11112 (fruit), 9946 (flowers). November, 1923. A tall shrub, 6 to 8 feet, found growing in the Peima Mountains at 14,000 feet altitude. The lanceolate leaves are glabrous and the flowers pink, spotted with purple.

59140. RHODODENDRON sp.

Nos. 11116 (fruit), 9272 (flowers). November, 1923. A tall shrub 10 feet high found in the Peima Mountains at 14,000 feet altitude. The oblong leaves are deeply copper colored beneath, and the flowers are white.

59000 to 59268—Continued.

59141. RHODODENDRON sp.

Nos. 11119 (fruit), 8851 (flowers). November, 1923. A shrub 5 to 6 feet high found in the Peima Mountains at 14,000 feet altitude. The leaves are oval acute at both ends and brown or yellowish tomentose beneath; the flowers are white with small purple spots.

59142. RHODODENDRON sp.

Nos. 11120 (fruit), 8860 (flowers). November, 1923. A small tree 6 to 8 feet high found on the Peima Mountains at 14,000 feet altitude. The oblong-acute leaves are covered with brown tomentum beneath, and the flowers are pale pink with deep-purple spots.

59143. RHODODENDRON sp.

Nos. 11121 (fruit), 8857 (flowers). November, 1923. A shrub 5 to 6 feet high collected at 14,000 feet altitude in the Peima Mountains. The leaves are ovate-oblong, brown to carmine tomentose beneath; the flowers are white and reddish purple.

59144. RHODODENDRON sp.

Nos. 11122 (fruit), 10358 (flowers). November, 1923. A shrub 7 to 8 feet high found at 14,000 feet altitude in the Peima Mountains. The oblong-acute leaves are deep brown tomentose beneath, and the flowers are pink.

59145. RHODODENDRON sp.

Nos. 11123 (fruit), 8926 (flowers). November, 1923. A shrub 5 feet high found at 14,000 feet altitude in the Peima Mountains. The linear-lanceolate leaves are covered on the under side with rust-brown flaky tomentum. The flowers are pink spotted with purple.

59146. RHODODENDRON sp.

Nos. 11124 (fruit), 9955 (flowers). November, 1923. A shrub 4 to 5 feet high collected at 14,000 feet altitude on the Peima Mountains. The oblong-acute leaves are dark-brown tomentose beneath, and the flowers are purple.

59147. RHODODENDRON sp.

Nos. 11125 (fruit), 9264 (flowers). November, 1923. A tall shrub 6 to 8 feet high collected at 14,000 feet altitude on the Peima Mountains. The oblong leaves are covered with pale-brown matted tomentum, and the white flowers are spotted with purple.

59148. RHODODENDRON sp.

Nos. 11126 (fruit), 9958 (flowers). November, 1923. A plant 5 inches high found on the high alpine meadows of the Peima Mountains at 15,000 feet altitude. The minute leaves are elliptical to ovoid and glabrous on both sides; the flowers are yellow.

59149. RHODODENDRON sp.

Nos. 11127 (fruit), 8848 (flowers). November, 1923. A low shrub 3 to 4 feet high found at 14,000 feet altitude on the Peima Mountains. The ovate-oblong leaves are glabrous, and the flowers are pinkish purple.

59150. RHODODENDRON sp.

Nos. 11128 (fruit), 9250 (flowers). November, 1923. A shrub 5 feet high found at 13,000 feet altitude in the Peima Mountains. The leaves are oval acute, subcordate base, and glabrous; the flowers are a rich lavender.

59151. RHODODENDRON sp.

There is no definite data available regarding these seeds, as they were received under a number belonging to a primrose.

59000 to 59268—Continued.

59152. RHODODENDRON sp.

Nos. 11130 (fruit), 9952 (flowers). November, 1923. A tiny shrub only 1 foot high found in the alpine meadows of the Peima Mountains at 15,000 feet altitude. The small oval leaves are brown and silky beneath, and the flowers are bluish purple.

59153. RHODODENDRON sp.

Nos. 11132 (fruit), 8866 (flowers). November, 1923. A small shrub 4 to 5 feet high found in the Peima Mountains at 13,000 feet altitude. The ovoid leaves are glabrous and paler beneath; the medium-sized flowers are lavender blue.

59154. RHODODENDRON sp.

Nos. 11133 (fruit), 9960 (flowers). November, 1923. A shrub 6 feet high found on the alpine slopes of the Peima Mountains at 14,000 feet altitude. The leaves are oblong, dark green with pale whitish yellow matted tomentum; the very large, rich purple flowers are spotted with dark purple.

59155. RHODODENDRON sp.

Nos. 11134 (fruit), 9947 (flowers). November, 1923. A shrub 5 feet high found at 14,000 feet altitude in the Peima Mountains. The ovate-acute leaves are dark green with revolute margins and are densely matted beneath with brown tomentum; the flowers are white.

59156. RHODODENDRON sp.

Nos. 11137 (fruit), 8947 (flowers). November, 1923. A low shrub 2 to 3 feet high found at 12,000 feet altitude in the alpine meadows of Litiping, Mekong-Yangtze Divide. The oval leaves are glabrous, and the bright-yellow flowers are in large umbels.

59157. RHODODENDRON sp.

Nos. 11139 (fruit), 9161 (flowers). November, 1923. A tree 12 to 15 feet high found at 12,000 feet altitude in the alpine forests of Litiping. The oblong glabrous leaves are green, and the deep-purple flowers are spotted with darker purple.

59158. RHODODENDRON sp.

Nos. 11140 (fruit), 9167 (flowers). November, 1923. A tall shrub 10 to 12 feet high found in the alpine forests of Litiping at 11,000 feet altitude. The oblong glabrous leaves are green, and the purple flowers are not spotted.

59159. RHODODENDRON sp.

Nos. 11141 (fruit), 9068 (flowers). November, 1923. A small shrub 4 to 5 feet high collected at 11,000 feet altitude on the slopes of the Yetche Mountains. The leaves are small, oval, green, and glabrous, and the flowers are lavender.

59160. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 11142 (fruit), 9075 (flowers). November, 1923. A shrub 6 feet high found in the Yetche Mountains, Mekong Valley, at 10,000 feet altitude. The leaves are oblong, lanceolate, acute with brown tomentum beneath; the flowers are pink.

59161. RHODODENDRON sp.

Nos. 11143 (fruit), 8950 (flowers). November, 1923. A small shrub 3 feet high found at 12,000 feet altitude in the mountains of Anwa-Yetche. The leaves are oval, acute with pale-yellow matted wool; the flowers are pinkish red.

59162. RHODODENDRON sp.

Nos. 11144 (fruit), 8941 (flowers). November, 1923. A small shrub 3 feet high found at 14,000 feet altitude in the alpine regions of Anwa.

59000 to 59268—Continued.

The leaves are linear lanceolate, coriaceous, densely rufous woolly beneath; the handsome flowers are pure white.

59163. RHODODENDRON sp.

Nos. 11146 (fruit), 8957 (flowers). November, 1923. A shrub 4 feet high found in the alpine regions of Anwa, Mekong Valley. The leaves are linear-oblong, deeply rufous beneath; the large flowers are white.

59164. RHODODENDRON sp.

Nos. 11147 (fruit), 8930 (flowers). November, 1923. A shrub 4 feet high found in the alpine regions of Anwa at 13,000 feet altitude. The broadly obovate leaves are suborbicular, green, and glabrous; the large flowers are bright yellow.

59165. RHODODENDRON sp.

Nos. 11148 (fruit), 9391 (flowers). November, 1923. A little plant 1 foot high found on the alpine slopes of the Mofing Mountains, north-east of Atuntze, at 14,000 feet altitude. The leaves are very small, oval, brown, and tuberculate beneath; the small flowers are yellow.

59166. RHODODENDRON sp.

Nos. 11154 (fruit), 10219 (flowers). A rare shrub only 1 foot high found in the Champutong Mountains, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The leaves are obovate elliptical with brownish black matted wool beneath; the flowers are yellowish red.

59167. RHODODENDRON sp.

Nos. 11157 (fruit), 10107 (flowers). October, 1923. A low shrub 1 to 3 feet high found at 13,000 feet altitude on the Champutong Mountains, Salwin-Irrawaddy Divide. The spatulate leaves are dark green and purplish black tomentose beneath; the rare flowers are yellowish red.

59168. RHODODENDRON sp.

Nos. 11158 (fruit), 10218 (flowers). October, 1923. A low shrub 1 to 2 feet high found at 13,000 feet altitude on the Champutong Mountains, Salwin-Irrawaddy Divide. The leaves are elliptical with drab tomentum beneath; the flowers are reddish purple.

59169. RHODODENDRON sp.

Nos. 11161 (fruit), 10109 (flowers). October, 1923. A small shrub 1 to 2 feet high found in the Champutong Mountains, Salwin-Irrawaddy Divide, at 14,000 feet altitude. The branches are stiff and erect, the elliptical leaves brownish beneath, and the flowers are yellow.

59170. RHODODENDRON sp.

Nos. 11163 (fruit), 10150 (flowers). October, 1923. A tree 8 to 10 feet high found at Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The leaves are obovate-oblong mucronate and densely matted with red-brown tomentum; the flowers are red.

59171. RHODODENDRON sp.

Nos. 11164 (fruit), 10162 (flowers). November, 1923. A small shrub 4 feet high found at 13,000 feet altitude on Mount Kenichunpu on the Salwin-Irrawaddy Divide. The leaves are obovate elliptical and covered with dark brownish black tomentum beneath; the flowers are pink.

59172. RHODODENDRON sp.

Nos. 11165 (fruit), 10120 (flowers). November, 1923. A tree 18 to 20 feet high found on Mount Kenichunpu on the Salwin-Irrawaddy Divide at 13,000 feet altitude. The very large leaves are obovate oblong, deep rich brown, and evenly tomentose beneath; the flowers are a rich yellow.

59000 to 59268—Continued.

59173. RHODODENDRON sp.

Nos. 11167 (fruit), 10223 (flowers). October, 1923. A small shrub 4 feet high found growing on Mount Kenichunpu, Champutong, at 12,000 feet altitude. The elliptic leaves are brownish glaucous and glabrous beneath; and the yellow flowers are on long pedicels.

59174. RHODODENDRON sp.

No. 11169. October, 1923. A very low shrub 1 to 2 feet high found growing in Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The obovate, spatulate leaves are glabrous, dark rich green above, and paler beneath. The flowers were not seen.

59175. RHODODENDRON sp.

Nos. 11175 (fruit), 10129 (flowers). October, 1923. A shrub 5 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The oval-obovate leaves are rich green above and chocolate colored beneath; the flowers are a rich red.

59176. RHODODENDRON sp.

Nos. 11176 (fruit), 10105 (flowers). October, 1923. A small shrub 1 to 2 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The leaves are small, elliptical, acute at both ends, and yellowish white tomentose beneath; the flowers are deep crimson.

59177. RHODODENDRON sp.

Nos. 11177 (fruit), 10098 (flowers). October, 1923. A shrub 2 to 3 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The leaves are elliptical, acute, and covered with white tomentum beneath; the flowers are very dark crimson.

59178. RHODODENDRON sp.

Nos. 11179 (fruit), 10145 (flowers). October, 1923. A tall shrub 7 to 8 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The oblong-acute leaves are long tapering at the base and densely squamately tomentose beneath; the flowers are red.

59179. RHODODENDRON sp.

Nos. 11180 (fruit), 10172 (flowers). October, 1923. A shrub 5 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The obovate-elliptical leaves are glabrous and golden yellowish green beneath; the flowers are red.

59180. RHODODENDRON sp.

Nos. 11181 (fruit), 10140 (flowers). October, 1923. A low shrub 3 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The elliptical leaves are brownish tomentose beneath, and the flowers are red.

59181. RHODODENDRON sp.

Nos. 11182 (fruit), 10133 (flowers). October, 1923. A shrub 6 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The obovate-oblong leaves are covered with squamose brown tomentum beneath, and the flowers are red.

59182. RHODODENDRON RADICANS Balf. f. and Forrest.

Nos. 11188 (fruit), 10122 (flowers). October, 1923. A prostrate plant only a few inches tall found between 14,000 and 15,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The very small leaves are elliptical and covered with pale-brown tomentum beneath, and the large bright-red flowers are on long pedicels.

59000 to 59268—Continued.

59183. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 11189 (fruit), 10125 (flowers). October, 1923. A tree 10 feet high found at 13,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The linear-lanceolate leaves are a rich green above and dark brown woolly beneath; the flowers are pink.

59184. RHODODENDRON sp.

Nos. 11190 (fruit), 10195 (flowers). October, 1923. A shrub 6 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The leaves are oval, acute, subcordate, and have thin brownish tomentum beneath; the flowers are pink.

59185. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 11192 (fruit), 10198 (flowers). A shrub or small tree 10 feet high found at 13,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The linear-oblong leaves are dull green above with the veins deeply impressed and reddish brown tomentose beneath; the flowers are pink.

59186. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 11193 (fruit), 10117 (flowers). October, 1923. A shrub or tree 7 to 10 feet high found at 13,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The leaves are linear lanceolate, acuminate, and dark rufous woolly beneath; the flowers are pink.

59187. RHODODENDRON sp.

Nos. 11195 (fruit), 10113 (flowers). October, 1923. A shrub or small tree 8 to 10 feet high found at from 12,000 to 13,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The oblong-acute leaves are greenish flaky and tomentose beneath; the flowers are pink.

59188. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 11196 (fruit), 10196 (flowers). October, 1923. A tree 8 to 10 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The oblong-acuminate leaves are covered with yellowish tomentum beneath, and both petioles and pedicels are hirsute; the flowers are pink.

59189. RHODODENDRON sp.

Nos. 11198 (fruit), 10126 (flowers). October, 1923. A very small shrub only 2 feet high found at 13,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The very small ovate leaves are tuberculate beneath, and the flowers are yellow.

59190. RHODODENDRON sp.

Nos. 11201 (fruit), 10199 (flowers). October, 1923. A shrub 6 feet high found at 13,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The large leaves are obovate-oblong with dense brown matted wool beneath; the flowers are scarlet.

59191. RHODODENDRON sp.

Nos. 11202 (fruit), 10149 (flowers). October, 1923. A shrub 7 to 8 feet high found at 12,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The linear-elliptical leaves are white and glaucous, glabrous beneath; the red flowers are on long pedicels.

59192. RHODODENDRON sp.

Nos. 11205 (fruit), 10170 (flowers). October, 1923. A small shrub 3 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide. The oval-elliptical leaves are pale yellow and glabrous beneath; the flowers are red.

59000 to 59268—Continued.

59193. RHODODENDRON SP.

No. 11211. October, 1923. A tree 15 to 18 feet tall found at 13,000 feet altitude on Mount Kenichunpu, Salwin-Irrawaddy Divide. The large oblong leaves are densely matted brown tomentose beneath; flowers not seen.

59194. RHODODENDRON AMAUOPHYLLUM Balf. f. and Forrest.

No. 11238. October, 1923. A small shrub 1½ to 2 feet high found on the rocky slopes of Mount Kenichunpu at 13,000 feet altitude on the Salwin-Irrawaddy Divide. The small oval leaves are brown tomentose beneath, and the flowers are red.

59195. RHODODENDRON SP.

No. 11252. October, 1923. A shrub 8 feet high found at from 12,000 to 13,000 feet altitude on Mount Lautchun. The narrow elliptical leaves are deeply rufous woolly beneath, and the flowers are pink.

59196. RHODODENDRON SP.

No. 11260. October, 1923. A low shrub 2 feet high found at 10,000 feet altitude on the slopes of Mount Lautchun. The small linear leaves are revolute and pale brown beneath; the flowers are pale pink.

59197. RHODODENDRON SP.

Nos. 11269 (fruit), 8395 (flowers). October, 1923. A shrub 5 feet high collected on Mount Lautchun at 8,500 feet altitude. The oblong leaves are dark green, glabrous, paler underneath, and the deep purplish red flowers are on slender pedicels.

59198. RHODODENDRON SP.

Nos. 11270 (fruit), 8393 (flowers). October, 1923. A very tall shrub 12 feet high found at 8,500 feet altitude on Mount Lautchun. The leaves are oblong-oval and glabrous on hirsute petioles, and the flowers are a rich pink.

59199. RHODODENDRON SP.

Nos. 11271 (fruit), 8419 (flowers). October, 1923. A shrub 6 to 10 feet high found at 8,500 feet altitude on Mount Lautchun. The small oval leaves are deep brown beneath, and the large flowers shade from lavender to deep purple.

59200. RHODODENDRON SP.

No. 11272. October, 1923. A shrub or small tree 15 to 18 feet tall found on the slopes of Mount Shenzi. The large dark-green leaves are glabrous on both sides, and the large flowers are red.

59201. RHODODENDRON SP.

Nos. 11275 (fruit), 9607 (flowers). October, 1923. A shrub 6 feet high found on Mount Shenzi at 10,000 feet altitude. The large oblong, acute leaves are dark green and glabrous on both sides; the flowers are red.

59202. RHODODENDRON SP.

Nos. 11278 (fruit), 9503 (flowers). A low shrub 2 to 3 feet high found among rocks on Mount Shenzi at 13,000 feet altitude. The thick coriaceous leaves are densely covered with a rough brown cottony tomentum on the under side; flowers pink.

59203. RHODODENDRON SP.

Nos. 11280 (fruit), 8429 (flowers). October, 1923. A tree 12 to 15 feet high found at Labako at about 9,000 feet altitude. The oval-acute leaves are glabrous green on both sides, and the white flowers have a pinkish tinge.

59000 to 59268—Continued.

59204. RHODODENDRON SP.

No. 11283. October, 1923. A shrub 5 feet high found in forests at Labako at 10,000 feet altitude. The acute-elliptical leaves are rich green and glabrous on both sides; the flowers are pink.

59205. RHODODENDRON SP.

No. 11285. October, 1923. A small tree 10 feet high found on the alpine plains of Labako at 12,000 feet altitude. The linear leaves are almost needle shaped with long revolute margins; they are dark green above and rufous brown woolly beneath. The white flowers are in dense umbels.

59206. RHODODENDRON SP.

No. 11287. October, 1923. A shrub only 2 feet high found among rocks on the mountains of Labako at 12,000 feet altitude. The small oval leaves are brown and dotted beneath, and the flowers are red.

59207. RHODODENDRON SP.

No. 11288. October, 1923. A low shrub 3 feet high found in forests in the Labako Mountains at about 1,000 feet altitude. The roundish, oval leaves are glaucous-green beneath; the flowers are white.

59208. RHODODENDRON SP.

Nos. 11290 (fruit), 9533 (flowers). October, 1923. A shrub 6 feet high found in a fir forest on the Labako Mountains at 11,000 feet altitude. The ovate-oblong acute leaves are green and glabrous on both sides with hairy stems. The flowers are red.

59209. RHODODENDRON SP.

No. 11294. October, 1923. A low shrub 2 feet high found among rocks on the alpine regions of the Labako Mountains at 13,000 feet altitude. The small oval leaves are pale golden brown beneath and spotted; the flowers are a purple blue.

59210. RHODODENDRON SP.

Nos. 11295 (fruit), 9527 (flowers). October, 1923. A small shrub 2 feet high found on rocky slopes of the alpine regions in the Labako Mountains at 13,000 feet altitude. Leaves oval, densely brown dotted beneath; the flowers are deep indigo with a purplish tinge.

59211. RHODODENDRON SP.

Nos. 11296 (fruit), 9554 (flowers). October, 1923. A shrub 3 feet high found growing at about 13,800 feet altitude in the alpine meadows of the Labako Mountains. The leaves are small, oval, and densely dotted with brown beneath. The flowers are deep purplish blue.

59212. RHODODENDRON SP.

Nos. 11297 (fruit), 8444 (flowers). October, 1923. A handsome species 3 feet high found among rocks on the Labako Mountains at 11,000 feet altitude. The leaves are elliptical, acute at both ends, with revolute undulate margins and pale green beneath; the flowers are large and white.

59213. RHODODENDRON SP.

No. 11301. October, 1923. A shrub 5 feet high found on the summit of Mount Kintze, at 13,000 feet altitude. The margins of the needle-shaped leaves are so strongly revolute that they meet below; the flowers are white.

59000 to 59268—Continued.

59214. RHODODENDRON SP.

Nos. 11303 (fruit), 9494 (flowers). October, 1923. A very small shrub 1 foot high found in rocky regions of Mount Kintze, at about 13,000 feet altitude. The minute elliptical leaves are brown tomentose beneath, and the small flowers are pale blue.

59215. RHODODENDRON SP.

Nos. 11304 (fruit), 9492 (flowers). October, 1923. A very small plant 6 to 8 inches high found in the rocky alpine regions of Mount Kintze, at about 13,000 feet altitude. The minute elliptical leaves are brown beneath, and the flowers vary from purplish pink to red.

59216. RHODODENDRON SP.

Nos. 11305 (fruit), 9482 (flowers). October, 1923. A plant a few inches high found on the alpine slopes of Mount Kintze, at about 13,000 feet altitude. The small oval, acute leaves are glabrous beneath, and the crimson flowers are on long erect peduncles.

59217. RHODODENDRON SP.

Nos. 11306 (fruit), 9490 (flowers). October, 1923. A scaly prostrate shrub growing on the summit of Mount Kintze, at 13,000 feet altitude. The spatulate leaves are densely covered with cottony brown tomentum, and the flowers are white.

59218. RHODODENDRON SP.

No. 11307. October, 1923. A shrub 8 feet high found near the summit of Mount Kintze, at 13,000 feet altitude. The elliptical leaves are densely woolly beneath, and the flowers are white.

59219. RHODODENDRON SP.

No. 11308. October, 1923. A shrub 5 feet high found at 12,000 feet altitude on Mount Kintze. The leaves are elliptical, oblong, glabrous, and the flowers are yellow.

59220. RHODODENDRON SP.

Nos. 11310 (fruit), 8455 (flowers). October, 1923. A small plant 1 foot high found on the mountains in Luruako Labako, at 12,000 feet altitude. The oblong-acute leaves are elliptical and pale green on both sides; the flowers are pale pink.

59221. RHODODENDRON SP.

Nos. 11311 (fruit), 8461 (flowers). October, 1923. A shrub 5 to 6 feet high found on the mountains of Luruako at 12,000 feet altitude. The linear needle-shaped leaves have revolute margins and are densely rufous beneath; the white flowers grow in dense umbels.

59222. RHODODENDRON SP.

Nos. 11312 (fruit), 8465 (flowers). October, 1923. A low shrub 3 to 4 feet high found on the rocky slopes of the mountains of Luruako, at 12,000 feet altitude. The long linear-lanceolate leaves are a glossy dark green above and red rufous woolly beneath; the flowers are white.

59223. RHODODENDRON SP.

Nos. 11313 (fruit), 8462 (flowers). October, 1923. A small shrub 4 feet high found in the high mountains of Luruako at 12,000 feet altitude. The leaves are oval, acute, subcordate, and pale yellow to brown tomentose beneath. The flowers are pink.

59224. RHODODENDRON SP.

Nos. 11314 (fruit), 8464 (flowers). October, 1923. A shrub 4 to 5 feet high found in the high

59000 to 59268—Continued.

mountains of Luruako, at 13,000 feet altitude. The oblong-acute leaves are dark green and reticulate above and from pale yellow to brown tomentose beneath. The flowers are pink.

59225. RHODODENDRON SP.

No. 11315. October, 1923. A plant 2 feet high found in swampy situations or on slopes along streams on the mountains of Luruako at 10,000 feet altitude. The small, linear-elliptical leaves are pale brown dotted beneath, and the flowers are blue.

59226. RHODODENDRON SP.

Nos. 11316 (fruit), 9168 (flowers). October, 1923. A shrub 5 feet high found at the foot of the mountains of Litiping. It is a beautiful species with pale-green elliptical leaves and very fragrant large yellow flowers.

59227. RHODODENDRON SP.

Nos. 11321 (fruit), 9070 (flowers). October, 1923. A shrub 7 to 8 feet high found in alpine meadows on the slopes of the Litiping Mountains at 12,000 feet altitude. The oval-acute leaves are subcordate at the base and pale green glabrous beneath; the yellow flowers have a pinkish tinge.

59228. RHODODENDRON SP.

No. 11322. October, 1923. A shrub 6 to 8 feet high found in the mountains of Yetche at 12,000 feet altitude. The leaves are oblong, acute at both ends, and covered with soft brown tomentum beneath. Flowers unknown.

59229. RHODODENDRON SP.

No. 11325. November, 1923. A shrub 5 to 6 feet high found in the Peima Mountains at 14,000 feet altitude. The broadly oval leaves are coriaceous with deciduous tomentum.

59230. RHODODENDRON SP.

No. 11335. November, 1923. A shrub 6 feet high found on the Moting Mountains at about 14,000 feet altitude. The leaves are oval, oblong, acute, subcordate, and brown tomentose beneath. Flowers not seen.

59231. RHODODENDRON SP.

No. 11341. November, 1923. A shrub 5 to 6 feet high found on the high alpine slopes of the Peima Mountains between 14,000 and 15,000 feet altitude. The acute, obovate-oblong leaves are covered beneath with a faintly appressed brown silky tomentum. Flowers not seen.

59232. RHODODENDRON SP.

No. 11342. November, 1923. A shrub from 5 to 8 feet high, found on the alpine slopes of the Moting Mountains between 14,000 and 15,000 feet altitude. The oblong-acute leaves are covered with rufous-brown tomentum beneath.

59233. RHODODENDRON SP.

No. 11344. November, 1923. A shrub 6 to 8 feet high found on the alpine slopes of the Moting Mountains at from 14,000 to 15,000 feet altitude. The leaves are elliptical, oblong, acute, and rich brown tomentose beneath.

59234. RHODODENDRON SINO-GRANDE Balf. f. and Smith.

No. 11348. A tree from 20 to 25 feet high, with spreading branches, found below Shund-sungla, Mekong-Salwin Divide, at 11,500 feet altitude. The very large oblong leaves are broadest at the tip and are 2 feet long, dark green above, and silvery beneath. The large flowers are cream colored.

59000 to 59268—Continued.

59235. *RHODODENDRON FULVIDES* Balf. f. and Forrest.

Nos. 11351. November, 1923. A tree 18 to 20 feet high with branches more or less slender, found at 11,500 feet altitude below Shundsungla, Mekong-Salwin Divide. The leaves are obovate-oblong, acute, and brown tomentose beneath.

59236. *RHODODENDRON* sp.

Nos. 11354. November, 1923. A tree 18 feet high found in a mixed forest on the slopes of the Dokerla Mountains at 11,000 feet altitude. The leaves are linear-oblong, acute at both ends, evenly green, and glabrous on both sides; the flowers are red and the fruits numerous.

59237. *RHODODENDRON* sp.

Nos. 11355. November, 1923. A shrub 4 to 5 feet high found on the outskirts of the pine forest on the eastern slopes of the Karila-Yangtze Divide at 12,000 feet altitude. The broadly ovate-oblong leaves are glaucous, glabrous beneath, and the flowers are said to be yellow.

59238. *RHODODENDRON* sp.

November, 1923. A large shrub 10 to 12 feet high found along the streams in forests on the Dokerla Mountains at 12,000 feet altitude. The dark-green oblong leaves are glabrous on both sides.

59239. *RHODODENDRON* sp.

Nos. 11358. December, 1923. A tree 12 to 15 feet high found along the streams in the forests of Pongela at 11,000 feet altitude. The linear-lanceolate leaves are dull green above, paler and glabrous beneath; the flowers are said to be purplish red.

59240. *RHODODENDRON* sp.

Nos. 11362. November, 1923. A low shrub 1 to 2 feet high found in swampy places near Haraku, Likiang Snow Range, at about 11,000 feet altitude. The small linear leaves are pale brown beneath, and the flowers are said to be whitish pink.

59241. *RHODODENDRON* sp.

Nos. 11364 (fruit), 8494 (flowers). November, 1923. A shrub 3 to 4 feet high found at 12,000 feet altitude on the Likiang Snow Range. The elliptical leaves are glabrous green on both sides, and the flowers are pale blue.

59242. *RHODODENDRON* sp.

Nos. 11366 (fruit), 8214 (flowers). November, 1923. A tree 12 feet high found between 10,000 and 11,000 feet altitude on the western slopes of the Likiang Snow Range. The linear-oblong leaves are glabrous and pale green beneath; the flowers are purple.

59243. *RHODODENDRON* sp.

Nos. 11368 (fruit), 8562 (flowers). November, 1923. A shrub 6 to 8 feet high found at 11,000 feet altitude on the Likiang Snow Range. The small, oval, acute leaves are pale yellow beneath, and the flowers are lavender.

59244. *RHODODENDRON* sp.

Nos. 11369 (fruit), 8212 (flowers). November, 1923. A shrub or small tree 8 feet high found on the western slopes of the Likiang Snow Range at 10,000 feet altitude. The linear-oblong leaves are pale green and glabrous beneath; the flowers are purplish red and spotted with darker red.

59245. *RHODODENDRON NIPHARGUM* Balf. f. and Ward.

Nos. 11370 (fruit), 8218 (flowers). November, 1923. A tree 25 feet high found on the western slopes of the Likiang Snow Range at 10,000 feet altitude. The obovate-oblong leaves are covered with ash-gray tomentum beneath, and the pale-pink flowers are on long pedicels in large umbels.

59000 to 59268—Continued.

59246. *RHODODENDRON NIPHARGUM* Balf. f. and Ward.

Nos. 11374 (fruit), 8216 (flowers). November, 1923. A tree 25 to 30 feet high with a trunk 1 foot in diameter found in forests on the western slopes of the Likiang Snow Range at 10,000 feet altitude. The large leaves are silvery white beneath; the flowers, rose pink (not spotted), grow in large umbels.

59247. *RHODODENDRON* sp.

Nos. 11375 (fruit), 8215 (flowers). November, 1923. A tree 12 to 18 feet high found at Zinako on the western slopes of the Likiang Snow Range at 10,000 feet altitude. The leaves are linear-oblong, glabrous, and dull green; the large flowers are a delicate pink with a few purple spots.

59248. *RHODODENDRON* sp.

Nos. 11376 (fruit), 8217 (flowers). Zinako. November, 1923. A tree 15 to 18 feet high found at 10,000 feet altitude on the western slopes of the Likiang Snow Range. The oval-oblong, acute leaves are pale yellowish gray beneath, and the large flowers are uniformly pinkish purple and not spotted.

59249. *RHODODENDRON* sp.

Nos. 11377 (fruit), 8210 (flowers). November, 1923. A shrub 12 to 18 feet high found at 10,000 feet altitude in the forests above Ashi on the western slopes of the Likiang Snow Range. The oblong, bluntly acute leaves are pale green beneath, and the large dark-purple flowers are not spotted.

59250. *RHODODENDRON* sp.

Nos. 11378 (fruit), 8272 (flowers). November 1923. A small tree 15 feet high found at 11,000 feet altitude in the mountains of Sungkwe south of Likiang. The large oblong leaves are densely rufous brown beneath, and the flowers are white.

59251. *RHODODENDRON* sp.

Nos. 11380 (fruit), 8262 (flowers). November, 1923. A shrub 7 to 8 feet high found at 10,000 feet altitude in the Sungkwe Mountains south of Likiang. The elliptical-oblong leaves are pale green and paler beneath; the flowers are deep reddish purple.

59252. *RHODODENDRON* sp.

Nos. 11390. November, 1923. A shrub 6 to 8 feet high found in the fir forests of Litiping on the Mekong-Yangtze Divide. The linear-oblong, narrow leaves are dark green, paler beneath, and the flowers are purple.

59253. *RHODODENDRON* sp.

Nos. 11392 (fruit), 8362 (flowers). October, 1923. A small shrub 3 to 4 feet high found growing on dry rocky limestone slopes at the edge of pine forests beyond Heshwe, east of the Likiang Snow Range, at 11,000 feet altitude. The obovate-acute leaves are a pale golden brown beneath, and the flowers are a rich bluish lavender.

59254. *RHODODENDRON* sp.

Nos. 11393 (fruit), 8331 (flowers). October, 1923. A shrub 4 feet high found among limestone boulders in a larch forest on the road to Baynva, east of the Likiang Snow Range, at 11,000 feet altitude. The elliptical-oval leaves are silky brown beneath, and the flowers are deep lavender.

59255. *RHODODENDRON* sp.

Nos. 11395. November, 1923. A small tree 25 feet high found in a fir forest on the western slopes of the Likiang Snow Range at 12,000 feet altitude. The large oblong leaves are dark green and densely rufous brown woolly beneath; the flowers are pink.

59000 to 59268—Continued.

59256. RHODODENDRON sp.

No. 11396. November, 1923. A shrub 8 feet high found at about 13,000 feet altitude on the western slope of the Likiang Snow Range. The oblong, acute leaves are yellowish brown tomentose beneath, and the flowers are white.

59257. RHODODENDRON sp.

No. 11401. November, 1923. A low shrub 2 feet high found among rocks at Haraku on the eastern slopes of the Likiang Snow Range. The small, narrow, linear leaves are brownish beneath, and the fragrant flowers are white.

59258. RHODODENDRON RACEMOSUM Franch.

No. 11415. November, 1923. A low shrub 2 feet high found in a drier region on the rocky slopes of the Likiang Snow Range at from 9,500 to 11,000 feet altitude. The leaves are small, oval, and white beneath; the flowers are pale pink.

59259. RHODODENDRON sp.

No. 11434. November, 1923. A shrub 2 feet high found among rocks on the alpine slopes of the Likiang Snow Range between 14,000 and 15,000 feet altitude. The small elliptical-spatulate leaves are bronze colored, and the flowers are deep red.

59260. RHODODENDRON sp.

No. 11459. November, 1923. A shrub 6 feet high found on the alpine slopes of the Likiang Snow Range at 14,000 feet altitude. The oblong, acute leaves are pale yellow beneath, and the large flowers are pure white.

59261. RHODODENDRON sp.

No. 11463. Nadchua. November, 1923. A tree 15 to 18 feet high found among rocks at 14,000 feet altitude on the Likiang Snow Range. The leaves are large, oblong, acute, silky, faintly brown tomentose beneath; the very large flowers are pink.

59262. RHODODENDRON sp.

No. 11465. Nadchua. November, 1923. A plant 1 foot high found on the rocky slopes of the Likiang Snow Range at 14,500 feet altitude. The very small leaves are elliptical, oval, and brown beneath; the flowers are indigo blue.

59263. RHODODENDRON sp.

No. 11460. November, 1923. A plant a foot high found in alpine meadows on the Likiang Snow Range at 15,000 feet altitude. The very small oval leaves are brown beneath, and the small flowers are deep purplish blue.

59264. ROSA OMEIENSIS Rolfe. Rosaceæ. Rose.

No. 11361. December, 1923. A shrub 12 to 15 feet high found on the Kari Pass, Yangtze Divide, at 13,000 feet altitude. The bush branches from the base, and the young branches, broadly winged, are carmine. The flowers are white over red.

For previous introduction, see S. P. I. No. 53737.

59265. SAUSSUREA GOSSIPHORA D. Don. Asteraceæ.

No. 11472. November, 1923. A curious plant 1½ feet high found among limestone rocks, at 15,500 feet altitude on the Likiang Snow Range. The basal leaves are linear lanceolate and the head oblong and densely cottony; the flower heads are buried in cottony scales.

59266. SORBUS sp. Malaceæ.

No. 11070. October, 1923. A tree 10 feet high found on the mountains of Tsechung, at 10,000 feet altitude. The small pinnate leaves are pale beneath, and the flowers are a deep red. The fruits are also red.

59000 to 59268—Continued.

59267. SWERTIA sp. Gentianaceæ.

No. 11447. November, 1923. A plant 1 foot high found in alpine meadows, at 13,000 feet altitude on the Likiang Snow Range. The leaves are stem clasping, and the large handsome flowers are rich lavender blue.

59268. VACCINIUM sp. Vacciniaceæ.

No. 11490. November, 1923. A shrub 3 feet high found on the rocky slopes of the Lautchun Mountains, at 10,000 feet altitude. The small leaves are obovate, spatulate, and green on both sides; the globose, bluish black fruits are edible.

59269 to 59273. FICUS CARICA L. Moraceæ. Fig.

From Tiziuzu, Algeria. Cuttings presented by E. Rolland. Received April 18, 1924. Notes by Mr. Rolland.

59269. *Tharanimth Amelal Embgais*; a white fig from Bougie.59270. *Tharanimth Sultane*; same as the Spanish variety "Cou de Dames."59271. *Tharanimth Sadfar*; a rock fig from Sidi Belloua.59272. *Tharanimth Baquor Gberkanen*, a black flowering fig from Delhys.59273. *Tharanimth Sultane Amrabob*.

59274 and 59275.

From Manila, Philippine Islands. Seeds presented by Adriano Hernandez, Director, Bureau of Agriculture. Received April 15, 1924.

59274. DILLENIA PHILIPPINENSIS Rolfe. Dilleniaceæ.

Katmon. As described by W. H. Brown (Wild Food Plants of the Philippines, p. 116) this is a large, handsome tree about 60 feet in height, with oval, leathery, shining leaves and very attractive single white flowers about 6 inches wide. The roundish fruits, 2 inches in diameter, contain an edible, soft, green, juicy pulp with acid flavor. Although not particularly good when fresh, the fruits make an excellent jam. This species is very common throughout the Philippines.

For previous introduction, see S. P. I. No. 38333.

59275. MUSA PARADISIACA L. Musaceæ.

Plantain.

Bulan. An edible, seed-bearing variety from the Philippines; introduced for use in banana-breeding experiments.

59276 to 59278. RUBUS spp. Rosaceæ.

From Orleans, France. Plants purchased from the Grandes Roseaies du Val de la Loire. Received April 18, 1924.

59276. RUBUS FLAGELLIFLORUS Focke.

An evergreen or partly deciduous, shrubby, climbing species about 8 feet high, with simple, heart-shaped leaves, white flowers, and medium-sized, glossy black fruits. Native to central and western China at altitudes of 4,000 to 6,000 feet.

59277. RUBUS HENRYI Hemsl. and Kuntze.

A handsome evergreen species, of graceful habit, with trailing shoots 10 to 15 feet long. The leaves, 4 to 6 inches long, are covered beneath with a white felt; the pink flowers are about three-fourths of an inch across; the fruits are shining black. Native to central and western China.

59278. RUBUS POLYTRICHUS Progel.

A thornless, very ornamental species, covered with red hairs and having entire, light-green leaves.

59279. SOCRATEA EXORRHIZA (Mart.)
Wendl. Phœnicaceæ. **Palm.**

From Rio de Janeiro, Brazil. Seeds presented by Dr. L. H. Bailey, Ithaca, N. Y. Received April 17, 1924.

This tall, handsome, spineless palm from tropical South America has a swollen cylindrical trunk elevated on a pyramid of exposed roots, which gives it a remarkable appearance. The trunk, 35 feet or more in height, bears at its summit a crown of large, irregularly pinnate leaves; the flowers are small and yellow and the fruits olive green.

59280 to 59284.

From Addis Ababa, Abyssinia. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received April 18, 1924. Notes by Doctor Shantz.

59280 and 59281. CICER ARIETINUM L. Fabacæ.
Chick-pea.

59280. (No. 61. February 4, 1924.) Black form from market. This is one of the important crops in grain rotation. Black plants do not produce brown seeds; these seem to be on separate plants.

59281. (No. 62. February 4, 1924.) Mostly brown seeds.

59282. HOLCUS SORGHUM L. (Sorghum vulgare Pers.). Poacæ.
Sorghum.

(No. 66. February 4, 1924.) Type of sorghum sold in market.

59293. PISUM SATIVUM L. Fabacæ. **Pea.**
(No. 64. February 4, 1924.) From market.

59284. TRITICUM DURUM Desf. Poacæ.
Durum wheat.

(No. 56. February 4, 1924.) A wheat with a dark perianth; may be of value for breeding purposes.

59285 to 59288.

From Angol, Chile. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received April 19, 1924.

Introduced for testing by cerealists.

59285. AVENA STERILIS L. Poacæ. **Oats.**
Avena rubia.

59286 and 59287. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poacæ. **Common wheat.**

59286. *Chufkin.* **59287.** *Florencio.*

59288. ZEA MAYS L. Poacæ. **Corn.**

A local 12-rowed flint variety with ears 8 inches long. (*Richey and Emerson.*)

59289. COLOCASIA ESCULENTA (L.)
Schott. Aracæ.

From Dominica, British West Indies. Rootstocks presented by Joseph Jones, curator, Botanic Gardens. Received April 22, 1924.

The "sulphur dasheen," as this is known here, has handsome red leafstalks and is worth growing as an ornamental. The tubers are sometimes used as food, but are inferior to those of the common dasheen. The name "sulphur" probably refers to the color of the interior of the tubers. (*Jones.*)

59290 and 59291. TRIFOLIUM PRATENSE L. Fabacæ. **Red clover.**

From Paris, France. Seeds purchased from Vil-morin-Andrieux & Co. Received April 23, 1924.

Locally grown seeds introduced for clover specialists.

59290. From Cotes du Nord.

59291. From Aisne.

59292. TALINUM TRIANGULARE (Jacq.)
Willd. Portulacacæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received April 22, 1924.

An erect, branching, herbaceous plant, about 3 feet high, native to the West Indies, and recently introduced from Java into the Philippine Islands. The flowers are pink and produced in great profusion. In the Philippines the fleshy, tender leaves are boiled like spinach and served with meat, for which purpose they are excellent. The plant is easily propagated by cuttings. (*Wester.*)

For previous introduction, see S. P. I. No. 57819.

59293. KHAYA NYASICA Stapf. Meliacæ.

From Mount Silinda, Southern Rhodesia. Seeds presented by Dr. W. L. Thompson. Received April 19, 1924.

The *red mahogany* is one of our most valuable timber trees and is widely distributed over Mozambique. It is fairly rapid in growth, though not equal to some of the eucalypts in this respect. It is found most often growing near streams, but also on high ground at a distance from water. The timber is very durable and is not attacked by white ants or borers. (*Thompson.*)

59294 to 59298.

From Amsterdam, Netherlands. Seeds presented by the director, Botanic Garden. Received April 22, 1924.

A collection of leguminous plants and grasses introduced for forage-crop specialists.

59294. AESCHYNOMENE INDICA L. Fabacæ.

A bushy leguminous annual 1 to 3 feet high, native to the Tropics, with pale-green, feathery leaves. Procured for trial as fodder and as green manure.

59295. BRACHYPODIUM MEXICANUM (Roem. and Schult.) Link. Poacæ. **Grass.**

An erect annual Mexican grass with rather narrow rough but succulent leaves. Its ultimate height is about 3 feet.

59296. MELICA ALTISSIMA L. Poacæ. **Grass.**

A rather tall perennial European grass, 3 to 4 feet in height, with creeping rhizomes which form a loose turf. The leaf sheaths and the backs of the leaves are very rough.

59297. SUTHERLANDIA FRUTESCENS (L.) R. Br. Fabacæ.

A leguminous shrub about 3 feet in height, with finely pinnate leaves and showy scarlet flowers produced in short axillary racemes. Native to the Mediterranean countries.

59298. SYNTERISMA SINGINALIS (L.) Dulac. Poacæ. **Crab grass.**

Introduced for varietal studies.

59299 and 59300. TRIFOLIUM PRATENSE L. Fabacæ. **Red clover.**

From Budapest, Hungary. Seeds purchased from the Royal Hungarian Seed-Control Station. Received April 23, 1924.

Locally grown seeds introduced for clover specialists.

59299. From the central part of the great Hungarian plain between the Danube and the Theiss Rivers.

59300. From the western part of Hungary, near the Styrian border.

59301 to 59304.

From Soledad, Cienfuegos, Cuba. Seeds collected by David Fairchild, Bureau of Plant Industry. Received April 17, 1924.

59301. *ALEURITES MOLUCCANA* (L.) Willd. (*A. triloba* Forst.). Euphorbiaceæ. Lumbang.

No. 14. This appears to be different from the tree as it is now growing in Florida. Since the lumbang is a very promising tree for nut culture in southern Florida, we ought to get all possible strains for our collection.

For previous introduction, see S. P. I. No. 52755.

59302. *CEDRELA ODORATA* L. Meliaceæ.

No. 15. This is the tree which produces the cigar-box wood of Cuba. It deserves to be tried in Florida as a possible timber tree.

A tree, sometimes 100 feet tall, with handsome bright-green compound leaves 10 to 20 inches long. Native to the West Indies.

59303. *SERJANIA PANICULATA* H. B. K. Sapindaceæ.

No. 16. An ornamental vine with white flowers and handsome clusters of fruits; these have white arils and red bracts. This vine would be useful for pergolas.

59304. *TRICHOSTIGMA OCTANDRA* (L.) H. Walter (*Villamilla octandra* Hook. f.). Phytolaccaceæ.

No. 17. *Juaniqui* (Cuban name). The larger twigs of this tree are used like osier willow twigs, for the manufacture of baskets, and an extensive trade is carried on here in Cuba.

59305 to 59317.

From Soledad, Cienfuegos, Cuba. Seeds collected by David Fairchild, Bureau of Plant Industry. Received April 21, 1924.

59305. *ASSONIA MASTERSII* (Hook.) Kuntze (*Dombeya mastersii* Hook.). Sterculiaceæ.

No. 25. An ornamental shrub closely related to *Assonia walkichii*, with rosy white flowers.

A shrub 4 or 5 feet high, native to tropical Africa. The leaves are velvety, heart shaped, and serrate, and the flowers are fragrant.

59306. *CAJAN INDICUM* Spreng. Fabaceæ.

Pigeon pea.

No. 29. A strain, brought by R. M. Grey into Cuba from Haiti, which may be more resistant to weevils than the common form.

59307. *CANAVALI RUSIOSPERMUM* Urban. Fabaceæ.

No. 30. An ornamental climber with brilliant red beans; it would be excellent for dooryard gardens in Florida.

59308 to 59310. *CARICA PAPAYA* × *POSOPOSA*. Papayaceæ.

These appear to be hybrids between a very large-fruited papaya and a species with very small round fruits which Mr. Grey thinks may be *Carica posoposa*. There are several types of these hybrids which differ not only in the shape of the fruits but also in seed characters.

59308. A hybrid papaya.

59309. A good melon papaya type.

59310. A top-shaped papaya type; the fruit weighed 12 pounds.

59311. *CARICA POSOPOSA* L. Papayaceæ.

No. 21. The small round fruits are produced in crowded racemes at the summit of the stem. This species may be of use for breeding purposes.

59305 to 59317—Continued.

59312. *CASSIA FISTULA* L. Caesalpinaceæ.

No. 23. The *golden shower* is a handsome yellow-flowered tree introduced into the West Indies from India. The large pinnate leaves have four to eight pairs of leaflets, and the black, cylindrical pods, 1 or 2 feet long, are the "cassia pods" of commerce.

59313. *EUGENIA UNIFLORA* L. Myrtaceæ.

Pitanga.

No. 32. This is like the ordinary pitanga except that it has smaller seeds than any I have observed in Florida. An improved variety should come from these seeds.

59314. *GARCINIA TINCTORIA* (DC.) W. F. Wight (*G. xanthochymus* Hook. f.). Clusiaceæ.

No. 33. These seeds are from a large tree growing at the Cuban Gardens, Cienfuegos, sent by the Office of Foreign Seed and Plant Introduction to Mr. Grey in 1907. Its deep-green foliage and handsome crown make it a very attractive ornamental. The tree was loaded with its brilliant yellow fruits, which are delicious when eaten with plenty of sugar; the sharp acid flavor is quite different from that of the citrus fruits. The yellow fruits are worthy of a place on the American table, either for direct use with sugar or for sherbet and ice cream. The tree ripens its fruits in southern Florida in April or even earlier and deserves to be popularized as a fruit tree for small places.

For previous introduction, see S. P. I. No. 55454.

59315. *LAGERSTROEMIA SPECIOSA* (Muenchh.) Pers. (*L. flos-reginae* Retz.). Lythraceæ.

Crape myrtle.

No. 24. A tree crape myrtle from the Malay Archipelago which deserves to be better known in southern Florida.

A tree 50 to 60 feet tall, with leaves resembling somewhat those of the guava, and pink or purplish flowers about 2 inches wide, produced in immense panicles.

For previous introduction, see S. P. I. No. 49538.

59316. *LATANIA LODDIGESII* Mart. Phœnicaceæ.

Palm.

No. 30. A magnificent palm from Mauritius, which grows close to the seashore, producing a most tropical effect. It is peculiarly suited to conditions in southern Florida, although rare in that region.

For previous introduction, see S. P. I. No. 51721.

59317. *TINNEA AETHIOPICA* Kotschy and Peyr. Menthaceæ.

No. 26. An ornamental flowering shrub from tropical Africa.

A much-branched shrub about 4 feet high, with oblong, short-stemmed leaves. The dark, purplish brown flowers are produced in axillary whorls.

59318 to 59323.

From Giza, Egypt. Seeds presented by the director of the horticultural section, Ministry of Agriculture. Received April 16, 1924.

A collection of leguminous plants obtained for the use of specialists experimenting with green-manure and cover-crop plants.

59318 to 59321. *CROTALARIA* spp. Fabaceæ.

59318. *CROTALARIA CANDICANS* Wight and Arn.

A stiffly erect, much-branched, shrubby species, with hairy and somewhat leathery, broadly rounded leaves, and panicles of small, silky, yellow flowers. Native to southwestern India.

59318 to 59323—Continued.

59319. CROTALARIA CAPENSIS Jacq.

A stout, much-branched, South African shrub about 4 feet in height, with broadly oval leaves and pure yellow flowers in many-flowered racemes.

59320. CROTALARIA LEIOLOBA Bartling.

A species from the mountainous districts of northeastern India, and also distributed through the East Indies. It is one of the more robust of the herbaceous species, with finely silky branches and leaves, the latter being oblong and about 2 inches in length.

59321. CROTALARIA TETRAGONA Roxb.

An erect, stiff shrub, often 6 feet in height, which grows wild in the Himalayas of northeastern India, ascending to an altitude of 3,500 feet. The thinly silky, membranous, narrow leaves are sometimes a foot long, and the lemon-yellow flowers are produced in lax racemes 6 inches or more in length.

59322. SESBAN SERICEUM (Willd.) DC. Fabaceae.

An unarmed shrubby annual, often several feet in height, native to the plains of Ceylon. The silky, pinnate leaves are about a foot in length, and the flowers, pale yellow dotted with red, are in lax racemes.

59323. SESBAN sp. Fabaceae.

Received as *Sesban aculeatum*, but the seeds do not appear to be that species.

59324 to 59327.

From Athens, Greece. Scions presented by P. O. Anagnostopoulos, director, horticultural station. Received April 25, 1924. Notes by Mr. Anagnostopoulos.

A collection of apple and pear varieties introduced from Greece for testing by pomologists.

59324. MALUS sp. Malaceae. Apple.

Feriki. Trees of good size and thrifty, bearing regularly and heavily. Fruit conical, mostly one sided; color yellow with cheeks streaked with red; quality good; time of harvesting September; good keeper.

59325 to 59327. PYRUS spp. Malaceae. Pear.

59325. PYRUS sp.

Kontoula. One of the popular summer varieties. Fruits juicy, of good flavor; shape pyriform; length about 2 inches; color light yellow. Ripens in July.

59326. PYRUS sp.

Skopelitic. Tree of medium size; fruit pyriform, $2\frac{1}{2}$ to $3\frac{1}{2}$ inches long; color yellow with red cheek; flesh somewhat coarse. Season, middle to end of July. Ships well when gathered slightly green.

59327. PYRUS sp.

Traconico. The winter pear of Greece. Shape pyriform; size 2 to 3 inches long. Flesh juicy and of good quality. When gathered in the fall it keeps all winter.

59328 and 59329.

From Loanda, Angola. Seeds presented by Reed Paige Clark, American consul, Loanda, through C. V. Piper, Bureau of Plant Industry. Received April 23, 1924.

The two forage grasses in this shipment were grown in the Loanda consular district, Angola, and are intended for the use of department forage-crop specialists. The native names given are those used in connection with the export statistics of these seeds at Loanda.

59328 and 59329—Continued.

59328. CHAETOCHLOA ITALICA (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.

Painco or *milho painco*.

59329. HOLCUS SORGHUM L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

Massambala.

59330. ALLIUM CEPA L. Liliaceae. Onion.

From Valencia, Spain. Seeds purchased through Clement S. Edwards, American consul. Received April 25, 1924.

In order to assist horticulturists carrying on onion-selection experiments, this shipment of authentic Denia onion seeds has been obtained from Spain. In the United States this variety is carried under the name Prizetaker.

59331. PACOURIA CAPENSIS (Oliver) S. Moore. Apocynaceae.

From Pretoria, Transvaal, South Africa. Seeds presented by I. B. Pole Evans, chief, Division of Botany. Received April 26, 1924.

A low, scrambling shrub which is common on the kopjes (hillocks) north of Pretoria, producing an abundance of white flowers in the spring and numerous large reddish yellow fruits in late summer. These fruits, known locally as "wild peaches" or "wild apricots," have an agreeable flavor and are used raw or as preserves. This shrub, allied to *Landolphia*, belongs to a family which includes rubber-yielding species, and has been secured for specialists who are seeking new sources of rubber.

59332. SIDEROXYLON AUSTRALE (R. Br.) Benth. and Hook. Sapotaceae.

From Brisbane, Queensland, Australia. Seeds purchased from C. T. White, Government botanist. Received April 26, 1924.

The rich milky sap of this Australian tree, which resembles cream in taste, is said to yield gutta-percha, and seeds have been secured for the use of department rubber specialists. The round, purplish fruits, about 2 inches in diameter, are edible, although of coarse texture and insipid flavor. The dark-colored, prettily veined timber is used in Australia for cabinetwork and carving.

For previous introduction, see S. P. I. No. 44072.

59333. CHENOPODIUM QUINOA Willd. Chenopodiaceae. Quinoa.

From South America. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received May 20, 1924.

Collected for cultural tests.

59334 to 59339. NICOTIANA TABACUM L. Solanaceae. Tobacco.

From Montevideo, Uruguay. Seeds presented by R. Salgueiro Silveira, Sección de Economía Rural. Received April 28, 1924.

Introduced for testing by tobacco specialists.

59334. *Anarello* or *Cheiros*.59335. *Anarello* Rio Grande do Sul No. 1.59336. *Bahia*.59337. *Espadin*.59338. *Fumo Bahiano* No. 4.59339. *Repollo*.

59340 and 59341. ALLIUM spp. Liliaceæ.

From Paris, France. Seeds presented by Prof. D. Bois, Museum of Natural History. Received April 26, 1924.

Introduced for horticulturists investigating the food possibilities of the genus *Allium*.

59340. ALLIUM OBLIQUUM L.

A species cultivated in Siberia as a substitute for garlic. It has a narrowly egg-shaped bulb and a stem up to 3 feet in height.

For previous introduction, see S. P. I. No. 58684.

59341. ALLIUM SUBHIRSUTUM L.

A white-flowered species from the warmer sections of the Mediterranean countries. It becomes about a foot high, with narrow, hairy margined leaves.

59342 to 59345. DIOSPYROS KAKI L. f. Diospyraceæ. Kaki.

From Okitsu, Japan. Scions presented by Prof. T. Onda, director, Government Horticultural Experiment Station. Received May 2, 1924. Notes by C. C. Thomas, Bureau of Plant Industry.

These are said to be unusually hardy varieties.

59342. A large oblate persimmon, equatorial diameter 3 inches, longitudinal diameter $1\frac{1}{2}$ inches, prominently quadrangular with four furrows extending upward from the blossom end. Flesh yellow, almost seedless; skin orange.

59343. An oblong conical persimmon, resembling Hachiya in shape, with a longitudinal diameter of about 3 inches and an equatorial diameter of $2\frac{1}{2}$ to 3 inches. Flesh and skin lemon yellow; seeds present.

59344. The fruit of this variety is oblate and noticeably quadrangular with four prominent furrows extending from the blossom end upward toward the angles. The equatorial diameters are about equal, 3 by 3 inches; the longitudinal diameter is $1\frac{1}{2}$ to 2 inches. Seeds are present. The flesh is yellow and the skin orange.

59345. A large, oblate persimmon somewhat angular. The equatorial diameter is 4 inches and the longitudinal 2 inches. The flesh is seedless and yellow; the skin is orange.

59346 to 59351. ALLIUM spp. Liliaceæ.

From Dorpat, Estonia. Seeds presented by the director, Botanical Garden, University of Dorpat. Received April 30, 1924.

A collection of *Alliums* secured for horticulturists investigating the food possibilities of the genus.

59346. ALLIUM ALBIDUM Fisch.

A species with clustered oblong bulbs, very narrow semiterete leaves, and white or yellowish white flowers. Native to southern Russia.

59347. ALLIUM ANGULOSUM L.

A rather variable species, distributed from eastern Europe through Siberia in dry rocky places. It is usually a low plant with narrow leaves and a hemispherical head of lilac-purple flowers.

For previous introduction, see S. P. I. No. 58675.

59348. ALLIUM LIBANI Boiss.

A species with very narrow, wavy leaves and a dense umbel of straw-colored flowers. It is about 4 inches in height and grows wild in the mountains of southern Palestine.

59349. ALLIUM LINEARE L.

A Siberian species with very narrow flat leaves and yellowish white flowers.

59346 to 59351—Continued.**59350. ALLIUM SACCULIFERUM Maxim.**

An erect, red-flowered species, 2 feet or more in height, with triangular, sharp-pointed leaves. Native to the southern Amur region, Siberia.

59351. ALLIUM VICTORIALIS L.

One of the most distinct species of European *Alliums*, with stems about a foot and a half high and leaves resembling those of the lily-of-the-valley. The white or greenish white flowers are produced in May.

For previous introduction, see S. P. I. No. 58691.

59352 to 59355.

From Cambridge, England. Seeds presented by the director of the Botanical Garden, University of Cambridge. Received April 26, 1924.

Introduced for the use of forage-crop specialists.

59352. ASTRAGALUS CHINENSIS L. f. Fabaceæ.

An erect, herbaceous plant, native to China, with smooth slender stems, elliptic-obtuse leaflets, and pendulous, few-flowered racemes.

59353. BRACHYPODIUM JAPONICUM Miquel. Poaceæ. Grass.

A tall coarse grass with rough leaves and large flower spikes about 6 inches long. Native to sandy places in Japan.

59354. PANICUM BULBOSUM H. B. K. Poaceæ. Grass.

A bulbous-rooted, caespitose Mexican grass with erect stems 3 or 4 feet in height and narrow long-pointed leaves.

59355. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.**59356. SPONDOGONA SALICIFOLIA (L.) House (*Dipholis salicifolia* A. DC.). Sapotaceæ.**

From San Manuel, Oriente, Cuba. Seeds presented by Dr. Mario Calvino, Estación Experimental y Escuela Agrícola. Received April 26, 1924.

Cuya, or *Jocuma blanca*. This is a beautiful, showy, evergreen, native tree; it is drought resistant, thrives in calcareous soils, and is a rapid grower. I consider it an excellent ornamental and shade tree for tropical regions. (Calvino.)

59357. VICIA MICHAUXII Spreng. Fabaceæ. Vetch.

From Ariana near Tunis, Tunisia, Africa. Seeds presented by F. Boeuf, chief, Botanical Service. Received April 30, 1924.

A creeping or climbing annual vetch, native to Syria, with very narrow leaflets, light-yellow flowers, and hairy pods about an inch long. Secured for department agronomists for trial as a green-manure and forage plant.

For previous introduction, see S. P. I. No. 55547.

59358 to 59360.

From Groningen, Netherlands. Seeds presented by the director, Botanical Gardens. Received April 26, 1924. Introduced for trial by forage-crop specialists.

59358. ARRHENATHERUM ERIANTHUM Boiss. and Reut. Poaceæ. Grass.

A tall, perennial grass, native to Spain, with flat leaf blades and dense erect panicles.

59359. CALAMAGROSTIS LANCEOLATA Roth. Poaceæ. Grass.

A perennial, moisture-loving grass, 2 to 4 feet high, with limp, very narrow leaves, drooping panicles, and creeping rhizomes with long stolons. Native to western Europe.

59358 to 59360—Continued.

59360. *CORONILLA GLAUCA* Jusl. Fabaceæ.

A small, yellow-flowered European shrub with handsome glaucous foliage.

59361 and 59362.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received April 26, 1924.

59361. *DANTHONIA SEMIANNULARIS* (Labill.) R. Br. Poaceæ.

A perennial tufted grass, producing a fair amount of soft succulent fodder suitable for either sheep or cattle. The leaves are narrow, usually hairy, and light green. The flower stems grow about 2 feet high and the seed, which sheds easily, is produced in clusters that have a white woolly appearance when ripe. *Wallaby grass* provides good pasturage during the spring and summer and remains green in the winter months.

For previous introduction, see S. P. I. No. 56566.

59362. *THEMEDA QUADRIVALVIS* (L.) Kuntze (*Anthistiria ciliata* L. f.). Poaceæ.

A coarse, rather tough annual grass which grows in tufts from 1 to 3 feet in height. It is closely related to the kangaroo grass of Australia and Tasmania. (C. V. Piper, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 50334.

59363 to 59371.

From Copenhagen, Denmark. Seeds presented by Dr. Axel Lange, director, Botanical Garden. Received April 30, 1924.

The following collection of plants, chiefly grasses, has been secured for forage-crop specialists.

59363. *AVENA MONTANA* Vill. Poaceæ. Grass.

A perennial, caespitose grass, native to alpine and subalpine sections of southern Europe, with laxly ascending stems and loosely folded leaves. The loose panicle is about 6 inches long.

59364. *AVENA PLANICULMIS* Schrad. Poaceæ. Grass.

A Siberian species with leaves about half an inch in width, found in dry, open situations.

59365. *CROTALARIA SEMPERFLORENS* Vent. Fabaceæ.

A shrubby species from the tropical section of India, with oblong green leaves about 4 inches long and bright-yellow flowers.

59366. *ELYMUS EUROPAEUS* L. Poaceæ. Lyme grass.

A loosely caespitose, perennial, European grass, with erect flowering stems and broadly linear leaves which taper to a long, slender point.

For previous introduction, see S. P. I. No. 53048.

59367. *MEDICAGO MARINA* L. Fabaceæ.

A perennial, very hairy, yellow-flowered species from the sandy coastal regions in Asia Minor. The stems are either prostrate or ascending.

59368. *MUHLENBERGIA MEXICANA* (L.) Trin. Poaceæ. Grass.

A good perennial fodder grass, native to Mexico, said to be particularly suited for low, humid lands. It has a creeping rootstock and a much-branched stem.

59369. *PISUM SATIVUM* L. Fabaceæ. Pea.

Introduced for varietal studies.

59370. *TRIFOLIUM MARITIMUM* Huds. Fabaceæ. Clover.

An annual, erect or decumbent, branching clover from Asia Minor, where it grows in fields and along the seacoasts. The flowers are white or pale flesh colored.

59363 to 59371—Continued.

59371. *VIGNA CYLINDRICA* (Stickm.) Skeels. Fabaceæ. Catjang.

The catjang is closely allied to the cowpea, and these seeds have been secured as of possible value in obtaining an improved strain of cowpea for cultivation in the United States.

59372 and 59373. *MAGNOLIA CAMPBELLII* Hook. f. and Thoms. Magnoliaceæ.

From Orleans, Loiret, France. Plants presented by Léon Chenault. Received May 14, 1924.

The enormous flowers of this magnolia, 10 to 14 inches across and varying in color from white to nearly purple, make it one of the finest ornaments of the genus. It is a native of the Himalayas, where it ascends to an altitude of 8,000 feet. The tree becomes 80 feet in height and is deciduous, with very dark bark and large, elliptical, dark-green leaves. It is most likely to find congenial conditions in mild-wintered sections of the Southern States where there is abundant rainfall.

59372. A red-flowered form.

59373. A white-flowered form.

59374. *ERYTHRINA BOGOTENSIS* Hort. Fabaceæ.

From Havana, Cuba. Cuttings presented by F. E. Betheuser. Received May 10, 1924.

The erythras are handsome leguminous trees or shrubs, rather generally distributed throughout the Tropics of both hemispheres. This species, in common with many of the rest, has terminal racemes of beautiful scarlet flowers and deserves a trial in southern Florida.

59375. *CICER ARIETINUM* L. Fabaceæ. Chick-pea.

From Los Mochis, Sinaloa, Mexico. Seeds presented by Albert H. Amis, Los Mochis Agricultural Experiment Station. Received May 2, 1924.

A small-seeded chick-pea introduced for testing by agronomists.

59376. *GARCINIA BINUCAO* (Blanco) Choisy. Clusiaceæ. Binukao.

From Manila, Philippine Islands. Seeds presented by the Director, Bureau of Agriculture. Received May 21, 1924.

For previous introduction and description, see S. P. I. No. 58958.

59377. *MUSA PARADISIACA SAPIENTUM* (L.) Kuntze. Musaceæ. Banana.

From Santa Marta, Colombia. Stumps presented by V. M. Cutter, United Fruit Co., Boston, Mass. Received May 6, 1924.

Gros Michel. More than nine-tenths of the bananas imported into the United States are of this variety. It is cultivated in the West Indies and in many places on the mainland of tropical America. Commercially it has been found the most satisfactory of all varieties, and now that our markets have become so accustomed to it, attempts to popularize other sorts have not been successful.

In quality, *Gros Michel* is surpassed by many other bananas. It has another defect also—susceptibility to the Panama disease, *Fusarium cubense*, which has played havoc in the banana plantations of several countries. In spite of these handicaps, it still reigns supreme.

During the last few years, considerable attention has been devoted to banana culture in Florida. The Cavendish or Chinese variety has been planted commercially in a few sections, and good returns have been reported. Several other varieties also

have been cultivated for many years, but a recent canvass of the State failed to bring to light a single plant of Gros Michel. In view of the prominence which this variety attained in the banana trade years ago, it seems nothing short of astonishing that it should not have become established in Florida.

Florida growers, therefore, requested the department to introduce this variety for trial in their State. Because of the danger of bringing with it the Panama disease, strict precautions must be taken. The plants which Mr. Cutter has presented, in response to our request, were sent from Santa Marta, Colombia, a region where the disease has never been found. Before they are planted in Florida they will be held in quarantine at Washington until all danger of their carrying the disease with them is past. (Wilson Popenoe.)

59378 to 59382.

From Echo, Kirin Province, Manchuria. Seeds presented by A. D. Woelkoff, director, Experimental Farm. Received April 28, 1924.

59378 and 59379. Two bush clovers secured for forage-crop specialists.

59378. *LESPEDEZA JUNCEA SERICEA* (Miquel) Forbes and Hemsl. Fabaceæ.

A Japanese bush clover which develops into a shrubby plant about 3 feet in height, with dense foliage and white flowers.

For previous introduction, see S. P. I. No. 55526.

59379. *LESPEDEZA STIPULACEA* Maxim. Fabaceæ.

This Korean bush clover appears to be especially promising in that portion of the eastern United States included between latitudes corresponding to those of northern Ohio and southern Virginia.

For previous introduction, see S. P. I. No. 49027.

59380 and 59381. *LILIUM CONCOLOR* Salisb. Liliaceæ.

A very attractive little Japanese lily, 1 to 3 feet in height, which produces three to six bright-scarlet flowers; these are erect, star shaped, and spotted with black. This species succeeds best in a half-shady place.

59380. Collected in 1922.

59381. Collected in 1923.

59382. *VICIA JAPONICA* A. Gray. Fabaceæ.

Vetch.

This has proved to be one of the most promising of the perennial vetches introduced into the United States. Obtained for cultural comparison tests.

59383. *AVENA STERILIS* L. Poaceæ. Oats.

From South America. Seeds collected by Fred D' Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received May 20, 1924.

Collected for cereal-breeding experiments.

59384 and 59385. *PHASEOLUS* spp. Fabaceæ.

From Italian Somaliland. Seeds presented by Dr. G. Scasellati Sforzolini, Director of Agriculture and Zootechnics. Received May 6, 1924. Notes by Doctor Sforzolini.

Introduced for horticulturists experimenting with varieties of beans.

59384. *PHASEOLUS AUREUS* Roxb. Mung bean.

Grows spontaneously in the village of Duca Abruzzi.

59384 and 59385—Continued.

59385. *PHASEOLUS RADIATUS* L.

A black-seeded variety from the central Sebeli region.

59386 to 59397.

From Cambridge, England. Seeds presented by the director, Botanical Garden, University of Cambridge. Received May 3, 1924.

59386 to 59389. *ALLIUM* spp. Liliaceæ.

Introduced for horticulturists studying the food possibilities of the genus *Allium*.

59386. *ALLIUM ODORUM* L.

In Japan this onion is cultivated for its leaves, which are eaten as greens; in the spring the leaves are borne luxuriantly by the old bulbs, becoming about a foot in length. (Adapted from *Useful Plants of Japan, Agricultural Society of Tokyo, p. 17.*)

For previous introduction, see S. P. I. No. 55442.

59387. *ALLIUM SCORODOPRASUM* L.

The sand-leek, or rocambol of Europe and Asia Minor, resembles garlic, but has smaller bulbs of milder flavor which are produced at the tip of the stem as well as at its base.

59388. *ALLIUM SCORODOPRASUM BABINGTONII* (Borrer) Richter.

This is a much larger plant than the typical species, the scape being 4 to 6 feet high, and the more numerous leaves are broader, sometimes 2 inches wide at the base. The flowers are pale reddish purple. The bulbous base of the plant is globose, with solid white bulbs attached to the hard white crown of the root. Native to England and probably to Ireland.

59389. *ALLIUM STELLERIANUM* Willd.

A perennial Siberian species which does not form a true bulb. It is characterized by semi-cylindrical leaves and dense flower heads.

59390. *BENINCASA HISPIDA* (Thunb.) Cogn. Cucurbitaceæ. Wax gourd.

Obtained for horticulturists experimenting with cucurbitaceous vegetables.

59391. *ILEX LATIFOLIA* Thunb. Aquifoliaceæ.

A Japanese holly, one of the most attractive of the genus, which sometimes develops into a tree 60 feet tall. The glossy green leaves, 3 to 7 inches long, are oval or narrowly oblong, and the red berries, about one-third of an inch in diameter, are produced in dense clusters.

59392. *LYCOPERSICON ESCULENTUM* Mill. Solanaceæ.

Var. *racemigerum*. A South American form with currantlike fruits; secured for horticulturists engaged in tomato-breeding experiments.

59393. *PICEA* sp. Pinaceæ. Spruce.

Received as *P. purgans*, for which a place of publication has not been found.

59394 to 59396. *PISUM* spp. Fabaceæ.

Obtained for testing by horticulturists experimenting with pea varieties.

59394. *PISUM SATIVUM* L. Pea.

59395. *PISUM SATIVUM* L. Pea.

59396. *PISUM SATIVUM UMBELLATUM* L. Pea.

A variety of garden pea with umbellate flowers.

59397. *THLADIANTHA DUBIA* Bunge. Cucurbitaceæ.

A tall climbing herbaceous vine with light-green oval leaves and yellow, bell-shaped flowers. The oblong, succulent fruit, about 3 inches long, is eaten by the natives of northeastern India.

59398 to 59401.

From Edinburgh, Scotland. Presented by William Wright Smith, regius keeper, Royal Botanic Garden. Received May 14, 1924. Introduced for horticulturists experimenting with small fruits.

59398 to 59401. Cuttings.

59398. *RIBES BETHMONTII* Jancz. Grossulariaceae.

A hybrid between *Ribes malvaceum* and probably *R. sanguineum*. It is an upright shrub, about 7 feet in height, with 3-lobed, deep-green leaves, light-pink flowers, and reddish fruits.

59399. *RUBUS BIFLORUS QUINQUEFLORUS* Focke. Rosaceae.

Because of the waxy bloom which covers the long spiny stems this is a very striking shrub. The large pinnate leaves, a foot or more in length, are white beneath, and the large white flowers are produced in terminal and axillary clusters. The edible, golden-yellow fruits of this western Chinese species are about the size of the common raspberry.

59400. *RUBUS CRATAEGIFOLIUS MORIFOLIUS* (Sieb.) Focke. Rosaceae.

A stout, erect or spreading wild raspberry, native to Japan. Because of its numerous, strong prickles and small, orange-red fruits it is of value chiefly to plant breeders.

59401. *VIBURNUM HUPEHENSE* Rehder. Caprifoliaceae.

A fairly hardy, deciduous shrubby species, allied to *Viburnum Wrightii*, with coarsely toothed, long-pointed dark-green leaves and ovoid, dark-red fruits. Native to central China.

59402. *CHENOPodium QUINOA* Willd. Chenopodiaceae. Quinoa.

From South America. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received May 20, 1924.

Obtained from Hector Cusicanqui, of La Paz, Bolivia; crop of 1924. Said to be the best variety grown at La Paz. (Richey and Emerson.)

59403 to 59642.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received April 29 and 30. Quoted notes by Mr. Rock.

59403. *ACONITUM FORRESTII* Stapf. Ranunculaceae.

No. 11446. November, 1923. A plant 3 to 4 feet high collected in alpine meadows at the foot of limestone rocks at an altitude of 11,000 feet, Likiang Snow Range. The leaves are pubescent and dark green, and the spikes, 2 feet or more long, are covered the entire length with the pale-blue to purple flowers.

59404. *ALLIUM* sp. Liliaceae.

No. 11467. November, 1923. A plant 1 to 2 feet high found among meadows of the Likiang Snow Range, at an altitude of 14,000 feet. The rich-blue flowers are produced in drooping globose umbels.

59405. *ASTER STATICEFOLIUS* Franch. Asteraceae.

No. 11423. November, 1923. A shrub 2 to 3 feet high found among rocks (limestone crevices), Likiang Snow Range, at an altitude of 11,000 feet. The leaves are spatulate, the flowers large, and the ray flowers deep blue-purple.

59403 to 59642—Continued.

59406. *ASTER* sp. Asteraceae.

No. 11426. November, 1923. A plant 2 feet high from alpine meadows, Likiang Snow Range, at an altitude of 12,000 to 13,000 feet. The leaves are lanceolate, the flower heads large, 2 inches in diameter, and the ray flowers long and deep blue-purple.

59407. *COTONEASTER* sp. Malaceae.

No. 11220. Champotong, Salwin Valley. October, 1923. A very ornamental shrub 6 inches high found at an altitude of 9,000 feet, with small, orbicular leaves and small red fruits.

59408. *PYRACANTHA ANGUSTIFOLIA* (Franch.) C. Schneid. Malaceae.

No. 11482. November, 1923. A much-branched, spiny shrub 4 to 5 feet high found in dry stream beds and meadows around the Likiang Snow Range, at an altitude of 9,000 feet. The leaves are small and linear, and the fruits are a rich orange-red.

59409. *CREMANTHODIUM* sp. Asteraceae.

No. 11456. Sungkwe, November, 1923. Found in the alpine meadows, at an altitude of 11,000 feet. The large, oval leaves of this plant form a basal rosette, and the drooping flower heads have deep-yellow ray flowers.

59410. *DELPHINIUM* sp. Ranunculaceae.

No. 11245. Mount Lauchun. October, 1923. A plant 3 to 4 feet high found in alpine meadows at an altitude of 12,000 feet, with large, deeply divided leaves and deep-blue flowers on long spikes.

59411. *DELPHINIUM* sp. Ranunculaceae.

No. 11413. November, 1923. A plant 2 feet or more high found at the head of a limestone gorge at Sabaloko, Likiang Snow Range. The deep-green leaves form globose rosettes, and the flowers, in ample spikes, are rich deep blue.

59412. *DELPHINIUM* sp. Ranunculaceae.

No. 11483. November, 1923. A plant 2 to 3 feet high growing in the wet meadows of Heshwe, Likiang Snow Range, at an altitude of 10,000 feet. The leaves are palmatisect and basal, and the dark blue-purple flowers are produced in long spikes.

59413. *DELPHINIUM* sp. Ranunculaceae.

No. 11485. Ngulukeu. November, 1923. A plant 1 to 2 feet high found in meadows among rocks at an altitude of 9,000 feet. The leaves are finely palmatisect, and the rich steel-blue flowers are in large racemes.

59414. *ENKIANTHUS* sp. Ericaceae.

No. 10949 (fruit), 8907 (flowers). November, 1923. A very handsome species 8 to 15 feet high found in the forests of Landjoela, southeastern Tibet, at an altitude of 9,000 feet. The evenly green leaves are oval, and the campanulate flowers are yellow with red stripes and arranged in large clusters.

59415. *EUPTELEA PLEIOSPERMA* Hook. f. and Thoms. Trochodendraceae.

No. 11224. October, 1923. A tree 30 to 40 feet high found along meadows of Champotong, Salwin Valley, at an altitude of 7,000 feet. The oval, crenate, caudately acuminate leaves are pale beneath, and the flowers are red.

59416. *GENTIANA* sp. Gentianaceae.

No. 11437. November, 1923. A branching plant 1 foot high found in alpine meadows at Ladsakodjo, Likiang Snow Range, at an altitude of 12,500 feet. The large, tubular flowers are indigo blue and have salver-shaped corollas.

59403 to 59642—Continued.

59417. *GENTIANA* sp. Gentianaceæ.

No. 11484. Saba. November, 1923. A branching corymbose plant 1 foot high found in moist meadows near Likiang at an altitude of 11,000 feet. The deep-blue flowers, 2 to 3 inches long, have salver-shaped corollas.

59418. *INCARVILLEA LUTEA* Bur. and Franch. Bignoniaceæ.

No. 11412. Likiang Snow Range. November, 1923. A bush 2 to 3 feet high found among limestone rock in scrub forests at an altitude of 9,600 to 11,000 feet. The large leaves are pinnatisect, and the large, yellow flowers are produced in long, terminal spikes.

59419. *INDIGOFERA PENDULA* Franch. Fabaceæ.

No. 11441. November, 1923. An exceedingly ornamental shrub 10 to 15 feet high collected on the Likiang Snow Range at an altitude of 10,000 feet. The handsome flowers are in large pendulous racemes.

For previous introduction, see S. P. I. No. 56315.

59420. *LILIUM* sp. Liliaceæ.

No. 10190. Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A plant 1 or 2 feet high found in alpine meadows. The leaves are elliptical, and the flowers are yellow to white.

59421. *MAGNOLIA* sp. Magnoliaceæ.

No. 11231. October, 1923. A tree 8 to 10 feet high growing on the slopes of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 10,000 feet. The oval leaves are thinly rufous pubescent beneath, and the flowers are large and white.

59422. *MALUS YUNNANENSIS* (Franch.) C. Schneid. (*Pyrus yunnanensis* Franch.). Malaceæ. Apple.

No. 11489. November, 1923. A tree 30 to 40 feet high found in the Lashipa Forest near Sembi, west of Likiang, at an altitude of 9,000 to 10,000 feet. The large, oval, rich-green leaves are greenish pubescent beneath, and the red fruits are 1 inch in diameter.

59423. *MALUS* sp. Malaceæ.

No. 11356. December, 1923. A shrub or tree 30 feet high found in the forests on the eastern slope of Karila, at an altitude of 12,000 feet. The lianlike branches are long and rambling, and the fruits are red and obovate.

59424. *MEIBOMIA* sp. (*Desmodium* sp.). Fabaceæ.

No. 11440. November, 1923. A shrub 8 to 10 feet high found along streams on the Likiang Snow Range, at an altitude of 9,000 to 10,000 feet. The rich-pink flowers, produced in large racemes, make this a very handsome shrub.

59425. *PAEONIA LUTEA* Delavay. Ranunculaceæ.

No. 11488. November, 1923. A shrub 1 to 2 feet high found on the dry slopes of Mount Lanchun, west of Likiang, at an altitude of 8,000 feet. The large leaves are white beneath, and the flowers are large and yellow.

59426. *PHILADELPHUS* sp. Hydrangeaceæ.

No. 11416. Likiang Snow Range. November, 1923. A very handsome species 8 to 10 feet high found on the outskirts of forests at an altitude of 10,000 to 11,500 feet. The large white flowers, produced in large racemes, are fragrant.

59427. *PINUS SINENSIS YUNNANENSIS* (Franch.) Shaw. Pinaceæ. Pine.

No. 11699. December, 1923. One of the most common trees in Yunnan, varying in height from 30 to 80 feet and with a very straight or crooked trunk, depending on the location and exposure. On the Likiang Snow Range, where these seeds were collected, this pine is associated with *Quercus*

59403 to 59642—Continued.

delarayi, *Q. semecarpifolia*, and *Rhododendron fortunei*. It prefers well-drained soils. It grows at altitudes ranging from 9,000 to 11,000 feet, with only scattered individual trees at the higher levels. In the more moist region its place is taken by *Pinus armandi* and in the higher altitudes by *Picea* and *Tsuga*.

59428 to 59434. *PRIMULA* spp. Primulaceæ. Primrose.59428. *PRIMULA LITTONIANA* Forrest.

No. 9859. September, 1923. A very handsome plant 2 to 3 feet tall growing in swampy meadows west of the Likiang Snow Range at Ganhaitze and also east of Lahgwubo, at an altitude of 10,000 to 11,000 feet. The deep indigo-blue flowers are borne in long, densely packed spikes and the calyxes, a rich carmine, are very striking.

59429. *PRIMULA SECUNDIFLORA* Franch.

No. 11425. Likiang Snow Range. November, 1923. Collected at an altitude of 13,000 feet.

For previous introduction and description, see S. P. I. No. 58375.

59430. *PRIMULA* sp.

No. 10182. October, 1923. A plant several inches high found in the alpine meadows of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 13,000 feet. The leaves are green and elliptical, and the flowers are a rich deep purple.

59431. *PRIMULA VALENTINIANA* Hand.-Mzt.

No. 11171. October, 1923. A plant 4 to 5 inches high found growing in the alpine meadows of Champutong, Salwin-Irrawaddy Divide, at an altitude of 13,000 feet. The leaves are small, and the flowers are large and blue.

59432. *PRIMULA AGLENIANA* Balf. f. and Forrest.

No. 11197. October, 1923. Found growing in the alpine meadows of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 13,000 feet. The leaves are lanceolate and crenate, and the flowers are large and white with a pinkish tinge, drooping in large umbels.

59433. *PRIMULA INGENS* W. W. Smith and Forrest.

No. 11332. November, 1923. Collected in the alpine meadows of Mount Peima, at an altitude of 14,000 feet. The leaves are linear-lanceolate and glabrous, and the flowers are pale blue.

59434. *PRIMULA FOISSONI* Franch.

No. 11487. November, 1923. From 3 to 4 feet high found in moist meadows near Labako, west of Likiang, at altitudes of 8,000 to 9,000 feet. The leaves are basal, linear-lanceolate, and the flowers are produced in long spikes (candelabra).

59435. *RHODODENDRON ARALIAEFORME* Balf. f. and Forrest. Ericaceæ.

No. 11404. November, 1923. Collected in pine forests of the Likiang Snow Range between 9,000 and 10,000 feet altitude. The large, fragrant flowers are white, pink, or purplish, but usually pink. This species is found all over Yunnan.

59436 to 59638. *RHODODENDRON* spp. Ericaceæ.59436. *RHODODENDRON* sp.

Nos. 1372 (fruit), 8500 (flowers). November, 1923. A shrub 4 feet high growing on alpine slopes among limestone rocks on the Likiang Snow Range at altitudes of 13,000 to 14,000 feet. The pale, thin leaves are obovate oblong and covered beneath with yellow tomentum. The flowers are rich pink.

59403 to 59642—Continued.

59437. RHODODENDRON sp.

Nos. 10898 (fruit), 10274 (flowers). November, 1923. A shrub 3 feet high found growing in moist regions on the alpine slopes of Londjre between 12,000 and 13,000 feet altitude. The leaves are elliptical, glabrous, and evenly green, and the flowers are a rich purplish red.

59438. RHODODENDRON sp.

Nos. 10918 (fruit), 9129 (flowers). November, 1923. A shrub 3 feet high found in the alpine region of Tschung at an altitude of 11,000 feet. The elliptical-obovate leaves are green above and covered beneath with deep, chocolate-colored tomentum. The flowers are dark crimson.

59439. RHODODENDRON sp.

Nos. 10920 (fruit), 9104 (flowers). November, 1923. A shrub 6 feet high found in the alpine region of Tschung. The narrow leathery linear leaves, 5 inches long, have revolute margins and are covered beneath with rufous wool. The flowers are white.

59440. RHODODENDRON sp.

Nos. 10921 (fruit), 9107 (flowers). November, 1923. A tree 13 to 14 feet high found in fir forests in the alpine region of Tschung at an altitude of 11,000 feet. The large, oblong leaves are dark green above and covered with a deep-brown wool beneath. The flowers are large and white and are on long pubescent pedicels.

59441. RHODODENDRON sp.

Nos. 10922 (fruit), 9287 (flowers). November, 1923. A shrub 1 to 2 feet high found growing in masses in the alpine region of Tschung. The oval-elliptical leaves are silvery white beneath, and the flowers are large and orange to red.

59442. RHODODENDRON sp.

Nos. 10923 (fruit), 9101 (flowers). November, 1923. A shrub 7 feet high from the alpine region of Tschung at an altitude of 11,000 feet. The elliptic-oblong, acute leaves are dark green above and a deep red to golden yellow beneath. The flowers are large and a rich pink.

59443. RHODODENDRON sp.

Nos. 10924 (fruit), 9124 (flowers). November, 1923. A shrub 1 to 2 feet high found growing in the rocky alpine meadows of Tschung at an altitude of 12,000 feet. The small, ovate leaves are yellow to red-brown beneath, and the small, deep rose-pink flowers are produced in clusters.

59444. RHODODENDRON sp.

Nos. 10928 (fruit), 10064 (flowers). November, 1923. A shrub 1 to 2 feet high growing in masses in the moist alpine region of Tschung at an altitude of 12,000 feet. The leaves are elliptic and white beneath, and the flowers are medium and bright red.

59445. RHODODENDRON sp.

Nos. 10929 (fruit), 9098 (flowers). November, 1923. A shrub 6 feet high from the slopes of the Tschung Mountains at an altitude of 10,000 feet. The evenly green leaves are obovate and glabrous, and the large, pink flowers are borne on slender pedicels.

59446. RHODODENDRON sp.

Nos. 10930 (fruit), 8835 (flowers). November, 1923. A shrub 3 to 4 feet high growing in fir forests on the alpine slopes of Tschung. The oval leaves are glabrous on both sides, and the flowers are a handsome pink.

59403 to 59642—Continued.

59447. RHODODENDRON FULVIDES Balf. f. and Forrest.

Nos. 10931 (fruit), 8883 (flowers). November, 1923. A tree 15 to 16 feet high found along streams on the Londjre Mountains, southeastern Tibet, at an altitude of 11,000 feet. The large, oblong, acute leaves are brown tomentose beneath, and the flowers are rose-pink.

59448. RHODODENDRON sp.

Nos. 10932 (fruit), 10301 (flowers). November, 1923. A shrub 4 feet high found growing in the alpine region of Londjre, southeastern Tibet. The ovate-elliptical leaves are dark green above and fawn-colored beneath, and the large, crimson flowers are borne on short pedicels.

59449. RHODODENDRON sp.

Nos. 10933 (fruit), 10292 (flowers). November, 1923. A shrub or small tree 7 feet high found in fir forests of Londjre, southeastern Tibet, at an altitude of 12,000 feet. The large, oblong, acute leaves are brown tomentose beneath, and the flowers are large and white and are borne on slender pedicels.

59450. RHODODENDRON sp.

Nos. 10934 (fruit), 10307 (flowers). November, 1923. A shrub 2 feet high, growing in masses on open slopes in the alpine region of Londjre, southeastern Tibet, at altitudes between 12,000 and 13,000 feet. The linear-elliptical leaves are white to drab beneath, and the flowers are a yellowish red.

59451. RHODODENDRON sp.

Nos. 10936 (fruit), 8888 (flowers). November, 1923. A shrub 3 to 4 feet high found in the forests of Londjre, southeastern Tibet, at altitudes between 10,000 and 11,000 feet. The large leaves are oblong, acuminate, and brown beneath. The flowers are rose-pink.

59452. RHODODENDRON sp.

Nos. 10937 (fruit), 8887 (flowers). November, 1923. A very handsome species 6 to 8 feet high growing on the slopes of the Londjre Mountains, southeastern Tibet. The elliptical, deep-green leaves are glabrous on both sides, and the very large, fragrant flowers, in large umbels are a rich blue-lavender.

59453. RHODODENDRON sp.

Nos. 10938 (fruit), 8909 (flowers). November, 1923. A shrub 2 to 3 feet high found growing in masses on the alpine slopes of Londjre, southeastern Tibet. The leaves are elliptical and drab beneath, and the flowers are a very dark red.

59454. RHODODENDRON sp.

Nos. 10939 (fruit), 8884 (flowers). November, 1923. A shrub 3 to 4 feet high found in the alpine forests of Londjre, southeastern Tibet. The oblong-ovate leaves are golden yellow and glabrous beneath; the flowers are large and a deep purplish red.

59455. RHODODENDRON sp.

Nos. 10940 (fruit), 8910 (flowers). November, 1923. A shrub 2 to 3 feet high growing in the alpine region of Londjre, southeastern Tibet, at an altitude of 12,000 feet. The elliptical leaves are white beneath; the flowers are yellow at the base, and the lobes are red.

59456. RHODODENDRON sp.

Nos. 10947 (fruit), 10313 (flowers). November, 1923. A handsome species 3 feet high growing in masses in the alpine region of Londjre, southeastern Tibet. The leaves are oblong linear and drab beneath; the flowers are large and a deep carmine.

59403 to 59642—Continued.

59457. RHODODENDRON sp.

Nos. 10948 (fruit), 10300 (flowers). November, 1923. A shrub 3 feet high found in the alpine region of Londjre, southeastern Tibet. The oblong leaves have brown wool beneath, and the carmine-purple flowers are produced in large clusters.

59458. RHODODENDRON sp.

Nos. 10950 (fruit), 10267 (flowers). November, 1923. A shrub 2 feet high growing on the alpine slopes of Londjre, southeastern Tibet. The small, oval, green leaves are mealy beneath, and the medium-sized flowers are rich pink.

59459. RHODODENDRON sp.

Nos. 10951 (fruit), 10304 (flowers). November, 1923. A shrub 2 feet high growing in the open moist region on the alpine slopes of Londjre, southeastern Tibet, at an altitude of 12,000 feet. The leaves are oval, small, and glabrous, and the flowers are pale yellow.

59460. RHODODENDRON sp.

Nos. 10952 (fruit), 8881 (flowers). November, 1923. A fine species 2 to 3 feet high growing in masses on the alpine slopes of Londjre, southeastern Tibet, at an altitude of 12,000 feet. The elliptical, glabrous leaves are green on both sides, and the flowers are large and a rich carmine.

59461. RHODODENDRON sp.

Nos. 10965 (fruit), 9155 (flowers). November, 1923. A shrub 4 feet high found on rocky alpine slopes of the Tsehung Mountains, Mekong Valley. The elliptical, glabrous leaves are pale beneath, and the flowers are pink.

59462. RHODODENDRON sp.

Nos. 10966 (fruit), 10061 (flowers). November, 1923. A tree 15 to 18 feet high growing in alpine forests on the Tsehung Mountains at an altitude of 13,000 feet. The very large, obovate-oblong leaves are glossy glabrous and silvery beneath. The large flowers are a purplish red.

59463. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10967 (fruit), 8784 (flowers). November, 1923. A shrub 5 to 6 feet high growing in alpine regions on the Tsehung Mountains, Mekong Valley, at an altitude of 12,000 feet. The coriaceous leaves are wrinkled above and covered beneath with ochre-yellow meal. The flowers are white with a pinkish tinge.

59464. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10968 (fruit), 9112 (flowers). November, 1923. A tree 8 to 10 feet high found on the slopes of the Tsehung Mountains, Mekong Valley, at an altitude of 10,000 feet. The oblong leaves are dark green above and brown beneath with prominent ribs. The flowers are pinkish white.

59465. RHODODENDRON sp.

Nos. 10969 (fruit), 9150 (flowers). November, 1923. A rare plant 3 feet high, found in the alpine region of Tsehung, Mekong Valley, at an altitude of 13,000 feet. The leaves are small and elliptical, and the flowers are deep yellow.

59466. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10970 (fruit), 9111 (flowers). November, 1923. A shrub 5 feet high growing on the slopes of the Tsehung Mountains, Mekong Valley, at an altitude of 10,000 feet. The oblong-acute, articulate leaves are covered beneath with brown wool. The flowers are white with a tinge of pink.

59403 to 59642—Continued.

59467. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10971 (fruit), 8780 (flowers). November, 1923. A shrub or small tree 8 feet high growing in the alpine region of Tsehung, Mekong Valley, at an altitude of 12,000 feet. The elliptical-oblong, acute leaves are brown woolly beneath, and the flowers are pinkish purple.

59468. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10972 (fruit), 8779 (flowers). November, 1923. A tree 8 to 10 feet high found at the foot of the Tsehung Mountains, Mekong Valley, at an altitude of about 8,000 feet. The oblong-lanceolate, acuminate leaves are covered with a brown meal beneath, and the large flowers are white with a pinkish tinge.

59469. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10973 (fruit), 8770 (flowers). November, 1923. A shrub 5 to 6 feet high growing in fir forests in the alpine region of the Tsehung Mountains, Mekong Valley, at an altitude of 12,500 feet. The oblong, acuminate leaves are dark green above and brownish yellow beneath. The flowers are large and white.

59470. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10974 (fruit), 8772 (flowers). November, 1923. A shrub 5 to 6 feet high found in the alpine region of Tsehung, Mekong Valley, at an altitude of 12,000 feet. The elliptical-ovate, acute, reticulate leaves are leathery and covered beneath with a brown tomentum. The flowers are purple with a pinkish tinge.

59471. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10975 (fruit), 8767 (flowers). November, 1923. A shrub 8 to 10 feet high found in the alpine region of Tsehung, Mekong Valley. The oblong-acute leaves are dark green above and yellow beneath. The flowers are white with a pinkish purple tinge.

59472. RHODODENDRON IXEUTICUM Balf. f. and Smith.

Nos. 10976 (fruit), 9113 (flowers). October, 1923. A shrub 5 feet high found growing in the alpine region of Tsehung, Mekong Valley, at an altitude of 11,000 feet. The leaves are coriaceous, reticulate, and pale yellow beneath. The flowers are white.

59473. RHODODENDRON REPENS Balf. f. and Forrest.

Nos. 10993 (fruit), 8788 (flowers). October, 1923. A very handsome, spreading, prostrate plant 1 foot high growing in the alpine meadows of Tsehung at an altitude of 14,000 feet. The obovate leaves are small and glabrous, and the flowers are large and bright scarlet.

59474. RHODODENDRON sp.

Nos. 10996 (fruit), 91321 (flowers). October, 1923. A shrub 4 feet high found in the alpine region of Tsehung, Mekong Valley. The linear-elliptical leaves are rich green covered beneath with brown, deciduous wool. The flowers are red with a purplish tinge.

59475. RHODODENDRON sp.

Nos. 10998 (fruit), 9134 (flowers). October, 1923. A shrub 4 feet high growing in the rocky alpine region of Tsehung at an altitude of 13,000 feet. The thick, linear, rich-green leaves, with revolute margins, have a deep-red wool beneath. The flowers are pink.

59403 to 59642—Continued.

59478. RHODODENDRON sp.

Nos. 11000 (fruit), 9114 (flowers). October, 1923. A shrub 6 feet high found on the slopes of the Tsechung Mountains at an altitude of 10,000 feet. The leaves are oval and glabrous, and the flowers are shaded from lavender to a bluish purple.

59477. RHODODENDRON sp.

Nos. 11004 (fruit), 9109 (flowers). October, 1923. A handsome species 14 to 15 feet high growing in the alpine forests of Tsechung at an altitude of 11,000 feet. The linear-oblong, acute leaves are brown beneath, and the very large, rich-peach flowers are produced in large umbels.

59478. RHODODENDRON COSMETUM Balf. f. and Forrest.

Nos. 11005 (fruit), 8822 (flowers). October, 1923. A very attractive species 1 to 3 feet high growing in the alpine region of Tsechung at an altitude of 13,000 feet. The leaves, with ciliate margins, are small, oval, and green. The flowers are large and shaded from deep, rich purple to lavender. The calyxes are carmine.

59479. RHODODENDRON sp.

Nos. 11006 (fruit), 9116 (flowers). October, 1923. A shrub 1 to 2 feet high found in the alpine region of Tsechung at an altitude of 13,000 feet. The oval, rich-green leaves are bluish beneath, and the flowers are a rich yellow.

59480. RHODODENDRON SEMNUM Balf. f. and Forrest.

Nos. 11007 (fruit), 9097 (flowers). October, 1923. A very handsome tree 15 to 18 feet high growing on the alpine slopes of Tsechung. The very large, glossy, obovate-oblong leaves are silvery gray beneath, and the flowers are shaded from white to pink.

59481. RHODODENDRON sp.

Nos. 11008 (fruit), 8830 (flowers). October, 1923. A shrub or small tree 8 to 10 feet high found in the alpine region of Tsechung at an altitude of 13,000 feet. The leaves, large and obovate-oblong, are subsessile and silver colored beneath. The purple flowers, tinged with pink, are produced in large umbels.

59482. RHODODENDRON SALUENENSE Franch.

Nos. 11010 (fruit), 9151 (flowers). October, 1923. A shrub 2 to 3 feet high found in the rocky alpine region of Tsechung at an altitude of 13,000 feet. The oval, dark-green leaves are pale brown beneath; the flowers are a rich purple and the calyx green.

59483. RHODODENDRON sp.

Nos. 11011 (fruit), 9092 (flowers). October, 1923. A shrub 1½ feet high found growing in masses in the alpine region of Tsechung at an altitude of 13,000 feet. The elliptical leaves are drab colored beneath, and the flowers are rich red.

59484. RHODODENDRON SALUENENSE Franch.

Nos. 11012 (fruit), 9282 (flowers). October, 1923. A shrub 1 to 2 feet high growing on the alpine slopes of Tsechung at an altitude of 13,000 feet. The oval leaves are green above and paler beneath, and the petioles are covered with brown hairs. The flowers are large, salver shaped, and deep purplish blue, with large, carmine calyxes.

59485. RHODODENDRON sp.

Nos. 11019 (fruit), 9141 (flowers). October, 1923. A shrub 1 to 2 feet high found on rocky alpine slopes of the Tsechung Mountains at an altitude of 13,000 feet. The leaves are small, oval, and dark brown beneath; the handsome, delicate-pink flowers are tubular.

59403 to 59642—Continued.

59486. RHODODENDRON sp.

Nos. 11020 (fruit), 9142 (flowers). October, 1923. A shrub 5 feet high growing in the alpine region of Tsechung at an altitude of 13,000 feet. The linear-lanceolate leaves are rufous red and woolly beneath. The white flowers are spotted with dark purple.

59487. RHODODENDRON sp.

Nos. 11022 (fruit), 9211 (flowers). October, 1923. A striking species 2 feet high growing in the alpine region of the Sila Pass, Mekong-Salwin Divide, at an altitude of 14,000 feet. The oval leaves are chalky white beneath, and the very large flowers are deep crimson.

59488. RHODODENDRON sp.

Nos. 11025 (fruit), 8739 (flowers). October, 1923. A shrub 4 to 5 feet high found in the Sila Pass, Mekong-Salwin Divide, at an altitude of 13,000 feet. The green, obovate leaves are golden yellow beneath, and the rich golden-yellow flowers are very large.

59489. RHODODENDRON FORRESTII Balf. f.

Nos. 11033 (fruit), 9234 (flowers). October, 1923. A prostrate plant, a few inches high, growing in the Sila Pass at an altitude of 13,000 feet. The small, oval, glabrous leaves are dark green above and deep purple beneath. The large flowers are rich carmine.

59490. RHODODENDRON sp.

Nos. 11035 (fruit), 8750 (flowers). October, 1923. A shrub 3 to 4 feet high found in the Sila Pass at an altitude of 12,000 feet. The obovate leaves are golden yellow to pale green beneath, and the very large, showy, yellow flowers have red lobes.

59491. RHODODENDRON sp.

Nos. 11036 (fruit), 9228 (flowers). October, 1923. A shrub 1 to 2 feet high found in the Sila Pass at an altitude of 12,000 feet. The oval leaves, prominently ribbed, are green on both sides, and the flowers are a deep purplish red.

59492. RHODODENDRON sp.

Nos. 11037 (fruit), 8751 (flowers). October, 1923. A shrub 3 to 4 feet high found in the Sila Pass at an altitude of 13,000 feet. The leaves are oblong, glabrous on both sides, and pale beneath; the flowers are pink and very large.

59493. RHODODENDRON sp.

Nos. 11039 (fruit), 9215 (flowers). October, 1923. A shrub 2 feet high found in the Sila Pass at an altitude of 13,000 feet. The small, elliptical leaves are drab colored beneath, and the broadly campanulate flowers are deep carmine.

59494. RHODODENDRON sp.

Nos. 11040 (fruit), 9201 (flowers). October, 1923. A shrub 5 feet high growing in the Sila Pass at an altitude of 12,000 feet. The obovate leaves are golden yellow beneath, and the large flowers are pinkish purple.

59495. RHODODENDRON FULVIDES Balf. f. and Forrest.

Nos. 11044 (fruit), 9222 (flowers). October, 1923. A tree 15 feet high found on the slopes of the Sila Pass at an altitude of 11,000 feet. The oblong, acute leaves are brown tomentose beneath, and the flowers are small and pink.

59496. RHODODENDRON sp.

Nos. 11046 (fruit), 9221 (flowers). October, 1923. A shrub 2 to 3 feet high growing in masses in the Sila Pass at an altitude of 13,000 feet. The linear-elliptical leaves are drab-gray beneath, and the flowers are a very rich carmine.

59403 to 59642—Continued.

59497. RHODODENDRON FULVIDES Balf. f. and Forrest.

Nos. 11048 (fruit), 8760 (flowers). October, 1923. A shrub 5 to 6 feet high found in the Sila Pass at an altitude of 13,000 feet. The oblong-obovate leaves are dark green above and dark to golden brown beneath. The flowers are a rich reddish purple.

59498. RHODODENDRON SP.

Nos. 11049 (fruit), 9210 (flowers). October, 1923. A shrub 2 feet high growing in masses in the Sila Pass at an altitude of 13,000 feet. The elliptical-obovate leaves are grayish brown beneath, and the flowers are deep carmine.

59499. RHODODENDRON SP.

Nos. 11051 (fruit), 9208 (flowers). October, 1923. A shrub 5 feet high found in the Sila Pass at an altitude of 12,000 feet. The leaves are small and obovate, and the flowers are yellow with a pinkish tinge.

59500. RHODODENDRON SP.

Nos. 11052 (fruit), 9206 (flowers). October, 1923. A shrub 2 feet high, growing in masses in the Sila Pass at an altitude of 13,000 feet. The elongated elliptical leaves are pale brown beneath, and the flowers are large and reddish purple.

59501. RHODODENDRON SP.

Nos. 11053 (fruit), 9229 (flowers). October, 1923. A shrub 5 feet high found in the Sila Pass at an altitude of 12,000 feet. The small, obovate leaves are golden yellow beneath, and the flowers are large and purplish red.

59502. RHODODENDRON SP.

Nos. 11058 (fruit), 9218 (flowers). October, 1923. A shrub 6 feet high growing in the Sila Pass at an altitude of 13,000 feet. The glabrous, oval leaves are green on both sides, and the flowers are cream colored with a pinkish tinge.

59503. RHODODENDRON SP.

Nos. 11060 (fruit), 9202 (flowers). October, 1923. A shrub 6 feet high found in the Sila Pass at an altitude of 12,000 feet. The obovate-oblong leaves are golden yellow to pale green beneath, and the flowers are small purplish pink.

59504. RHODODENDRON SP.

Nos. 11062 (fruit), 9239 (flowers). October, 1923. A shrub 6 feet high found in the Sila Pass. The glabrous oval leaves are pale green beneath, and the flowers are very large and pale pink.

59505. RHODODENDRON SP.

Nos. 11067 (fruit), 9236 (flowers). October, 1923. A shrub 5 feet high growing in the Sila Pass at an altitude of 12,000 feet. The glabrous, oval leaves are green on both sides; the flowers are yellow.

59506. RHODODENDRON SP.

Nos. 11071 (fruit), 8716 (flowers). October, 1923. A tree 12 to 20 feet high found on the lower slopes of the Tseku Mountains at an altitude of 11,000 feet. The oblong, acute leaves are dark brown tuberculate beneath, and the flowers are lavender, spotted with purple.

59507. RHODODENDRON SP.

Nos. 11075 (fruit), 8714 (flowers). October, 1923. A small tree 8 to 10 feet high found on the slopes of the Tseku Mountains at an altitude of 10,000 feet. The long, lanceolate leaves are dark, ashy gray beneath, and the flowers are deep pink.

59403 to 59642—Continued.

59508. RHODODENDRON SP.

Nos. 11079 (fruit), 8723 (flowers). October, 1923. A shrub 3 feet high found in the alpine region of Tseku at an altitude of 12,000 feet. The leaves are small, oval, and glabrous, and the small, yellow flowers are produced on long pedicels.

59509. RHODODENDRON SP.

Nos. 11086 (fruit), 9248 (flowers). November, 1923. A shrub 1 to 2 feet high found in alpine meadows of the Peima Mountains, Mekong-Yangtze Divide, at an altitude of 14,000 to 15,000 feet. The very small, oval leaves are brown tomentose beneath, and the flowers are bluish purple.

59510. RHODODENDRON SP.

Nos. 11087 (fruit), 9942 (flowers). November, 1923. A shrub 5 feet high found in the alpine region of the Peima Mountains, Mekong-Yangtze Divide, at an altitude of 15,000 feet. The oval, acute leaves are brown beneath.

59511. RHODODENDRON SP.

Nos. 11090 (fruit), 9242 (flowers). November, 1923. A shrub 6 feet high found in the alpine region of the Peima Mountains, Mekong-Yangtze Divide. The oval, acute leaves are brown tomentose beneath, and the flowers are pink with a purple tinge and spotted dark purple.

59512. RHODODENDRON SP.

Nos. 11095 (fruit), 8853 (flowers). November, 1923. A shrub 4 feet high found in the alpine region of the Peima Mountains at an altitude of 14,000 feet. The oval leaves are green on both sides, and the flowers are purple.

59513. RHODODENDRON SP.

Nos. 11098 (fruit), 9268 (flowers). November, 1923. A shrub 1 foot high found in the high alpine region of the Peima Mountains at an altitude of 14,000 feet. The acute elliptical leaves, half an inch long, are a silky brown beneath. The flowers are deep indigo shading to lighter blue.

59514. RHODODENDRON SP.

Nos. 11100 (fruit), 8858 (flowers). November, 1923. A shrub 4 to 5 feet high found in the Peima Mountains at an altitude of 13,000 feet. The oval, acute leaves are brown tomentose beneath, and the flowers are purple but paler toward the base.

59515. RHODODENDRON SP.

Nos. 11101 (fruit), 9973 (flowers). November, 1923. A tree 8 to 10 feet high found in the Peima Mountains, Mekong-Yangtze Divide, at an altitude of 14,000 feet. The leaves are elliptical, acute at both ends, and brown tomentose beneath. The flowers are white.

59516. RHODODENDRON SP.

Nos. 11102 (fruit), 8856 (flowers). November, 1923. A shrub 4 to 5 feet high, similar to No. 11101 [S. P. I. No. 59515], but having pink flowers; found in the Peima Mountains at an altitude of 14,000 feet.

59517. RHODODENDRON SP.

Nos. 11103 (fruit), 8852 (flowers). November, 1923. A shrub 3 feet high found in the Peima Mountains at an altitude of 13,000 to 14,000 feet. The ovate-elliptical, acute leaves are brown tomentose beneath, and the flowers shade from white to purple.

59518. RHODODENDRON SP.

Nos. 11104 (fruit), 8862 (flowers). November, 1923. A shrub 5 to 6 feet high found in the Peima Mountains at an altitude of 13,000 feet. The elliptical-oblong leaves are fawn-colored tomentose beneath, and the flowers are white with a pinkish tinge.

59403 to 59642—Continued.

59519. RHODODENDRON sp.

Nos. 11105 (fruit), 9273 (flowers). November, 1923. A shrub 10 feet high found in the alpine regions of the Peima Mountains, Mekong-Yangtze Divide, at an altitude of 14,000 feet. The linear-oblong, rich-green leaves are pale brown tomentose beneath, and the flowers are white.

59520. RHODODENDRON sp.

Nos. 11107 (fruit), 8854 (flowers). November, 1923. A shrub 5 to 6 feet high found in the Peima Mountains at an altitude of 14,000 feet. Leaves the same as No. 11106 [S. P. I. No. 59135], and the flowers are pink.

59521. RHODODENDRON sp.

Nos. 11108 (fruit), 9267 (flowers). November, 1923. A shrub 10 feet high found in the Peima Mountains at an altitude of 13,000 feet. The oval-elliptical leaves are brown tomentose beneath, and the flowers are white spotted with purple.

59522. RHODODENDRON sp.

Nos. 11113 (fruit), 8925 (flowers). November, 1923. A shrub 5 feet high found in the Peima Mountains, Mekong-Yangtze Divide, at an altitude of 13,000 feet. The linear-lanceolate, leathery leaves are deep rufous tomentose beneath. The flowers are large and white.

59523. RHODODENDRON sp.

Nos. 11114 (fruit), 9252 (flowers). November, 1923. A shrub 5 to 10 feet high found on the slopes of the Peima Mountains at an altitude of 13,000 feet. The ovate leaves on long petioles are subcordate at the base, and the large bright-yellow flowers are produced in large umbels.

59524. RHODODENDRON sp.

Nos. 11115 (fruit), 9939 (flowers). November, 1923. A shrub 3 to 4 feet high found in the Peima Mountains at an altitude of 14,000 feet. The long, linear-lanceolate, leathery leaves are deep green above and densely covered beneath with rufous wool. The flowers are white.

59525. RHODODENDRON sp.

Nos. 11138 (fruit), 8703 (flowers). November, 1923. A shrub 6 to 8 feet high found in the alpine meadows of Litiping at an altitude of 12,000 feet. The oblong, acute leaves are green on both sides, and the flowers are deep red.

59526. RHODODENDRON sp.

Nos. 11145 (fruit), 8956 (flowers). November, 1923. A small tree 8 to 10 feet high found in the mountains of Anwa (Mekong Valley). The leaves are large, obovate, and cordate, and the flowers are rich white.

59527. RHODODENDRON sp.

Nos. 11149 (fruit), 9326 (flowers). November, 1923. A shrub 6 feet high found in the Moting Mountains northeast of Atuntze at an altitude of 14,000 feet. The oblong-lanceolate leaves are brown tomentose beneath, and the flowers are pale pink spotted with purple.

59528. RHODODENDRON sp.

Nos. 11150 (fruit), 9317 (flowers). November, 1923. A shrub 5 feet high found in the Moting Mountains northeast of Atuntze. The ovate-oblong leaves are densely matted beneath and pale yellow tomentose; the flowers are rich purplish red, spotted with dark purple.

59529. RHODODENDRON sp.

No. 11151. Moting Mountains, Mekong-Yangtze Divide. November, 1923. A small tree 8 feet high growing at an altitude of 14,000 feet. The oblong leaves are densely matted beneath with pale tomentum; the flowers are pinkish white.

59403 to 59642—Continued.

59530. RHODODENDRON sp.

Nos. 11152 (fruit), 9320 (flowers). October, 1923. A shrub 5 feet high found on alpine altitude of 13,000 feet. The leaves are green, and glabrous, and the large rich flowers are borne in large umbels.

59531. RHODODENDRON sp.

Nos. 11153 (fruit), 9313 (flowers). Moting Mountains, Mekong-Yangtze Divide. November, 1923. A tree 13 to 15 feet high with large, oblong leaves, densely matted beneath with pale-yellow, glossy tomentum; the flowers are pink.

59532. RHODODENDRON sp.

Nos. 11155 (fruit), 10104 (flowers). Champu-tong, Salwin-Irrawaddy Divide. November, 1923. A shrub 5 feet high growing at an altitude of 12,000 feet. The obovate-oblong leaves have a peculiar brown, flaky tomentum. The flowers are red.

59533. RHODODENDRON sp.

Nos. 11156 (fruit), 10211 (flowers). Champu-tong, Salwin-Irrawaddy Divide. October, 1923. The obovate-oblong, dark-green leaves are chocolate-brown tomentose beneath. The very large flowers are rich carmine.

59534. RHODODENDRON sp.

Nos. 11159 (fruit), 10128 (flowers). Champu-tong, Mount Kenichunpu. October, 1923. A tree 12 to 15 feet high growing at an altitude of 12,000 feet. The large, obovate-oblong rounded leaves are covered beneath with tomentum shaded from fawn to red. The flowers are yellowish red.

59535. RHODODENDRON sp.

Nos. 11160 (fruit), 10176 (flowers). October, 1923. A shrub 6 inches high found in the alpine regions of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 14,000 feet. The small, elliptical, glabrous leaves are glaucous beneath, and the flowers, drooping on long erect pedicels, are red with a glaucous tinge.

59536. RHODODENDRON sp.

Nos. 11162 (fruit), 10142 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. November, 1923. A shrub 5 to 6 feet high found at an altitude of 13,000 feet. The obovate-oblong, green leaves are dark rough squamous tomentose beneath. The flowers are red.

59537. RHODODENDRON CRASSUM Franch.

Nos. 11166 (fruit), 10168 (flowers). October, 1923. A small tree 6 to 8 feet high found on the slopes of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 11,000 feet. The large, oblong-elliptical leaves are brownish, glabrous, and punctate beneath. The flowers are white.

59538. RHODODENDRON FULVIDES Balf. f. and Forrest.

Nos. 11168 (fruit), 10214 (flowers). Champu-tong, Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A tree 15 feet high found at an altitude of 12,000 feet. The large, oblong, pale-brown leaves are thinly tomentose beneath. The flowers are red.

59539. RHODODENDRON sp.

Nos. 11170 (fruit), 10257 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 3 to 4 feet high found at an altitude of 13,000 feet. The small, spatulate leaves, greenish beneath, have squamously brown tomentose veins.

59403 to 59642—Continued.

59497.

For RHODODENDRON sp.

Nos. 11172 (fruit), 10194 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 2 to 3 feet high found at an altitude of 13,000 feet. The elliptical leaves, glaucous beneath, are tuberculate, and the flowers are small and yellow.

59541. RHODODENDRON sp.

Nos. 11174 (fruit), 10127 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A tree 18 feet high with oblong, glabrous leaves, acute at both ends, and silvery to golden yellow beneath. The flowers are white and fragrant.

59542. RHODODENDRON sp.

Nos. 11184 (fruit), 10131 (flowers). October, 1923. A shrub 5 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide. The obovate-elliptical leaves have hirsute bases and petioles and are chocolate-colored tomentose beneath. The flowers are red.

59543. RHODODENDRON sp.

Nos. 11185 (fruit), 10155 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A very robust plant 10 feet high with obovate-oval, oblong, large leaves which are rich-brown tomentose beneath and dark green above. The flowers are red.

59544. RHODODENDRON sp.

Nos. 11187 (fruit), 10221 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A tree 16 to 20 feet high found at an altitude of 13,000 feet. The large, obovate-oblong, dark-green leaves are deep reddish brown tomentose beneath, and the flowers are red.

59545. RHODODENDRON sp.

Nos. 11194 (fruit), 10146 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A small tree 8 feet high found at an altitude of 13,000 feet. The oval-oblong, acute leaves are yellowish brown to olive-green pubescent beneath and have yellow hirsute petioles. The flowers are pink.

59546. RHODODENDRON sp.

Nos. 11199 (fruit), 10099 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 2 feet high growing at an altitude of 13,000 feet. The spatulate leaves are drab colored beneath, and the flowers are yellowish red.

59547. RHODODENDRON sp.

Nos. 11200 (fruit), 10138 (flowers). October, 1923. A tree 18 to 20 feet high found in the forests of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 11,000 feet. The leaves are oblong acute, green, and glabrous, and the red flowers are produced on long pedicels.

59548. RHODODENDRON sp.

Nos. 11204 (fruit), 10121 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 4 to 5 feet high found at an altitude of 13,000 feet. The ovate-obovate leaves are dark-brown, densely squamately tomentose beneath. The flowers are red.

59549. RHODODENDRON sp.

Nos. 11206 (fruit), 10173 (flowers). Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 2 feet high, growing at an altitude of 13,000 feet. The oval-elliptical leaves are chocolate brown tomentose beneath, and the flowers are orange-red.

59403 to 59642—Continued.

59550. RHODODENDRON sp.

Nos. 11207 (fruit), 10119 (flowers). October, 1923. A tree 16 to 18 feet high growing on the slopes of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 12,000 to 13,000 feet. The large, obovate-oblong leaves are deep brown to carmine tomentose beneath, and the flowers are red.

59551. RHODODENDRON sp.

No. 11209. Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 7 feet high found at an altitude of 13,000 feet. The ovate leaves, subcordate at the base, are glaucous and green beneath.

59552. RHODODENDRON sp.

No. 11210. Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 3½ feet high growing at an altitude of 13,000 feet. The oval leaves are densely matted and brown beneath, and the flowers are yellow.

59553. RHODODENDRON sp.

No. 11212. Kenichunpu, Salwin-Irrawaddy Divide, October, 1923. A shrub 2 feet high found at an altitude of 13,000 feet. The leaves are dark purplish gray tomentose beneath.

59554. RHODODENDRON sp.

No. 11213. October, 1923. A shrub 3 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide. The oval-oblong leaves are faintly brown tomentose and subglabrous beneath, and the petioles are hirsute.

59555. RHODODENDRON sp.

No. 11216. Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 3 feet high found at an altitude of 13,000 feet. The elliptical-ovate leaves are pale glaucous and brown beneath, and the flowers are red.

59556. RHODODENDRON sp.

No. 11217. October, 1923. A shrub or small tree 15 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide. The oblong, acute, glabrous leaves are green on both sides.

59557. RHODODENDRON MEGACALYX Balf. f. and Ward.

No. 11222. Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub 6 feet high found on rocky slopes at an altitude of 13,000 feet. The large, oblong leaves are greenish gray and glabrous beneath, and the veins are rufous tomentose. The flowers are white.

59558. RHODODENDRON sp.

No. 11223. Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A shrub or small tree 15 feet high found at an altitude of 13,000 feet. The large leaves are covered with a brown wool underneath.

59559. RHODODENDRON FULVIDES Balf. f. and Forrest.

No. 11225. Mount Kenichunpu, Salwin-Irrawaddy Divide. October, 1923. A tree or shrub 6 to 8 feet high found at an altitude of 13,000 feet. The oblong leaves are yellowish brown floccose beneath.

59560. RHODODENDRON sp.

No. 11227. October, 1923. A shrub 4 feet high growing on Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 13,000 feet. The large, obovate leaves are chocolate-colored tomentose beneath, and the flowers are red.

59403 to 59642—Continued.

59561. RHODODENDRON SINONUTTALLII Balf. f. and Forrest.

Nos. 11233 (fruit), 10130 (flowers). October, 1923. A tree 8 to 10 feet high growing on the slopes of Mount Kenichunpu, Salwin-Irrawaddy Divide, at an altitude of 11,000 feet. The large, leathery leaves, prominently veined, are deeply impressed above and brownish gray and punctate beneath. The very large flowers, 3 inches in diameter, are yellow to cream colored. The fruits are enormous.

59562. RHODODENDRON sp.

No. 11240. October, 1923. A shrub or small tree 6 feet high growing in Sila among firs at an altitude of 13,000 feet. The oblong-acute leaves are grayish brown tomentose beneath.

59563. RHODODENDRON sp.

No. 11242. October, 1923. A tree 20 feet high found on Mount Lautchun west of Likiang at an altitude of 11,000 feet. The large, oblong leaves are densely covered with brown wool beneath. The large flowers are white.

59564. RHODODENDRON sp.

No. 11243. Mount Lautchun. October, 1923. A shrub 1½ feet high found at an altitude of 12,000 feet. The small, elliptical leaves are punctate beneath, and the flowers are small and a deep indigo blue.

59565. RHODODENDRON sp.

Nos. 11244 (fruit), 8394 (flowers). Mount Lautchun. October, 1923. A tree 24 feet high found in fir forests at an altitude of 11,000 feet. The oblong leaves are covered with a brown wool beneath, and the flowers are large and white.

59566. RHODODENDRON sp.

No. 11246. Mount Lautchun. October, 1923. A tree 10 feet high found in fir forests at an altitude of 12,000 feet. The elliptical, acute leaves are yellow brown tomentose beneath. The flowers are white.

59567. RHODODENDRON sp.

Nos. 11247 (fruit), 9585 (flowers). Mount Lautchun. October, 1923. A shrub 5 to 6 feet high found at an altitude of 12,000 feet. The leaves are obovate, subcordate, and glabrous, and the flowers are cream colored to yellow with a pinkish tinge.

59568. RHODODENDRON sp.

No. 11248. Mount Lautchun. October, 1923. A shrub 5 feet high found in fir forests at an altitude of 12,000 feet. The oblong, acute leaves are green and glabrous on both sides and the flowers are pink.

59569. RHODODENDRON sp.

No. 11249. Mount Lautchun. October, 1923. A shrub 1 to 2 feet high found at an altitude of 13,000 feet and having very small, elliptical leaves, brown tomentose beneath, and small, deep blue-purple flowers.

59570. RHODODENDRON sp.

Nos. 11250 (fruit), 8422 (flowers). October, 1923. A shrub 5 feet high found in fir forests on Mount Lautchun at an altitude of 12,000 feet. The linear-lanceolate leaves are deep rufous woolly beneath, and the flowers are pink spotted with purple, making them very handsome.

59571. RHODODENDRON sp.

Nos. 11251 (fruit), 8400 (flowers). October, 1923. A shrub 4 feet high found in the alpine regions of Mount Lautchun, at an altitude of 12,000 feet. The elliptical, dark-green leaves are reticulate above and rufous woolly beneath. The flowers are pink.

59403 to 59642—Continued.

59572. RHODODENDRON sp.

No. 11253. October, 1923. A shrub 8 feet high growing on Mount Lautchun, at an altitude of 13,000 feet. The small, linear-elliptical leaves are deeply rufous beneath, and the flowers are white.

59573. RHODODENDRON sp.

Nos. 11255 (fruit), 8381 (flowers). Mount Lautchun. October, 1923. A shrub or tree 18 feet high growing at an altitude of 12,000 feet. The large, oval, subcordate leaves are densely matted with brown wool, and the flowers are white to pink.

59574. RHODODENDRON sp.

No. 11257. October, 1923. A tree 15 to 18 feet high found in mixed forests on the slopes of Mount Lautchun at an altitude of 10,000 feet. The large, oblong, glabrous leaves are pale grayish green beneath. The flowers are red to purple.

59575. RHODODENDRON sp.

No. 11261. October, 1923. A shrub 5 feet high growing on the slopes of Mount Lautchun at an altitude of 10,000 feet. The leaves are linear-oblong and are covered beneath with a deep rufous wool. The flowers are pink.

59576. RHODODENDRON sp.

No. 11262. October, 1923. A shrub 3 feet high growing at an altitude of 10,000 feet in fir forests on Mount Lautchun. The leaves are small, oval, glabrous, and grayish purple beneath. The flowers are pink.

59577. RHODODENDRON RACEMOSUM Franch.

No. 11264. October, 1923. A handsome species 3 feet high growing at the foot of Mount Lautchun at an altitude of 8,000 to 9,000 feet. The small, elliptical-oval leaves are pale pink to white beneath, and the flowers are pink.

59578. RHODODENDRON RACEMOSUM Franch.

Nos. 11265 (fruit), 8404 (flowers). October, 1923. A shrub 2 to 3 feet high growing at the foot of Mount Lautchun at an altitude of 8,000 to 9,000 feet. The oval leaves, white beneath, are black punctate. The large white flowers are very striking.

59579. RHODODENDRON sp.

Nos. 11266 (fruit), 8392 (flowers). October, 1923. A shrub 6 feet high growing on the slopes of Mount Lautchun at an altitude of 9,000 feet. The leaves are oval, acute, coriaceous, pale green, and glabrous on both sides; the flowers are large and pure white spotted with purple.

59580. RHODODENDRON sp.

Nos. 11268 (fruit), 9596 (flowers). October, 1923. A shrub 4 feet high growing at the foot of Mount Lautchun at an altitude of 8,000 feet. The small, oval, acute leaves are glaucous and glabrous beneath, and the flowers are white.

59581. RHODODENDRON sp.

Nos. 11273 (fruit), 8430 (flowers). October, 1923. A tree 25 feet high found among rocks in the alpine regions of Mount Shenzi at an altitude of 10,000 feet. The oblong-acute leaves are glaucous and glabrous on both sides, and the flowers are white.

59582. RHODODENDRON sp.

Nos. 11274 (fruit), 9505 (flowers). October, 1923. A tree 15 to 18 feet high growing in mixed forests on Mount Shenzi at an altitude of 10,000 feet. The oblong, acute leaves are coriaceous, glaucous, and glabrous, and have undulate margins. The flowers are white.

59403 to 59642—Continued.

59583. RHODODENDRON sp.

Nos. 11277 (fruit), 8426 (flowers). October, 1923. An exceedingly handsome species 2 to 3 feet high found among limestone boulders on Mount Shenzi at an altitude of 13,000 feet. The oval, acute leaves have impressed veins above and are densely matted beneath with rough cottony tomentum. The flowers are very large and pink.

59584. RHODODENDRON sp.

No. 11279. October, 1923. A tree 10 feet high growing on the slopes of Mount Shenzi at an altitude of 10,000 feet. The oblong, acute leaves are glabrous and pale brown beneath, and the flowers are red.

59585. RHODODENDRON sp.

Nos. 11281 (fruit), 8437 (flowers). October, 1923. A shrub 4 feet high growing among rocks in Labako, at an altitude of 9,000 feet. The leaves, lanceolate-oval and acute at both ends, are glabrous and glaucous beneath. The flowers are large and white spotted with purple.

59586. RHODODENDRON sp.

No. 11282. October, 1923. A shrub 8 feet high growing among rocks in the forests of Labako at an altitude of 9,000 feet. The oblong, acute, dull-green leaves, pale brownish green beneath, are strongly veined.

59587. RHODODENDRON sp.

Nos. 11284 (fruit), 9523 (flowers). October, 1923. A shrub 3 feet high found in the alpine meadows of Labako at an altitude of 14,000 feet. The small, elliptical leaves are dotted with brown beneath, and the flowers are lavender-blue.

59588. RHODODENDRON sp.

No. 11286. October, 1923. A tree 15 feet high found in fir forests on the mountains of Labako at an altitude of 12,000 feet. The obovate-oblong leaves are densely covered beneath with rough brown tomentum, and the flowers are large and pink.

59589. RHODODENDRON sp.

Nos. 11292 (fruit), 8446 (flowers). October, 1923. An exceedingly handsome species growing 6 to 8 feet high among rocks in the alpine region of Labako at an altitude of 13,000 feet. The narrow, linear, needle-shaped leaves are covered beneath with deep-red wool. The flowers are pink, spotted with purple.

59590. RHODODENDRON sp.

No. 11293. Labako. October, 1923. A shrub 6 feet high found in the alpine region at an altitude of 13,000 feet. The leaves are linear lanceolate and needle shaped and are covered beneath with a rufous wool. The flowers are white.

59591. RHODODENDRON sp.

No. 11298. October, 1923. A shrub 5 feet high found in the alpine region of Labako at an altitude of 9,000 feet. The orbicular-oval cordate leaves are glaucous purple beneath, and the flowers are red.

59592. RHODODENDRON sp.

Nos. 11299 (fruit), 8474 (flowers). Labako. October, 1923. A shrub 4 to 5 feet high found along stream beds in mixed forests at an altitude of 10,000 feet. The narrow, elliptical leaves are pale green above and pale gray-green beneath. The flowers are handsome yellow.

59403 to 59642—Continued.

59593. RHODODENDRON sp.

Nos. 11300 (fruit), 9511 (flowers). October, 1923. A shrub 7 to 8 feet high found in forests on the slopes of Mount Kintze at an altitude of 10,000 feet. The elliptical, acute leaves are brownish green and glabrous beneath. The flowers are purple.

59594. RHODODENDRON sp.

Nos. 11302 (fruit), 9499 (flowers). October, 1923. A shrub 7 to 8 feet high found on the alpine slopes of Mount Kintze at an altitude of 13,000 feet. The narrow, linear leaves are rufous woolly beneath, and the flowers are white.

59595. RHODODENDRON sp.

Nos. 11309 (fruit), 9478 (flowers). October, 1923. A shrub 6 feet high growing on the rocky alpine slopes of Mount Kintze at an altitude of 13,000 feet. The elliptical, acute leaves are densely covered with rufous wool beneath, and the flowers are white.

59596. RHODODENDRON sp.

Nos. 11317 (fruit), 8702 (flowers). October, 1923. A shrub 6 to 8 feet high found in the alpine meadows of Litiping, Mekong-Yangtze Divide. The rich-green leaves are oval-elliptical and acute at both ends. The flowers are lavender.

59597. RHODODENDRON sp.

Nos. 11318 (fruit), 9194 (flowers). October, 1923. A shrub 3 feet high growing in the swampy, alpine meadows of Litiping at an altitude of 12,000 feet. The elliptical leaves are covered beneath with a bronze-colored pubescence. The flowers are deep bluish purple.

59598. RHODODENDRON sp.

No. 11319. October, 1923. A shrub 1 to 2 feet high growing in the swampy alpine meadows of Litiping at an altitude of 12,000 feet. The very small, oval-elliptical leaves are bronze-colored tomentose beneath, and the flowers are rich blue.

59599. RHODODENDRON sp.

Nos. 11328 (fruit), 9749 (flowers). Peima Mountains. November, 1923. A shrub 3 to 4 feet high found at an altitude of 13,000 feet. The oval, glabrous leaves, rounded at both ends, are pale green beneath, and the flowers are pinkish white with deep-purple markings.

59600. RHODODENDRON sp.

No. 11329. November, 1923. A shrub 7 to 8 feet high found on the alpine slopes of the Peima Mountains at an altitude of 13,000 feet. The oval-elliptical leaves are pale, or dark brown, soft tomentose beneath.

59601. RHODODENDRON ARALIAEFORME Balf. f. and Forrest.

Nos. 11331 (fruit), 10359 (flowers). Atuntze Mountains. November, 1923. A shrub 5 to 6 feet high found at an altitude of 11,500 feet. The oval, glabrous leaves are pale yellow beneath.

59602. RHODODENDRON sp.

No. 11333. November, 1923. A shrub 8 to 10 feet high growing on the alpine slopes of Mount Peima at an altitude of 15,000 feet. The large, ovate-oblong leaves are a rich golden brown, soft tomentose beneath.

59403 to 59642—Continued.

59603. RHODODENDRON sp.

No. 11334. November, 1923. A tree 10 to 15 feet high found on the high passes east of Atuntze, Mount Motung, at an altitude of 13,000 feet. The very large, oblong-acute leaves are pale silvery to pale brown beneath.

59604. RHODODENDRON sp.

No. 11336. Mount Motung. November, 1923. A shrub 4 feet high growing at an altitude of 14,000 feet. The oblong leaves, with the margins folded inward, are pale brown, farinaceous tomentose beneath.

59605. RHODODENDRON sp.

No. 11337. November, 1923. A shrub 6 to 10 feet high found in the passes of Mount Motung at an altitude of 14,000 feet. The large, oblong leaves, acute at both ends, have deciduous, rich-brown tomentum beneath.

59606. RHODODENDRON sp.

No. 11338. November, 1923. A shrub 5 to 6 feet high growing on the alpine slopes of Mount Peima at an altitude of 14,000 to 15,000 feet. The oval, acute leaves are covered beneath with a brown, flaky tomentum.

59607. RHODODENDRON sp.

No. 11339. Mount Peima. November, 1923. A shrub 4 feet high growing on alpine slopes at an altitude of 14,000 to 15,000 feet. The elliptical-oblong leaves, with infolded margins, are pale-yellow tomentose beneath.

59608. RHODODENDRON sp.

No. 11340. A shrub growing on Mount Peima at an altitude of 14,000 to 15,000 feet.

For description, see S. P. I. No. 59607.

59609. RHODODENDRON sp.

No. 11343. Mount Motung. November, 1923. A shrub 5 to 8 feet high growing at an altitude of 14,000 to 15,000 feet. The leaves are oblong, acute, with deciduous tomentum beneath.

59610. RHODODENDRON sp.

No. 11345 (fruit), 9334 (flowers). November, 1923. A shrub 6 feet high growing on the alpine slopes of Mount Motung at an altitude of 14,000 to 15,000 feet. The broadly obovate-oblong, blunt leaves are covered beneath with deciduous flaky tomentum. The flowers are pink.

59611. RHODODENDRON sp.

No. 11346 (fruit), 1975 (flowers). Litiping, Mekong-Yangtze Divide. November, 1923. A shrub 12 feet high growing at an altitude of 12,000 feet. The long, linear-oblong, acute leaves are pale green and glabrous beneath. The flowers are pink.

59612. RHODODENDRON sp.

No. 11349. November, 1923. A shrub 5 to 6 feet high growing on the summit of Shund-sangtu, Mekong-Salwin Divide, at an altitude of 13,000 feet. The obovate-oblong, acute leaves are dull green above and brownish beneath.

59613. RHODODENDRON sp.

No. 11352. November, 1923. A shrub or tree up to 20 feet high growing in masses on the slopes of Mount Peima, Mekong-Yangtze Divide, at an altitude of 15,000 feet. The large, oval, acute leaves are covered beneath with a silky, bronze-colored tomentum.

59614. RHODODENDRON sp.

No. 11357. December, 1923. A tree 15 to 20 feet high found in mixed forests on the slopes of Pongela, Yangtze Divide, at an altitude of 11,000 feet. The leaves are oblong, acute, both sides being glossy green and glabrous. The flowers and fruits are red.

59403 to 59642—Continued.

59615. RHODODENDRON sp.

Nos. 11363 (fruit), 8527 (flowers). Haraku, Likang Snow Range. November, 1923. A shrub 3 feet high found in swampy meadows at an altitude of 11,000 feet. The small, elliptical-elongate leaves are pale yellow beneath, and the flowers are rich blue.

59616. RHODODENDRON sp.

No. 11365 (fruit), 8495 (flowers). Haraku, Likang Snow Range. November, 1923. A shrub 2 to 3 feet high found at an altitude of 11,000 feet. The small, narrow, elliptical leaves are pale beneath, and the flowers are dark purplish blue.

59617. RHODODENDRON sp.

No. 11367 (fruit), 8510 (flowers). Likang Snow Range. November, 1923. A stiff-branched shrub 5 to 6 feet high found at an altitude of 11,000 feet. The leaves are oblong and leathery and are matted beneath with a pale wool. The flowers are large and white dotted with red.

59618. RHODODENDRON sp.

No. 11371 (fruit), 8499 (flowers). November, 1923. A shrub 5 to 8 feet high found on the slopes of the Likang Snow Range at an altitude of 13,000 feet. The large, oblong leaves are dark green above and pale-yellow tomentose beneath. The flowers are white with a pinkish tinge.

59619. RHODODENDRON sp.

No. 11373 (fruit), 8496 (flowers). November, 1923. A shrub 6 to 8 feet high growing on the alpine slopes of the Likang Snow Range at an altitude of 14,000 feet. The oval-oblong leaves are white to cream-colored tomentose beneath. The flowers are large and white.

59620. RHODODENDRON sp.

No. 11381 (fruit), 8283 (flowers). November, 1923. A shrub 12 to 15 feet high found on the Sungkwe Pass at an altitude of 10,000 feet. The large, elliptical-oblong glabrous leaves, uniformly green, are strongly veined beneath. The flowers are pinkish white.

59621. RHODODENDRON sp.

No. 11383 (fruit), 8259 (flowers). November, 1923. A tree 20 feet high found on the Sungkwe Pass south of Likang, at an altitude of 11,000 feet. The broadly oval to obovate leaves are covered beneath with a faintly brown tomentum. The flowers are large and rich pink.

59622. RHODODENDRON sp.

No. 11389 (fruit), 8965 (flowers). November, 1923. A shrub 6 feet high found in the alpine meadows of Litiping, Mekong-Yangtze Divide, at an altitude of 12,000 feet. The leaves are ovate and pale yellow and glaucous beneath. The flowers are rich yellow.

59623. RHODODENDRON NIPHARGUM Balf. f. and Ward.

Nos. 11391 (fruit), 8360 (flowers). Heshwe Road. October, 1923. A small tree 12 to 15 feet high found along stream beds in mixed forests (Tsuga predominant) on the western slopes of the Likang Snow Range at an altitude of 10,000 to 11,000 feet. The large, oblong-obovate leaves, with prominent veins, are silvery gray underneath. The flowers are pink.

59624. RHODODENDRON sp.

No. 11397. November, 1923. A tree 25 feet high growing in Ganhaizte on the western slopes of the Likang Snow Range at an altitude of 12,000 feet. The large, oblong leaves are dark green and glossy above and densely rufous brown beneath. The flowers are white.

59403 to 59642—Continued.

59625. RHODODENDRON sp.

No. 11408 (fruit), 8223 (flowers). Saba, Likiang Snow Range. November, 1923. One of the finest species, 15 to 20 feet high, found in larch forests at an altitude of 11,000 to 11,500 feet. The oval, acute, subcordate leaves are glabrous on both sides and pale beneath. The large, pink flowers, produced in large corymbs, are faintly fragrant.

59626. RHODODENDRON sp.

No. 11418. November, 1923. A shrub 3 feet high growing in pine forests of the Likiang Snow Range at an altitude of 10,000 to 11,000 feet. The elliptical-oval, green leaves are glabrous on both sides, and the large, purple-lavender flowers are produced on slender pedicels.

59627. RHODODENDRON sp.

No. 11429. November, 1923. A handsome species 6 feet high growing on the alpine slopes among rocks on the Likiang Snow Range at an altitude of 14,000 feet. The oval, glabrous leaves are dotted beneath, and the petioles and stems are carmine purple. The flowers are large and red.

59628. RHODODENDRON sp.

No. 11452. November, 1923. A tree 8 to 10 feet high found in the Sungkwe Mountains, south of Likiang, at an altitude of 11,000 feet. The oblong-ovate leaves are densely covered beneath with cinnamon-brown tomentum. The flowers are large and white.

59629. RHODODENDRON sp.

No. 11453. November, 1923. A shrub 8 feet high found on the Sungkwe Mountains south of Likiang at an altitude of 11,000 feet. The oblong, acute, aromatic leaves are green on both sides but dotted with brown beneath. The flowers are pale pink.

59630. RHODODENDRON sp.

No. 11454. Sungkwe Mountains. November, 1923. A shrub 8 feet high found at an altitude of 11,000 feet. The leaves are coriaceous and pale yellow beneath. The flowers are large and white.

59631. RHODODENDRON sp.

No. 11455. Sungkwe Mountains, south of Likiang. November, 1923. An aromatic shrub 1 to 3 feet high found among rocks at an altitude of 11,000 feet. The small, elliptical leaves are covered with pale-brown pubescence beneath, and the flowers are white.

59632. RHODODENDRON sp.

No. 11460. November, 1923. A shrub 10 feet high growing on the alpine slopes of the Likiang Snow Range at an altitude of 13,000 feet. The very large, oblong leaves are glossy green above and cinnamon brown beneath. The flowers are large and produced in large corymbs.

59633. RHODODENDRON sp.

No. 11461. November, 1923. A shrub 5 feet high found on the alpine slopes of the Likiang Snow Range at an altitude of 14,000 feet. The oval, acute, white to cream-colored leaves are faintly pubescent. The flowers are large and white.

59634. RHODODENDRON sp.

No. 11468. November, 1923. A shrub 2 feet high growing on the alpine, rocky slopes of the Likiang Snow Range at an altitude of 14,000 feet. The oval leaves are brown beneath; the flowers are white, tubular, and fragrant.

59403 to 59642—Continued.

59635. RHODODENDRON sp.

No. 11470. November, 1923. A tree 15 feet high found in fir forests on the alpine slopes of the Likiang Snow Range at an altitude of 14,500 feet. The oblong, acute leaves are pale tomentose beneath, and the flowers are white.

59636. RHODODENDRON sp.

No. 11471. November, 1923. A shrub 3 to 4 feet high found in fir forests on the alpine slopes of the Likiang Snow Range at an altitude of 14,500 feet. The leaves are oblong acute and are covered beneath with pale-brown tomentum. The flowers are large and pink.

59637. RHODODENDRON sp.

No. 11473. November, 1923. A shrub 4 feet high found on the alpine slopes of the Likiang Snow Range at an altitude of 14,000 feet. The oblong-ovate leaves are pale brown silky beneath. The flowers are white.

59638. RHODODENDRON RACEMOSUM Franch.

No. 11476. November, 1923. A shrub 1½ feet high growing with pines on the dry, rocky limestone range opposite the Likiang Snow Range. The leaves are oval and dotted with gray beneath. The flowers are small and red.

59639. ROSA sp. Rosaceae. Rose.

No. 11218. October, 1923. A climber growing in the Salwin Valley, Champutong, at an altitude of 7,000 feet. The flowers, 2 inches in diameter, are rich red.

59640. SCABIOSA sp. Dipsacaceae.

No. 11466. November, 1923. A herb, found in alpine meadows at Saba, Likiang Snow Range, at an altitude of 11,000 feet, with a rosette of lanceolate leaves and small flowers produced in drooping, white, globose heads on long peduncles.

59641. SOPHORA DAVIDII (Franch.) Komorov (S. viciifolia Hance). Fabaceae.

December, 1923. A spiny shrub, which is a prolific fruiter, 6 to 10 feet high, most common in the arid region of the Mekong, north of Yangtze, and in the Atuntze Valley, at an altitude of 8,000 to 10,000 feet. The leaves are small. This shrub forms the sole food for goats and sheep of this region.

59642. (Undetermined.)

No. 11009. October, 1923. A plant 2 to 3 feet high found in the alpine meadows of Tsehchung. The flowers are yellow and have greenish veins.

59643 to 59648.

From Soledad, Cienfuegos, Cuba. Cuttings collected by David Fairchild, Bureau of Plant Industry. Received April 7, 1924. Quoted notes by Doctor Fairchild.

This collection was made at the Cuban Gardens, maintained by Harvard University.

59643. ANTIGONON GUATEMALENSE Meisn. Polygonaceae.

"The globular heads of this plant appear to be a deeper red than those of the ordinary type. Since the typical form is one of the most desirable climbers in Florida, this should be grown there for comparison with the common type."

59644. HIBISCUS ROSA-SINENSIS L. Malvaceae.

"Var. *Hedda*. An attractive single, pure-white variety."

59645 and 59646. MANGIFERA INDICA L. Anacardiaceae. Mango.

59643 to 59648—Continued.

59645. "Mulgo-fil. Originated by H. A. Van Hermann, at Finca Mulgoba, Rancho Boyeros, Cuba, about 1917, by crossing the Mulgoba and the 'Philippine' mango. The fruit is pink, yellow, and red, resembling the Mulgoba, but with the long, flat shape of the Philippine variety, with a depression on one side. The fruits are borne in clusters. The seed is flat, and the quality of the flesh good. The name, applied by Mr. Van Hermann, indicates the hybrid origin of the variety."

59646. Van Hermann. An improved Chinese mango discovered by Mr. Van Hermann. Unlike most other varieties it does not harbor the black fly, because of its open habit of growth and comparatively scanty foliage. Furthermore, the fruits do not spot with Colletotrichum as do ordinary mangos. The flesh is free from fiber and of good quality, and the tree is a regular bearer at Finca Mulgoba. It is named in honor of its discoverer, Mr. Van Hermann.

59647. PLUMERIA RUBRA L. Apocynaceae.

This strain of *Plumeria rubra* blooms in April in Cuba and may flower earlier in Florida than the white-flowered species, *P. alba*. Its flowers are superb.

59648. PUNICA GRANATUM L. Punicaceae.
Pomegranate.

An attractive double-flowered white variety, which might be useful as a pot plant.

For previous introduction, see S. P. I. No. 55923.

59649. LITCHI CHINENSIS Sonner. Sap-indaceae. Lychee.

From Santiago de las Vegas, Cuba. Fruits presented by H. A. Van Hermann, Finca Mulgoba. Received May 19, 1924.

In the hope of establishing the lychee in Florida, the Office of Foreign Plant Introduction has from time to time distributed young plants to experimenters in that State. Many of these plants have succumbed to cold winters, and at Miami the soil does not seem altogether satisfactory. On the western coast conditions are better in this last-named respect; when planted far enough south to be out of danger from severe frosts, the tree should have a good chance of success. Judging from the conditions under which the lychee is cultivated in southern China, we would expect the banks of the Caloosahatchee, below Fort Myers, to prove better suited to it than most other sections of Florida.

At Santa Barbara, Calif., the behavior of a single specimen planted 20 years ago or more has shown that the lychee can be grown there with a fair degree of success, provided a location practically free from danger of frost is selected. Most attempts to cultivate it in California, however, have resulted in failure. It does not seem likely that it will ever be feasible to grow it commercially in that State.

The excellent quality of the lychee as a fresh fruit and its ability to stand shipment suggest the desirability of establishing lychee orchards somewhere in the Western Hemisphere, so as to supply the North American markets. It may be practicable to develop these in southern Florida. Certainly they would succeed in Cuba, Porto Rico, and tropical America generally. (Wilson Popenoe, Bureau of Plant Industry.)

59650. ALLIUM CEPA L. Liliaceae.
Onion.

From Ankober, Abyssinia. Bulbs collected by H. V. Harlan, Bureau of Plant Industry. Received June 3, 1924.

Introduced for onion-breeding tests.

No. 430. December 11, 1923. Purchased in Allu Amba. (Harlan.)

59651 to 59671.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received May 2, 1924.

59651. ACACIA SEYAL Delile. Mimosaceae.

A small and rather slender acacia with reddish brown bark, ivory-white spines about 2 inches long, and heads of very fragrant flowers. The tree is common in tropical Africa north of the Equator, and is one of the principal gum-yielding acacias of the Nile region. This gum becomes white and brittle when dry, and has a relatively high viscosity and strong adhesive power.

For previous introduction, see S. P. I. No. 44923.

59652. ACACIA SUMA (Roxb.) Kurz. Mimosaceae.

A medium-sized tree, native to the East Indies, with light-colored bark and branchlets armed with pairs of short, hooked spines. The heartwood is said to yield gum catechu, and the bark is used for tanning.

For previous introduction, see S. P. I. No. 52281.

59653. ASTRAGALUS sp. Fabaceae.

59654. BETULA sp. Betulaceae. Birch.

59655. CENTAUREA CANARIENSIS Willd. Asteraceae.

A rather large bush which is very drought resistant. When covered with its large purple flowers, it is very ornamental. (Proschowsky.)

For previous introduction, see S. P. I. No. 53910.

59656. CUPRESSUS sp. Pinaceae.

A very handsome species with drooping, glaucous branches. (Proschowsky.)

59657. DIOSPYROS sp. Diospyraceae.

59658. ENTELEA PALMATA Lindl. Tiliaceae.

The native home of this greenhouse shrub appears to be unknown. It grows about 4 feet high with heart-shaped, palmate leaves and umbels of rather small white flowers.

59659. GAULTHERIA FRAGRANTISSIMA Wall. Ericaceae.

An Asiatic relative of the wintergreen which grows wild in the mountains of eastern India. It is a fragrant evergreen shrub or small tree which is loaded in summer with white or pinkish flowers; these are succeeded by racemes of handsome bluish purple berries.

For previous introduction, see S. P. I. No. 48309.

59660. HYDRANGEA HETEROMALLA D. Don. Hydrangeaceae.

A Himalayan hydrangea, about 10 feet high, with red stems, oval, sharp-pointed leaves, white hairy beneath, and white flowers borne in clusters about 6 inches wide.

59661. LEUCOSCEPTRUM CANUM J. E. Smith. Menthaceae.

A stout-branched, densely hairy tree, commonly about 30 feet in height, with large, narrowly ovate leaves, silvery hairy beneath and at times a foot long. The small white or pinkish flowers are in spikes.

For previous introduction, see S. P. I. No. 57888.

59662. PASSIFLORA ALBA Link and Otto. Passifloraceae.

A tropical American passiflora with broadly oval, somewhat heart shaped, shallowly 3-lobed leaves, clear-white flowers over 2 inches across, and yellowish fruits about the size and shape of a hen's egg.

59651 to 59671—Continued.

59663. *PITTOSPORUM MACROPHYLLUM* Schum. and Lauterb. Pittosporaceæ.

The plant has existed in my garden for more than 20 years. It is the most beautiful of the dozen or so Pittosporum species which I cultivate. The leaves occasionally attain nearly the size of those of *Magnolia grandiflora*, and the flowers are perhaps not surpassed in fragrance by any other flower; indeed the fragrance is most exquisite. (*Proschowsky*.)

59664. *PRUNUS* sp. Amygdalaceæ.

From Indo China.

59665. *PRUNUS* sp. Amygdalaceæ.

From Tran Ninh, Tonkin.

59666. *RHODODENDRON* sp. Ericaceæ.

A hybrid.

59667. *RUBUS LINEATUS* Reinw. Rosaceæ.

An attractive suberect woody plant which is found wild at altitudes of 6,000 to 9,000 feet in the Sikkim Himalayas, according to Hooker (*Flora of British India*). The white flowers are produced in short axillary heads and terminal silvery panicles, and the berries are small and red.

For previous introduction, see S. P. I. No. 48409.

59668. *SAMBUCUS ADNATA* Wall. Caprifoliaceæ.

A Himalayan relative of the elderberry which has clusters of fragrant, white flowers about 10 inches in diameter, followed by red fruits.

For previous introduction, see S. P. I. No. 46100.

59669. *TIPUANA TIPU* (Benth.) Lillo (*T. speciosa* Benth.). Fabaceæ. **Tipu.**

Tipu. Sr. Salvador Izquierdo describes this plant as follows: A handsome, ornamental tree from the Argentine Republic. It has compact, delicate foliage and is excellent for parks and roadways. In its native country it is said to grow nearly as rapidly as *Eucalyptus globulus*. In the Botanic Gardens at Buenos Aires it has reached a height of 4½ meters (15 feet) in 31½ months. Plants imported from Argentina have shown much vigor at Santa Ines, Chile, and have grown even during the winter months. The wood is useful for furniture and rough purposes. Its horizontal branches make it an excellent shade tree.

For trial on the Pacific coast and in our Southwestern States.

For previous introduction, see S. P. I. No. 54643.

59670. (Undetermined.)

A climbing plant from Indo China which is said to yield rubber.

59671. *VACCINIUM GLAUCO-ALBUM* Hook. f. Vacciniaceæ.

An evergreen Himalayan shrub, about 4 feet high, with stiff, oval leaves, green above and bluish white beneath. The pinkish white flowers are in axillary racemes which are conspicuous because of their large, persistent, blue-white bracts, edged with bristles. The blue-black berries are about one-third of an inch in diameter.

59672 to 59687.

From Lucknow, United Provinces, India. Seeds presented by F. H. Johnson, superintendent, Government Horticultural Gardens. Received May 5, 1924.

59672. *ACACIA AURICULAEFORMIS* A. Cunn. Mimosaceæ.

One of the many species of *Acacia* found native in Australia. It is described by Benth (*Flora Australiensis*) as a small tree with sickle-shaped

59672 to 59687—Continued.

phyllodia and pods which are irregularly and very much twisted. Of possible value as an ornamental for the most tropical parts of the United States.

59673. *ADANSONIA DIGITATA* L. Bombacaceæ. **Baobab.**

The baobab, originally from central Africa, is now cultivated in many tropical countries and is famous for the great age which it is said to attain. The short, thick trunk sometimes becomes 30 feet in diameter. The pulp of the gourdlike fruit is edible, and the juice is used to make a beverage.

For previous introduction, see S. P. I. No. 42827.

59674. *ANOGEISSUS* sp. Combretaceæ.

Received as *Antidemsa ghesaembilla* but does not agree with that species.

The members of this genus are trees or shrubs, native to India; some of the species are valued for timber and for the gum, used in printing calico, which exudes from the bark.

59675. *CASSIA DIDYMOBOTRYA* Fres. Cæsalpiniaceæ.

An African shrub or small tree, 7 to 10 feet high, with finely divided leaves about a foot long, and numerous yellow flowers in erect racemes up to a foot in length.

For previous introduction, see S. P. I. No. 51632.

59676. *COLVILLEA RACE MOSA* Boj. Cæsalpiniaceæ.

This handsome tropical tree, believed to be native to East Africa, should be tested in southern Florida along with the poinciana, to which it is related. It is said to reach 40 or 50 feet in height. The pinnate leaves are 3 feet in length, and the brilliant scarlet, curiously shaped flowers are borne in drooping racemes more than a foot long. The tree was named for Sir Charles Colville, Governor of Mauritius; it was discovered in 1824 on the west coast of Madagascar, where it flowers in April or May.

In all probability it will stand no more frost than the poinciana. Like most other leguminous trees, it is readily propagated from seeds. Since it is not yet commonly cultivated in tropical America, it is recommended for trial in Porto Rico, Cuba, the Canal Zone, and elsewhere.

59677. *FICUS LACOR* Buch.-Ham. Moraceæ.

A tropical Asian fig which attains a height of 60 feet and appears to be of promise as a shade tree for the warm parts of the United States. The small whitish fruits, a quarter of an inch thick, are in axillary pairs.

59678. *FIRMIANA COLORATA* (Roxb.) R. Br. (*Sterculia colorata* Roxb.). Sterculiaceæ.

The brilliant orange flowers of this Indian tree, appearing before the leaves, make it desirable as an ornamental tree for regions having very little frost.

59679. *HETEROPHRAGMA ADENOPHYLLUM* (DC.) Seem. Bignoniaceæ.

An ornamental African tree related to catalpa, but adapted for cultivation in subtropical regions only. It reaches a height of 30 to 50 feet, with large opposite, pinnate leaves and brownish yellow, woolly flowers in terminal panicles.

For previous introduction, see S. P. I. No. 52291.

59680. *HOLOPTELEA INTEGRIFOLIA* (Roxb.) Planch. Ulmaceæ.

A large, spreading tree, closely related to the elms, which grows in dry, sandy soils at low altitudes in northern and central India. Its chief use appears to be as a timber tree; the wood is yellowish gray and moderately hard and is used for general construction.

59672 to 59687—Continued.

59681. *MIMUSOPS ELENGI* L. Sapotaceæ.

A tall East Indian tree, 50 feet or less in height, with thick, shining leaves and edible, ovoid fruits an inch or less in length. The chief value of this tree is likely to be as an ornamental for southern Florida.

For previous introduction, see S. P. I. No. 51819.

59692. *PITHECOLOBIUM BIGEMINUM* (L.) Mart. Mimosaceæ.

The chief uses of this large Indian tree appear to be as timber and for native medicine, a decoction of the leaves being employed externally as a stimulant. The wood is dark colored and heavy.

59693. *PUTRANJIVA ROXBURGHII* Wall. Euphorbiaceæ.

A moderate-sized, evergreen, tropical Indian tree, with small, obtuse leaves and white, hairy fruits the size of a cherry. From the seeds is obtained an olive-brown oil used by the natives of India for burning. The hard, gray wood is used for making tools.

For previous introduction, see S. P. I. No. 52296.

59694. *SAPINDUS EMARGINATA* Vahl. Sapindaceæ.

A handsome tree from southern India, which is valued in its native country chiefly for the supposed medicinal virtues of the pulp of the small fleshy fruit.

59685. *SOYMIDA FEBRIFUGA* (Roxb.) Juss. Meliaceæ.

A tall, tropical tree, closely related to the mahogany, found throughout northwestern and southern India, where it is used for many purposes. The deep-red bark, according to Watt (Dictionary of the Economic Products of India), contains a valuable adhesive gum, is used for tanning, yields a strong fiber, and has been used medicinally as a substitute for Peruvian bark. The wood is heavier and stronger than the better known American mahogany and has many uses.

59686. *TERMINALIA BELLERICA* (Gaertn.) Roxb. Combretaceæ.

The small, round fruits of this handsome tropical Indian tree have been exported from India for tanning purposes under the name of myrobalans. The yellowish gray wood is used for general construction. The tree also has merit as a shade tree for avenues, with its huge, buttressed trunk and long horizontal branches.

59687. *TERMINALIA MUELLERI* Benth. Combretaceæ.

Some of the *Terminalias* have proved to be very attractive shade trees for subtropical regions. According to Benth (Flora Australiensis) this Australian species is a large tree, when grown under favorable conditions, with leathery leaves up to 8 inches long, loose spikes of small white flowers, and small, ovoid, blue fruits.

59688. *SACCHARUM OFFICINARUM* L. Poaceæ. Sugar cane.

From Taru Jabba, near Peshwar, India. Cuttings presented by Robertson Brown, Agricultural Officer, Northwest Frontier Province. Received May 23, 1924.

Assam Red. A variety which appears especially promising because of its vigor, earliness, and freedom from disease and the sugar-cane borer.

Introduced for sugar-cane specialists.

59689. *AVENA BARBATA* WIESTII (Steud.) Hausskn. Poaceæ. Oats.

From Giza, Egypt. Seeds presented by the director; horticultural section, Ministry of Agriculture. Received May 8, 1924.

An erect, caespitose, somewhat hairy annual grass about 3 feet in height, with very narrow leaves about 6 inches long. Native to Egypt and Arabia. Introduced for forage-crop specialists.

For previous introduction, see S. P. I. No. 53626.

59690. *COLOCASIA* sp. Araceæ.

From Buitenzorg, Java. Tubers presented by the director of the Botanic Garden. Received May 10, 1924.

The central corm of this relative of the dasheen is of excellent quality for eating.

Received as *C. monorrhiza*, for which a place of publication has not been found.

59691 to 59700.

From Lwow (Lemberg), Poland. Seeds presented by Walery Swiderski, director, Station Expérimentale Botanique et Agricole. Received May 3, 1924.

59691. *ALLIUM SCHOENOPRASUM* L. Liliaceæ.

For previous introduction and description, see S. P. I. No. 59387.

Introduced for horticulturists investigating the food possibilities of the genus *Allium*.

59692. *ATROPA BELLADONNA* L. Solanaceæ.

Belladonna seeds introduced for the use of drug-plant specialists.

59693 to 59700.

A collection of native European plants introduced chiefly for forage-crop specialists for breeding and selection experiments.

59693. *AVENA PLANTICULMIS* Schrad. Poaceæ. Grass.

A perennial Siberian grass which thrives in dry, open places, forming a thick turf. The numerous branches are about 4 inches long, and the coarse leaves are up to an inch in width.

59694. *AVENA VERSICOLOR* Vill. Poaceæ. Grass.

A perennial grass which forms a thick turf. The rhizome is short and creeping, with short runners. The stems are sometimes 2 feet in height. Native to rocky places in the Mediterranean countries.

59695. *FESTUCA ELATIOR APENNINA* (DeNot.) Hack. Poaceæ. Grass.

A perennial European grass which forms a loose turf, with stems 2 to 3 feet high, and bluish green leaves about a foot long.

59696. *FESTUCA RUBRA PICTA* (Kit.) Hack. Poaceæ. Grass.

A perennial Hungarian grass which occasionally forms a loose turf. The stems are about a foot high, with bristly leaves.

59697. *PINUS MONTANA PUMILIO* (Haenke) Willk. Pinaceæ. Pine.

A handsome, hardy, low, shrubby pine with ascending branches densely clothed with bright-green foliage. Before maturity the cone is usually violet-purple, becoming yellowish or dark brown when fully ripe. This form is native to the mountains of central Europe.

59691 to 59700—Continued.

59698. *POA VIOLACEA* Bell. Poaceae. Grass.

An alpine perennial grass, found native only in the European Alps, with rhizomes forming a thick turf. The roughish stems are a foot or two in height, and the blue-green leaves terminate in long bristly points.

59699. *TRIFOLIUM PRATENSE FRIGIDUM* Aschers. and Graebn. Fabaceae. Red clover.

A Hungarian variety of red clover which differs from the type chiefly in having smaller flower heads and obcordate leaflets in the lower leaves.

59700. *TRisetum CARPATICUM* (Host.) Roem. and Schult. Poaceae. Grass.

A perennial grass, about a foot high, from the alpine and subalpine regions of central Europe. It is very similar to *Trisetum alpestre*, but has a wider creeping rhizome. The leaf-sheaths are often very bristly, and the leaves are about a quarter of an inch wide.

59701 to 59764.

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received April 29, 1924. Notes by Mr. Rock.

59701. *ALLIUM* sp. Liliaceae.

No. 11427. November, 1923. A plant from 2 to 3 feet tall found on the alpine meadows of the Likang Snow Range between 12,000 and 13,000 feet altitude. The leaves are long-linear and the deep wine-colored flowers are in large umbels.

59702. *DELPHINIUM* sp. Ranunculaceae.

No. 11435. November, 1923. A beautiful species which resembles very much *Delphinium likiangense*, but the plant is smaller. The large, blue flowers are bell-shaped. It was found growing in an alpine meadow of the Likang Snow Range at an altitude of 14,000 feet.

59703. *DELPHINIUM* sp. Ranunculaceae.

No. 11436. November, 1923. A large, handsome species 1 to 2 feet high found growing on limestone boulders at 12,500 feet altitude on the Ladsakodjo-Likang Range. The steel-blue flowers are large and pubescent.

59704. *DELPHINIUM* sp. Ranunculaceae.

No. 11438. November, 1923. A plant 2 to 3 feet high found along streams on the Likang Snow Range at from 9,000 to 10,000 feet altitude. The leaves are broadly palmatisect, and the deep purple flowers are on long spikes.

59705. *DEUTZIA* sp. Hydrangeaceae.

No. 11417. November, 1923. A small bush 5 to 8 feet high found on the Likang Snow Range. The small leaves are oval elliptical and pubescent; the flowers are deep lavender purple and grow in small racemes.

59706. *PEDICULARIS* sp. Scrophulariaceae.

No. 11442. November, 1923. A small plant 1 foot high found on alpine meadows of the Likang Snow Range at 13,000 feet altitude. The leaves are of millefolium type, and the rich reddish purple flowers grow in spikes.

59707. *PHILADELPHUS* sp. Hydrangeaceae.

No. 11445. November, 1923. A shrub 5 to 8 feet high found growing on the slopes of the Likang Snow Range along the streams at from 9,000 to 10,000 feet altitude. This fine species has small leaves and fragrant white flowers.

59701 to 59764—Continued.

59708. *PIERIS* sp. Ericaceae.

No. 11420. November, 1923. A handsome shrub from 5 to 6 feet high found growing in scrub forests of the Likang Snow Range from 10,000 to 11,000 feet altitude. The small, oval-elliptical leaves are on red branchlets, and the white bell-shaped flowers are in short racemes.

59709. *PIERIS* sp. Ericaceae.

No. 11431. November, 1923. A shrub 5 feet high found in scrub forests on the Likang Snow Range at 10,000 feet altitude. The oval leaves are glabrous and rich green; the white flowers grow in spikes which protrude beyond the leaves.

59710. *PRIMULA FORRESTII* Balf. f. Primulaceae. Primrose.

No. 11410. November, 1923. A perennial (50 to 100 years old) found in limestone crevices in the drier regions of the Likang Snow Range at from 10,000 to 11,000 feet altitude. The deep-green crenate leaves have the fragrance of apples, and the flowers are deep golden yellow.

59711. *PRIMULA PINNATIFIDA* Franch. Primulaceae. Primrose.

November, 1923. A plant 3 to 10 inches tall found in swampy alpine meadows on the Likang Snow Range at from 14,000 to 15,000 feet altitude in company with *P. pseudosikkimensis* and *P. secundiflora*. The thin leaves are pinnatifid, and the bright-blue flowers are in spikes.

59712. *PRIMULA SEPTEMLLOBA* Franch. Primulaceae. Primrose.

No. 11439. November, 1923. A plant found in shady places on mossy banks in fir forests at Saba, Likang Snow Range, at 11,000 feet altitude. The large flaccid leaves are irregularly lobed, and the large deep-red wine-colored flowers grow in small umbels.

59713 to 59762. *RHODODENDRON* spp. Ericaceae.59713. *RHODODENDRON CHARTOPHYLLUM* Franch.

No. 11422. November, 1923. One of the finest species, found in a fir forest on the Likang Snow Range at from 9,800 feet to 12,000 feet altitude. It is deciduous at flowering, and the large flowers are all shades from white to mauve, deep pink, and even blue smoke colored.

59714. *RHODODENDRON HELIOLEPIS* Franch.

Nos. 10943 (fruit), 8889 (flowers). November, 1923. A shrub or small tree from 5 to 15 feet high found in forests of fir and spruce on the Londre Mountains at from 11,000 to 12,000 feet altitude. The oval leaves are brown beneath and punctate; the flowers are deep lavender purple.

59715. *RHODODENDRON HELIOLEPSIS* Franch.

Nos. 11263 (fruit), 8419 (flowers). October, 1923. A shrub 6 to 10 feet high found in spruce forests on Mount Lanchun at from 11,000 to 12,000 feet altitude. The oval, acute leaves are brown punctate beneath, and the flowers are rich lavender purple.

59716. *RHODODENDRON LEPIDOTUM* Wall.

No. 11430. November, 1923. A shrub only a foot high found among rocks on the outskirts of pine forests on the Likang Snow Range at from 9,000 to 10,000 feet altitude. The very small leaves are oval, and the flowers, on slender pedicels, are deep-red wine colored.

59701 to 59764—Continued.

59717. RHODODENDRON RACEMOSUM Franch.

Nos. 11403 (fruit), 8512 (flowers). November, 1923. A small shrub 2 to 3 feet high found on the alpine meadows of Saba, Likiang Snow Range, at 11,000 feet altitude. The small, elliptical-ovate leaves are pale beneath, and the deep-pink flowers smell like mint when crushed.

59718. RHODODENDRON RACEMOSUM Franch.

No. 11424. November, 1923. A small shrub 2 feet high found in pine forests on the Likiang Snow Range at from 10,000 to 11,000 feet altitude. The small oval leaves are pale beneath, and the pink flowers are fragrant.

59719. RHODODENDRON sp.

Nos. 10935 (fruit), 8878 (flowers). November, 1923. A shrub 2 feet high found on the alpine regions of Mount Londjre at from 12,000 to 13,000 feet altitude. The small elliptical leaves are brown beneath, and the flowers are small, tubular, and pink.

59720. RHODODENDRON sp.

Nos. 10941 (fruit), 10288 (flowers). November, 1923. A small shrub 2 feet high growing in masses on the alpine slopes of Mount Londjre. The leaves are elliptical and glabrous; the large flowers are bright crimson.

59721. RHODODENDRON sp.

Nos. 10942 (fruit), 8882 (flowers). November, 1923. A shrub or small tree 7 to 8 feet high found on the alpine slopes of Mount Londjre. The long, linear-lanceolate leaves are glabrous and the large flowers are deep lavender purple.

59722. RHODODENDRON sp.

Nos. 10944 (fruit), 8885 (flowers). November, 1923. A shrub 4 feet high found in forests on Mount Londjre at from 10,000 to 12,000 feet altitude. The oval-oblong leaves are golden yellow beneath, and the large flowers are deep purplish crimson.

59723. RHODODENDRON sp.

Nos. 10945 (fruit), 10287 (flowers). November, 1923. A small shrub 1 to 2 feet high found in the alpine regions of Mount Londjre at 12,000 feet altitude. The elliptic-lanceolate leaves are brown tomentose beneath. The large flowers are rich reddish purple.

59724. RHODODENDRON sp.

Nos. 10946 (fruit), 10264 (flowers). November, 1923. A shrub 3 feet high found on the alpine slopes of Mount Londjre at 12,000 feet altitude. The linear-elliptical leaves are deep chocolate brown beneath, and the large flowers are rich golden yellow.

59725. RHODODENDRON sp.

Nos. 10953 (fruit), 10283 (flowers). November, 1923. A small shrub 2 feet high found on the alpine slopes of Mount Londjre at 12,000 feet altitude. The elliptical leaves are glabrous and vary from green to brown; the deeply lobed flowers are yellow with a reddish tinge.

59726. RHODODENDRON sp.

Nos. 10954 (fruit), 9154 (flowers). November, 1923. A shrub 5 feet high found on the slopes of the Tsechung Mountains at 10,000 feet altitude. The oval leaves are glabrous, and the flowers are lavender purple.

59701 to 59764—Continued.

59727. RHODODENDRON sp.

Nos. 10955 (fruit), 9284 (flowers). November, 1923. A tree 18 to 20 feet high found on the slopes of the Tsechung Mountains, Mekong Valley, at 10,000 feet altitude. The very large leaves are oblong and grayish brown beneath; the large flowers are pale pink.

59728. RHODODENDRON sp.

Nos. 10956 (fruit), 9126 (flowers). November, 1923. A shrub 5 feet high found in the alpine regions of the Tsechung Mountains, Mekong Valley, at 13,000 feet altitude. The narrow leathery leaves have revolute margins and are covered with deep rufous wool beneath; the flowers are pink or whitish purple.

59729. RHODODENDRON SEMNUM Balf. f. and Forrest.

Nos. 10957 (fruit), 9138 (flowers). November, 1923. A small tree 8 to 10 feet high found in the alpine regions of the Tsechung Mountains, Mekong Valley, in fir forests at 13,000 feet altitude. The large, broadly oblong leaves are silvery brown beneath, and the large flowers are cream colored.

59730. RHODODENDRON sp.

Nos. 10958 (fruit), 8824 (flowers). November, 1923. A shrub or small tree 7 to 8 feet high found in the alpine regions of the Tsechung Mountains, Mekong Valley, at 13,000 feet altitude. The oval glabrous leaves are brownish beneath, and the flowers are pink, spotted with dark purple.

59731. RHODODENDRON sp.

Nos. 11021 (fruit), 8752 (flowers). October, 1923. A small tree 8 to 10 feet high found on the Sila Pass, Mekong-Salwin Divide, at 14,000 feet altitude. The linear-oblong leaves are dark green above and glabrous brown beneath; the flowers are rose red.

59732. RHODODENDRON sp.

Nos. 11088 (fruit), 9957 (flowers). November, 1923. A low bush only a few inches high found in alpine meadows on the Peima Mountains, Mekong-Yangtze Divide, at from 15,000 to 16,000 feet altitude. The minute leaves are one-fourth of an inch or less in length, and the flowers are blue.

59733. RHODODENDRON sp.

Nos. 11091 (fruit), 9266 (flowers). November, 1923. A woody plant only a few inches high found on the alpine slopes of the Peima Mountains, Mekong-Yangtze Divide, at from 15,000 to 16,000 feet altitude. The leaves are minute and covered beneath with a silky brown tomentum; the flowers are deep blue.

59734. RHODODENDRON sp.

Nos. 11093 (fruit), 9249 (flowers). November, 1923. A small shrub 12 inches high found in the alpine regions of the Peima Mountains, Mekong-Yangtze Divide, at 15,000 feet altitude. The very small leaves are oval and a silky brown beneath; the small flowers are rich yellow.

59735. RHODODENDRON sp.

Nos. 11094 (fruit), 9954 (flowers). November, 1923. A shrub 4 to 5 feet high found on the Peima Mountains, Mekong-Yangtze Divide, at 15,000 feet altitude. The ovate glabrous leaves are acute, and the flowers are white to pinkish, spotted purple.

59701 to 59764—Continued.

59736. RHODODENDRON sp.

Nos. 11096 (fruit), 9271 (flowers). November, 1923. A small tree 12 to 15 feet high found on the Peima Mountains at 14,000 feet altitude. The rich green leaves are covered with fawn tomentum beneath, and the large flowers of white spotted with purple are in large umbels.

59737. RHODODENDRON sp.

Nos. 11097 (fruit), 9241 (flowers). November, 1923. A shrub or small tree 10 feet high, found on the high alpine slopes on the Peima Mountains. The oval, acute leaves are densely matted beneath with yellowish white tomentum, and the flowers are pinkish spotted with purple.

59738. RHODODENDRON sp.

Nos. 11099 (fruit), 8864 (flowers). November, 1923. A small tree 8 to 10 feet high found on the alpine slopes of the Peima Mountains at from 14,000 to 15,000 feet altitude. The large obovate-oblong, acute leaves are brown beneath, and the large flowers are pale pink.

59739. RHODODENDRON sp.

Nos. 11117 (fruit), 9963 (flowers). November, 1923. A shrub 5 feet high found in the Peima Mountains, Mekong-Yangtze Divide, at 14,000 feet altitude. The linear-lanceolate leaves are covered with brown tomentum beneath, and the flowers are pink.

59740. RHODODENDRON sp.

Nos. 11118 (fruit), 9265 (flowers). November, 1923. A shrub 6 to 7 feet high found in the Peima Mountains at 14,000 feet altitude. The ovate, cordate leaves are covered with pale yellowish white matted tomentum; the flowers are white with the lobes of the petals purple.

59741. RHODODENDRON sp.

Nos. 11135 (fruit), 9262 (flowers). November, 1923. A small tree 12 to 15 feet high found in the Peima Mountains at from 14,000 to 15,000 feet altitude. The oblong, acute leaves are dark green with revolute margins and are densely matted beneath with brown tomentum; the flowers are white, spotted with purple.

59742. RHODODENDRON sp.

Nos. 11178 (fruit), 10167 (flowers). October, 1923. A low shrub 2 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at the Tibetan border. The oblong-elliptical leaves are tomentose beneath and the flowers are deep rich red.

59743. RHODODENDRON sp.

Nos. 11183 (fruit), 10258 (flowers). October, 1923. A low shrub 1 to 2 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at about 13,000 feet altitude. The small elliptical leaves are rich green above and golden-yellow tomentose beneath; the flowers are very dark carmine.

59744. RHODODENDRON sp.

Nos. 11186 (fruit), 10174 (flowers). October, 1923. A low shrub 2 feet high found on the Kenichunpu Mountains, Salwin-Irrawaddy Divide, Tibet. The small, elliptical, sessile leaves are acute at both ends, dark green above and covered with purplish black tomentum beneath; the flowers are rich yellowish red.

59745. RHODODENDRON sp.

Nos. 11191 (fruit), 10210 (flowers). October, 1923. A shrub 6 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, on the Tibetan border at 13,000 feet altitude. The ovate leaves are covered with a thin brown tomentum beneath, and the flowers are red.

59701 to 59764—Continued.

59746. RHODODENDRON sp.

Nos. 11203 (fruit), 10101 (flowers). October, 1923. A small shrub 1 foot high found on Mount Kenichunpu, Salwin-Irrawaddy Divide. The small, ovate-elliptical leaves are gray beneath, and the flowers are dark crimson.

59747. RHODODENDRON sp.

Nos. 11208 (fruit), 10171 (flowers). October, 1923. A shrub 1 to 2 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, Tibetan border, at 13,000 feet altitude. The small elliptical leaves are dark gray tomentose beneath, and the flowers are dark red.

59748. RHODODENDRON sp.

No. 11214. October, 1923. A shrub 2 to 3 feet high found on Mount Kenichunpu, Salwin-Irrawaddy Divide, at 13,000 feet altitude. The small elliptical leaves are glaucous beneath, and the flowers, which were not seen, may be red.

59749. RHODODENDRON sp.

Nos. 11254 (fruit), 8580 (flowers). October, 1923. A shrub 6 to 8 feet high found on rocky alpine regions on Mount Lautchun at 13,500 feet altitude. The large, oval-oblong leaves are covered with white matted tomentum beneath, and the large flowers are snow white.

59750. RHODODENDRON sp.

Nos. 11256 (fruit), 8403 (flowers). October, 1923. A small tree found on the slopes of Mount Lautchun at 10,000 feet altitude. The linear-oblong, green leaves are glabrous beneath, and the large flowers are purplish red.

59751. RHODODENDRON sp.

Nos. 11267 (fruit), 8407 (flowers). October, 1923. A small shrub 3 to 4 feet high found on Mount Lautchun at 8,000 feet altitude. The oval, glaucous leaves are glabrous beneath, and the rich pink flowers are on long pedicels.

59752. RHODODENDRON CRASSUM Franch.

Nos. 11276 (fruit), 9502 (flowers). October, 1923. A shrub 8 feet high found on Mount Shenzi at from 10,000 to 12,000 feet altitude. This is an extraordinary plant with dark green, oval-oblong acute leaves which are greenish brown punctate beneath; the fleshy tubular flowers are very large.

59753. RHODODENDRON sp.

Nos. 11290 (fruit), 8449 (flowers). October, 1923. A tree 25 to 30 feet high found on the Labako Mountains at 12,000 feet altitude. This remarkable tree has leaves which are very large, dark green and glossy above and deep brown woolly beneath; the flowers are white.

59754. RHODODENDRON sp.

Nos. 11379 (fruit), 8260 (flowers). November, 1923. A tree 20 feet high found on the mountains of Sungkwe, south of Likang, at 11,000 feet altitude. The broad, oblong leaves are faintly tomentose and greenish brown beneath; the flowers are white.

59755. RHODODENDRON sp.

Nos. 11382 (fruit), 8263 (flowers). November, 1923. A tree 20 feet high found on the Sungkwe Mountains south of Likang at 10,500 feet altitude. The ovate-acute leaves are a glossy dark green above and deep rufous woolly beneath. The flowers are pinkish white.

59701 to 59764—Continued.

59756. RHODODENDRON sp.

Nos. 11385 (fruit), 9185 (flowers). November, 1923. A shrub 7 to 8 feet high found on the alpine meadows of Litiping, Mekong-Yangtze Divide, at 12,000 feet altitude. The oval glabrous leaves are subcordate, and the pale pink flowers are slightly spotted.

59757. RHODODENDRON NIPHARGUM Balf. f. and Ward.

Nos. 11386 (fruit), 9174 (flowers). November, 1923. A shrub 10 feet high found in fir forests of Litiping, Mekong-Yangtze Divide, at 12,000 feet altitude. The oblong leaves are silvery beneath, and the flowers are deep rich pink.

59758. RHODODENDRON sp.

Nos. 11387 (fruit), 9186 (flowers). November, 1923. A shrub 7 to 8 feet high found in the mountains of Litiping, Mekong-Yangtze Divide, at 12,000 feet altitude. The oval leaves are glossy green and paler beneath; the flowers are bluish purple.

59759. RHODODENDRON GLISCHRUM Balf. f. and Smith.

Nos. 11388 (fruit), 9178 (flowers). November, 1923. A tree 15 to 18 feet high found in fir forests on the Litiping Mountains, Mekong-Yangtze Divide, at 12,000 feet altitude. The large leaves are rich green above; beneath they are brown hirsute as are also the petioles, inflorescence, and capsules; the flowers are rich pinkish purple.

59760. RHODODENDRON sp.

No. 11410. November, 1923. A small shrub 2 feet high found on the Sanhaitze Road on the rocky slopes of the Likiang Snow Range at an altitude of 11,000 feet. The small oval-elliptical leaves are whitish and punctate beneath; the flowers are pink.

59761. RHODODENDRON sp.

No. 11421. November, 1923. A shrub 8 feet high found on the alpine slopes of the Likiang Snow Range at from 13,000 to 14,000 feet altitude. The oval-oblong leaves are covered with fine brownish tomentum beneath, and the large flowers are pink.

59762. RHODODENDRON sp.

Seeds unaccompanied by notes.

59763. ROSCOEA sp. Zinziberaceæ.

No. 11443. November, 1923. A plant 1 to 2 feet high found in meadows and scrub forest on the drier slopes of the Likiang Snow Range at from 10,000 to 11,000 feet altitude. This handsome species has linear leaves and large yellow flowers.

59764. SAUSSUREA sp. Asteraceæ.

No. 11433. November, 1923. A curious plant found at 17,000 feet altitude among limestone rocks on the Likiang Snow Range. It has palmatisect leaves, and the oblong flower heads are covered and hidden with a cottony substance.

59765. CUCUMIS SATIVUS L. Cucurbitaceæ. **Cucumber.**

From Basingstoke, Hants, England. Seeds presented by G. W. Schroeder, Cedar Nurseries. Received May 24, 1924.

Butcher's "Disease Resister." Introduced for trial in comparison with the commonly cultivated American cucumbers.

59766. ASCLEPIAS SUBULATA Decaisne. **Asclepiadaceæ.**

From Bard, Calif. Seeds presented by Harry A. Gunning, Bureau of Plant Industry. Received June 5, 1924.

The milky juice of many milkweeds contains a small percentage of rubber, and this species has been secured for testing by rubber specialists. It is an erect perennial, native to northwestern Mexico, with very narrow, subulate leaves.

59767. UROCHLOA BRACHYURA Stapf. **Poaceæ.**

From Pretoria, Transvaal, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, Division of Botany. Received June 5, 1924.

Introduced for forage-crop specialists.

An annual tufted grass, 4 feet or more in height, native to the eastern and western parts of South Africa. It is said to be the one grass most sought after by wild game and domestic animals of the regions where it grows.

59768. PHYLLOCARPUS SEPTENTRIONALIS Donn-Smith. **Cæsalpiniaceæ.**

From the city of Guatemala, Guatemala. Seeds purchased through the American consul. Received May 26, 1924.

A handsome flowering tree of eastern Guatemala, where it occurs in the Motagua Valley at elevations of 1,000 to 2,000 feet. It is usually of spreading habit, up to 40 feet in height, with small, light-green, compound leaves, and small crimson-scarlet flowers, which are borne in great profusion during the latter part of the dry season, at which time the tree is deciduous. It is a striking thing when it is in full bloom and is worthy of trial throughout the Tropics. It is probably no more frost resistant than the royal poinciana. At Naples, Fla., plants several years old give promise of being successful.

For previous introduction, see S. P. I. No. 56906.

59769. ERYTHRINA MONOSPERMA Gaud. **Fabaceæ.**

From Honolulu, Hawaii. Seeds presented by Dr. H. L. Lyon, in charge, department of botany and forestry, experiment station of the Hawaiian Sugar-Planters' Association. Received May 24, 1924.

The *wiliwili* is a handsome tree of spreading habit which inhabits the dry regions of all of the islands of the Hawaiian Archipelago. According to J. F. Rock, in "The Leguminous Plants of Hawaii," it becomes 30 feet high, with a short trunk and thin, yellowish bark. A few prickles are scattered along the trunk and branches. The rounded heart-shaped leaflets are about 2 inches long, and the brick-red, orange, or pale-yellow flowers are in terminal clusters.

For previous introduction, see S. P. I. No. 54897.

59770 to 59774.

From South America. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received May 20, 1924.

59770 and 59771. HELIANTHUS ANNUUS L. **Asteraceæ.** **Sunflower.**

To be tested for seed production.

59770. From Gorbea, Chile.

59771. Light sulphur.

59770 to 59774—Continued.

59772 and 59773. *HORDEUM VULGARE FALLIDUM* Seringe. Poaceæ. Six-rowed barley.

Collected for cereal-breeding experiments.

59774. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

Collected for testing as forage.

59775. *LANDOLPHIA SENEGALENSIS* Kotschy and Peyr. Apocynaceæ.

From Jamaica, British West Indies. Cuttings presented by F. E. Betheuser. Received May 23, 1924.

A woody climber from the forests of Senegal, French West Africa, introduced for testing by rubber specialists.

59776. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceæ.

Common wheat.

From South America. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received May 20, 1924.

Collected for cereal-breeding experiments.

59777 to 59840.

From Seine, France. Plants purchased from Millet & Fils, Bourg-la-Reine. Received April 18, 1924.

Introduced for strawberry breeders.

59777 to 59829. *FRAGARIA* spp. Rosaceæ.

Strawberry.

59777. *Abondance*. Fruit large, intense red; flesh red, juicy, fragrant. A vigorous, very early variety. (*Rivoire Père & Fils catalogue*.)

59778. *Africa*. Fruit large, dark red. (*Millet & Fils catalogue*.)

59779. *Alphonse XIII*. Vigorous, drought resistant, and productive. Fruits large to very large, uniformly heart-shaped, scarlet; flesh firm, pink, juicy, of excellent flavor. Recommended for cultivation on a large scale. (*Vilmorin-Andrieux & Co. catalogue*.)

59780. *Ananas de Guémené*. Seedling of a Chilean strawberry; a magnificent berry, rosy white, juicy, perfumed, late. (*J. M. Merrick, jr., The Strawberry, 1870, p. 68*.)

59781. *Avant-Toutes*. The earliest variety known to us; of unknown origin. Fruit small, dark red, and acid. (*Millet & Fils catalogue*.)

59782. *Aviateur Guynemer*. A noneverbearing variety with aromatic sugary flesh. Quality very good. (*La Pomologie Française, p. 154, 1924*.)

59783. *Barnes's Large White*. Plant moderately vigorous, thickest; fruits round or conical, blunt, white tinged with pink; flesh white, juicy, sugary, with musky flavor. Very productive. (*Robinson, Vegetable Garden, p. 681*.)

59784. *Belle Bordelaise*. A thickset, compact plant with rather long, often conical, fruits which ripen about the middle of June. (*Robinson, Vegetable Garden, p. 677*.)

59785. *Belle de Cours*. A vigorous, late-ripening variety; fruits numerous, dark red; flesh rosy white, firm, and sweet. (*Robinson, Vegetable Garden, p. 681*.)

59786. *Black Hautbois*. A seedling of the conical Hautbois, raised in 1815. Fruit conical, dark dingy purple; seeds little sunken; flesh buttery and high flavored. A great bearer, early. (*J. M. Merrick, jr., The Strawberry, 1870, p. 67-68*.)

59777 to 59840—Continued.

59787. *Centenaire*. Fruits very large, oblong, blunt, well colored, of good quality. Plant vigorous, thriving without special care. (*Vilmorin-Andrieux & Co. catalogue*.)

59788. *Cérés*. Fruit large, or very large, elongated conical, truncated; color deep red; flesh red, firm, sugary, and juicy. Plant vigorous and productive. A seedling of Haquin, which it surpasses. (*J. M. Merrick, jr., The Strawberry, 1870, p. 72*.)

59789. *Châtelaine de Grentherville*. Related to *Louis Gauthier*; almost as large and whiter. Flesh very sweet, fragrant. (*Millet & Fils catalogue*.)

59790. *Commandant Marchand*. Fruit elongated, with pinkish white, sweet flesh. (*Millet & Fils catalogue*.)

59791. *Délicatesse*. A very early variety with fruit of excellent quality. (*Millet & Fils catalogue*.)

59792. *Docteur Morère*. A very vigorous variety with very large, broad fruits which are deep red when ripe, with pink, sugary flesh resembling that of the Chilean strawberry in flavor. (*Robinson, Vegetable Garden, p. 683*.)

59793. *Duc de Malakoff*. Berries enormous, sometimes weighing $1\frac{1}{2}$ ounces; variable, cockscombed, dull red; seeds prominent; flesh very juicy, and with a sort of mulberry flavor. Vigorous, moderately productive, and as hardy as any foreign kind. Said to be a cross of a Chilean variety and the British Queen. (*J. M. Merrick, jr., The Strawberry, 1870, p. 78*.)

59794. *Edouard Lefort*. A distinct, very early variety, very productive. Fruit large, shaped like the Hautbois strawberry, scarlet; flesh red, sweet, and juicy. (*Vilmorin-Andrieux & Co. catalogue*.)

59795. *Eléonore*. A late variety; fruit oblong, very dark red; flesh pale scarlet, not very juicy, but sugary and fragrant. (*Robinson, Vegetable Garden, p. 698*.)

59796. *France-Russie*. Fruit large, similar to that of Sharpless. (*Millet & Fils catalogue*.)

59797. *Général Chanzy*. Very vigorous; fruit usually very large and long, very dark red; flesh blood red, juicy, sugary. (*Robinson, Vegetable Garden, p. 685*.)

59798. *Général de Castelnau*. An everbearing, very productive variety. Fruit larger than that of *La Perle*, dark red, very juicy, sweet, and firm. (*Grandes Roseraies du Val de Loire catalogue*.)

59799. *Gloire du Mans*. Fruit very large, elongated, humpbacked. (*Millet & Fils catalogue*.)

59800. *Helvetia*. Fruit long; flesh white and melting, of good quality. (*Millet & Fils catalogue*.)

59801. *Jarles*. Fruit very large, of good quality. An improved *Docteur Morère*. (*Baetel Freres, 1919-20 catalogue*.)

59802. *Jeanne d'Arc*. An everbearing variety resembling *St. Joseph*, but more vigorous and with larger fruits. (*Robinson, Vegetable Garden, p. 702*.)

59803. *Jubilé*. Fruit large; flesh firm, sweet. A vigorous early variety. (*Rivoire Père & Fils catalogue*.)

59804. *L'Aurore*. Very early, with large round pink fruits of good quality. (*Millet & Fils catalogue*.)

59777 to 59840—Continued.

59805. *La Parisienne*. Fruits glossy red, very large, round, flattened, with ribs; flesh melting, sweet. (*Barbier & Co. catalogue.*)
59806. *La Brune*. Fruit very large, dark red, elongated, of delicious flavor; easily detached from the calyx. (*Millet & Fils catalogue.*)
59807. *Londres*. Fruits red, conical, the size of a small egg; flesh rosy, juicy, melting, acid-sweet. A very vigorous, late variety. (*Millet & Fils catalogue.*)
59808. *Madame Eugène Delannay*.
59809. *Madame Meslé*. A very vigorous giant variety with enormous brilliant vermilion-red fruits with pink flesh; a good commercial variety of large yield. Season medium. (*Millet & Fils catalogue.*)
59810. *Madame Moutot*. A giant variety, with enormous, spherical red fruits; flesh light salmon. Quality excellent. (*Millet & Fils catalogue.*)
59811. *Marguerite Lebreton*. A very early variety, with abundant elongated fruits. One of the best forcing varieties. (*Millet & Fils catalogue.*)
59812. *Marguerite Chabert*. Fruit conical, very large, dark red; flesh pink. (*Rivoire Père & Fils catalogue.*)
59813. *Merveille de Bon-Secours*. A cross between Saint-Antoine de Padoue and La Perle. Plants very vigorous, productive and hardy. Fruits large, conical, red; flesh juicy, perfumed, of excellent flavor. (*Vilmorin-Andrieux & Co. catalogue.*)
59814. *Merveille de Caen*. A highly recommended variety; everbearing, with excellent fruits. (*Millet & Fils catalogue.*)
59815. *Monsieur Sclarandis*. Fruits very large, round, with vinous, sweet, very juicy flesh. (*Millet & Fils catalogue.*)
59816. *Monstrueuse Caennaise*. A very vigorous, large-fruited variety, with highly colored fruit. (*Millet & Fils catalogue.*)
59817. *Monstrueuse Hautbois*. A variety with exceedingly large fruits, resembling the raspberry in flavor. Very productive. (*Millet & Fils catalogue.*)
59818. *Pain de Sucre*. Medium-sized plant, very productive. Fruit medium to large, elongated, becoming an inch and a half long, brilliant red; flesh firm, rosy, juicy, and sweet. (*Vilmorin-Andrieux & Co. catalogue.*)
59819. *Passe-Edouard*. An excellent variety, superior to Edouard Lefort. (*Millet & Fils catalogue.*)
59820. *Perle Rouge*. Fruits medium size, ovoid; flesh clear red, of first quality. (*La Vie Agricole et Rurale*, vol. 22, no. 17, April 28, 1923, p. 288.)
59821. *Potager de Versailles*. Fruits bright red, fan-shaped, of good quality. (*Millet & Fils catalogue.*)
59822. *Président Poincaré*. Fruit orange-red; flesh white. Everbearing. (*Millet & Fils catalogue.*)
59823. *Princesse Marie-Clotilde*. Plant vigorous. Fruit round, with firm flesh. (*Millet & Fils catalogue.*)
59824. *Reine Louise*. Fruit dark red, elongated. (*Millet & Fils catalogue.*)
59825. *Rêve d'Été*. An interesting, everbearing variety, with fruits of good quality. (*Millet & Fils catalogue.*)
59826. *Suaris*. A vigorous variety, fruits pinkish white, large. (*Millet & Fils catalogue.*)

59777 to 59840—Continued.

59827. *Sulpice Barbe*. An especially fine variety, with round, flattened fruits. (*Millet & Fils catalogue.*)
59828. *Sybel*. Vigorous; fruits elongated, red; flesh firm, vinous, of good quality. (*Millet & Fils catalogue.*)
59829. *Tardive de Léopold*. Fruits very large, spherical, wine red. Season very late. (*Millet & Fils catalogue.*)
- 59830 to 59840. RUBUS spp. Rosaceæ. **Raspberry.**
59830. *All Summer*. Large crimson fruits of excellent quality, maturing in autumn. (*Barbier & Co. catalogue.*)
59831. *Colonel Wilder*. A variety with large, white, sweet, slightly acidulous fruits. (*Millet & Fils catalogue.*)
59832. *Congy*. Vigorous, with fine red fruits of excellent quality. (*Millet & Fils catalogue.*)
59833. *Couleur de Chair*. Fruits yellow, very large, with pinkish flesh. A good cropper. (*Barbier & Co. catalogue.*)
59834. *De Romainville*. A large red variety especially adapted for market purposes. (*Millet & Fils catalogue.*)
59835. *Feldbrunnen*. Fruit of enormous size, brilliant red, of exceptional quality. (*Millet & Fils catalogue.*)
59836. *Goliath*. A very vigorous grower, but of rather straggling habit; canes about 4 to 5 feet high; good cropper; berries fairly large, deep red, globular, having very large drupels, rather soft, of good flavor. Very great quantities of young vigorous canes are produced each season. (*Journal of the Royal Horticultural Society*, vol. 47, p. 47.)
59837. *Perpétuelle de Billard*. Fruits rather large, round, deep red; clusters long. Plants multiply rapidly.
59838. *Pilate*. Fruit red, large, elongated, moderately sweet. Quality good. (*Millet & Fils catalogue.*)
59839. *Souvenir de Désiré Bruneau*. A vigorous grower, rather straggling, canes about 4 feet high, a heavy cropper, berries large in large clusters, bluntly conical, firm, deep carmine, of good flavor. (*Journal of the Royal Horticultural Society*, vol. 47, p. 49.)
59840. *Sucrée de Metz*. Fruits clear yellow, large, of good quality. (*Barbier & Co. catalogue.*)

59841 to 59857. SOJA MAX (L.) Piper
(*Glycine hispida* Maxim.). Fabaceæ.
Soy bean.

From Omagari, Akita Ken, Japan. Seeds presented by Isaburo Nagai, director, Riku-U substation, Agricultural Experiment Station. Received May 15, 1924.

Introduced for soy-bean specialists.

59841. No. 1. *Nezumisaya*.
59842. No. 2. *Gizuka*.
59843. No. 3. *Sennari*.
59844. No. 4. *Tamazukuri*.
59845. No. 5. *Sohgetsu*.
59846. No. 6. *Fukui-shiro*.
59847. No. 7. *Shirohachikoku*.
59848. No. 8. *Akagara*.
59849. No. 9. *Enoki*.

59841 to 59857—Continued.

59850. No. 10. *Gowari*.
 59851. No. 11. *Sennari*.
 59852. No. 12. *Hadaka*.
 59853. No. 13. *Akasaya* (7).
 59854. No. 14. *Yagi* (3).
 59855. No. 15. *Takiya* (5).
 59856. No. 16. *Onihadaka*.
 59857. No. 17. *Dozan*.

**59858 to 59933. IPOMOEA BATATAS (L.)
Poir. Convolvulaceæ.****Sweet potato.**

From St. Croix, Virgin Islands. Seeds presented by J. B. Thompson, Agronomist in Charge, Agricultural Experiment Station. Received March 4, 1924.

Introduced for testing by horticulturists experimenting with sweet-potato varieties.

Numbers 7 to 429 refer to seedlings grown at the station.

**59934 to 60167. ZEA MAYS L. Poaceæ.
Corn.**

From South America. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received May 26, 1924. Notes by Messrs. Richey and Emerson.

59934 to 59936. El Verjel, Angol, Chile. March 17, 1924. Two ears, dark yellow flint, much mixed in type; from field. Ears 8 and 9 inches long; 12 rows of kernels each; nearly mature. Plants 5½ to 6½ feet high.

59934. No. 5. Mixed. 59936. No. 5b.

59935. No. 5a.

59937 to 59939. Towards "Los Alpes," near El Verjel, Angol, Chile. March 7, 1924. Two ears, light yellow flint; from field. Ears 8 inches long; 12 rows of kernels each. Possibly of Indian origin.

59937. No. 6. Mixed. 59939. No. 6b.

59938. No. 6a.

59940 to 59944. Northwest from Gorbea, Chile. March 12, 1924. Five ears of small-eared flint, yellow and white with occasional purple seeds. Bought from an Indian on the edge of town, plants not seen. Ears 5 to 7 inches long, mostly eight rows of kernels, but strongly inclined to be irregular.

59940. No. 7a. 59943. No. 7d.

59941. No. 7b. 59944. No. 7e.

59942. No. 7c.

59945 and 59946. South of Gorbea, from the farm of Francisco Huichalaf. March 13, 1924. Two ears of early Indian flint, yellow and white mixed, with a few blue seeds and some with pericarp pattern. Plants 4½ to 5½ feet tall, mature, and nearly dry 130 days after planting.

59945. No. 8a. 59946. No. 8b.

59947 to 59949. South of Gorbea, from the farm of Francisco Huichalaf. March 13, 1924. Two ears of yellow flint, probably not of Indian origin; from a different field from No. 8 [S. P. I. No. 59945]. Ears 6 to 8 inches long, 10 to 14 rows of kernels. Plants 6 to 7 feet high, mature but not dry.

59947. No. 9. Mixed. 59949. No. 9b.

59948. No. 9a.

59950 to 59952. Quitrante, Chile. March 13, 1924. From the farm of Firmin Velasquez. Three ears taken from a braid. Probably the same as No. 8 [S. P. I. No. 59945].

59950. No. 10a. 59952. No. 10c.

59951. No. 10b.

59953 to 59957. From Juan Huenuhueque, near Curacautin, Chile. March 14, 1924. Five ears of flint maize. Corn already harvested. Plants about 4 feet high.

59953. No. 11a. 59956. No. 11d.

59954. No. 11b. 59957. No. 11e.

59955. No. 11c.

59958 to 59961. East of Curacautin, Chile. March 14, 1924. Four ears of yellow and white flint, some blue kernels. Ears 4 to 5 inches long. Frost in January killed a neighbor's corn, but this escaped. Corn already harvested.

59934 to 60167—Continued.

59958. No. 12a. 59960. No. 12c.
59959. No. 12b. 59961. No. 12d.
- 59962 to 59969. Curacautin, Chile. March 14, 1924. Seven ears of yellow and white flint with some blue seeds; from a farm. Ears 4 to 6 inches long, one ear with a variegated pericarp. Already harvested.
59962. No. 13. Mixed. 59967. No. 13e.
59963. No. 13a. 59968. No. 13f.
59964. No. 13b. 59969. No. 13g.
59965. No. 13c.
59966. No. 13d. Variegated pericarp.
59970. No. 14. La Paz, Bolivia. March 14, 1924. Bulk seed bought in the market.
59971. No. 15. La Paz, Bolivia. March 24, 1924. Bulk seed bought in the market. The various colored kernels are smaller than No. 14 [S. P. I. No. 59970].
59972. No. 16. La Paz, Bolivia. March 24, 1924. Bulk seed bought in the market; looks like Peruvian.
59973. No. 17. La Paz, Bolivia. March 24, 1924. Bulk seed bought in the market. Yellow flour with some speckling.
59974. No. 18. La Paz, Bolivia. March 24, 1924. Bulk seed bought in the market. Small-kernelled yellow dent, said to have been imported from Concepcion, Chile.
59975. No. 19. La Paz, Bolivia. March 24, 1924. Bulk seed bought in market. Yellow flour with some kernels having other colors; looks like Peruvian corn.
59976. No. 20. La Paz, Bolivia. March 24, 1924. Bulk seed bought in market. White flour; looks like Peruvian corn.
59977. No. 21. La Paz Valley. March 24, 1924. "Maiz Negro Oscuro." From Julie C. Patino, "Los Manzanos," Hacienda Calacota, about 4 miles below Obrajés; altitude about 11,000 feet. Crop of 1922-23. Dark purple, nearly black. Purple cob. Ear 3½ inches long with 12 rows of pointed kernels. Ear conical. Plants said to be 2½ to 3 meters high, probably require about six months to mature.
59978. No. 22. La Paz Valley. March 24, 1924. From Julie C. Patino, "Los Manzanos," Hacienda Calacota, about 4 miles below Obrajés; altitude about 11,000 feet. Crop of 1922-23. One ear yellow flint 2½ inches long with irregular rows; seeds small; cob red. Plants said to be small and to require about four months to mature.
59979. No. 23. La Paz Valley. March 24, 1924. From Julie C. Patino, "Los Manzanos," Hacienda Calacota, about 4 miles below Obrajés; altitude about 11,000 feet. Crop of 1922-23. One ear of white corn 3¾ inches long, with six to eight rows of large kernels. Said to require about six months to mature.
- 59980 and 59981. La Paz Valley. March 29, 1924. From Julie C. Patino, "Los Manzanos," Hacienda Calacota, about 4 miles below Obrajés; altitude about 11,000 feet. Crop of 1922-23. Two ears of white-rice pop corn about 4 inches long, said to have come originally from Copacabana.
59980. No. 24a. 59981. No. 24b.
59982. No. 25. La Paz, Bolivia. March 27, 1924. Maiz Amarilla. Altitude about 11,700 feet. Bulk seed presented by Luis Crespe. Contains some sweet-corn kernels. Plants said to be 7 to 9 feet tall and to require six months or more to mature.

59934 to 60167—Continued.

59983. No. 26. La Paz, Bolivia. March 27, 1924. Maiz Morado. Altitude 11,700 feet. Bulk seed presented by Luis Crespe. Crop of 1922-23. Plants said to be 7 to 9 feet tall and to require about six months or more to mature.
59984. No. 27. La Paz, Bolivia. March 27, 1924. Maiz Gris. Altitude 11,700 feet. Bulk seed presented by Luis Crespe. Of various colors and patterns. Crop of 1922-23. Plants said to be 7 to 9 feet tall and to require six months or over to mature.
- 59985 to 59987. March 29, 1924. From a farm about 7 miles below Obrajés, Bolivia; altitude about 11,000 feet. Three ears of small-seeded yellow flint. Ears about 3 inches long with red cobs. Crop of 1922-23. Said to be a short-season maize maturing in about four months.
59985. No. 28a. 59987. No. 28c.
59986. No. 28b.
- 59988 and 59989. March 29, 1924. From a farm about 7 miles below Obrajés, Bolivia; altitude about 11,000 feet. Maiz Griz. Two ears of various colors and patterns. Ears about 4 inches long with large seeds.
59988. No. 29a. 59989. No. 29b.
- 59990 and 59991. March 29, 1924. Maiz Blanco. From a farm about 7 miles below Obrajés, Bolivia; altitude 11,000 feet. This seed is from the same field as No. 29 [S. P. I. No. 59988-89].
59990. No. 30a. 59991. No. 30b.
- 59992 and 59993. March 29, 1924. Maiz Rojo. From a farm about 7 miles below Obrajés, Bolivia; altitude about 11,000 feet. From the same field as No. 29 [S. P. I. No. 59988-89].
59992. No. 31a. 59993. No. 31b.
59994. No. 32. La Paz, Bolivia. March 29, 1924. One ear 2½ inches long with 12 rows of kernels which are white and yellow with a pink blush. The plants are of the purple type and grow 3 or 4 feet high, making a very thick stand on the poor soil of the American Institute.
59995. No. 33. March 29, 1924. One ear with very large seeds from an Indian field down the La Paz Valley about 5½ miles below Obrajés, Bolivia. Altitude about 11,000 feet and soil very poor and stony.
- 59996 and 59997. La Paz, Bolivia. March 27, 1924. Two ears 4 inches long with 12 rows of large white kernels, grown on the grounds of the American Institute. Altitude 12,200 feet. Plants 4 to 5 feet tall; sun-red type.
59996. No. 34a. 59997. No. 34b.
- 59998 to 60000. La Paz, Bolivia. March 27, 1924. Three ears 2½ inches long with 12 to 14 rows of white kernels. Grown in the garden of an Aymará Indian in poor soil on the north slope of a hillside; altitude 12,200 feet.
59998. No. 35a. 60000. No. 35c.
59999. No. 35b.
- 60001 to 60012. La Paz, Bolivia. March 27, 1924. Twelve ears 2 to 4 inches long with medium-sized kernels of various colors. The field belonged to an Aymará Indian; it was planted September 4, 1923, and just harvested.
60001. No. 36a. 60007. No. 36g.
60002. No. 36b. 60008. No. 36h.
60003. No. 36c. 60009. No. 36i.
60004. No. 36d. 60010. No. 36k.
60005. No. 36e. 60011. No. 36l.
60006. No. 36f. 60012. No. 36m.

59934 to 60167—Continued.

60013. No. 37. La Paz, Bolivia. March 31, 1924. One ear about 3 inches long with 12 rows of pink kernels and a purple cob. Grown in an Indian garden at 12,600 feet altitude.

60014 to 60018. La Paz, Bolivia. March 27, 1924. Five ears of red, yellow, and variegated flint. Ears about 2 inches long with 12 to 16 rows of small kernels. Grown in an Indian garden on a hillside, at about 12,600 feet altitude and said to mature in about four months.

60014. No. 38a. 60017. No. 38d.

60015. No. 38b. 60018. No. 38e.

60016. No. 38c.

60019. No. 40. Urco Mission, Calca, Peru. Bulk seed of native white corn. Large seeded, Cuzco type.

60020. No. 41. Urco Mission, Calca, Peru. Bulk seed of native yellow corn. Large seeded, Cuzco type.

60021. No. 42. Urco Mission, Calca, Peru. Bulk seed of native red corn. Large seeded, Cuzco type.

60022. No. 43. Urco Mission, Calca, Peru. Native variegated corn. Bulk seed, large seeded of the Cuzco type.

60023. No. 44. Urco Mission, Calca, Peru. Corn from the United States grown at the mission for six generations. Said to have been a yellow flint originally, and Mr. Payne thinks the chances of crossing with local corn are negligible.

60024. No. 45. Urco Mission, Calca, Peru. Seed obtained by crossing the native yellow corn of the Cuzco type and Reid Yellow Dent. This corn represents the fifth and sixth generation of the cross grown at Calca.

60025. No. 46. Urco Mission, Calca, Peru. Seed obtained by crossing the native yellow corn of the Cuzco type and Leaming. This corn represents the fifth or sixth generation of the cross grown at Calca.

60026. No. 47. Urco Mission, Calca, Peru. Seed obtained by crossing the native yellow corn of the Cuzco type and some unknown sort of yellow dent from the United States. This corn represents the fifth or sixth generation of the cross grown at Calca.

60027. No. 48. Urco Mission, Calca, Peru. Seed obtained by crossing a native yellow corn of the Cuzco type and a yellow flint from the Dakotas, possibly Gehu. This corn represents the fifth or sixth generation of the cross grown at Calca.

60028 and 60029. Urco Mission, Calca, Peru. Two ears of large-seeded speckled corn of the Cuzco type. Said to be quite early.

60028. No. 52a. 60029. No. 52b.

60030. No. 54. Urco Mission, Calca, Peru. Ear of large-seeded black corn. Stalks said to be very sweet. Pericarp deep red, aleurone colorless.

60031. No. 55. Urco Mission, Calca, Peru. Ear of large-seeded white (Ivory) corn.

60032 to 60075. Urco Mission, Calca, Peru. Forty-three ears of higher altitude maize, grown at from 12,000 to 12,500 feet. These represent the earliest types in the vicinity. Ears of various colors.

60032. No. 56. Mixed. 60036. No. 56d.

60033. No. 56a. 60037. No. 56e.

60034. No. 56b. 60038. No. 56f.

60089. No. 62d.

60094. No. 62i.

60090. No. 62e.

60095. No. 62k.

60096 to 60099. Sicuani, Peru. April 12, 1924. Four ears of various colors and mixed type grown on the farm of a Quechua Indian north-east of Sicuani. The seeds from which this crop was grown came from Cuzco.

60096. No. 63a.

60098. No. 63c.

60097. No. 63b.

60099. No. 63d.

59934 to 60167—Continued.

- 60100 to 60103. Sicuani, Peru. April 12, 1924. Four ears of corn bought in an Indian market and said to have come from Cusipata, Peru.
60100. No. 64a. 60102. No. 64c.
60101. No. 64b. 60103. No. 64d.
- 60104 to 60106. Sicuani, Peru. April 12, 1924. Three ears, red and yellow, bought in an Indian market; said to have been grown locally.
60104. No. 65a. 60106. No. 65c.
60105. No. 65b.
- 60107 to 60115. Sicuani, Peru. April 12, 1924. Nine ears bought in an Indian market, said to have been grown near San Pabla.
60107. No. 66a. 60112. No. 66f.
60108. No. 66b. 60113. No. 66g.
60109. No. 66c. 60114. No. 66h.
60110. No. 66d. 60115. No. 66i.
60111. No. 66e.
- 60116 to 60120. Sicuani, Peru. April 12, 1924. Five ears from an Indian market, said to have come from Asomayo, Peru, 4 leagues west of Chuquichuana.
60116. No. 67a. 60119. No. 67d.
60117. No. 67b. 60120. No. 67e.
60118. No. 67c.
- 60121 to 60123. Cuzco, Peru. April, 1924. Two ears of sweet corn and one ear of mixed sweet and flour corn from Sr. Ochoa.
60121. No. 68a. 60123. No. 68c.
60122. No. 68b.
- 60124 to 60127. Cuzco, Peru. April, 1924. Four ears of white and colored corn from Sr. Ochoa.
60124. No. 69a. 60126. No. 69c.
60125. No. 69b. 60127. No. 69d.
60128. No. 70. Near Arequipa, Peru. April, 1924. *Chicha maize*. From Elias C. Bedregal. Seeds very large, red and purple. Matures in about six months. Altitude 7,000 feet.
60129. No. 71. Arequipa, Peru. April, 1924. *Chulpe maize*. From Elias C. Bedregal. This type is boiled and then dried. Seeds medium size, yellow, some are wrinkled (sugar type). Requires about seven months to mature.
60130. No. 72. Arequipa, Peru. April, 1924. *Amarillo maize*. From Elias C. Bedregal. Seeds intermediate in size between those of No. 70 (S. P. I. No. 60128) and No. 71 (S. P. I. No. 60129). The mixture of nongellow seeds in this sample is said to be artificial.
60131. No. 73. Calea, Peru. April, 1924. Cuzco type, yellow-dent cross F-51, from T. E. Payne.
- 60132 to 60136. Huancayo, Peru. April 27, 1924. Five ears of red variegated maize, purchased in the Indian market and said to have come from within a few miles of town; altitude 10,700 feet.
60132. No. 74a. 60135. No. 74d.
60133. No. 74b. 60136. No. 74e.
60134. No. 74c.
60137. No. 75. Huancayo, Peru. April 27, 1924. Six ears of yellow, rice-pointed pop corn, bought in an Indian market. Said to have come from within a few miles of town; altitude 10,700 feet.
60138. No. 76. Huancayo, Peru. April 27, 1924. White maize. Bulk seeds from the Indian market, said to have been grown within a few miles of town; altitude 10,700 feet.

59934 to 60167—Continued.

- 60139 to 60143. Huancayo, Peru. April 27, 1924. Five ears of brown maize (one with red cob) bought in the Indian market.
60139. No. 77a. 60142. No. 77d.
60140. No. 77b. 60143. No. 77e.
60141. No. 77c.
- 60144 to 60151. Huancayo, Peru. April 27, 1924. Eight ears of red, purple, and rose-colored maize. From the Indian market.
60144. No. 78a. 60148. No. 78e.
60145. No. 78b. 60149. No. 78f.
60146. No. 78c. 60150. No. 78g.
60147. No. 78d. 60151. No. 78h.
60152. No. 79. Huancayo, Peru. April 27, 1924. Bulk seed of purple maize from the Indian market. Said to have been grown a few miles from town; altitude 10,700 feet.
- 60153 to 60156. Huancayo, Peru. April 27, 1924. Four ears, white, splashed with purple. One with rose-colored bands around kernels. Bought in the Indian market and said to have come from within a few miles of town; altitude 10,700 feet.
60153. No. 80a. 60155. No. 80c.
60154. No. 80b. 60156. No. 80d.
- 60157 and 60158. Lima, Peru. April, 1924. Two ears of yellow maize from Escuela Nacional de Agricultura. Grown locally.
60157. No. 81a. 60158. No. 81b.
- 60159 and 60160. Lima, Peru. April, 1924. Yellow maize. Two ears, one with purple cob from Escuela Nacional de Agricultura. Grown locally.
60159. No. 82a. 60160. No. 82b.
- 60161 and 60162. Lima, Peru. April, 1924. Purple maize. Two ears bought in a store. Said to have come from Arequipa, Peru.
60161. No. 83a. 60162. No. 83b.
- 60163 and 60164. Atucha, Province of Buenos Aires, Argentina, April, 1924. *Pinmontes* flint, two ears.
60163. No. 84a. 60164. No. 84b.
- 60165 and 60166. Casilda, Argentina. April, 1924. *Colorado Casilda* from Escuela Nacional de Agricultura.
60165. No. 85a. 60166. No. 85b.
60167. No. 86. Pontant, Province of Buenos Aires, Argentina. April, 1924. *Quaranton* maize from the experimental farm. Bulk sample.

60168 and 60169. ORNITHOGALUM THYRSOIDES Jacq. Liliaceæ.

From Pretoria, Transvaal, Union of South Africa. Bulbs presented by I. B. Pole Evans, chief, Division of Botany. Received May 26, 1924.

In South Africa, where this bulbous ornamental is native, it is known as one of the "chinkerichees." The globose bulb is about 2 inches thick, and the five or six very narrow leaves are 6 inches to a foot in length. The flowers, sometimes an inch long under cultivation, are borne in rather dense racemes on a scape about a foot high. In a dried condition these make excellent "everlasting flowers."

60168. A pure-white variety.

60169. A black-eye variety.

60170. CRACCA CANDIDA (DC.) Kuntze
(*Tephrosia candida* DC.). **Fabaceæ.**

From Dominica, British West Indies. Seeds presented by the Botanic Gardens, Dominica, through Alfred Keys, Bureau of Plant Industry. Received May 21, 1924.

The large terminal and lateral clusters of reddish or white flowers of this low Himalayan shrub make it worthy of trial as an ornamental in the warmer parts of the United States. The branches are slender and covered with a velvety pubescence, while the smooth green leaves, 6 to 8 inches long, have gray-silky lower surfaces.

For previous introduction, see S. P. I. No. 55678.

60171. NEPHELIUM MUTABILE Blume.
Sapindaceæ. Pulasan.

From Buitenzorg, Java. Seeds presented by P. J. S. Cramer, director, General Experiment Station, Department of Agriculture. Received June 5, 1924.

The pulasan is closely related to the lychee and is native to the Malayan region. It is tropical in its requirements and will probably not succeed in the United States; it merits cultivation, however, in Porto Rico, the Canal Zone, and elsewhere.

The tree attains a height of about 30 feet; the leaves are compound, with two to four pairs of oblong to elliptic, acuminate leaflets 5 to 10 inches long. The red fruit, commonly borne in small clusters, is about the size of a walnut; the pericarp is thick and covered with short, blunt, stout fleshy spines. The flesh (properly the aril) is translucent, whitish, juicy, and of sweet, slightly acidulous flavor; it contains a single oblong seed of large size.

For previous introduction, see S. P. I. No. 56781.

60172 to 60174.

From Stavanger, Norway. Plants presented by Thoralf Bryne, Brynes Rosen-Og Planteskole. Received June 3, 1924.

Introduced for horticulturists engaged in small-fruit breeding.

60172. RIBES sp. Grossulariaceæ.

Studenken au Lorgus. This is my new hybrid red currant; it is a very late variety with long trusses and is chiefly adapted for preserves. (Bryne.)

60173. RUBUS sp. Rosaceæ. Raspberry.

Paradise berry. A large red raspberry, almost as large as the largest variety known in cultivation, which is the English variety "The Royal." (Bryne.)

For previous introduction, see S. P. I. No. 56145.

60174. RUBUS sp. Rosaceæ. Raspberry.

An unnamed Norwegian raspberry.

60175 to 60184. SOJA MAX (L.) Piper
(*Glycine hispida* Maxim.). **Fabaceæ.**
Soy bean.

From Pyengyang, Chosen. Seeds presented by D. N. Lutz. Received May 26, 1924. Notes by Mr. Lutz.

Introduced for soy-bean specialists.

60175. No. 1. *Small Yellow.* Used for bean sprouts; yield small.

60176. No. 2. May be the same as No. 1 [S. P. I. No. 60175]. Used for bean sprouts; yield small.

60177. No. 3. *Small Black* ("Rat Eye"). Used for bean sprouts and said to be used as medicine; yield small.

60178. No. 4. *Green.* Used for bean sprouts; yield fairly good.

60175 to 60184—Continued.

60179. No. 5. *Small Black* ("Rat Eye"). May be the same as No. 3 [S. P. I. No. 60177]. Used for bean sprouts and said to be used as medicine. Yield and plants small.

60180. No. 6. *Medium Yellow.* Most widely grown type in Chosen. High yield. Used for stock feed and for making bean sauce "soy." Cheaper than other varieties.

60181. No. 7. *Black Medium.* Not widely grown and of rather low yield. Used roasted as human food.

60182. No. 8. *Large Yellow.* A widely-grown variety of high yield. Used for human food; also fed to stock.

60183. No. 9. *Brown.* A rather rare variety. The sample as purchased was mixed with black beans.

60184. No. 9a. Mixed.

60185 to 60187. SOJA MAX (L.) Piper
(*Glycine hispida* Maxim.). **Fabaceæ.**
Soy bean.

From Sapporo, Japan. Seeds presented by K. Abiko, agronomist, Hokkaido Agricultural Experiment Station. Received May 31, 1924. Notes by Mr. Abiko.

Introduced for soy-bean specialists.

60185. *Aotairu.* Used as meal and for green manure.

60186. *Ohyachi.* Used in industry and as food.

60187. *Tsurunoko.* Used in industry and as food.

60188. ANEMONE JAPONICA (Thunb.)
Sieb. and Zucc. Ranunculaceæ.
Japanese anemone.

From Stuttgart, Germany. Plants purchased from Wilhelm Pfitzer. Received May 31, 1924.

Var. *Schneekönigin.* This new anemone variety, originated by Mr. Pfitzer, may be described in general as an improved Luise Uhink, according to Möllers Deutsche Gärtner-Zeitung for November 1, 1923. The snow-white flowers, about 4 inches across, are produced more freely and on more upright stems than those of Luise Uhink and are made intensely striking by the dark-green background of the handsome foliage.

60189. INCARVILLEA DELAVAYI Bur.
and Franch. Bignoniaceæ.

From Glasnevin, Dublin, Ireland. Seeds presented by the director, Royal Botanic Gardens. Received November 8, 1923. Numbered June, 1924.

Var. *Przewalskii.* A handsome hardy Chinese perennial plant with attractive pinnate foliage and showy yellow flowers. It is said to thrive best in a light, sandy loam, with plenty of sunshine.

60190 to 60200. HIBISCUS CANNABINUS
L. Malvaceæ. Ambari hemp.

From New York City. Seeds presented by Charles O. Tappan. Received May 24, 1924. Notes by Mr. Tappan.

A collection of varieties grown in India and Brazil for cordage, introduced for specialists experimenting with fiber plants.

60190 to 60197. From the Imperial Economic Botanist, Pusa.

60190. No. 1. 60193. No. 4.

60191. No. 2. 60194. No. 5.

60192. No. 3. 60195. No. 6.

60190 to 60200—Continued.

60196. No. 7. 60197. No. 8.

60198 and 60199. From Gogu, Circars, Coimbatore Experimental Farm, India.

60198. No. 1. 60199. No. 2.

60200. From Brazil.

60201. ESENBECKIA LEIOCARPA Engl. Rutaceæ.

From Brazil. Seeds presented by F. L. Rhodes, American Telephone & Telegraph Co., New York City. Received May 7, 1924.

An erect, medium-sized tree from the forests of southeastern Brazil. The straight trunk is often branchless for a considerable height from the ground, a characteristic which suggests its use as pole timber. In Brazil the clear yellow wood is used for railway ties and for general construction. Coming from the cooler parts of Brazil, this tree might succeed in the southern portion of the United States.

60202 and 60203. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

From Fukuoka, Japan. Seeds presented by Dr. Mitsunaga Fujioka, Kyushu Imperial University. Received May 15, 1924.

Locally developed varieties introduced for soy-bean specialists.

60202. *Hakkoku*. 60203. *Toppa*.**60204 to 60207.**

From Yunnan, China. Seeds collected by J. F. Rock, National Geographic Society, Washington, D. C. Received May 15, 1924. Notes by Mr. Rock.

60204 and 60205. HORDEUM spp. Poaceæ. Six-rowed barley.

Garthok, eastern Tibet, February, 1924. The two best grades of barley from the high plateau of eastern Tibet, where they grow at an altitude of 10,000 feet or more.

60204. HORDEUM VULGARE COELESTE L.

Grade 1. This barley sheds its hull with the awn; the latter does not break off, leaving the hull attached, as is the case with American barley. The grain is large and pure white. This grade is probably adapted to the uplands of the central western part of the United States.

60205. HORDEUM VULGARE COELESTE L.

Grade 2. A black barley from the same region as grade 1 [S. P. I. No. 60204].

60206. RHODODENDRON sp. Ericaceæ.

No. 11324. November, 1923. A shrub 6 feet high found on the slopes of Mount Peima, Mekong-Yangtze Divide, at 14,000 feet altitude. The elliptical-oblong leaves are covered with soft pale-brown tomentum; the flowers were not seen.

60207. RHODODENDRON ARALIAEFORME Balf. f. and Forrest. Ericaceæ.

Nos. 11326 (fruit), 9269 (flowers). November, 1923. A shrub 8 feet high found on the alpine slopes of Mount Peima at 13,000 feet altitude. The oval leaves are rounded at both ends, golden yellow beneath, and glabrous; the flowers are rich purplish pink.

60208 to 60217. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

From Tottori, Japan. Seeds presented by Prof. Akio Kikuchi, College of Agriculture. Received May 16, 1924.

Introduced for soy-bean specialists.

60208. No. 1. *Shakkinnashi*.60209. No. 2. *Ichireu*.60210. No. 3. *Mejiro*.60211. No. 4. *Tamazukuri*.60212. No. 5. *Omokage*.60213. No. 6. *Tamanishiki*.60214. No. 7. *Kuromame*.60215. No. 8. *Uzura-daizu*.60216. No. 9. *Natsu-daizu*.60217. No. 10. *Natsu-cha-caizu*.**60218 to 60224.**

From Minchow, Kansu, China. Seeds presented by W. N. Ruhl. Received May 17, 1924. Notes by Mr. Ruhl.

60218. BRASSICA sp. Brassicaceæ.

No. 2. Oil from seeds used for cooking and illuminating.

60219. BRASSICA sp. Brassicaceæ.

No. 3. Grown extensively in southwestern Kansu. Oil is extracted from the seeds.

60220. GLEDITSIA SINENSIS Lam. Cæsalpinia-cæ.

No. 8. The pods are used as a soap substitute.

60221. LACTUCA SATIVA L. Cichoriaceæ. Lettuce.

No. 1. This variety grows to a height of 12 to 20 inches. The stalks and not the leaves are eaten. When creamed they are very palatable.

60222. PEUCEDANUM DECURSIVUM (Miquel) Maxim. Apiaceæ.No. 6. *Tan Kwei* (Dan Gwey). An aromatic plant extensively cultivated in this section. The roots, the part used, are dug in late October.**60223. RHEUM OFFICINALE Baill. Polygonaceæ.**

No. 7. This is the medicinal rhubarb, found all over Kansu. The roots are used medicinally, and sometimes the stalks are eaten.

60224. RHUS VERNICIFLUA Stokes (R. vernicifera DC.). Anacardiaceæ.

No. 4. The sap of this tree, when properly prepared, makes a very good varnish with a hard, lacquerlike finish.

60225. AGAVE sp. Amaryllidaceæ.

From Algiers, Algeria. Seeds presented by Dr. A. Trabut, Algiers, through L. H. Dewey, Bureau of Plant Industry. Received May 17, 1924.

These are seeds of an agave hybrid sent to me by Doctor Trabut. I believe that Doctor Trabut made this cross about 1908. The staminate parent was the sisal, *Agave sisalina*, and the pistillate parent was an undetermined species which he had received from San Luis Potosi, Mexico. His object in making the cross was to obtain a plant more resistant to cold than the sisal and yet having the thin straight leaves producing fiber similar to that of sisal. He has developed some varieties by selection from the numerous variations resulting from the cross, but thus far none are cultivated commercially for fiber production in Algeria. (Dewey.)

60226 to 60230. ALLIUM spp. Liliaceæ.

From Stockholm, Sweden. Seeds presented by Dr. Robert E. Fries, director, Botanical Garden. Received May 17, 1924.

Introduced for horticulturists studying the food value of wild species of *Allium*.

60226. ALLIUM FISTULOSUM L. Welsh onion.

A Siberian species which differs from the common onion in having no distinct bulb, but only an enlarged base or crown; the leaves are usually more clustered.

For previous introduction, see S. P. I. No. 58679.

60227. ALLIUM HYMENORRHIZUM Ledeb.

A perennial moisture-loving Russian species with linear leaves and purplish violet flowers.

60228. ALLIUM KARATAVIENSE Regel.

An herbaceous plant with very broad, ovate-oblong, flat leaves and pink flowers borne in dense, convex umbels. The scapes are about 6 inches high. Native to Turkestan.

For previous introduction, see S. P. I. No. 58874.

60229. ALLIUM ODORUM L.

This onion, which grows wild in Europe, is cultivated in Japan for its leaves, which are eaten as greens; in the spring the leaves are borne luxuriantly by the old bulbs, becoming about a foot in length.

For previous introduction, see S. P. I. No. 58879.

60230. ALLIUM POLYPHYLLUM Kar. and Kir.

A Siberian species, 1 to 2 feet high, with flat, linear leaves and rose-colored flowers.

60231. PHORMIUM TENAX Forst. Liliaceæ. New Zealand flax.

From Palmerston North, New Zealand. Seeds presented by G. Smerle, Palmerston North, through L. H. Dewey, Bureau of Plant Industry. Received May 17, 1924.

According to Mr. Smerle these seeds were collected from tall varieties cultivated near Palmerston North, and he recommends that an attempt be made to grow this tall form in the southern part of the United States. (Dewey.)

60232 to 60241. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

From Meguro, near Tokyo, Japan. Seeds presented by Dr. H. Shirasawa, director, Forest Experiment Station. Received May 19, 1924.

A collection of locally developed varieties introduced from Japan for department soy-bean specialists.

60232. Ao-Daizzu.**60237. Kurakake.****60233. Ao-Gozen.****60238. Kuro-Daizu.****60234. Goha.****60239. Oilan.****60235. Hokkado.****60240. Shiro-Gozen.****60236. Kimusume.****60241. Soden.****60242. RUBUS TURQUINENSIS Rydb. Rosaceæ.**

From Santiago de las Vegas, Cuba. Seeds presented by Gonzalo M. Fortun, director, Estación Experimental Agronómica. Received May 21, 1924.

A Cuban species which grows to a height of about 5 feet; the entire plant is densely hairy and armed with curved prickles about a quarter of an

inch long. The leaves are dark green, and the small berries are about half an inch in length. Introduced primarily for use in small-fruit breeding experiments.

60243 to 60251.

From Yihhsien, Shantung, China. Seeds presented by K. M. Gordon, South Shantung Industrial School. Received May 21, 1924. Notes by Mr. Gordon.

Introduced for soy-bean specialists.

60243 to 60250. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

60243. Big Green bean. Pods large, green; ripens in 90 to 100 days; grows 3 feet or more tall; oil content small. Used largely as a vegetable, both green and dried; can be roasted like peanuts. Vines coarse, not good for hay.

60244. Big White pod. Habit upright; pods white; ripens in 75 to 80 days; good bearer. Produces good oil and bean curd; used extensively for human and animal food; can be ground wet or dry.

60245. Black bean. Habit upright; pods black; ripens in 80 days; good bearer. Used extensively for stock feed, not used for oil because of dark color; ground wet, dry, or cooked.

60246. Black-Haired Yellow bean. Habit upright; pods dark, covered with black hairs; ripens in 80 days, good bearer, three to four beans to each pod; produces good oil and bean curd; can be ground wet, dry, or cooked. One of the best varieties in this district.

60247. Ch'a Tou. Habit upright; pods black, beans dark green; ripens in 80 days. Not used for oil, makes a stiff bean curd; ground with water and fed to animals.

60248. Hua Ch'a tou. Habit upright; pods dark colored, seeds varicolored; ripens in 80 days, good bearer. Used extensively for stock feed and somewhat as human food.

60249. Pai Chia K'e' tzu. Habit upright; pods small, white; ripens in 70 to 80 days; oil content high, makes good bean curd. Used extensively for human food and as stock feed. This is considered the best soy bean of this district.

60250. Ping Niu Huang. Habit upright; pods black; ripens in 90 days; oil content high, makes good bean curd. Used extensively for animal and human food.

60251. VIGNA SINENSIS (Torner) Savi. Fabaceæ. Cowpea.

Chiang tou. Habit spreading; pods long, round; ripens in 70 days; can be ground dry into meal for human consumption. Used to make a refreshing hot-weather beverage.

60252. POLYGONUM CAMPANULATUM Hook. f. Polygonaceæ.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received May 21, 1924.

During the late summer and autumn this hardy perennial, native to the Himalayas, produces dense racemes of charming, bell-shaped, fragrant, rosy white flowers. The plant is of compact, bushy habit, with handsome foliage, and is useful for growing in moderately shaded, moist situations.

60253. VIGNA LUTEA (Swartz) A. Gray (V. retusa Walp.). Fabaceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received May 21, 1924.

Silani. A native perennial creeper or climbing vine found along the seashore in the Philippines.

I first saw this vine at Mindanao in 1919 and considered it promising as a cover crop, for which purpose it has since proved very satisfactory. It has also made a good green forage for cattle. Although it does not seed freely, cuttings root very readily, and the plant would appear to have possibilities for tropical regions like Porto Rico and Hawaii. (*Wester.*)

60254. SAPIUM JENMANNI Hemsl. Euphorbiaceæ.

From Georgetown, British Guiana. Seeds presented by R. Ward, superintendent, Botanic Gardens. Received May 21, 1924.

A tall forest tree which grows in low, humid situations in British Guiana and is said to be the principal, if not the only, source of rubber from that colony. The product has excellent elasticity and has brought good prices in the English markets. Seeds have been secured for department rubber specialists.

60255. COTULA CINEREA Delile. Asteraceæ.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received May 21, 1924.

A densely hairy, pale-green herbaceous plant about 5 inches high, which, according to Doctor Trabut, makes a very agreeable tealike infusion.

60256. CUCUMIS SATIVUS L. Cucurbitaceæ. Cucumber.

From Perthshire, Scotland. Seeds presented by J. B. Roberts. Received May 21, 1924.

An Indian variety, from Malwa, Central India, 18 to 20 inches long and quite thick. It should be picked when partly ripe; a few should be left to ripen fully for seed purposes. The flavor is very pronounced. (*Roberts.*)

60257. HYOSCYAMUS FALZLEZ Cos. Solanaceæ.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received May 21, 1924.

This is known to the Touarregs as "Afahlehlé." It is common in the southern part of the Sahara, where its toxic properties are well known to the natives. It can be eaten by camels, goats, and sheep, but is very poisonous to horses and donkeys. It is believed that Afahlehlé fattens ruminants and also women, corpulency among the latter being considered a mark of beauty. (*Trabut.*)

60258. CITRULLUS VULGARIS Schrad. Cucurbitaceæ. Watermelon.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received May 21, 1924.

This is said to be a small watermelon with a hard thin rind and flesh of exceptionally fine quality. (*Wester.*)

60259 to 60266. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

From Seoul, Chosen, Japan. Seeds presented by Dr. Y. Nishimura, chief, Industrial Bureau, Government-General of Chosen. Received June 2, 1924.

Introduced for soy-bean specialists.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received May 15, 1924. Notes by Mr. Towns.

60285. CUCUMIS MELO L. Cucurbitaceæ. Melon.

A Cuban variety which bears well and has a delicious flavor.

60286. CUCURBITA PEPO L. Cucurbitaceæ. Pumpkin.

Small solid pumpkins which are excellent for pie.

60287. PRUNUS sp. Amygdalaceæ.

From Germany. Plants sent at the request of Omar E. Mueller, Clifton Park, Lakewood, Ohio. Received May 19, 1924.

Weichsel. This hardy flowering cherry is exceedingly fragrant, with aromatic bark. (*Mueller*.)

60288. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ.

Soy bean.

From Fukuoka, Japan. Seeds presented by Tyôzaburo Tanaka, Kyushu Imperial University, through Dr. Mitsunaga Fujioka, Division of Forestry, Kyushu Imperial University. Received May 20, 1924.

Shimabara Wase. From the Kumamoto Agricultural Experiment Station. (*Tanaka*.)

Introduced for cultural and comparison tests.

60289 and 60290.

From Burringbar, New South Wales, Australia. Seeds presented by B. Harrison. Received May 21, 1924. Notes by Mr. Harrison.

60289. CUCUMIS MELO L. Cucurbitaceæ. Melon.

Thorne's Monster muskmelon. A variety of delicious flavor which attains a weight of 24 pounds and a diameter of about 3 feet. Grown on reclaimed swamp land. From L. G. Thorne, Murwillumbah, New South Wales.

60290. ELICHRYSUM sp. Asteraceæ.

A very rare native double white "aster." It is a shrub about 3 feet high; the flowers are borne in large clusters.

60291. RUBUS sp. Rosaceæ.

Raspberry.

From Bolivia. Seeds collected by A. S. Hitchcock, Bureau of Plant Industry. Received May 21, 1924.

An enormous pale-rose raspberry, an inch long, from Yungas, Bolivia. I saw only one or two fruits. (*Hitchcock*.)

60292 and 60293. CINCHONA spp. Rubiaceæ.

From Tjinjiroean, Dutch East Indies. Seeds presented by the director of the Government Cinchona Plantations. Received May 22, 1924. Notes by G. A. Russell, Bureau of Plant Industry.

Introduced for specialists experimenting with drug plants.

60292. CINCHONA LEDGERIANA Moens.

Yields a bark remarkably rich in quinine which crystallizes readily as quinine sulphate. The percentage of cinchonine and other alkaloids present is relatively small. The bark of this species matures in the fifth or sixth year and does not increase in quinine after that. Suitable for cultivation only on hillsides in frost-free regions.

60293. CINCHONA SUCCIRUBRA Pavon.

Yields a bark containing a large amount of alkaloids, of which a relatively large percentage is cinchonidine which retards the separation of the quinine as sulphate. The bark of this species matures in the fourth or fifth year and does not increase in quinine thereafter. Suitable for cultivation only on hillsides in frost-free regions.

60294 to 60300.

From Shaoking, Chekiang China. Seeds presented by Rev. A. F. Ufford, American Baptist Foreign Mission Society. Received June 9, 1924. Notes by Mr. Ufford.

Introduced for forage-crop specialists.

60294 to 60299. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

60294. A mixture of *Wu Mao deo* (Black Hairy bean) and *Do Kyng deo* (Big Green bean). The black beans are not used for bean curd, but are used as a tonic food.

60295. Fifth Month White. Planted in April and matures in two months. Grows well in dry places with no fertilizer.

60296. Loh Yuih bah (Sixth Month White). Planted in April; matures in about 80 days.

60297. Eighth Month White. Planted in May; matures in about 90 days.

60298. Ninth Month White. Planted early in June; matures in about 100 days.

60299. Tenth Month White. Planted early in June; matures in 120 days.

60300. VIGNA SESQUIPEDALIS (L.) Fruwirth. Fabaceæ. Yard Long bean.

Planted in April; matures in about 80 days. The culture is the same as that for soy beans. The pods, a foot or more long, are eaten green, like string beans.

60301 to 60306. CROTALARIA spp. Fabaceæ.

From Salisbury, Rhodesia, Africa. Seeds presented by H. G. Mundy, chief agriculturist, Department of Agriculture. Received May 26, 1924. Notes by Mr. Mundy.

These crotalarias appear promising to us as green manure and may be of interest for trial for a similar purpose in the United States.

60301. CROTALARIA INTERMEDIA Kotschy.

Plant 2 to 3 feet high, branching less than 6 inches above ground; leaflets long and narrow. Flowers creamy yellow with purple veins. Matures in four months.

60302. CROTALARIA MAXILLARIS Klotzsch.

Plant 1½ to 2½ feet high; branching along entire main stem; leaflets broad. Flowers bright yellow. Matures in four months.

60303. CROTALARIA SPHAEROCARPA Perr.

Plant 1 to 1½ feet high, of bushy habit. Flowers yellow. Matures in three and one-half months.

60304. CROTALARIA sp.

Plant 3 to 5 feet high, branching on upper part of stem. Flowers small, yellow. Matures in five months.

60305. CROTALARIA sp.

Plant 2 to 2½ feet high. Similar to *Crotalaria intermedia* [S. P. I. No. 60301], but has smaller flowers.

60306. CROTALARIA sp.

Similar to *Crotalaria maxillaris* [S. P. I. No. 60302], but takes two or three weeks longer to mature, and does not seed as freely.

60307 and 60308. MANGIFERA spp. Anacardiaceæ.

From Manila, Philippine Islands. Plants presented by Don D. Strong, acting director, Bureau of Agriculture. Received June 12, 1924.

These two Philippine relatives of the mango bear edible fruits, which are sold in the markets of their native country. Although tropical in their requirements, it is possible that they will do as well in southern Florida as some of the varieties of the mango, and it is for the purpose of testing them in that section of the United States that plants have been obtained. The fruits of both are similar to those of the mango.

60307. MANGIFERA ODORATA Griffith.

According to P. J. Wester, in "Food Plants of the Philippines," the *Huani* is a handsome tree very similar to the mango in habit, foliage, and flowers. The fruits, about the size of a carabao mango, but more rounded, are green, thick skinned, sweet, and juicy, very aromatic, with yellow flesh containing numerous coarse fibers. Its occurrence as a wild plant is confined to low altitudes in the Philippines where the rainfall is equally distributed throughout the year. It is recommended for trial in regions where the mango does not thrive because of excessive moisture.

60308. MANGIFERA VERTICILLATA C. B. Robinson. Anacardiaceæ. Bauno.

Like the preceding [S. P. I. No. 60307] the bauno resembles the mango, although it is more upright in habit, with sparser foliage. The smooth, leathery, narrow leaves are 5 to 7 inches long, and the small, blue flowers are produced in terminal panicles like those of the mango. According to P. J. Wester (Food Plants of the Philippines), there is considerable variation in the size and quality of the Philippine fruit on different trees; the best being somewhat larger than the Carabao mango, about 5 inches long and 3 inches in diameter, yellowish green, with very thin skin, and very juicy white flesh, which is subacid, aromatic, and of excellent flavor, resembling that of the apricot and soursop combined. The best strains of the bauno are found in Zamboanga.

60309 to 60313.

From Edinburgh, Scotland. Seeds presented by W. Wright Smith, regius keeper, Royal Botanic Gardens. Received May 22, 1924.

60309. ECHEVERIA NODULOSA Otto (Cotyledon nodulosa Baker). Crassulaceæ.

According to Saunders (Refugium Botanicum, vol. 1) this Mexican plant, about 8 inches high, is excellent for greenhouse culture. It produces an abundance of small, straw-colored flowers tinged with red. The fleshy, oval, sharp-pointed leaves, dull green tinged with red, are in a rosette at the apex of the stem.

60310. LOPEZIA RACEMOSA Cav. Onagraceæ.

A graceful annual, native to Mexico, described by Cavanilles (Icones Plantarum, vol. 1) as a plant 3 to 4 feet high, with narrowly oval, toothed leaves and terminal racemes of crimson flowers.

60311 and 60312. PASSIFLORA SUBEROSA L. Passifloraceæ.

Several of the small-fruited passifloras are valued as ornamental plants, and this woody climber from the West Indies is one of the little-known species which properly comes under that class. The flowers are greenish yellow, and the fruit is a small, ovoid berry. Coming from the Tropics, this vine will probably endure little or no frost.

For previous introduction, see S. P. I. No. 46629.

60309 to 60313—Continued.

60313. SCHIZOCENTRON ELEGANS (Schlecht.) Meisner. Melastomaceæ.

A very charming little creeper native to eastern Mexico, which roots at the joints and forms a dense carpet. The leaves are small, opposite, and short stemmed, and the comparatively large, purplish flowers appear at the ends of short branches. The plant deserves to be more widely cultivated and would probably grow in the open in the southern part of the United States. (J. N. Rose, United States National Museum.)

For previous introduction, see S. P. I. No. 58366.

60314 and 60315. HIBISCUS spp. Malvaceæ.

From Dacca, Eastern Bengal, India. Seeds presented by R. S. Finlow, Department of Agriculture. Received June 23, 1924.

Introduced for testing as a possible source of fiber.

60314. HIBISCUS CANNABINUS L. Ambari hemp.

Ambari is an annual plant with slender herbaceous stems, 1 to 3 meters tall, usually dark purple, the earlier lower leaves nearly round, and the later upper ones deeply lobed. The flowers are large, 4 to 7 cm. across, creamy white, with purple at the base of the petals.

It is cultivated for fiber in southern India, and its fiber, shipped from the port of Bimlipitam, is known in the London markets as "Bimlipitam jute" and is quoted at prices 20 to 30 per cent less than quotations for Indian jute. In Senegal and other parts of French West Africa the plant and its fiber are called "da." In Angola it is called "gambo" or "gombo" and in Brazil it was given the fanciful name "Canhamo Brazilianis Perini."

The fiber is cleaned by hand after retting the stalks in water. It belongs to the jute group and is suitable for making bags, burlaps, and twines.

Ambari will grow in this country from the Potomac and Ohio valleys southward, but the fiber could not be produced profitably without efficient fiber-cleaning machines. It is a hardy plant, resistant to drought and attractive in appearance, and is worthy of cultivation as an ornamental. (L. H. Dewey, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 55481.

60315. HIBISCUS SABDARIFFA L. Roselle.

Variety *alba*. A form with calyces which are smaller than those of the typical roselle and whitish or pale yellow in color. The plant is of upright habit and not as vigorous as the typical form.

For previous introduction, see S. P. I. No. 51268.

60316 and 60317. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

From Hakozaki, Fukuoka, Japan. Seeds presented by Dr. Tyozauro Tanaka, Kyushu Imperial University. Received June 24, 1924. Notes by Doctor Tanaka.

Introduced for specialists interested in soy beans.

60316. A, *Meguro Daizu* (black-eye soy bean; black-eye may be a local name). From Tara village, Fujitsu County.

60317. B, From Nanaura village, Fujitsu County.

60318. TRITICUM TURGIDUM L. Poaceæ. Poulard wheat.

From South America. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received May 20, 1924.

No. 49. Calca, Peru. *Yana barba* (black bearded). Obtained from T. E. Payne; grown locally for a long time. (Richey and Emerson.)

60319. AMPELODESMA BICOLOR (Poir.) Kunth. Poaceæ. Grass.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received June 27, 1924.

A cespitose grass, with long tough leaves, which appears to do well in Algeria on poor soil. It will be tested as a forage grass, and it may also be of possible use for paper making.

60320 to 60322. CUCUMIS MELO L. Cucurbitaceæ. Melon.

From Teheran, Persia. Seeds presented by Joseph S. Kornfeld, American Minister. Received June 9, 1924.

Sent in response to a request for the best varieties of melons cultivated in Persia, for the use of horticulturists engaged in melon-breeding experiments.

60320. *Gorgabe d'Ispahan*.

60321. *Kharabose Samsour id'Ispahan*.

60322. *Kharabose Sine d'Ispahan*.

60323. TRACHYLOBIMUM VERRUCOSUM (Gaertn.) Oliver. Cæsalpiniaceæ.

From Soledad, Cienfuegos, Cuba. Seeds presented by Robert M. Grey, superintendent, Cuban Gardens. Received June 11, 1924.

Although this leguminous tree, native to Madagascar, produces a resin used to some extent in the manufacture of varnish, its chief value will probably be as an ornamental. It attains a height of 20 feet, is spineless, and bears dense clusters of white flowers. According to Mr. Grey, who sends seeds from Cuba, the "Copal tree," as he calls it, does well in that country on shallow, clay uplands, either partially shaded or fully exposed to the sun.

60324. MORUS KAGAYAMAE Koidz. Moraceæ.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received June 12, 1924.

A handsome Japanese mulberry which thrives in Algeria. The leaves are eaten readily by silkworms.

60325 to 60334. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

From Nishigahara, Tokyo, Japan. Seeds presented by H. Ando, director, Imperial Agricultural Experiment Station. Received June 12, 1924. Notes by Mr. Ando.

Introduced for agronomists experimenting with soy beans.

60325. *Akasaya*. Medium growing season. From the Ibaraki Prefectural Agricultural Experiment Station.

60326. *Bakamame*. Medium growing season. From the Saitama Prefectural Agricultural Experiment Station.

60327. *Kimusume*. Medium growing season. From the Ibaraki Prefectural Agricultural Experiment Station.

60328. *Okuechigo*. Long growing season. From the Gumma Prefectural Agricultural Experiment Station.

60329. *Onihadaka*. Long growing season. From the Gumma Prefectural Agricultural Experiment Station.

60330. *Sennari-Kimusume*. Short growing season. From the Saitama Prefectural Agricultural Experiment Station.

60331. *Shakkinnashi*. Long growing season. From the Gumma Prefectural Agricultural Experiment Station.

60325 to 60334—Continued.

60332. *Shirobana*. Short growing season. From the Saitama Prefectural Agricultural Experiment Station.

60333. *Shizika*. Medium growing season. From the Ibaraki Prefectural Agricultural Experiment Station.

60334. *Suzumame*. Short growing season. From the Saitama Prefectural Agricultural Experiment Station.

60335 to 60352.

From Omsk, Siberia, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received May 25, 1924.

60335. *ASTRAGALUS PHYODES* L. Fabaceæ.

A nearly stemless species from the desert regions of southwestern Russia.

60336. *ASTRAGALUS VIMINEUS* Pall. Fabaceæ.

An erect, shrubby species from southern Russia and the Caucasus.

60337 to 60339. *CHAETOCHELOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceæ. **Millet.**

From the Province of Akmolinsk.

60337. *Mogar*.

60338. *Mogar* (black).

60339. *Mogar* (white).

60340. *CITRULLUS VULGARIS* Schrad. Cucurbitaceæ. **Watermelon.**

From the Province of Kustanai.

60341. *HALIMODENDRON HALODENDRON* (Pall.) Voss. Fabaceæ. **Salt tree.**

From the Province of Omsk. The *chinguil* is an ornamental shrub characteristic of the Kirgiz steppes and Turkestan deserts. It is very drought resistant and not particular as to soil. (*Murashinsky*.)

For previous introduction, see S. P. I. No. 42283.

60342. *HEDYSARUM POLYMORPHUM* Ledeb. Fabaceæ.

A Siberian species with an ascending stem

60343. *IRIS HALOPHILA* Pall. Iridaceæ. **Iris.**

From the Province of Kustanai. A low-growing Siberian iris, 1 or 2 feet high, with pale-green leaves and spicate clusters of yellow flowers.

60344. *LIMONUM GMEINI* (Willd.) Kuntze (*Statice gmelini* Willd.). Plumbaginaceæ.

From the Province of Akmolinsk. A hardy, pink-flowered shrub which grows in salt marshes; it is sometimes used for tanning.

60345. *OXYTROPIS FLORIBUNDA* (Pall.) DC. Fabaceæ.

A low herbaceous perennial with purplish red flowers, which grows in sandy places in Siberia.

60346. *SOPHORA ALOPECUROIDES* L. Fabaceæ.

A semihardy, grayish pubescent undershrub with upright branches and dense, terminal racemes of yellow flowers. Native to western Asia.

60347 to 60350. *STIPA* spp. Poaceæ. **Grass.**

60347. *STIPA CAPILLATA* L.

A cespitose grass, with erect rigid stems, from rocky places in Europe and western Asia.

60348 to 60350. Native Siberian species, valuable as fodder grasses, introduced for testing in this country.

60335 to 60352—Continued.

60348. *STIPA PENNATA* L.60349. *STIPA PENNATA* LESSINGIANA (Tr. and Rupr.) Richter.
No. 1.60350. *STIPA PENNATA* LESSINGIANA (Tr. and Rupr.) Richter.
No. 2.60351. *TRIFOLIUM FRAGIFERUM* L. Fabaceæ.

From the shores of the Tobol River, Province of Kustanai.

Strawberry clover has proved, in Australia, to be suitable as a pasture plant for wet, marshy ground.

For previous introduction, see S. P. I. No. 58854.

60352. *ZEA MAYS* L. Poaceæ. Corn.

From the Province of Akmolinsk, District of Atbasar.

60353. *ASCLEPIAS STELLIFERA* Schlechter. Asclepiadaceæ.

From Pretoria, Transvaal, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, Division of Botany. Received May 24, 1924.

A low, narrow-leaved, purple-flowered milkweed introduced from South Africa for the use of specialists seeking new sources of rubber.

60354. *PASSIFLORA* sp. Passifloraceæ.

From Para, Brazil. Seeds presented by Godfrey Davidson. Received June 13, 1924.

This is a very choice hybrid *granadilla* and is the best of two hundred varieties which I am growing here. I believe the seeds will come nearly true to type. The fruit is large, yellow, and sweet, and the plant bears throughout the year. (Davidson.)

60355 and 60356.

From Gatun, Canal Zone. Seeds presented by Joseph A. Close. Received June 11, 1924.

60355. *CARICA PAPAYA* L. Papayaceæ. Papaya.

A large papaya of very good flavor. (Close.)

60356. *PASSIFLORA VITIFOLIA* H. B. K. Passifloraceæ.A tropical climber, native to Panama, where it is known as *sandia del monte*, or wild watermelon. The plant is a vigorous grower, with handsome red flowers which give it ornamental value. The fruit, though edible, is not of good quality. For trial in southern Florida and tropical regions.

60357 to 60359.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received June 12, 1924.

60357. *EUONYMUS FIMBRIATUS* Wall. Celastraceæ.The chief value of the various species of *Euonymus* lies in the beauty of the fruits and the autumnal coloring of the foliage. This particular species, native to the more temperate portions of the Himalayas at altitudes of 8,000 to 12,000 feet, is apparently unknown horticulturally. It is a shrub or small tree, with deeply cut, dark-green leaves, small white flowers, and fruits about the size of cherries.60358. *HELLEBORUS FOETIDUS* L. Ranunculaceæ.

A hardy herbaceous perennial from western Europe which is valued chiefly for the ornamental character of its handsome leathery foliage. The inconspicuous flowers are greenish or bordered with purple.

For previous introduction, see S. P. I. No. 53146.

60357 to 60359—Continued.

60359. *RUSCUS HYPOGLOSSUM* L. Convallariaceæ.

A handsome evergreen shrub 1 to 2 feet high, which is very attractive in the fruiting condition, when the large orange-scarlet berries contrast pleasingly with the long dark-green leaves. It is native in southern Europe, and thrives best in shady, moist situations.

60360 and 60361.

From Kirstenbosch, Newlands, Cape Province, South Africa. Seeds presented by the director of the National Botanic Gardens. Received June 9, 1924.

60360. *CALLITRIS CUPRESSOIDES* (L.) Kuntze. Pinaceæ.

An evergreen South African shrub about 10 feet high, with opposite linear leaves closely pressed against the branchlets like scales. It is probably best suited for growing in the Gulf States and California.

60361. *GLADIOLUS CALLISTUS* Bolus f. Iridaceæ.As an ornamental for the Southern States and for breeding purposes this South African gladiolus may be of value. It is described in the July, 1917, number of the *Annals of the Bolus Herbarium* as a tall plant, 30 to 40 inches high, with four to seven narrow, sword-shaped basal leaves 1 to 2 feet long and two stem leaves. The flowers, white suffused with pink and 9 to 12 in number, are produced on 1 to 3 branches.60362. *BERBERIS KOEHNEANA* C. Schneid. Berberidaceæ. Barberry.

From Dehra Dun, India. Seeds presented by the botanist, Department of Agriculture. Received May 21, 1924.

A shrubby barberry from northern India, which is described by C. K. Schneider (*Bulletin l'Herbier Boissier, ser. 2, vol. 5, p. 814*) as having purplish branches, brownish spines in clusters of one to three, and oblong-acute leaves, light green above and ashy beneath.

60363 to 60366.

From Ventimiglia, Italy. Seeds presented by S. W. McLeod Braggins, superintendent, La Mortola Botanic Garden. Received June 16, 1924.

These three grasses and the unnamed tomato variety have been obtained for specialists who are testing all available strains of these crop plants in the effort to discover superior types for growing in the United States.

60363. *BRACHYPODIUM DISTACHYUM* (L.) Roem. and Schult. Poaceæ. Grass.

A very stiff, densely branched annual grass 4 to 12 inches high, upright or ascending in habit, found in cultivated fields and along roadsides, often in chalky soil, in the Mediterranean countries.

60364. *BRACHYPODIUM RAMOSUM* (L.) Roem. and Schult. Poaceæ. Grass.

A blue-green, perennial, creeping grass, much branched at the base, found in the warmer portions of the Mediterranean countries, especially on chalky soil and in dry, rocky places.

60365. *LYCOPERSICON ESCULENTUM* Mill. Solanaceæ. Tomato.

An unnamed variety.

60366. *PHALARIS NODOSA* L. Poaceæ. Grass.

A perennial grass with ascending stems, found in sunny, grassy places along roadsides and on the edges of fields in the Mediterranean countries. It is often propagated by means of the swollen rootstocks which are situated just below the surface of the ground.

60367. GUILIELMA SPECIOSA Mart.
Pheniceaceæ. Pupunha.

From Para, Brazil. Seeds presented by P. H. Anet, Caixa 270. Received June 16, 1924.

The pupunha is an Amazonian palm, becoming ultimately about 60 feet high, and is closely allied to the peibayé (*Guiljelma utilis*). Like the latter, it furnishes food for great numbers of people in regions where it is indigenous, and appears to be of promise for cultivation as a food plant throughout the Tropics in congenial situations.

60368. CUCUMIS METULIFERUS E. Mey.
Cucurbitaceæ.

From Pretoria, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, Division of Botany. Received June 23, 1924.

This South African "wild cucumber" is native to the Kalahari Desert and the Belgian Congo, where, according to Pole Evans, the fruit is considered excellent for eating. The plant is an annual creeper, much branched, and covered with bristly hairs. The dark-green leaves are similar to those of the ordinary cucumber, and the flowers are yellow. The gourdlike fruit, oblong in shape, varies from greenish yellow to red in color when ripe, is about 5 inches long, and is covered with short, hard spines. It is eaten in the same way as the ordinary cucumber, according to the Journal of the South African Department of Agriculture for August, 1923.

60369 to 60377.

From French Somaliland. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received May 16, 1924. Notes by Doctor Shantz.

60369. ACACIA sp. Mimosaceæ.

No. 48. Aicha, French Somaliland. February 8, 1924. An acaciadlike tree with seeds edible just before they are ripe.

60370. CAPPARIS sp. Capparidaceæ.

No. 55. En route from Jibuti to Addis Ababa, Abyssinia. January 31, 1924. A prominent plant in Lower Abyssinia. The fruits are eaten by birds.

60371. CICER ARIETINUM L. Fabaceæ.**Chick-pea.**

No. 22. Doukham, Abyssinia. February 1, 1924. Grown as the most common legume in Abyssinia. This black form is quite abundant.

60372. CROTALARIA sp. Fabaceæ.

No. 14. Afdem, Abyssinia. January 30, 1924. A small spreading plant.

60373 and 60374. ERAGROSTIS ABYSSINICA (Jacq.) Schrad. Poaceæ.**Teff.**

60373. No. 65. Addis Ababa, Abyssinia. February 4, 1924. A white teff grown here on black cotton soil. After heavy rains when the soil is thoroughly trampled by animals until a soft mud, teff is sown over the mud and yields a good crop.

60374. No. 68. Addis Ababa, Abyssinia. February 4, 1924. Brown teff.

60375. GOSSYPIUM sp. Malvaceæ.**Kidney cotton.**

No. 8. Errar, French Somaliland. January 29, 1924. Grown by the natives.

60376. GOSSYPIUM sp. Malvaceæ.**Kidney cotton.**

No. 9.

60377. GOSSYPIUM sp. Malvaceæ.**Cotton.**

No. 60.

60378. BERBERIS ARISTATA DC. Berberidaceæ.
Barberry.

From Kew, England. Seeds presented by Dr. Arthur W. Hill, director, Royal Botanic Gardens. Received November 10, 1923. Numbered June, 1924.

A handsome shrub of elegant, spreading habit, becoming at times as much as 10 feet high. The spine-tipped leaves are often whitish beneath, and the numerous flowers are bright golden yellow. The spindle-shaped berries, about half an inch in length, are red, covered with a blue-white bloom. This is said to be one of the most vigorous of the Himalayan barberries; it has proved hardy at the Arnold Arboretum, Jamaica Plain, Mass.

For previous introduction, see S. P. I. No. 53628.

60379 to 60387.

From French Somaliland. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received May 16, 1924. Notes by Doctor Shantz.

60379. HOLCUS SORGHUM L. (Sorghum vulgare Pers.). Poaceæ.
Sorghum.

No. 67. Type of sorghum sold in the market.

60380. INDIGOFERA sp. Fabaceæ.

No. 5. Above Jibuti. January 29, 1924. A small perennial legume 2 to 5 feet high with a pleasant odor. Abundant in French Somaliland.

60381. LENTILLA LENS (L.) W. F. Wight (Lens esculenta Moench). Fabaceæ.
 Lentil.

No. 63. Addis Ababa, Abyssinia. February 4, 1924.

60382. PENNISETUM sp. Poaceæ.
Grass.

No. 54a. Addis Ababa, Abyssinia. February 5, 1924. Mixed.

60383. THEMEDA sp. Poaceæ.
Grass.

No. 54b. Addis Ababa, Abyssinia. February 5, 1924. Mixed.

60384. ROSA sp. Rosaceæ.
Rose.

No. 26. Addis Ababa, Abyssinia. February 4, 1924. A very attractive single white rose which grows wild on the highlands. It is much used as a hedge.

60385. RUBUS sp. Rosaceæ.

No. 33. Addis Ababa, Abyssinia. February 4, 1924. A very large, ornamental bush having reddish purple flowers and large orange or darker berries similar to blackberries, prized as a fruit in Abyssinia. May prove to be of value for breeding experiments.

60386. TRITICUM DURUM L. Poaceæ.
Durum wheat.

No. 57. Addis Ababa, Abyssinia. February 4, 1924. Wheat having a dark pericarp. Quite common in the market; may be very valuable for breeding experiments.

60387. TRITICUM DURUM L. Poaceæ.
Durum wheat.

No. 58. Addis Ababa, Abyssinia. February 4, 1924. Lighter in color than Nos. 56 and 57 [S. P. I. Nos. 59284 and 60386]. Found to be common in the market.

60388 to 60394.

From Uganda, British East Africa. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received May 20, 1924. Notes by Doctor Shantz.

60388. ACACIA sp. Mimosaceæ.

No. 124. Karmosa, Kenya. March 8, 1924. An attractive flat-topped tree whose occurrence characterizes the best type of soil.

60388 to 60394—Continued.

60389. *ALBIZZIA* sp. Mimosaceæ.

No. 127. Karmosa, Kenya. March 8, 1924. A large, handsome flat-topped tree, with bright-green foliage, which is especially ornamental when covered with its mantle of flowers.

60390. *ARISTOLOCHIA* sp. Aristolochiaceæ.

No. 144. Kampala, Uganda. March 16, 1924. A very attractive ornamental vine with large mottled flowers.

60391. *FICUS* sp. Moraceæ.

No. 143. Kampala, Uganda. March 16, 1924. An ornamental tree grown extensively in East Africa. It is considered one of the best shade trees in Kampala. Probably this is the same as that used for making bark cloth.

60392. *VOANDZEIA SUBTERRANEA* (L.) Thouars. Fabaceæ.

No. 129. Karmosa, Kenya. March 8, 1924. This nut is hard when ripe and can not be used as is our peanut. The plant should be pulled while the beans are still soft, boiled, and then shelled. In this form it would make a very desirable side vegetable.

60393. (Undetermined.)

No. 125. Karmosa, Kenya. March 8, 1924. A large tree with a straight white trunk and good ivory-colored wood. The edible fruit is very popular in the market.

60394. (Undetermined.)

No. 126. Karmosa, Kenya. March 8, 1924. Fruit like that of *Landolphia*, but appears to come from a tree; it is full of latex; about 2 inches in diameter, with seeds inclosed in yellow pulp. May be of value for rubber.

60395 to 60405.

From Uganda, British East Africa. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received May 26, 1924. Notes by Doctor Shantz.

60395. *BAUHINIA* sp. Cæsalpiniaceæ.

No. 149. Iganga, Uganda. March 19, 1924. A small ornamental tree with handsome foliage and attractive pink flowers. Grown extensively in East Africa as an ornamental.

60396. *CERBERA THEVETIA* L. (*Thevetia nereifolia* Juss.). Apocynaceæ.

No. 152. Iganga, Uganda. March 19, 1924. An excellent ornamental, willow-leaved, yellow-flowered tree.

60397. *COLOCASIA* sp. Araceæ.

No. 181. Nairobi, Kenya. March 23, 1924.

60398. *JATROPHA MULTIFIDA* L. Euphorbiaceæ.

No. 150. Kimule, Uganda. March 19, 1924. Leaves finely cut, like those of *Manihot*; flower heads red. Widely grown as an ornamental.

60399. *GOSYPIUM* sp. Malvaceæ. Cotton.

No. 176.

60400. *HIBISCUS* sp. Malvaceæ.

No. 183. Tororo, Uganda. March 23, 1924. A small species which may be useful as an ornamental.

60401. *MELOTHRIA* sp. Cucurbitaceæ.

No. 178. Tororo, Uganda. March 23, 1924. Fruits small, red, eaten by birds. Plant would make a good ornamental.

60402. *PHASEOLUS LUNATUS* L. Fabaceæ. Lima bean.

No. 151. Kampala, Uganda. March 18, 1924. A large, climbing form, growing over many of the fences in Kampala.

60395 to 60405—Continued.

60403. *TELFARIA PEDATA* (J. E. Smith) Hook. Cucurbitaceæ.

No. 179. This cucurbit is sold in the Nairobi market. One seed house now has orders for 25,000 pounds.

60404. (Undetermined.)

No. 146. Iganga, Uganda. March 19, 1924. The best timber tree of the Bargand country; trunk straight, wood walnutlike but hard and resistant to termites. Used universally for cabinetwork.

60405. (Undetermined.)

No. 184. Nairobi, Kenya. March 27, 1924. An attractive ornamental vine with capsules like that of the morning-glory, but with tubular flowers varying from yellow to red.

60406 to 60410. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

From Yenping, Fukien, China. Seeds presented by L. C. Lin. Received June 25, 1924. Notes by Mr. Lin.

Introduced for agronomists experimenting with soy beans.

60406. *Cung Yien*. Used for making bean curd.60407. *Heh Yien*. Used for making bean curd and soy-bean cheese.60408. *Kuan Huang*. May be a mixture of *Mammoth Yellow*, A. K., and *Haberlandt*. Good for making bean curd.60409. *Sao Heh*. Good for making soy-bean sauce.60410. *Tai Yien*. Good for making bean curd.

60411 and 60412. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

From Ichang, China. Seeds purchased from Rev. A. S. Cooper, American Church Mission. Received June 25, 1924. Notes by Mr. Cooper.

These are the two varieties grown in this locality. They are used for making bean curd, a staple article of diet in this region.

60411. Common variety.

60412. The black variety.

60413 to 60416. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

From Foochow, China. Seeds presented by Dr. Franklin P. Metcalf, Fukien Christian University. Received June 25, 1924. Notes by Doctor Metcalf.

Introduced for agronomists experimenting with the soy bean.

60413. No. 1. *Uong dau* (yellow bean). Obtained in Foochow, but reported to come from Manchuria. Used for bean curd and used in Hankow as well as here for the oil. This variety is also raised here for oil, for which purpose it ranks second among these four varieties.

60414. No. 2. *Chang dau* (green bean). Not grown in Foochow, but used for oil and bean curd.

60415. No. 3. *Uong dau* (yellow bean). Grown principally in the vicinity of Kutien, not around Foochow. Used for bean curd and for oil; considered the best of all the soy beans around here for oil.

60416. No. 4. *Ou dau* (black bean). Like the preceding, this is grown only in the vicinity of Kutien. Used mostly for human food; makes excellent bean curd.

60417. AGROSTIS CAPILLARIS L. Poaceæ.

From Wellington, New Zealand. Seeds presented by E. Bruce Levy, Department of Agriculture. Received June 28, 1924.

Rhode Island bentgrass, introduced for cultural and comparison tests.

60418 to 60420.

From Kew, England. Seeds presented by Dr. Arthur W. Hill, director, Royal Botanic Gardens. Received November 10, 1923. Numbered June, 1924.

60418. BERBERIS SINENSIS Desf. Berberidaceæ. Barberry.

A slender-branched shrub 4 to 6 feet high, with ovoid, purplish berries. Native to the Caucasus. (*Alfred Rehder, Arnold Arboretum, Jamaica Plain, Mass.*)

For previous introduction, see S. P. I. No. 58118.

60419. BERBERIS WILSONÆ Hemsl. Berberidaceæ. Barberry.

A handsome, sometimes partially evergreen shrub, 2 to 4 feet high, with abundant, roundish, coral-red berries, somewhat translucent. The leaves assume brilliant tints in autumn.

For previous introduction, see S. P. I. No. 53647.

60420. CLEMATIS MONTANA RUBENS Wilson. Ranunculaceæ.

A vigorous, hardy climber, native to the Himalayas; it often reaches a height of 15 to 20 feet; the foliage is reddish, particularly when the young leaflets are unfolding, and the sweet-scented, pink flowers, about 2 inches across, are produced several in each axil, opening in succession one at a time.

For previous introduction, see S. P. I. No. 52934.

60421 to 60424. MUSA TEXTILIS Nee. Musaceæ. Abaca.

From the south end of the island of Luzon, Philippine Islands. Plants presented by James Zetek, Ancon, Canal Zone. Received June 25, 1924.

A collection of abaca varieties introduced for testing by fiber specialists.

60421. Camalig. 60423. Pula.**60422. Itom. 60424. Puti.****60425. COTONEASTER FRIGIDA Wall. Malaceæ.**

From Kew, England. Seeds presented by Dr. Arthur W. Hill, director, Royal Botanic Gardens. Received November 10, 1923. Numbered June, 1924.

Var. *vicarii*. This is an improved form with deep-green leaves, grayish beneath, and large clusters of rich-red berries which are larger and brighter than those of the typical form.

For previous introduction, see S. P. I. No. 58609.

60426 and 60427. VITEX spp. Verbenaceæ.

From Mount Silinda, Southern Rhodesia. Seeds presented by Dr. W. L. Thompson, American Board Mission. Received June 30, 1924.

The fruits of both of these species are eaten with relish by the natives; we also enjoy them occasionally. (*Thompson.*)

60426. VITEX CIENKOWSKII Kotschy and Peyr.

According to Thiselton-Dyer (*Flora of Tropical Africa*) this species becomes a tree 50 feet high, with leathery leaflets, dense axillary clusters of yellowish brown flowers, and edible fruits the size of cherries.

60426 and 60427—Continued.**60427. VITEX EYLESII S. Moore.**

A large South African shrub with dense cymes of small heliotrope flowers.

60428 to 60437. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceæ. Soy bean.

From Fukuoka, Japan. Seeds presented by Tyôzaburô Tanaka, Kyushu Imperial University, through Dr. Mitsunaga Fujioaka, Division of Forestry, Kyushu Imperial University. Received June 17, 1924.

Introduced for testing by soy-bean specialists's.

From the Oita Prefectural Agricultural Experiment Station. (*Tanaka.*)

60428. Bungo No. 1. 60431. Bungo No. 5.**60429. Bungo No. 2. 60432. Bungo No. 6.****60430. Bungo No. 3.**

From the Miyazaki Prefectural Agricultural Experiment Station. (*Tanaka.*)

60433. Ameiro. 60436. Kindaizu.**60434. Aochi. 60437. Sanryûiri.****60435. Ishiwaru Daizu.****60438 to 60440.**

From Kingston, Jamaica, British West Indies. Plants presented by F. E. Betheuser. Received June 9, 1924.

60438. DILLELIA BURBIDGEI (Hook. f.) Gilg. Dilleniaceæ.

A handsome yellow-flowered shrub from northern Borneo which may prove sufficiently hardy for growing in southern Florida. The deep-green leaves are 8 to 10 inches long, and the pale golden-yellow flowers are about 3 inches in diameter. (Adapted from *Curtis's Botanical Magazine*, pl. 6531.)

60439. NAPOLEONA IMPERIALIS Beauv. Lecythidaceæ.

An interesting ornamental tree from West Africa with oblong leaves sometimes a foot and a half long, and solitary, saucer-shaped, axillary flowers which are dominantly reddish and bluish and about 2 inches across. Probably tropical in its requirements.

60440. THUNBERGIA MYSORENSIS (Wight) T. Anders. Acanthaceæ.

There are already a number of Thunbergias which have earned popularity as ornamentals in southern Florida, and this species, which is native to southern India, will be of great interest for that section if it proves hardy. It is a climber with long slender stems, opposite, very narrow leaves, and irregular racemes of handsome flowers, yellow with deep-red borders.

60441 and 60442. CRYPTOSTEGIA spp. Asclepiadaceæ.

From Kew, England. Cuttings presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received June 25, 1924.

Introduced for testing by rubber specialists.

60441. CRYPTOSTEGIA GRANDIFLORA R. Br. Palay rubber.

An erect, woody climber, of unknown nativity, but now cultivated in many places in the Tropics of both hemispheres as an ornamental, and occasionally growing as an escape from cultivation. The flowers, reddish purple becoming pale pink, are about 2 inches across and are produced in short spreading cymes. In India the plant is called palay and is cultivated for the rubber obtained from the juice.

60441 and 60442—Continued.

For previous introduction, see S. P. I. No. 58851.

60442. *CRYPTOSTEGIA MADAGASCARIENSIS* Bojer.

A climbing shrubby vine, native to Madagascar, which is grown as an ornamental in South America and elsewhere. The leaves are short and leathery, and the whitish or pink flowers are 2 to 3 inches wide.

60443 to 60447. *IPOMOEA BATATAS* (L.) Poir. Convolvulaceae.

Sweet potato.

From St. Croix, Virgin Islands. Seeds presented by J. B. Thompson, agronomist in charge, Agricultural Experiment Station. Received June 26, 1924.

From the eight American varieties sent us in 1922 only one, the Pumpkin "yam," has seeded at all. I am sending you some of this variety. (Thompson.)

60443. Pumpkin "yam" No. 1.

60444. Pumpkin "yam" No. 6.

60445. Pumpkin "yam" No. 12.

60446. Pumpkin "yam."

60447. Pumpkin "yam" (mixed).

60448. *MEIBOMIA JAPONICA* (Miquel) Kuntze (*Desmodium podocarpum* DC.). Fabaceae.

From Leningrad, Russia. Seeds presented by W. I. Kousnetzoff, in charge of forage plants of the Bureau of Applied Botany. Received June 12, 1924.

Introduced for testing by forage-plant specialists.

An herbaceous species 2 to 3 feet high, with membranous leaflets, native to temperate and tropical regions of the Himalayas of northeastern India at altitudes ranging from 2,000 to 7,000 feet.

60449 to 60460.

From East Africa. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received May 7, 1924. Notes by Doctor Shantz.

60449. *ALOE* sp. Liliaceae.

No. 99. Voi Wusi. February 20, 1924. A very handsome ornamental plant.

60450. *BAUHINIA* sp. Cæsalpiniaceae.

No. 81. Wusi, Kenya. February 28, 1924. A small, ornamental shrub with large, orchidlike flowers, valuable as an ornamental.

60451. *CARICA PAPAYA* L. Papayaceae. Papaya.

No. 10. Afdem, Lower Abyssinia. January 30, 1924. Grows here at a high altitude and in a very dry country.

60452. *CITRUS MEDICA* L. Rutaceae. Citron.

No. 11. Afdem, Lower Abyssinia. January 30, 1924. A very coarse, large lemonlike variety, 8 to 10 inches long, of very good flavor, eaten fresh by the Ethiopians. Seeds numerous. Known as "Treng" to the Arabs.

60453. *CROTON MEGALOCARPUS* Hutchinson (*C. ellipticus* Pax and Engl., not Baill.). Euphorbiaceae.

No. 95. Nairobi. February 23, 1924. A timber tree the seeds of which are used medicinally.

60454. *ERAGROSTIS SUPERBA* Peyr. Poaceae.

Grass.

No. 87. Wusi. February 20, 1924. An excellent native pasture grass, about 3 feet tall, with broad compressed spikelets.

60449 to 60460—Continued.

60455. *SOLANUM* sp. Solanaceae.

No. 94. Nairobi, Kenya. February 23, 1924. An ornamental producing snow-white berries about three-fourths of an inch in diameter.

60456. *SPOROBOLUS* sp. Poaceae. Grass.

No. 80. Wusi. February 20, 1924.

60457. *TRICHOLAENA ROSEA* Nees. Poaceae. Natal grass.

No. 84. Wusi. February 20, 1924.

60458. *ZIZIPHUS MAURITIANA* Lam. Rhamnaceae.

No. 92. French Somaliland. February 10, 1924. A small fruit of good flavor sold in the market at Djibuti.

60459. (Undetermined.)

No. 93. Djibuti, French Somaliland. February 10, 1924. A rather large, ornamental tree with edible pods. The pulp around the seed is white, starchy, and of very good flavor. The seeds are not eaten.

60460. (Undetermined.)

No. 100. Voi Wusi, Kenya. February 20, 1924. A large bulb with many flowers on one stem, which grows in semidesert brushland. The bulbs are eaten by animals.

60461 to 60636.

From Abyssinia. Seeds collected by H. V. Harlan, Bureau of Plant Industry. Received June 3, 1924. Notes by Doctor Harlan.

60461. *ABUTILON* sp. Malvaceae.

No. 535. January 10, 1924. Seeds of a flowering plant not previously seen, collected a 3-days' journey west of Lalibela at an altitude of 9,600 feet.

60462. *ALOE* sp. Liliaceae.

No. 512. Lalibela. January 7, 1924. Collected at an altitude of 8,800 feet.

60463. *AVENA ABYSSINICA* Hochst. Poaceae. Oats.

No. 399a. December 8, 1924. From a threshing field on the road to Ankober at an altitude of 9,600 feet.

60464. *BRACHIARIA OBTUSIFLORA* (Hochst.) Stapf. Poaceae. Grass.

No. 577. February 1, 1924. A belated specimen in black cotton soil near Koqui.

60465. *BROMUS* sp. Poaceae. Grass.

No. 530. January 12, 1924. Collected a 3-days' journey east of Debra Tabor, on the mountain side at an altitude of 9,700 feet.

60466 and 60467. *CARUM COPTICUM* (L.) Benth. and Hook. Apiaceae.

60466. No. 450. December 15, 1923. Purchased in the market at Makfid.

60467. No. 519. January 7, 1924. *Nach Azmoj*. A flavoring spice obtained in the Lalibela market.

60468. *CASSIA OCCIDENTALIS* L. Cæsalpiniaceae.

No. 483. December 27, 1923. Collected a 2-days' journey north of Dessie, Mille Valley, at an altitude of 6,000 feet.

60469. *CASSIA TORA* L. Cæsalpiniaceae.

No. 566. January 26, 1924. Collected a day's journey east of Wahiini.

60470 and 60471. *CICER ARIETINUM* L. Fabaceae. Chick-pea.

60470. No. 423. December 11, 1923. Purchased in Allu Amba, Ankober.

60461 to 60636—Continued.

60471. No. 520. January 7, 1924. Lalibela market.
60472. *CROTALARIA* sp. Fabaceæ.
- No. 446. December 2, 1923. Collected on the roadside 10 miles west of Addis Ababa at an altitude of 8,000 feet.
- 60473 to 60476. *CYMOPOGON* spp. Poaceæ.
Grass.
60473. *CYMOPOGON SCHOENANTHUS* (L.) Spreng. (*Andropogon schoenanthus* L.).
- No. 581. February 4, 1924. Collected near Gadaref, Sudan.
60474. *CYMOPOGON* sp.
- No. 528. January 12, 1924. Collected on the mountain side a 3-days' journey east of Debra Tabor at an altitude of 9,700 feet.
60475. *CYMOPOGON* sp.
- No. 531. January 12, 1924. Collected on the mountain side at an altitude of 9,700 feet, a 3-days' journey east of Debra Tabor.
60476. *CYMOPOGON* sp.
- No. 562. Wahini. January 27, 1924. Collected in bottom land.
60477. *CYNODON PLECTOSTACHYS* (Schum.) Pilg. Poaceæ.
Grass.
- No. 467. December 18, 1923. Collected in a river bottom, a day's journey south of Majetie, at an altitude of 5,500 feet.
- 60478 to 60480. *ELEusine CORACANA* (L.) Gaertn. Poaceæ.
Ragi.
60478. No. 401. December 5, 1923. Presented by H. H. Ras Tafari, Addis Ababa. Of possible value for forage and seed.
60479. No. 538. January 19, 1924. A prolific-seeded grass collected a 2-days' journey south of Gondar. Used for bread. At this elevation it would be a fine forage crop.
60480. No. 546. January 19, 1924. Found on the border of Lake Tsana a 2-days' journey south of Gondar.
- 60481 to 60486. *ERAGROSTIS* spp. Poaceæ.
- 60481 to 60485. *ERAGROSTIS ABYSSINICA* (Jacq.) Schrad. Teff.
60481. No. 418. December 11, 1923. Red teff. Purchased in Allu Amba, Ankober.
60482. No. 419. December 11, 1923. White teff. Purchased in Allu Amba, Ankober.
60483. No. 515. January 7, 1924. Lalibela market.
60484. No. 517. January 7, 1924. Lalibela market.
60485. No. 542. January 19, 1924. Found on the border of Lake Tsana a 2-days' journey south of Gondar.
60486. *ERAGROSTIS* sp. Grass.
- No. 583. Found on the plateau probably between Lalibela and Debra Tabor.
- 60487 to 60489. *Gossypium* spp. Malvaceæ.
Cotton.
60487. *Gossypium* sp.
- No. 457. December 15, 1923. Makfud market.
60488. *Gossypium* sp.
- No. 472. December 24, 1923. Purchased in the Dessie market.

60461 to 60636—Continued.

60489. *Gossypium* sp.
- No. 487. Dessie. December 28, 1923. Collected in a river valley at an altitude of 6,000 feet.
60490. *HELMINTHOCARPUM ABYSSINICUM* A. Rich. Fabaceæ.
- No. 523. Lalibela. January 7, 1924. Found on the canyon side at an altitude of 8,800 feet.
60491. *HIBISCUS* sp. Malvaceæ.
- No. 556. January 20, 1924. Found on the edge of Lake Tsana, a day's journey south of Gondar.
- 60492 to 60524. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceæ.
Sorghum.
60492. No. 412. Ankober. December 11, 1923. Purchased in a village.
60493. No. 417. December 11, 1923. Purchased in Ankober.
60494. No. 422. Ankober. December 11, 1923. Purchased in Allu Amba.
60495. No. 448. Makfud. December 15, 1923. A dry-stemmed grain sorghum found growing at an altitude of 8,000 feet.
60496. No. 456. Makfud. December 15, 1923. Found in the Robi River Valley at an altitude of 5,300 feet.
60497. No. 460. December 17, 1923. A yellow sorghum growing 15 to 18 feet in height, a 2-days' journey south of Majetie.
60498. No. 461. December 17, 1923. Panicle 2 feet in length. Found a 2-days' journey south of Majetie.
60499. No. 462. December 18, 1923. A tall sorghum, 12 to 15 feet in height, found a day's journey south of Majetie.
60500. No. 465. December 18, 1923. Found a day's journey south of Majetie.
60501. No. 468. December 23, 1923. Collected a 2-days' journey south of Dessie.
60502. No. 478. Dessie. December 24, 1923. Purchased in the market.
60503. No. 481. December 27, 1923. Found in the Mille Valley, a 2-days' journey north of Dessie at an altitude of 6,500 feet.
60504. No. 482. December 28, 1923. Collected a 3-days' journey north of Dessie in a valley at an altitude of 6,100 feet.
60505. No. 485. December 29, 1923. Collected in a valley a day's journey south of Waldia at an altitude of 6,300 feet.
60506. No. 488. Waldia. December 30, 1923. Found at an altitude of 6,400 feet.
60507. No. 492. January 2, 1924. Growing near the Ala River, a 2-days' journey west of Waldia at an altitude of 8,000 feet.
60508. No. 495. December 31, 1923. Collected a day's journey west of Waldia.
60509. No. 508. Lalibela. January 5, 1924. Found at an altitude of 8,800 feet. Not more than 3½ feet high as compared with 15 to 18 feet in the grain-sorghum valleys east of the escarpment.
60510. No. 547. January 19, 1924. Collected on the border of Lake Tsana a 2-days' journey south of Gondar.
- 60511 to 60518. January 21, 1924. Types of grain sorghum found in fields about Tsana. No. 549 [S. P. I. No. 60512] apparently does not hybridize, as it is pure on the margin of fields. All other types were picked from the interior of two adjoining fields.

60461 to 60636—Continued.

80511. No. 548. 80515. No. 552.
 80512. No. 549. 80516. No. 553.
 80513. No. 550. 80517. No. 554.
 80514. No. 551. 80518. No. 555.
60519. No. 560. January 23, 1924. Found north of Lake Tsana, a day's journey west of Gondar at an altitude of 7,400 feet.
60520. No. 563. Wahini. January 28, 1924.
60521. No. 564. Wahini. January 27, 1924.
60522. No. 567. January 20, 1924. Found at the head of Lake Tsana, a day's journey south of Gondar.
60523. No. 573. Koqui. January 31, 1924.
60524. No. 579. February 4, 1924. Growing in grass, but probably from an old cultivated field near Doka, Sudan.
- 60525 to 60531. *HORDEUM* spp. Poaceæ.
60525. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 No. 443. December 12, 1923. Collected north of Ankober at an altitude of 10,400 feet.
- 60526 and 60527. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Six-rowed barley.
 December 14, 1923. Collected a 2½-days' journey north of Ankober at an altitude of 10,000 feet.
60526. No. 444. 60527. No. 445.
- 60528 and 60529. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 60528. No. 507. January 2, 1924. Collected a 3-days' journey east of Lalibela at an altitude of 11,100 feet.
60529. No. 515. January 7, 1924. Lalibela market.
60530. *HORDEUM VULGARE COELESTE* L. Six-rowed barley.
 Subvariety *Himalayense*. No. 440. December 13, 1923. From a high valley, a 2-days' journey north of Ankober, at an altitude of 10,000 feet.
60531. *HORDEUM VULGARE DUPLINIGRUM* Koern. Six-rowed barley.
 No. 500. January 3, 1924. Collected a 2-days' journey east of Lalibela at an altitude of 10,000 feet.
- 60532 to 60535. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Six-rowed barley.
 60532. No. 397. December 7, 1923. Obtained on the road to Ankober, Addis Ababa, at an altitude of 8,500 feet.
60533. No. 398. December 7, 1923. Obtained on the road to Ankober, Addis Ababa, at an altitude of 8,500 feet.
60534. No. 406. December 10, 1923. Obtained a half-day's journey from Ankober at an altitude of 9,600 feet.
60535. No. 434. December 12, 1923. Collected on a ridge above Ankober at an altitude of 10,000 feet.
- 60536 to 60538. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 60536. No. 407. Ankober, December 11, 1923. Purchased in a village.
60537. No. 414. Ankober, December 11, 1923. Purchased in a village.
60538. No. 424. Ankober. December 11, 1923. Purchased in Allu Amba.

60461 to 60636—Continued.

60539. *HORDEUM VULGARE COELESTE* L. Six-rowed barley.
 No. 395. Addis Ababa. December 7, 1923. Collected on the road to Ankober at an altitude of 8,400 feet.
- 60540 to 60546. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 60540. No. 399b. December 8, 1923. From a threshing field on the road to Ankober at an altitude of 9,600 feet.
60541. No. 405. December 9, 1923. Collected a day's journey west of Ankober at an altitude of 9,600 feet.
60542. No. 435. December 12, 1923. Collected on a high ridge above Ankober at an altitude of 11,000 feet.
60543. No. 453. December 15, 1923. Makfud market.
60544. No. 473. Dessie. December 24, 1923. Purchased in the market.
60545. No. 474. Dessie. December 24, 1923. Purchased in the market.
60546. No. 477. Dessie. December 24, 1923. Purchased in the market.
60547. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Six-rowed barley.
 No. 494a. January 2, 1924. Collected on the Ala River a 2-days' journey west of Waldia at an altitude of 10,000 feet.
60548. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 No. 532. January 13, 1924. From a threshing floor a 2-days' journey east of Debra Tabor at an altitude of 10,600 feet.
- 60549 and 60550. *HORDEUM DEFICIENS* Steud. Deficient barley.
 60549. No. 540. January 18, 1924. A sample of barley given to me as horse feed a 3-days' journey south of Gondar.
60550. No. 545. January 19, 1924. Collected on the border of Lake Tsana, a 2-days' journey south of Gondar.
60551. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.
 No. 584. February 9, 1924. From the experiment station, Khartum. Native (Beldi) barley.
60552. *IPOMOEA CAIRICA* (L.) Sweet (*I. palmata* Forsk.). Convolvulacæ.
- No. 479. Dessie. December 23, 1923. Collected in a river bottom at an altitude of 6,500 feet.
60553. *JUNIPERUS PROCERA* Hochst. Pinacæ. East African cedar.
 No. 498. January 2, 1924. Found on the Ala River at an altitude of 9,000 feet.
60554. *KOSTELETZKYA ADOENSIS* Hochst. Malvacæ.
 No. 533. January 17, 1924. A flowering herbaceous plant found in the Tsana district a day's journey west of Debra Tabor at an altitude of 7,700 feet.
- 60555 and 60556. *LATHYRUS SATIVUS* L. Fabacæ. Bitter vetch.
 60555. No. 489. Waldia. December 30, 1923. Collected at an altitude of 6,600 feet. Not previously seen.
60556. No. 509. January 4, 1924. Found in small quantity a day's journey east of Lalibela at an altitude of 9,000 feet or over.

60461 to 60636—Continued.

60557. *LENTILLA LENS* (L.) W. F. Wight (*Lens esculenta* Moench). Fabaceæ. Lentil.

No. 421. Ankober. December 11, 1923. Purchased in Allu Amba.

60558 to 60561. *LINUM USITATISSIMUM* L. Linaceæ. Flax.

60558. No. 432. Ankober. December 11, 1923. Purchased in Allu Amba.

60559. No. 455. Makfud. December 15, 1923. From the market.

60560. No. 514. Lalibela. January 7, 1924. From the market.

60561. No. 543. January 19, 1924. Collected on the border of Lake Tsana a 2-days' journey south of Gondar.

60562. *MEDICAGO HISPIDA DENTICULATA* (Willd.) Urban. Fabaceæ. Bur clover.

No. 503. January 3, 1924. Collected a 2-days' journey east of Lalibela at an altitude of 10,000 feet.

60563. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

No. 585. February 9, 1924. From the experiment station, Khartum, Egypt. Has proved much better than Peruvian or other hot-weather types at Khartum.

60564. *MEIBOMIA* sp. (*Desmodium* sp.). Fabaceæ.

No. 575. January 27, 1924. Seed of a small, broad-leaved legume found in a burned-over area near Wahini. Only one plant seen.

60565. *NIGELLA SATIVA* L. Ranunculaceæ.

No. 449. December 15, 1923. Purchased in the market at Makfud. This market is a large one on a mountain top where there is no town. Grain of the plateau is exchanged for cotton of the valleys and bananas of the lower levels.

60566. *OCIMUM BASILICUM* L. Menthaceæ.

No. 476. Dessie. December 24, 1923. Purchased in the market.

60567. *PANICUM* sp. Poaceæ. Grass.

No. 529. January 12, 1924. Collected on a mountain side a 3-days' journey east of Debra Tabor at an altitude of 9,700 feet.

60568 to 60572. *PENNISETUM* spp. Poaceæ.

60568. *PENNISETUM GLAUCUM* (L.) R. Br. (*P. typhoides* Rich.). Pearl millet.

No. 580. February 4, 1924. Growing in grass, but probably from an old cultivated field near Doka, Sudan.

60569 and 60570. *PENNISETUM UNISETUM* (Nees) Benth. Grass.

60569. No. 458. December 17, 1923. Collected a 2-days' journey south of Majetie at an altitude of 5,200 to 6,000 feet.

60570. No. 582. February 4, 1924. Collected near Gadaref, Sudan.

60571. *PENNISETUM* sp.

No. 527. January 12, 1924. Collected on the side of a mountain a 3-days' journey east of Debra Tabor at an altitude of 9,700 feet.

60572. *PENNISETUM HORDEIFORME* (L.) Spreng. Grass.

No. 541. January 18, 1924. A branching grass collected a 3-days' journey south of Gondar; stands heavy pasturing in the Tsana Flats.

60573 to 60579. *PHASEOLUS* spp. Fabaceæ.

60461 to 60636—Continued.

60573 and 60574. *PHASEOLUS AUREUS* Roxb. Mung bean.

60573. No. 415. Ankober. December 11, 1923. Presented by Desta Heile. Seed said to swell when cooked and to become soft like butter.

60574. No. 416a. Ankober. December 11, 1923. Presented by Desta Heile.

60575 to 60579. *PHASEOLUS VULGARIS* L. Fabaceæ. Common bean.

60575. No. 413. Ankober. December 11, 1923. Purchased in a village.

60576 to 60578. Ankober. December 11, 1923. Presented by Desta Heile.

60576. No. 416b. Chocolate with black markings.

60577. No. 416c. Dark gray.

60578. No. 416a. White.

60579. No. 428. Ankober. December 11, 1923. Purchased in Allu Amba.

60580. *PHRAGMITES VULGARIS* (Lam.) B. S. P. Poaceæ. Grass.

No. 463. December 18, 1923. Collected in swamp land a day's journey south of Majetie.

60581 to 60584. *PISUM SATIVUM* L. Fabaceæ. Pea.

60581. No. 427. Ankober. December 11, 1923. Purchased in Allu Amba.

60582. No. 475. Dessie. December 24, 1923. Purchased in the market.

60583. No. 522. Lalibela. January 7, 1924. From the market.

60584. No. 439. December 13, 1923. Collected a 2-days' journey from Ankober at an altitude of 10,200 feet.

60585. *ROSA* sp. Rosaceæ. Rose.

No. 404. December 9, 1923. A lavender-flowered plant from a canyon side, near Ankober, at an altitude of 9,500 feet.

60586. *RUBUS* sp. Rosaceæ.

Seeds of unknown origin, accompanying Doctor Harlan's shipment.

60587. *SACCHARUM* sp. Poaceæ. Grass.

No. 464. December 18, 1923. From swamp land a day's journey south of Majetie.

60588 and 60589. *SESAMUM ORIENTALE* L. Pedaliaceæ. Sesame.

60588. No. 429. Ankober. December 11, 1923. Purchased in Allu Amba.

60589. No. 572. Koqui. January 31, 1924.

60590. *TRICHOLAENA ROSEA* Nees. Poaceæ. Natal grass.

No. 459. December 17, 1923. Collected a 2-days' journey south from Majetie at an altitude of 5,200 to 6,000 feet.

60591. *TRICHOPTERYX* sp. Poaceæ. Grass.

No. 565. January 25, 1924. Collected a day's journey west of Chelga.

60592. *TRIFOLIUM PROCUMBENS* L. Fabaceæ.

No. 524. Lalibela, January 7, 1924. Collected on the side of a canyon at an altitude of 8,800 feet.

60593. *TRIFOLIUM* sp. Fabaceæ. Clover.

No. 502. January 3, 1924. Collected a 2-days' journey east of Lalibela at an altitude of 10,000 feet.

60461 to 60636—Continued.

60594. *TRIFOLIUM* sp. Fabaceæ. Clover.
No. 504. January 3, 1924. Collected a 2-days' journey east of Lalibela at an altitude of 10,000 feet.
60595. *TRIGONELLA FOENUM-GRÆCUM* L. Fabaceæ. Fenugreek.
No. 518. January 7, 1924. A cultivated legume obtained in the Lalibela market.
- 60596 to 60613. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Common wheat.
60596. No. 12. From Pusa, India.
60597. No. 396. Addis Ababa. December 7, 1923. Secured on the road to Ankober at an altitude of 9,600 feet.
60598. No. 400. December 8, 1923. Collected on the road to Ankober at an altitude of 9,400 feet.
60599. No. 408. Ankober. December 11, 1923. Purple wheat, purchased in a village.
60600. No. 410. Ankober. December 11, 1923. Purchased in a village.
60601. No. 420. Ankober. December 11, 1923. Purchased in Allu Amba.
60602. No. 436. Ankober. December 13, 1923. Wheat found growing at an altitude of 10,400 feet; all seeds above that altitude were barley.
60603. No. 437. Ankober. Collected at an altitude of 10,000 feet. This was the second lot of wheat found.
60604. No. 441. December 14, 1923. Found growing a 3-days' journey north of Ankober at an altitude of 9,000 feet. Stacked with field peas and broad beans.
60605. No. 442. December 14, 1923. Collected a 2-days' journey north of Ankober at an altitude of 10,300 feet.
60606. No. 451. Makfud. December 15, 1923. Obtained in the market.
60607. No. 452. Makfud. December 15, 1923. Obtained in the market.
60608. No. 454. Makfud. December 15, 1923. Obtained in the market.
60609. No. 493. January 2, 1924. Collected on the Ala River a 2-days' journey west of Waldia at an altitude of 9,000 feet.
60610. No. 505. January 3, 1924. Collected a 2-days' journey east of Lalibela at an altitude of 9,500 feet.
60611. No. 511. January 5, 1924. From a threshing floor in Ashatan Mariam, Lalibela, at an altitude of 8,000 feet.
60612. No. 559. January 23, 1924. Collected north of Lake Tsana a day's journey west of Gondar at an altitude of 7,500 feet.
60613. No. 568. January 20, 1924. Found growing at the head of Lake Tsana a day's journey south of Gondar.
- 60614 to 60616. *TRITICUM DICOCUM* Schrank. Emmer.
60614. No. 471. December 26, 1923. Collected near Dessie at an altitude of 7,200 feet.
60615. No. 491. January 2, 1924. Collected on the Ala River, a 2-days' journey west of Waldia, at an altitude of 9,000 feet.
60616. No. 576. Record lost, but obviously from the plateau.
- 60617 and 60618. *TRITICUM TURGIDUM* L. Poulard wheat.

60461 to 60636—Continued.

60617. No. 525. January 12, 1924. Found growing a 3-days' journey east of Debra Tabor at an altitude of 9,800 feet.
60618. No. 558. January 23, 1924. Collected north of Lake Tsana a day's journey west of Gondar, at an altitude of 7,500 feet.
60619. *TRITICUM* spp. Wheat.
No. 469. December 23, 1923. Mixed seed found growing a 2-days' journey south of Dessie—the first small grain found above the sorghum belt.
60620. *TRITICUM TURGIDUM* L. Poulard wheat.
No. 470. December 23, 1923. Found growing a 2-days' journey south of Dessie—the first small grain found above the sorghum belt.
60621. *TRITICUM* spp. Wheat.
No. 480. Dessie. December 24, 1923. Mixed seed purchased in the market.
60622. *TRITICUM* spp. Wheat.
No. 490. January 2, 1924. Mixed seed found on the Ala River a 2-days' journey west of Waldia at an altitude of 10,000 feet.
60623. *TRITICUM* spp. Wheat.
No. 494b. January 2, 1924. Mixed seed found on the Ala River a 2-days' journey west of Waldia at an altitude of 10,000 feet.
60624. *TRITICUM* spp. Wheat.
No. 499. January 3, 1924. Mixed seed collected a 2-days' journey east of Lalibela at an altitude of 10,000 feet. Ice, which probably forms every night, was seen one hour after sunrise beside emmer fields that were in the best of condition.
60625. *TRITICUM* spp. Wheat.
No. 526. January 11, 1924. Mixed seed found a 4-days' journey east of Debra Tabor at an altitude of 9,800 feet.
- 60626 to 60630. *VICIA FABA* L. Fabaceæ. Broad bean.
60626. No. 409. Ankober. December 11, 1923. Purchased in a village.
60627. No. 411. Ankober. December 11, 1923. Purchased in a village.
60628. No. 425. Ankober. December 11, 1923. Purchased in Allu Amba.
60629. No. 516. Lalibela. January 7, 1924. Obtained in the market.
60630. No. 569. January 20, 1924. Collected at the head of Lake Tsana a day's journey south of Gondar.
60631. *VICIA* sp. Fabaceæ. Vetch.
No. 447. Makfud. December 15, 1923. Found in a rocky waste place at an altitude of 9,000 feet.
60632. *VIGNA CYLINDRICA* (Stickm.) Skeels. Fabaceæ. Catjang.
No. 416d. Ankober. December 11, 1923. Presented by Desta Helle.
60633. *VIGNA SINENSIS* (Torner) Savi. Fabaceæ. Cowpea.
No. 571. Kowul. January 31, 1924.
- 60634 and 60635. *ZEA MAYS* L. Poaceæ. Corn.
60634. No. 433. Ankober. December 11, 1923. Purchased in Allu Amba.
60635. No. 480. Dessie. December 24, 1923. Purchased in the market.
60636. (Undetermined.)
No. 574. Record lost, but probably seed of sweet-scented flowering tree in the Tsana region.

60637 to 60648.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received May 6, 1924.

60637 to 60639. *BERBERIS* spp. Berberidaceæ. **Barberry.**

60637. *BERBERIS INSIGNIS* Hook. f. and Thoms.

A beautiful hollylike bush of erect habit, with very few spines and large, shining, evergreen leaves 3 to 7 inches in length. The golden-yellow flowers are borne in clusters of about 15 and are followed by ovoid, black berries. Native to the eastern Himalayas.

For previous introduction, see S. P. I. No. 55671.

60638. *BERBERIS NAPAULENSIS* (DC.) Spreng.

An evergreen shrubby Himalayan barberry which is probably too tender for any but the southern sections of the United States. In its native home it becomes 20 feet in height, and the dark, glossy green compound leaves consist of 15 to 20 spine-toothed, leathery leaflets. The yellow flowers are in slender racemes up to a foot in length, and the roundish berries are covered with a bluish white bloom.

For previous introduction, see S. P. I. No. 57884.

60639. *BERBERIS WALLICHIANA* DC.

A narrow-leaved, evergreen barberry from temperate regions in the Himalayas, where it ascends to about 10,000 feet. The shining black-purple berries are produced in dense clusters.

For previous introduction, see S. P. I. No. 55673.

60640. *BETULA CYLINDROSTACHYA* Wall. Betulaceæ.

A Himalayan birch which grows as a tall, deciduous tree at an altitude of 6,000 feet along the northeastern border of India. The wood is red, hard, and heavy and seasons well. The tree might be sufficiently hardy to grow in parts of Florida and California.

For previous introduction, see S. P. I. No. 39002.

60641. *BUCKLANDIA POPULNEA* R. Br. Hamamelidaceæ.

A large evergreen tree, 80 feet or less in height, native to the eastern Himalayas at altitudes of 3,000 to 8,000 feet. The wood is grayish brown, close grained, and durable, and is commonly used in Darjiling for planking and for doors and window frames.

For previous introduction, see S. P. I. No. 55674.

60642. *CRACCA CANDIDA* (DC.) Kuntze (*Te-phrosia candida* DC.). Fabaceæ.

A low shrub with slender velvety branches, smooth green leaves 6 to 9 inches long, with gray silky lower surfaces, and copious terminal and lateral clusters of reddish or white flowers. It is native to the more tropical of the Himalayas, ascending to 5,000 feet altitude.

For previous introduction, see S. P. I. No. 55678.

60643. *ENGELHARDTIA SPICATA* Leschen. Juglandaceæ.

This large, handsome tree, which belongs to the walnut family, grows wild on the foothills of the eastern Himalayas, and is probably adapted for growing only in the Gulf States. The thick, brown bark contains much tannin, and the wood, which is said not to check, shows a beautiful grain.

For previous introduction, see S. P. I. No. 47842.

60637 to 60648—Continued.

60644. *GAULTHERIA FRAGRANTISSIMA* Wall. Ericaceæ.

A very fragrant evergreen shrub or small tree found in the mountains of India from Nepal eastward to Bhutan. In summer it is loaded with white or pinkish flowers which are followed by beautiful racemes of blue-purple fruits.

For previous introduction, see S. P. I. No. 48309.

60645. *HYDRANGEA ROBUSTA* Hook. f. and Thoms. Hydrangeaceæ.

A vigorous, spreading, shrubby hydrangea which is native to the mountainous regions of northeastern India, and therefore probably best adapted to the southern part of the United States. The short-stemmed, oval leaves are coarsely toothed, and the flowers, with white sepals, blue petals, and stamens, are produced in loose, spreading corymbs with red pedicels.

For previous introduction, see S. P. I. No. 55681.

60646. *ILEX INSIGNIS* Hook. f. Aquifoliaceæ.

An attractive holly from the Sikkim Himalayas where it grows at an altitude of 7,000 feet. It forms a small tree or shrub with thick grooved branches which are purplish when young. The dark-green leathery leaves are pinnately lobed, with lobes spine tipped and alternately raised and depressed, so that there appears to be a double row of spiny lobes on each side. This holly has proved hardy in Ireland and may be suited for growing in the Gulf States and southern California.

For previous introduction, see S. P. I. No. 55682.

60647. *INDIGOFERA DOSUA TOMENTOSA* Baker. Fabaceæ.

A low, shrubby, hairy indigo from the temperate parts of the Himalayas, where it grows at altitudes of 1,000 to 5,000 feet. The dull-green compound leaves, 9 inches in length, and the long racemes of bright-red flowers make this a decidedly ornamental species.

For previous introduction, see S. P. I. No. 55748.

60648. *LAGERSTROEMIA PARVIFLORA* Roxb. Lythraceæ.

This Himalayan relative of the crape myrtle (*Lagerstroemia indica*) is a tree 50 to 70 feet high, with green, leathery leaves and fragrant white flowers, half an inch wide, in axillary or terminal panicles. The wood is very tough and durable.

For previous introduction, see S. P. I. No. 53582.

60649. *COTONEASTER SALICIFOLIA FLOCCOSA* Rehd. and Wils. Malaceæ.

From Kew, England. Seeds presented by Dr. Arthur W. Hill, director, Royal Botanic Gardens. Received November 10, 1923. Numbered June, 1924.

A graceful shrub, up to 13 feet high, which bears dense corymbs of white flowers and light-red roundish fruits. Native to western China at altitudes of 7,500 to 9,800 feet.

For previous introduction, see S. P. I. No. 53693.

60650 to 60659.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received May 6, 1924.

60650. *LEUCOSCEPTRUM CANUM* J. E. Smith. Menthaceæ.

According to Hooker (Flora of British India) this tree, which belongs to the mint family, is stout branched and densely hairy, and the narrowly oval leaves are silvery beneath and at times a foot in length. The small white or pinkish flowers are in spikes.

For previous introduction, see S. P. I. No. 57888.

60650 to 60659—Continued.

60651. *LIGUSTRUM CONFUSUM* Decaisne. Oleaceæ.

A small tree, up to 40 feet in height, one of the tropical relatives of the California privet (*Ligustrum ovalifolium*). The leathery, obtuse leaves are about 3 inches long, and the small white flowers are in panicles 1 to 5 inches long.

60652. *MEIBOMIA SEQUAX* (Wall.) Kuntze (*Desmodium sequax* Wall.). Fabaceæ.

The brownish or grayish hairs which cover the branches of this low Himalayan shrub and the large racemes of red flowers make it of possible value as an ornamental for the warmer parts of the United States.

For previous introduction, see S. P. I. No. 47725.

60653. *PIERIS OVALIFOLIA* (Wall.) D. Don (*Andromeda ovalifolia* Wall.). Ericaceæ.

Although this shrub or small tree may prove of value as a semihardy ornamental because of its racemes of bluish or white flowers, it is used as an insecticide in its native country, India, because of the presence of a poisonous principle in the young leaves and buds. The oblong, leathery leaves are 3 to 6 inches long.

For previous introduction, see S. P. I. No. 47755.

60654. *PRUNUS CERASODES* D. Don (*P. pudum* Roxb.). Amygdalaceæ.

A handsome, ornamental cherry with pendulous rose-red or white solitary flowers which appear before the bright, glossy green leaves. The tree is native to the highlands of Burma and is said to endure light frosts in its native country.

For previous introduction, see S. P. I. No. 57680.

60655. *RHODODENDRON ARBOREUM* J. E. Smith. Ericaceæ.

This Himalayan rhododendron is variable both in its foliage and in the color of its flowers. In one form the leaves are silvery on the lower surface, while in another they are covered with a brownish red down. The bell-shaped flowers, borne in dense trusses, vary from deep crimson to pure white. The tree sometimes reaches a height of 35 feet, with a trunk 4 feet in circumference.

For previous introduction, see S. P. I. No. 55697.

60656. *STYRAX HOOKERI* C. B. Clarke. Styracaceæ.

The storaxes in general are handsome shrubs of graceful, spreading habit, and this Himalayan representative of the genus is no exception to the rule. Its white flowers, in small racemes, are sometimes an inch wide, and the fruits are white-hairy drupes half an inch long. According to Hooker (Flora of British India) this is perhaps only a form of *Styrax serrulatum*.

60657. *VACCINIUM DUNALIANUM* Wight. Vacciniaceæ.

Many of the wild species of *Vaccinium* are being tested by department horticulturists for the purpose of determining the food value of the fruits. This species is a large erect shrub from the mountainous regions of northeastern India, and it will probably not withstand much frost.

For previous introduction, see S. P. I. No. 47821.

60658. *ZANTHOXYLUM ACANTHOPODIUM* DC. Rutaceæ.

A shrub or small tree with vertically flattened prickles on the trunk and branches and dense foliage with a pungent, aromatic odor. The small, pale-red fruits are in loose panicles. Native to warm valleys in the subtropical Himalayas at altitudes of 4,000 to 7,000 feet.

60650 to 60659—Continued.

60659. *ZANTHOXYLUM OXYPHYLLUM* Edgeworth. Rutaceæ.

A Himalayan shrub with the branches and leaves covered with hooked prickles; the leaves are shining green and exceedingly variable in size. This species is native to temperate regions in northeastern India at altitudes of 4,000 to 8,000 feet.

60660 to 60674. *HORDEUM* spp. Poaceæ.

From Ariana, near Tunis, Tunisia, Africa. Seeds presented by Dr. F. Boeuf, chief, Botanical Service, Tunis, through H. V. Harlan, Bureau of Plant Industry. Received June 16, 1924. Notes by Doctor Boeuf.

Introduced for cereal specialists.

60660 to 60673. *HORDEUM VULGARE PALLIDUM* Seringe. Six-rowed barley.

60660. 1921-0.9. Tripoli.

60661. 1921-0.10. Tripoli. For forage.

- No. 285. Province of Yeniseisk, District of Minusinsk, Siberia.
- Nos. 289 and 290. Province of Tambov.
- Nos. 293 and 294. Province of Voronezh.
60854. LATHYRUS SATIVUS L. Fabaceæ. **Bitter vetch.**
- No. 2092. Mountain Buchara. Var. *azureus*.
- 60855 to 60861. LENTILLA LENS (L.) W. F. Wight (*Lens esculenta* Moench). Fabaceæ. **Lentil.**
60855. No. 8. Persia.
60856. No. 15. Daghestan.
60857. No. 19. Bokhara.
60858. No. 181. Mongolia.
60859. No. 244. Province of Kief.
60860. No. 263. Province of Pensa.
60861. No. 303. Province of Saratov.
- 60862 to 60871. LINUM USITATISSIMUM L. Linaceæ. **Flax.**
60862. No. 4. Vitebsk. Fiber flax.
60863. No. 5. Ribinsk. Fiber flax.
60864. No. 132. Tver. Fiber flax.
60865. No. 250. Pskov. Fiber flax.
60866. No. 253. Saratov. Oil flax.
60867. No. 460. Dvinsk. Fiber flax.
60868. No. 512. Vologda. Fiber flax.
60869. No. 523. Pskov. Fiber flax.
60870. No. 524. Pskov. Fiber flax.
60871. No. 633. Stavropol, Caucasus. Oil flax.
60872. LOLIUM MULTIFLORUM Lam. Poaceæ. **Italian rye grass.**
- No. 1516. Province of Moscow. Bekasovskaia Experiment Station.
- 60873 and 60874. LOLIUM PERENNE L. Poaceæ. **Perennial rye grass.**

60744 to 60956—Continued.

60873. No. 819. Province of Tambov. Grassland station of Marusino.
60874. No. 1863. Province of Moscow. State Institution for Grassland Investigations.
60875. *LOTUS CORNICULATUS* L. Fabaceæ.
- No. 1861. Province of Moscow. State Institution for Grassland Investigations.
60876. *MEDICAGO FALCATA* L. Fabaceæ.
- No. 1741. Province of Samara. Experiment station of Krasny Kut.
- 60877 and 60878. *MEDICAGO SATIVA* L. Fabaceæ. **Alfalfa.**
60877. No. 1769. Kuban, District of Armavir.
60878. No. 1771. Chiva.
60879. *ONOBRYCHIS VULGARIS* Hill (*O. viciaefolia* Scop.). Fabaceæ.
- No. 1916. Province of Poltava.
60880. *ORNITHOPUS SATIVUS* Brot. Fabaceæ. **Serradella.**
- No. 1866. Province of Tshernigov.
60881. *PHALARIS ARUNDINACEA* L. Poaceæ. **Reed canary grass.**
- No. 2030. Province of Poltava.
- 60882 to 60887. *PHLEUM PRATENSE* L. Poaceæ. **Timothy.**
60882. No. 1655. Province of Ekaterinburg.
60883. No. 1676. Province of Tver.
60884. No. 1715. Province of Tambov.
60885. No. 1930. Province of Vologda.
60886. No. 1946. Province of Yaroslav.
60887. No. 2059. Province of Tambov.
- 60888 to 60935. *PISUM SATIVUM* L. Fabaceæ. **Pea.**
60888. No. 209. Omsk, western Siberia.
60889. No. 240. Daghestan. A local, unimproved gray variety.
60890. No. 241. Province of Riazan. A local unimproved white variety.
60891. No. 280. Province of Saratov. A local unimproved variety.
60892. No. 943. Archangel, North Dvinsk. A local unimproved variety.
60893. No. 966. East Mongolia. A local unimproved variety collected on the Mongolian expedition.
60894. No. 972. Collected on the Mongolian expedition.
60895. No. 1097. Province of Vladimir. A local unimproved mixed variety.
60896. No. 1098. Province of Tsheliabinsk. A local unimproved mixed variety.
60897. No. 1099. Province of Ekaterinburg. A local unimproved mixed variety.
60898. No. 1101. Province of Kaluga. A local unimproved mixed variety.
60899. No. 1105. Province of Pskov. A local unimproved variety.
60900. No. 1108. Province of Perm. A local unimproved variety.
60901. No. 1118. Province of Tyumen. A local unimproved variety.
60902. No. 1119. Province of Vitebsk. A local unimproved variety.

60744 to 60956—Continued.

60903. No. 1121. Province of Yaroslav. A local unimproved variety.
60904. No. 1131. Province of Smolensk. A local unimproved variety.
60905. No. 1435. Province of Kostroma. A local unimproved variety.
60906. No. 1529. Province of Archangel. A local unimproved variety.
60907. No. 1591. Archangel, North Dvinsk.
60908. No. 1625. The Tartarian Republic, Kazan. A local unimproved mixed variety.
60909. No. 1643. Province of Pskov. A local unimproved variety.
60910. No. 1651. Province of Smolensk. *Pel-jushka*. Engelgardt Experiment Station.
60911. No. 1767. Voronezh. *Asparagus*. Experiment station of the Bureau of Applied Botany and Plant Breeding. A spotted variety selected by Dr. A. I. Malzev.
- 60912 to 60935. *PISUM SATIVUM* L. Fabaceæ. **Pea.**
60912. No. 19. Omsk, western Siberia.
60913. No. 316. Province of Irkutsk. *The hybrid of Tulun*. A selection by Dr. V. E. Pissarev, of the Eastern Siberian Experiment Station.
60914. No. 1106. Gorskaia (Mountain) Republic, Caucasus. A local unimproved variety.
60915. No. 1115. Volhynia.
60916. No. 1537. Manchuria.
60917. No. 1538. Manchuria.
60918. No. 1549. Altai, Siberia. A local unimproved variety.
60919. No. 1541. Far East, Siberia. A green variety.
60920. No. 1563. Province of Yakutsk, eastern Siberia. A local unimproved variety.
60921. No. 1564. Province of Tyumen. A local unimproved mixed variety.
60922. No. 1624. Province of Samara. *Victoria*.
60923. No. 1629. Turkestan. A local unimproved variety.
60924. No. 1634. Semipalatinsk. A local unimproved variety.
60925. No. 1649. Province of Gomel.
- 60926 to 60935. Voronezh. Experiment station of the Bureau of Applied Botany and Plant Breeding. Selections by Dr. A. I. Malzev.
60926. No. 1751.
60927. No. 1752. *Victoria*. A green variety.
60928. No. 1755. A yellow variety.
60929. No. 1756. An early variety from Rostov.
60930. No. 1758. A pink-seeded variety.
60931. No. 1762. A grainlike variety.
60932. No. 1764. A sugar variety.
60933. No. 1765. A waxen variety.
60934. No. 1768. An umbelliferous variety.
60935. No. 1772. *Victoria*. An angular variety.

60744 to 60956—Continued.

60936. *POA PALUSTRIS* L. Poaceæ.
Fowl meadow grass.

No. 353. Estate "Castle Zagnitz," Livland.

60937. *POA PRATENSIS* L. Poaceæ. Bluegrass.

No. 1070. Province of Petrograd.

60938. *RICINUS COMMUNIS* L. Euphorbiaceæ.
Castor bean.

Nos. 83, 89, 90, 95, 96, 97, 98, 101, 106, 108, 109.
Collection of different strains of the castor bean of
Turkestan origin.

60939. *SESAMUM ORIENTALE* L. Pedaliaceæ.
Sesame.

Nos. 1-13, 16-40. Collection of different varie-
ties of sesame originating in Turkestan.

60940 and 60941. *TRIFOLIUM HYBRIDUM* L. Faba-
ceæ. Alsike clover.

60940. No. 1434. Province of Moscow. Beka-
sovskaja Experiment Station.

60941. No. 1758. Province of Tambov.

60942 to 60952. *TRIFOLIUM PRATENSE* L. Fabaceæ.
Red clover.

60942. No. 1624. Province of Vologda.

60744 to 60956—Continued.

60943. No. 1639. Province of Viatka.

60944. No. 1650a. Province of Perm, Kungur.

60945. No. 1659. Province of Krasnoufimsk.

60946. No. 1664. Province of Ivanovo Vos-
nesensk.

60947. No. 1684. Province of Tula.

60948. No. 1685. Province of Orel.

60949. No. 1686. Province of Orel.

60950. No. 1719. Province of Minsk.

60951. No. 2000. Province of Ekaterinburg. A
variety from Perm.

60952. No. 2007. Province of Vladimir.

60953. *TRIFOLIUM SUAVEOLENS* Willd. Faba-
ceæ. Fragrant clover.

No. 1841. Turkestan.

60954 to 60956. *VICIA SATIVA* L. Fabaceæ.
Bitter vetch.

60954. No. 112. Saratov.

60955. No. 315. Saratov.

60956. No. 505. Kharkof. From the experi-
ment station.

INDEX OF COMMON AND SCIENTIFIC NAMES

- Abacá, *Musa textilis*, 60421-60424.
 Abutilon sp., 60461.
 Acacia spp., 60369, 60388.
 auriculataeformis, 59672.
 seyal, 59651.
 suma, 59652.
 Aconitum spp., 59000, 59001.
 forrestii, 59403.
 Adansonia digitata, 59673.
 Aeschynomene indica, 59294.
 Agave sp., 60225.
 Agropyron cristatum, 60744, 60745.
 Agrostis capillaris, 60417.
 palustris, 60746, 60747.
 Albizzia sp., 60389.
 Aleurites moluccana, 59301.
 triloba. See *A. moluccana*.
 Alfalfa, *Medicago sativa*, 59774, 60563, 60877, 60878.
 Allium spp., 59404, 59701.
 albidum, 59346.
 angulosum, 59347.
 cepa, 59330, 59650.
 fistulosum, 60226.
 hymenorrhizum, 60227.
 karataciense, 60228.
 libani, 59348.
 lineare, 59349.
 obliquum, 59340.
 odorum, 59386, 60229.
 polyphyllum, 60230.
 sacculiferum, 59350.
 schoenoprasum, 59691.
 scorodoprasum, 59387.
 scorodoprasum babingtonii, 59388.
 stellerianum, 59389.
 subhirsutum, 59341.
 trictoriale, 59351.
 Aloe spp., 60449, 60462.
 Alopecurus pratensis, 60748, 60749.
 Ampelodesma bicolor, 60319.
 Andromeda ovalifolia. See *Pieris ovalifolia*.
 Andropogon schoenanthus. See *Cymbopogon schoenanthus*.
 Androsace spinulifera, 59002.
 Anemone Japanese, *Anemone japonica*, 60188.
 Anemone japonica, 60188.
 Anogeissus sp., 59674.
 Anthistiria ciliata. See *Themeda quadrivalis*.
 Anthozanthum odoratum, 60750.
 Antigonon guatemalense, 59643.
 Apple, *Malus* spp., 58975, 59324, 59422.
 Apricot, *Prunus armeniaca*, 58976.
 Aristolochia sp., 60390.
 Arrhenatherum erianthum, 59358.
 Asclepias stellifera, 60353.
 subulata, 59766.
 Assonia mastersii, 59305.
 Aster sp., 59406.
 staticifolius, 59405.
 Astragalus sp., 59653.
 chinensis, 59352.
 physodes, 60335.
 timineus, 60336.
 Atropa belladonna, 59692.
 Arena abyssinica, 60463.
 barbata wiestii, 59659.
 montana, 59363.
 planiculmis, 58364, 59693.
 sativa, 60751-60770.
 sterilis, 59285, 59383.
 versicolor, 59694.
 Azonopus scoparius, 58966.
 Banana, *Musa paradisica sapientum*, 59377.
 Baobab, *Adansonia digitata*, 59673.
 Barberry. See *Berberis* spp.
 Barley, *Hordeum intermedium haztoni*, 60674.
 deficient, *H. deficiens*, 60549, 60550, 60692, 60694-60697.
 Barley, naked, *H. distichon nudum*, 60693.
 six-rowed, *H. vulgare coeleste*, 60204, 60205, 60530, 60539, 60690, 60691, 60700.
 H. vulgare duplinigrum, 60531, 60689.
 H. vulgare nigrum, 60526, 60527, 60532-60535, 60547.
 H. vulgare pallidum, 59772, 59773, 60525, 60528, 60529, 60536-60538, 60540-60546, 60543, 60551, 60660-60673, 60675-60684, 60686-60688.
 two-rowed, *H. distichon palmella*, 60701.
 Bauhinia spp., 60395, 60450.
 Bauno, *Mangifera verticillata*, 60308.
 Bean, broad, *Vicia faba*, 60626-60630.
 castor, *Ricinus communis*, 60938.
 common, *Phaseolus vulgaris*, 60575-60579.
 Lima, *P. lunatus*, 60402.
 mung, *P. aureus*, 59384, 60573, 60574.
 Yard Long, *Vigna sesquipedalis*, 60300.
 Beckmannia erucaeformis, 60771, 60772.
 Benincasa hispida, 59390.
 Berberis aristata, 60378.
 dictyophylla, 59003.
 insignis, 60637.
 koehneana, 60362.
 napaulensis, 60638.
 sinensis, 60418.
 wallichiana, 60639.
 wilsonae, 60419.
 Betula sp., 59654.
 cylindrostachya, 60640.
 Binukao, *Garcinia binucao*, 58958, 59376.
 Birch, *Betula* sp., 59654.
 Blackberry, *Rubus* spp., 58997-58999.
 R. fruticosus, 58968.
 Brachiaria obtusiflora, 60464.
 Brachypodium distachyum, 60363.
 japonicum, 59353.
 mexicanum, 59295.
 ramosum, 60364.
 Brassica spp., 60218, 60219.
 alba, 60773, 60774.
 juncea, 60775, 60776.
 oleracea capitata, 60777-60789.
 rapa, 60790-60793.
 Bromus sp., 60465.
 inermis, 60794, 60795.
 Bucklandia populnea, 60641.
 Buddleia forrestii, 59004.
 Cabbage, *Brassica oleracea capitata*, 60777-60789.
 Cajan indicum, 59306.
 Calamagrostis lanceolata, 59359.
 Callitris cupressoides, 60360.
 Campanula sp., 59005.
 Canavali rusiospermum, 59307.
 Cannabis sativa, 60796-60817.
 Capparis sp., 60370.
 Caragana sp., 59006.
 Carica papaya, 60355, 60451.
 papaya × *posoposa*, 59308-59310.
 posoposa, 59311.
 Carum copticum, 60466, 60467.
 Cassia didymobotrya, 59675.
 fistula, 59312.
 occidentalis, 60468.
 tora, 60469.
 Castanopsis argentea, 58931, 58961.
 tungurrut, 58932.
 Catjang, *Vigna cylindrica*, 59371, 60632.
 Cedar, East African, *Juniperus procera*, 60553.
 Cedrela odorata, 59302.
 Centaurea canariensis, 59655.
 Cerbera thevetia, 60396.
 Cereus validus, 58988.
 Chaetochloa italica, 59328, 60337-60339.
 Chenopodium quinoa, 59333, 59402.
 Cherry, *Prunus* spp., 59664, 59665.

- Chick-pea. See *Cicer arietinum*.
Cicer arietinum, 59280, 59281, 58375, 60371, 60470, 60471, 60818-60821.
Cinchona ledgeriana, 60292.
succirubra, 60293.
Citron. See *Citrus medica*.
Citrullus vulgaris, 60258, 60340, 60822-60828.
Citrus medica, 60452.
sinensis, 58989, 58990.
Clematis montana rubens, 60420.
Clover, *Trifolium* spp., 60593, 60594.
T. africanum glabellum, 58987.
fragiferum, 60351.
maritimum, 59370.
alsike, *Trifolium hybridum*, 60940, 60941.
bur, *Medicago hispida denticulata*, 60562.
fragrant, *Trifolium suaveolens*, 60953.
red, *Trifolium pratense*, 59290, 59291, 59299, 59300, 60942-60952.
T. pratense frigidum, 59699.
Colocasia spp., 59690, 60397.
esculenta, 59289.
Colvillea racemosa, 59676.
Corn. See *Zea mays*.
Coronilla glauca, 59360.
Corylopsis sp., 59007.
Corylus tibetica, 59008.
Cotoneaster sp., 59407.
frigida, 60425.
salicifolia floccosa, 60649.
Cotton. See *Gossypium* spp.
Cotula cinerea, 60255.
Cotyledon nodulosa. See *Echeveria nodulosa*.
Cowpea, *Vigna sinensis*, 60251, 60633.
Cracca candida, 60170, 60642.
Crape myrtle, *Lagerstroemia speciosa*, 59315.
Cremanthodium spp., 59009, 59409.
Crotalaria spp., 60304-60306, 60372, 60472.
capensis, 59319.
intermedia, 60301.
leioloba, 59320.
mazillaris, 60302.
semperflorens, 59365.
sphaerocarpa, 60303.
tetragona, 59321.
Croton megalocarpus, 60453.
elliotianus. See *C. megalocarpus*.
Cryptostegia grandiflora, 60441.
madagascariensis, 60442.
Cucumber. See *Cucumis sativus*.
Cucumis melo, 60285, 60289, 60320-60322, 60829-60835.
metuliferus, 60368.
sativus, 59765, 60256.
Cucurbita maxima, 60836-60841.
pepo, 60286, 60842, 60843.
Cupressus sp., 59656.
Cymbopogon spp., 60474-60476.
schoenanthus, 60473.
Cynodon plectostachys, 60477.
Dactylis glomerata, 60844, 60845.
Danthonia semiannularis, 59361.
Davidia involucrata, 59377.
Delphinium spp., 59010, 59011, 59410-59413, 59702-59704.
Desmodium spp. See *Meibomia* spp.

INVENTORY No. 80

Washington, D. C.

Issued April, 1927

SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN PLANT INTRODUCTION, BUREAU OF PLANT INDUSTRY, DURING THE PERIOD FROM JULY 1 TO SEPTEMBER 30, 1924 (S. P. I. NOS. 60957 TO 61737)

CONTENTS

	Page
Introductory statement-----	1
Inventory-----	3
Index of common and scientific names-----	31

INTRODUCTORY STATEMENT

The outstanding feature of the introductions included in this inventory is the relatively large proportion of forage plants, cereals, and vegetables contributed almost entirely by representatives of the bureau traveling abroad or by foreign agricultural institutions with which the Office of Foreign Plant Introduction has contacts.

H. L. Westover, of the Office of Forage Crops, made a trip to Argentina and Chile with the particular object of studying the culture of alfalfa. Extensive collections of plant material were made in those countries by Mr. Westover, not only of local strains of alfalfa but also of cereals, native grasses, and leguminous forage plants.

H. L. Shantz, of the Office of Plant Geography and Physiology, whose trip to Africa for the African Educational Commission was mentioned in the preceding inventory, continued his travels in that continent during this period, and sent in several more shipments of plant material which included native forage plants, sorghums, and other cereals and a considerable number of shrubby and herbaceous ornamentals.

While carrying on agricultural explorations in Yunnan, southwestern China, for the National Geographic Society, J. F. Rock, a collaborator of this office, made a special collection of native strains of beans and peas (Nos. 61018 to 61038). This collection should prove of special interest to vegetable breeders. A similarly interesting collection of local varieties of beans was received from George H. Winn, of Taiku, Chosen (Nos. 61039 to 61054).

Further shipments of local strains of crop plants were received from Dr. N. I. Vavilov, Director of the Bureau of Applied Botany and Plant Breeding, Leningrad, Russia. These included a series of wheats (*Triticum* spp., Nos. 61101 to 61198), a series of barleys (*Hordeum* spp., Nos. 61506 to 61592), and a small series of cottons (*Gossypium* spp., Nos. 61696 to 61714). Many of these strains originated in parts of Russia where climatic conditions are not favorable for growing crops, so that this material should prove unusually valuable for extending the range in this country of the crops represented. These same observations might also apply to additional shipments of plant material received from Prof. K. Murashinsky, of the Siberian Agricultural Academy, Omsk, Siberia. Grasses and forage plants constitute the greater part of Professor Murashinsky's contributions. For the benefit of forage-crop specialists of the

bureau who are carrying on experiments with small-seeded strains of chick-peas as a stock feed in the Southwest, material was introduced from a number of agricultural institutions in India (*Cicer arietinum*, Nos. 61066 to 61073; 61074 to 61081; 61082 and 61083; 61356 to 61365).

Seeds of a number of rubber-producing plants, introduced for bureau specialists seeking new sources of rubber, were received in a shipment from Alleyne Leechman, director of the Biological and Agricultural Institute at Amani, Tanganyika Territory, Africa. Among these may be mentioned *Castilla elastica* (No. 61483), *Funtumia elastica* (No. 61491), *Landolphia kirkii* and *L. stolzii* (Nos. 61492 and 61493), *Manihot glaziovii* (Nos. 61496 and 61497), and *Mascarenhasia elastica* (No. 61498).

Of especial interest to fruit breeders should be a prune (*Prunus domestica*, No. 60973), very similar to the French prune in character of fruit, which thrives in the latitude of Washington, D. C. Such a tree is growing in the garden of Dr. Aleš Hrdlička in Washington, and bears large crops each fall. The tree came originally from Czechoslovakia.

A new hybrid peach (*Amygdalus persica* × *persica nectarina*, No. 61302) originated at the Plant Introduction Garden, Chico, Calif., by hybridizing with foreign material gives promise of being a good home fruit. The round, light greenish yellow clingstone fruits, 2 inches in diameter, have white, firm, juicy flesh of a pleasing peachy flavor.

The botanical determinations of introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., August 19, 1926.

INVENTORY¹

60957. PRUNUS CANESCENS Bois. Amygdalaceæ.

From Loiret, France. Seeds presented by L. Pardé, Directeur des Ecoles des Barres, Nogent sur Vernisson. Received September 8, 1924.

A shrubby cherry from Szechwan, China, with attractive, dark orange-brown bark and very hairy leaves and stems. In habit it is rounded and bushy and about 7 feet high. The clustered rosy white flowers are exceedingly fragrant, but fall quickly from the leafless branches. The smooth, red fruits, half an inch in diameter, have a pleasant, acid flavor.

60958. HIBISCUS CANNABINUS L. Malvaceæ. **Ambari hemp.**

From Pretoria, Transvaal, Union of South Africa. Seeds presented by I. B. Pole Evans, Division of Botany. Received September 8, 1924.

Introduced for testing by fiber specialists.

A prickly-stemmed plant 6 to 8 feet in height, cultivated throughout India and elsewhere in the warmer parts of the world for its fiber, which is used as a substitute for hemp. The fiber is soft, white, and silky and is considered by some authorities to be more durable than jute for coarse textiles.

For previous introduction see S. P. I. No. 55481.

60959. ANDROPOGON SACCHAROIDES Swartz. Poaceæ. **Silver beard grass.**

From Sucre, Buenos Aires, Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

April 5, 1924. This grass is very abundant west of Buenos Aires; it apparently is not relished by stock except when young. (Westover.)

60960 to 60971.

From Peking, China. Seeds purchased from Rufus H. Lefever, Presbyterian Mission. Received September 12, 1924. Notes by Mr. Lefever.

60960. PHASEOLUS ANGULARIS (Willd.) W. F. Wight. Fabaceæ. **Adsuki bean.**

No. 1. Nay shou do tzu (small black beans). These are boiled soft and sugar added to make a sweet cake.

60961. PHASEOLUS AUREUS Roxb. Fabaceæ. **Mung bean.**

No. 12. Starch is obtained from this for stiffening clothes and for eating like vermicelli.

60962 and 60963. PISUM SATIVUM L. Fabaceæ. **Pea.**

60962. No. 7. A local variety.

60963. No. 9. A local variety.

60964 to 60970. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. **Soy bean.**

Local soy-bean varieties.

60964. No. 2.

60965. No. 3. *Nay do.* Fed to animals.

60966. No. 4.

60967. No. 5. *Li lang do.*

60968. No. 6. Sprouted and stewed with meat.

60969. No. 8. Used as flavoring for food.

60970. No. 10. *Huang do* (yellow bean). Used as flavoring for food.

60971. VIGNA SINENSIS (Torner) Savi. Fabaceæ. **Cowpea.**

No. 11. Stewed and eaten with rice or millet.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction; further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the specific identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

**60972. ATTALEA COHUNE Mart. Phœni-
caceæ. Cohune.**

From La Providencia, Chiapas, Mexico. Seeds presented by Dr. C. A. Purpus. Received September 15, 1924.

The cohune is a magnificent feather-leaved palm, native to the West Indies and Central America, which reaches a height of 40 feet, with leaves about 20 feet long, produced abundantly at the top of the trunk. The yellowish flowers are borne very freely, and the ovoid fruit, 2 to 3 inches long, contains the seed or nut, which yields an oil of considerable value. According to a statement published in Commerce Reports, May 9, 1919, this oil is of high quality, finds a ready sale for cooking purposes, and is suitable for any use to which a good cooking oil may be applied.

For previous introduction see S. P. I. No. 54017.

**60973. PRUNUS DOMESTICA L. Amyg-
dalaceæ. Prune.**

From Czechoslovakia. Budsticks presented by Dr. Aleš Hrdlička, United States National Museum, Washington, D. C. Received September 15, 1924.

Some years ago Doctor Hrdlička received from Czechoslovakia a shipment of trees and shrubs. These were planted on Tilden Street, Washington, D. C. One of the trees, a prune, has shown such value that Doctor Hrdlička has called it to our attention with the recommendation that it be propagated and given wide distribution in this part of the United States.

This prune, from specimens which we have examined recently, appears very similar to the French prune in character of fruit. The latter does not succeed in the climate of Washington, whereas Doctor Hrdlička's tree bears heavy crops annually, and the fruit seems almost immune to the attacks of curculio and other pests. The ripening season is September and October.

**60974. EUGENIA CURRANII C. B. Robin-
son. Myrtaceæ. Lipoti.**

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, Director, Bureau of Agriculture. Received September 16, 1924.

The lipoti is a handsome Philippine tree which is described in the Philippine Agricultural Review, volume 8, as a vigorous tree about 30 feet high, with a gnarled trunk and tortuous branches, and dark-green, shining leaves. The fruits are in clusters of 20 to 50 on the bare boughs or between the leaves on the larger twigs; the individual fruit is about the size of a grape, with thin, smooth, dark-red skin, and white, dry, crisp flesh with a flavor like that of the crab apple. The seed is comparatively large. The fruit is probably best suited for making preserves and jelly.

For previous introduction see S. P. I. No. 51201.

**60975 to 60982. DOLICHOS LABLAB L.
Fabaceæ. Hyacinth bean.**

From Salisbury, Rhodesia. Seeds presented by H. G. Mundy, Chief Agriculturist, Department of Agriculture, through C. V. Piper, Bureau of Plant Industry. Received September 16, 1924. Notes by Mr. Mundy.

All of these varieties are of the bush type except Maclean's [S. P. I. No. 60978] and McGillivray's [S. P. I. No. 60977].

60975. Gonzudzu. A native variety with rather small, white seeds.

60976. Lablab Stringless. A variety having medium-sized white seeds.

60977. McGillivray's. The khaki-brown seeds are medium sized.

60978. Maclean's. A variety with large, yellowish white seeds.

60979. A variety with purple vines and leaves and dark-purple seeds.

60980. Thurgarton. A variety with large, brown seeds.

60981. An imported, white-seeded variety similar to *Gonzudzu* [S. P. I. No. 60975].

60982. Woodforde's. A variety with small, brown seeds.

**60983. PRUNUS GLANDULOSA Thunb.
Amygdalaceæ.**

From Rochester, N. Y. Budwood presented by William L. G. Edson, in charge of the herbarium, Department of Parks. Received September 19, 1924.

This was grown from seeds originally brought from Manchuria by C. S. Sargent. The shrub, 15 to 20 years old, is about 5 feet high, and the fruit is the size of a large sweet cherry. (*George M. Darrow, Bureau of Plant Industry.*)

This pink-flowered Chinese shrub, often grown as an ornamental, bears abundant fruits, with a fresh acid flavor, which make excellent preserves.

For previous introduction see S. P. I. No. 54028.

**60984. ATTALEA COHUNE Mart. Phœni-
caceæ. Cohune.**

From Summit, Canal Zone. Seeds presented by Holger Johansen, Agronomist, Plant Introduction Garden. Received September 19, 1924.

For previous introduction and description see S. P. I. No. 60972.

**60985 to 60987. COLOCASIA spp. Ara-
ceæ. Taro.**

From Titikaveka, Rarotonga, Cook Islands. Tubers presented by Capt. J. D. Campbell. Received September 17, 1924.

Three varieties of taro introduced for cultural tests and comparison with taros now grown in the Gulf States.

60985. Taro kerekere.

60986. Taro simoa.

60987. Mixed varieties.

60988. SALACIA sp. Hippocrateaceæ.

From Akkra, Gold Coast Colony, Africa. Seeds presented by W. S. D. Tudhope, Director, Agricultural Department. Received September 23, 1924.

The roots and stems of this shrub, known to the natives of the Gold Coast Colony as "tetso," are said to contain a rubberlike substance, according to the Bulletin of the Imperial Institute, London, for 1912. The plant has been introduced for testing by rubber specialists.

60989. ZEA MAYS L. Poaceæ. Corn.

From Guasave, Sinaloa, Mexico. Seeds presented by F. W. Smith. Received September 15, 1924.

A variety of red sweet corn, introduced for testing by corn specialists.

60990 to 60999. TRITICUM spp. Poaceæ. Wheat.

From Maison-Carree, Algeria. Seeds presented by the governor general, Institute of Agriculture. Received May 21, 1924.

60990 to 60998. TRITICUM AESTIVUM L. (T. vulgare Vill.). Common wheat.

60990. No. 14. *Yahia*.

60991. No. 221. *Jidi Mansour*.

60992. No. 24. *Bahmond*.

60993. No. 36. *Mastaf*.

60994. No. 53. *Cafertast*.

60995. No. 59. *Hamra de Deldoul*.

60996. No. 62. *Chatar*.

60997. No. 69. *Heha*.

60998. No. 73. *Hamra barbu*.

60999. TRITICUM TURGIDUM L. Poulard wheat.

No. 57. *Ouin Rakba*.

61000. ULMUS PUMILA L. Ulmaceæ. Chinese elm.

From Nanking, China. Seeds purchased from Dr. J. H. Reisner, College of Agriculture, University of Nanking. Received July 11, 1924.

The Chinese elm, originally introduced some years ago, is proving a valuable acquisition to the semiarid regions of this country because of its resistance to alkali, drought, and extremes of temperature. As a windbreak and ornamental shade tree it has become popular in regions where other shade trees do not thrive.

61001. COTONEASTER SALICIFOLIA RUGOSA (E. Pritz.) Rehd. and Wils. Malaceæ.

From Kew, England. Seeds presented by Dr. Arthur W. Hill, Director, Royal Botanic Gardens. Received November 10, 1923. Numbered July, 1924.

A very handsome Chinese shrub with long pendulous branches and wrinkled, narrow leaves with the lower surfaces covered with down. The small, scarlet berries contrast very effectively with the autumnal tints of the foliage.

61002 and 61003.

From Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

61002. ANNESLIA sp. (Calliandra sp.). Mimosaceæ.

March 31, 1924. Found on dry gravelly mesas near Paso de los Andes, Mendoza. (Westover.)

61003. BOUTELOUA MEGAPOTAMICA (Spreng.) Kuntze. Poaceæ. Grass.

Sucre, Buenos Aires, April 5, 1924. Rare in this region. (Westover.)

61004 and 61005.

From Chile. Collected by H. L. Westover, Bureau of Plant Industry. Received July 2, 1924.

61004. MALUS SYLVESTRIS Mill. (Pyrus malus L.). Malaceæ. Apple.

Santiago, June 11, 1924. Scions of a variety supplied by Señor Comacho, at the Quinta Normal; said to be very resistant to the woolly aphid. The moderately large fruit is yellow and of fair quality. (Westover.)

61005. PASPALUM sp. Poaceæ. Grass.

June 11, 1924. Seeds collected near Alto del Carmen, Huasco Valley. (Westover.)

61006 to 61008. PHASEOLUS spp. Fabaceæ.

From Tucuman, Argentina. Seeds presented by Dr. W. E. Cross, experiment station, Tucuman, through C. V. Piper, Bureau of Plant Industry. Received July 9, 1924.

Introduced for testing by forage-crop specialists.

61006. PHASEOLUS CARACALLA L. Bertoni bean.

No. 169. May 11, 1924. Collected at Yerba Buena. (Cross.)

For previous introduction see S. P. I. No. 41882.

61007 and 61008. PHASEOLUS SEMIERECTUS L.

Introduced for trial as a forage and as a cover crop.

61007. No. 1765. 61008. No. 1784.

61009. POLYGALA BUTYRACEA Heckel. Polygalaceæ.

From Paris, France. Seeds presented by M. Aug. Chevalier, Museum of Natural History. Received July 3, 1924.

Some of the more primitive tribes of West Africa have cultivated this species, probably since ancient times, for food. It is an annual plant about 7 feet high, with hairy leaves, large yellowish flowers, and black, cylindrical seeds nearly a quarter of an inch long. It is for the sake of these seeds, which are oleaginous and very nutritious, that the plant is grown. Although the yield is not great, this is compensated for by the high food value of the seeds. The cultivation of the plant simply for the oil contained in these seeds would not, however, be profitable. (Chevalier.)

61010. FICUS sp. Moraceæ.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received July 2, 1924.

Tibig, as this undetermined species of Ficus is known here, is the best fruit I have tasted in this genus next to the cultivated fig. It does not, of course, compare with the fig, but is worth trying where figs can not be grown for climatic reasons, and also for crossing with the fig to obtain varieties for tropical climates too trying for the fig.

The tree is upright and of medium size. The fruits are produced in short racemes on the trunk from the ground up and on the stout branches, and are about 1½ inches in diameter, fleshy and juicy, very

sweet for a wild fruit, with the characteristic flavor of the cultivated fig.

Though the tibig has fruited in Manila, the tree does best in a fairly moist climate with the rainfall equally distributed throughout the year. It is probably very tender. (Wester.)

61011 to 61014. SOJA MAX (L.) Piper
(*Glycine hispida* Maxim.). Fabaceae.
Soy bean.

From Changli, Chihli, China. Seeds presented by C. F. Chou, Methodist Episcopal Mission. Received July 8, 1924.

These are planted in April, ripening in August. They grow best on black or light yellow clay soil, with good drainage. (Chou.)

Introduced for testing by agronomists engaged in soy-bean experiments.

61011. *Ch'ing Pi Gat* (green bean).

61012. *Er* (yellow bean).

61013. *Kwan Tung* (small bean).

61014. *Ta Bi Mei*.

61015 to 61017. LANDOLPHIA spp. Apocynaceae.

From Zomba, Nyasaland Protectorate, Africa. Seeds presented by E. J. Wortley, Director of Agriculture. Received July 2, 1924.

Several species of *Landolphia* contain more or less rubber in the latex, and these listed below are introduced for testing by rubber specialists.

61015. *LANDOLPHIA PARVIFOLIA* Schum.

This is described by Otto Stapf (Thielsen-Dyer, Flora of Tropical Africa) as a much-branched, climbing shrub, with small, oblong leaves and small, pale-yellow or white flowers in small, dense clusters. The greenish purple fruits, about 2 inches in diameter, have a smooth, thick rind.

61016. *LANDOLPHIA* sp.

61017. *LANDOLPHIA* sp.

61018 to 61038.

From Honolulu, Hawaii. Seeds sent in by Dr. H. L. Lyon, in charge, department of botany and forestry, experiment station of the Sugar-Planters' Association. Received July 3, 1924. Notes by J. F. Rock.

A collection of bean varieties collected in Yunnan by J. F. Rock, National Geographic Society, Washington, D. C. These may prove of value for bean specialists for breeding and cultural experiments.

61018 to 61020. *DOLICHOS LABLAB* L.
Fabaceae. Hyacinth bean.

61018. No. 3. Tsuchu district. *Hwei Pen* bean.

61019. No. 1. Yuanmao district. *Hung Pin* bean (red thin bean).

61020. No. 2. Monhua district. *Pai Pin* bean (white thin bean).

61021 to 61033. *PHASEOLUS* spp. Fabaceae.

61021 to 61023. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. *Adsuki* bean.

61021. No. 6. Chaofung district. *Lui* bean (common bean).

61018 to 61038—Continued.

61022. No. 8. Chinying district. *Hung Fan* bean (red rice bean).

61023. No. 17. Chaofung district. *Pai Fan* bean (white rice bean).

61024. *PHASEOLUS AUREUS* Roxb.
Mung bean.

No. 7. Penchuan district. *Si Lue* bean (light-green bean).

61025 and 61026. *PHASEOLUS COCCINEUS* L.
Scarlet Runner bean.

61025. No. 14-A. Chengkuan district.

61026. No. 9. Kuanming district. *Hung Hau Tsai* bean.

61027. *PHASEOLUS LUNATUS* L.
Lima bean.

No. 13. Erhyuan district. *Hung Pao* bean (red-package bean).

61028 to 61033. *PHASEOLUS VULGARIS* L.
Common bean.

61028. No. 18. Chinying district. *Hua* bean (flower bean).

61029. No. 15. Chaofung district. *Sui Chi* bean (four-season bean).

61030. No. 14-B. Chengkuan district.

61031. No. 10. Hingping district. *Ta Pai* bean (large white bean).

61032. No. 20. Fengyi district. Small white bean.

61033. No. 16. Taoon district. *Wu Chin* bean.

61034. *PISUM SATIVUM* L. Fabaceae. Pea.
No. 12. Fengyi district. *Wan* bean.

61035 to 61037. *SOJA MAX* (L.) Piper
(*Glycine hispida* Maxim.). Fabaceae.
Soy bean.

61035. No. 5. Hsinping district. *Ta Lu* bean (large green bean).

61036. No. 4. Fumin district. *Sung Tzu* bean (pine seed bean).

61037. No. 19. Chiacha district. *Hwang* bean (yellow bean).

61038. *VICIA FABA* L. Fabaceae.
Broad bean.

No. 11. Fumin district. *Tan* bean (egg bean).

61039 to 61056.

From Taiku, Chosen, Japan. Seeds presented by George H. Winn. Received July 2, 1924.

Introduced for specialists engaged in experimenting with various types of beans.

61039 to 61044. *PHASEOLUS* spp. Fabaceae.

61039 to 61041. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. *Adsuki* bean.

61039. No. 1. Ordinary red "pat."

61040. No. 2. White "pat."

61041. No. 7. Fifty-day gray "pat."

61042. *PHASEOLUS AUREUS* Roxb.
Mung bean.

No. 4. Very small green "pat."

61039 to 61056—Continued.

61043. *PHASEOLUS CALCARATUS* Roxb.
Rice bean.

No. 5. Very small red "pat."

61044. *PHASEOLUS VULGARIS* L.
Common bean.

No. 7. Red soy.

61045 to 61054. *SOJA MAX* (L.) Piper
(*Glycine hispida* Maxim.). Fabaceæ.
Soy bean.

61045. No. 10. Black.

61046. No. 11. Brown.

61047. No. 8. Green.

61048. No. 3. Larger green.

61049. No. 2. Ordinary white.

61050. No. 9. Small black.

61051. No. 4. Small gray.

61052. No. 5. Striped brown.

61053. No. 6. Very small white.

61054. No. 1. White (largest variety).

61055. *VIGNA CYLINDRICA* (Stickm.)
Skeels. Fabaceæ. Catjang.

No. 3. Small black "pat."

61056. *VIGNA SINENSIS* (Torner) Savi.
Fabaceæ. Cowpea.

No. 6. Mottled red "pat."

61057 to 61060.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received July 1, 1924.

61057. *ELAEOCARPUS CYANEUS* Ait. Elæocarpaceæ.

As an ornamental tree for tropical and subtropical regions this Australian species shows considerable promise. In its native habitat it sometimes grows 60 feet high, with narrow, acuminate, prominently veined leaves, and cream-colored, fringed flowers in loose clusters a little shorter than the leaves. The fruits are globular, blue drupes.

For previous introduction see S. P. I. No. 45789.

61058. *HYMENOSPORUM FLAVUM* (Hook.)
F. Muell. Pittosporaceæ.

An ornamental evergreen shrub or tree, sometimes becoming 50 feet high, from Australia. The leaves are up to 9 inches long, and the fragrant flowers, yellow marked with red at the throat, are over an inch across. Its symmetrical pyramidal habit and rapid growth make it promising as a street tree for the Gulf States and California.

61059. *INDIGOFERA AUSTRALIS* Willd. Fabaceæ. Indigo.

An interesting shrubby indigo, native to Australia, and probably suitable for growing as an ornamental in the warmer parts of the United States. It is an erect, branching plant 2 to 4 feet high, with very attractive foliage and dense or loose clusters of showy red flowers.

For previous introduction see S. P. I. No. 56575.

61057 to 61060—Continued.

61060. *LEPTOSPERMUM SCOPARIUM* Forst.
Myrtaceæ. Manuka.

This evergreen shrub is one of the most abundant in New Zealand; it is of compact, bushy habit, sometimes becoming 30 feet high. The leaves are hard, leathery, and sharp pointed, and the white or pink flowers, borne in great profusion, are about three-fourths of an inch across. When this shrub is in bloom the entire region appears as if covered with snow. The leaves are very aromatic, for which reason they have sometimes been used for making tea.

For previous introduction see S. P. I. No. 44849.

61061 and 61062. *TRIFOLIUM PRATENSE*
L. Fabaceæ. Red clover.

From Copenhagen, Denmark. Seeds collected by G. C. Edler, United States Department of Agriculture. Received July 8, 1924.

Local red-clover strains introduced for testing by agronomists.

61061. G. C. E. No. 12.

61062. G. C. E. No. 13.

61063. *CASTANOPSIS* sp. Fagaceæ.
Chestnut.

From Palembang, Sumatra. Seeds presented by the Government Botanic Garden. Received July 15, 1924.

Tree No. 148-E. Collected April 20, 1924, at Palembang, Sumatra.

This species is of the 2-seeded to 3-seeded type and thus presumably one with edible nuts, since the other three species which I know from this region with more than one seed in a bur are edible. The nuts resemble somewhat those of *Castanopsis sumatrana*, but are of some other species, and very different from any the department is now growing. (Carl Hartley, Bureau of Plant Industry.)

61064. *PARKIA TIMORIANA* (DC.) Merr.
(*P. roxburghii* G. Don). Mimosaceæ. Cupang.

From Manila, Philippine Islands. Seeds presented by Don D. Strong, Acting Director, Bureau of Agriculture, at the request of P. J. Wester. Received July 11, 1924.

A huge and remarkably handsome, quick-growing tree, attaining a height of 120 feet or more, with a clear, smooth trunk, and beautiful, fine-feathery, pinnate leaves. Native to Malaya, Burma, etc. It has been introduced into and become well established in Ceylon, thriving in the moist low country up to 2,000 feet. The long pods, which grow in clusters, contain a quantity of white, powdery, farinaceous substance. The tree is easily propagated by seed.

61065. *RUBUS MACROCARPUS* Benth.
Rosaceæ. Colombian blackberry.

From Bogota, Colombia. Seeds presented by F. L. Rockwood. Received July 17, 1924.

To be grown for plant breeders experimenting with small fruits.

These came from the best-looking fruits I have ever seen in the Bogota market. The original source was a barranca near Facatativa, in a place sheltered from the wind. They were from $1\frac{1}{2}$ to $1\frac{1}{2}$ inches long, rather triangular, and of fine appearance. (*Rockwood.*)

61066 to 61073. Cicer arietinum L.
Fabaceae. Chick-pea.

From Pusa, Bihar, India. Seeds purchased from Asjan Singh, imperial agriculturist, Agricultural Research Institute. Received July 7, 1924.

Small-seeded strains introduced for trial as stock feed in the southwestern United States.

61066. *Gram Pusa 6.*

61082 and 61083. Cicer arietinum L.
Fabaceae. Chick-pea.

From Burma, India. Seeds presented by L. Lord, Deputy Director of Agriculture, Northern Circle, Mandalay. Received July 9, 1924.

Introduced for trial as stock feed in the southwestern United States.

61082. *Burmese.* 61083. *Karachi.*

61084. Persea americana Mill. (P. grisea Gaertn. f.). Lauraceae.

Avocado.

From Honolulu, Hawaii. Budwood presented by Gerrit P. Wilder. Received July 24, 1924.

Wilder. The seed of the original tree of the Wilder was obtained by Gerrit P. Wilder from F. W. McFarlane, who lived on the Wiedemann place, now known as the Macdonald Hotel. Mr. Wilder planted the small seedling tree in his private garden at 1930 Ualakaa Street, Makiki, Honolulu, in 1900. Although the tree grew vigorously for eight years and bore fruit abundantly, it gradually began to show signs of unsatisfactory soil conditions, and new trees

were propagated from it by inarching on seedling rootstocks. The variety was maintained through inarching the progeny, from which there has been developed a large number of individuals. When grown in proper environment the Wilder is a vigorous tree of rather upright growth and produces an abundance of fruit of excellent quality. The variety is easily propagated by budding. The fruit ripens during October, November, December, and January.

Fruit: Form, almost spherical or slightly elongated; color, olive green; rind, surface slightly undulated, so thick as to be shell-like; weight, $1\frac{1}{4}$ pounds; flesh, yellow, tinged to green next to the rind, nutty in flavor, and free from fiber; seed, larger than the ideal, tight in the cavity, covered with skin, but a perfect freestone. Keeping qualities of the fruit are very good. (*The Guatemalan Avocado in Hawaii, Hawaii Bull. 51, p. 20.*)

61085 and 61086.

From Nigeria, Africa. Seeds presented by the senior conservator of forests, Oloke-moji, Southern Provinces. Received July 14, 1925.

61085. Carpodinus hirsuta Hua. Apocynaceae.

A common vine in the dry zone of West Africa; according to Holland (*Useful Plants of Nigeria*) it yields a rubber of inferior quality, known as "flake rubber" or "paste rubber," and the latex is commonly used to adulterate that of *Funtumia elastica*. It is one of the so-called "root-rubbers." Introduced for department rubber specialists.

61086. Funtumia elastica (Preuss)
Stapf. Apocynaceae. Lagos rubber tree.

A large forest tree which is very widely distributed throughout central Africa and is the source of Lagos rubber, which is of excellent quality. It is being introduced with a view to including it in the collection of rubber plants now being brought together in southern Florida for investigational purposes.

For previous introduction see S. P. I. No. 58963.

61087. Saccharum officinarum L.
Poaceae. Sugar cane.

From Honolulu, Hawaii. Cuttings presented by Atherton Lee, experiment station of the Hawaiian Sugar-Planters' Association. Received July 10, 1924.

Cuttings of *Striped Tip* sugar cane, introduced for pathologists investigating sugar-cane diseases.

61088 to 61099.

From Africa. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received July 3, 1924. Notes by Doctor Shantz.

61088 and 61089. Voi Taviti. March 31, 1924. Collected from rather dry grassland.

61088. Chloris sp. Poaceae. Grass.
No. 186.

61089. Cynodon plectostachys
(Schum.) Pilg. Poaceae. Grass.

No. 186b. A low, perennial grass with creeping stolons and short blades and upright flowering stems.

1088 to 61099—Continued.

61090. DIOSCOREA LATIFOLIA Benth.
Dioscoreaceae. Acom.

No. 190. Moshi. April 2, 1924. An important element in the natives' diet; grown alone on poles or allowed to cover banana plants.

61091. ERAGROSTIS sp. Poaceae. Grass.

No. 196. M'Kambara, Tanganyika Territory. April 3, 1924. A small grass grown as a semiruderal along the track.

61092. HOLCUS SORGHUM L. (*Sorghum vulgare* Pers.). Poaceae. Grass sorghum.

No. 186a. Karogive, Tanganyika Territory, April 3, 1924. A wild sorghum.

61093. LATIPES SENEGALENSIS Kunth.
Poaceae. Grass.

No. 186c. Voi Taviti. March 31, 1924. Collected from dry grasslands.

61094 to 61097. PHASEOLUS VULGARIS L.
Fabaceae. Common bean.

Moshi. April 2, 1924.

61094. No. 192. Type grown at Moshame, slopes of Mount Kilimanjaro.

61095. No. 193. Recently introduced at Moshame.

61096. No. 194. Red beans; introduced at Moshame.

61097. No. 195. White beans; introduced at Moshame.

61098. SECALE CEREALE L. Poaceae. Rye.

No. 189. Moshi. April 2, 1924. Grown on slopes of Mount Kilimanjaro, at Moshame; altitude about 5,000 feet.

61099. TRITICUM AESTIVUM L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 188. Moshi. April 2, 1924. Grown at Moshame, but not extensively. Does fairly well.

61100. STIZOLOBIUM sp. Fabaceae.
Velvet bean.

From Wembley, England. Seeds secured by C. V. Piper, Bureau of Plant Industry. Received July 26, 1924.

Seeds gray, marbled with black; secured from the Nyasaland exhibit, June, 1924. (*Piper*.)

61101 to 61198. TRITICUM spp. Poaceae.

From Leningrad, Russia. Seeds presented by Prof. N. I. Vavilov, Director of the Bureau of Applied Botany and Plant Breeding. Received June 19, 1924. Notes by Professor Vavilov.

61101 to 61103. TRITICUM AESTIVUM L. (*T. vulgare* Vill.). Common wheat.

61199. *MEDICAGO SATIVA* L. Fabaceæ.
Alfalfa.

From Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

April 19, 1924. Procured from the highest point reached by the Trans-Andean Railroad, at an altitude of about 10,000 feet. (Westover.)

61200. *CITRUS MEDICA* L. Rutaceæ.
Citron.

From the island of Corsica. Cuttings received August 1, 1924.

For testing by horticulturists engaged in citrus-breeding experiments.

61201 to 61223.

From the Union of South Africa. Collected by H. L. Shantz, Bureau of Plant Industry. Received July and August, 1924. Notes by Doctor Shantz.

61201. *MARANTA ARUNDINACEA* L. Araceæ.
Bermuda arrowroot.

No. 292. Livingstonia, Nyasaland. April 30, 1924. Arrowroot grown by the natives on the highlands above Nyasa.

61202. *DISA* sp. Orchidaceæ.

No. 289. Livingstonia, Nyasaland, April 29, 1924. A beautiful blue terrestrial orchid, growing abundantly in mountain grassland west of Nyasa and said to be one of the most beautiful flowers here.

61203. *ORNITHOGALUM* sp. Liliaceæ.

No. 453. Deedorns, Cape Province. June 16, 1924. Lilylike bulbs from the desert at the edge of the karoo.

61204. (Undetermined.)

No. 446. Deedorns, Cape Province. June 16, 1924. A handsome lilylike plant with yellow-tipped, red flowers. Not only is the flower of this plant attractive but the foliage is also somewhat variegated.

61205. *COTYLEDON* sp. Crassulaceæ.

No. 444. Deedorns, Cape Province. June 16, 1924. This forms a fleshy, tree-like plant, reaching a height of 6 feet or more. It is leafless during the dry period, but the whole plant stem usually remains soft and green. At the beginning of growth it develops a bulbous stem which reminds one of true bulbous plants.

61206. (Undetermined.)

No. 445. Deedorns, Cape Province. June 16, 1924. Bulbs of a liliaceous plant about 6 inches in diameter, which usually is very abundant throughout this section. The plant has a curious habit of forming a new bulblet at the base of each of the leaves when the old bulb dies. It is produced in great abundance at the edge of the karoo.

61201 to 61223—Continued.

61207. (Undetermined.)

Same as No. 445 [S. P. I. No. 61206], but has small bulblets.

61208. (Undetermined.)

No. 446a. Deedorns, Cape Province. June 16, 1924. A lilylike plant with attractive, yellow-tipped, red flowers.

61209. *BABIANA* sp. Iridaceæ.

No. 447. Deedorns, Cape Province. June 16, 1924. A very attractive iridaceous plant growing over a large portion of South Africa.

61210. (Undetermined.)

No. 448. Deedorns, Cape Province. June 16, 1924. A bulbous plant similar in general character to Massonia.

61211. (Undetermined.)

No. 449. Deedorns, Cape Province. June 16, 1924. A bulbous plant similar in general character to Massonia.

61212. (Undetermined.)

No. 452. Deedorns, Cape Province. June 16, 1924. A small liliaceous plant.

61213. *BUPHANE DISTICHA* (L. f.) Herbert.
Amaryllidaceæ.

No. 459. Cape Town, Cape Province. June 22, 1924. A plant, typically South African, with a very large bulb and stems a foot in diameter. It contains a very powerful toxic alkaloid called hemanthine, and was one of the sources of arrow poison used by the bushmen. The bulb sends up a large head of small flowers.

61214. *COTYLEDON* sp. Crassulaceæ.

No. 444a. Deedorns, Cape Province. June 16, 1924. This is a fleshy, tree-like plant, reaching a height of 6 feet or more. It is leafless during the dry period, but the whole plant stem usually remains soft and green. At the beginning of growth it develops a thickened stem which reminds one of true bulbous plants.

61215. *GLADIOLUS* sp. Iridaceæ.

No. 287. Livingstonia, Nyasaland. April 29, 1924. A fine, large type, probably yellow flowered.

61216. *GLADIOLUS* sp. Iridaceæ.

No. 288. April 29, 1924. From the west escarpment above Nyasa near Livingstonia. A beautiful, small, pink, frail gladiolus; flowers few but large.

61217. *BULBINE* sp. Liliaceæ.

No. 286. Livingstonia, Nyasaland. April 29, 1924. A fine, tall, wild type, with deep-blue to purple flowers; abundant throughout the grassland.

61218. (Undetermined.)

No. 290. Livingstonia, Nyasaland. Said to have very attractive flowers. These lilies grow in a heavy clay (lateritic) soil in a region where drought occurs but is not very severe.

61219. (Undetermined.)

No. 455. Deedorns, Cape Province. June 16, 1924. From the karoo.

61201 to 61223—Continued.

61220. (Undetermined.)

No. 450. Deedorns, Cape Province. June 16, 1924. A curious tuberous plant.

61221. (Undetermined.)

No. 454. Deedorns, Cape Province. June 16, 1924. A fleshy leaved bulbous plant from the desert and the edge of the karoo.

61222. (Undetermined.)

No. 451. Deedorns, Cape Province. June 16, 1924. A plant with a small green spike.

61223. *COTYLEDON* sp. Crassulaceæ.

No. 444b. Deedorns, Cape Province. June 16, 1924. This is a fleshy, treelike plant, reaching a height of 6 feet or more. It is leafless during the dry period, but the whole plant stem usually remains soft and green. At the beginning of the wet season it develops a thickened stem which reminds one of the true bulbous plants.

61224. *PRUNUS SPINOSA* × *DOMESTICA*. Amygdalaceæ. Hybrid plum.

From Koslov, Tambov Government, Russia. A form developed at the Plant Introduction Garden, Chico, Calif., from one of the original 14 cuttings received in 1911 from I. V. Mijurin, Koslov, through Frank N. Meyer, agricultural explorer. Numbered July, 1924.

Fruit $1\frac{1}{2}$ to $1\frac{3}{4}$ inches in diameter; pale yellow mottled with brownish, irregular blotches; cavity small, shallow; suture more or less prominent; skin thick; flesh yellow, melting, very juicy and deliciously sweet; pit small, practically free.

61225 to 61229. *CORCHORUS* spp. Tiliaceæ. Jute.

From Dacca, eastern Bengal, India. Seeds presented by R. S. Finlow, fiber expert to the Government of Bengal. Received July 30, 1924.

Native varieties of jute introduced for fiber-plant specialists. The quoted notes are from the Bengal Agricultural Journal, vol. 2, no. 1, 1922.

61225. *CORCHORUS OLITORIUS* L.

"Chinsura Green, a selected type of Bogey jute which was raised by the fiber expert to the Government of Bengal and has given exceptionally heavy yields in western Bengal." (P. 7.)

For previous introduction see S. P. I. No. 55973.

61226 to 61229. *CORCHORUS CAPSULARIS* L.

For previous introduction see S. P. I. No. 45809.

61226. *Kalir Char*. Locally grown seeds, Khulua, Bengal.61227. *Kaya Bombai* (mixed with *Kalir Char*).

61228. "R. 85. An eastern Bengal jute with the reputation of being a heavy yielder. It was selected by the fiber expert from the Kakai Bombai strain and is resistant to the disease known as 'chlorosis,' which causes yellowing of the leaves." (P. 7.)

61229. *D. 154*.61230. *JASMINUM SAMBAC* (L.) Ait. Oleaceæ. Arabian jasmine.

From Nogent sur Marne, Seine, France. Plant presented by the director, Colonial Garden. Received August 8, 1924.

Arabian jasmine is cultivated in India for the sake of the oil, used in perfumery, which is obtained from the fragrant flowers. It is now introduced for the use of specialists investigating oil plants which yield perfume.

61231 to 61234.

From South America. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924. Notes by Mr. Westover.

61231. *BROMUS UNIOLOIDES* (Willd.) H. B. K. Poaceæ. Rescue grass.

April 5, 1924. Collected near Sucre, Buenos Aires, Argentina. Locally known as Australian brome or cebadilla. Highly prized as winter pasture grass.

61232. *GALEGA OFFICINALIS* L. Fabaceæ. Goat's-rue.

Collected near Hospital, O'Higgins Province, Chile. This plant makes a very vigorous growth during the summer months and might be of some value in sections of this country where a summer green-manuring crop is desired.

61233. *GOSSYPIMUM* sp. Malvaceæ. Cotton.

June 1, 1924. Collected from a large plant growing along the ditch bank several miles above Alto del Carmen, Chile.

61234. *HORDEUM DISTICHON PALMELLA* Harlan. Poaceæ. Two-rowed barley.

May 2, 1924. Hacienda Eltambo, Mal-lao, Chile.

61235 to 61237. *COIX LACRYMA-JOBI* MAYEN (Rom.) Stapf. Poaceæ.

Adlay.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, Director, Bureau of Agriculture, at the request of P. J. Wester, Bureau of Agriculture. Received September 17, 1924.

The ma-yuen, or adlay, has attracted considerable attention as a cereal for tropical regions. According to Mr. Wester, it is better than upland rice for tropical agriculture in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

61235. *Bontac*.61237. *Davao*.61236. *La Union Red*.

61238 to 61242.

From Buitenzorg, Java. Plants presented by Dr. C. J. J. Van Hall, Department of Agriculture, Buitenzorg, through Carl Hartley, Bureau of Plant Industry. Received July 18, 1924.

61238. *CASTANOPSIS ARGENTEA* (Blume) A. DC. Fagaceæ.

No. 2. An evergreen East Indian chestnut 50 to 60 feet high, with thin, narrow leaves about 7 inches long and dense clusters of spiny burs; each bur is about 2 inches wide and usually contains a single nut an inch in diameter. According to Doctor Hartley, these nuts are edible.

For previous introduction see S. P. I. No. 57732.

61238 to 61242—Continued.

61239 to 61242. *QUERCUS* spp. *Fagaceæ*.
Oak.

These four East Indian oaks are introduced for trial in the warmer parts of the southern United States as shade trees and as possible sources of tannin. The descriptive notes are taken from Miquel's *Flora van Nederlandsch Indie*, vol. 1. and from Ridley's *Flora of the Malay Peninsula*, vol. 3.

61239. *QUERCUS BLUMEANA* Korth.

No. 3. A rather uncommon tree, 40 to 50 feet high, with narrowly oblong, leathery leaves about 8 inches long and roundish silky tomentose acorns three-fourths of an inch wide.

61240. *QUERCUS INDUTA* Blume.

No. 9. A tree with long-pointed, entire leaves and flattened acorns.

61241. *QUERCUS SUNDAICA* Blume.

No. 6. A tall tree, 60 to 80 feet high, with silvery, thinly coriaceous elliptic leaves, and fruits in rather crowded stout spikes. The dark chestnut-colored ovoid-conic acorns are an inch in greatest diameter.

61242. *QUERCUS TEYSMANNII* Blume.

No. 4. A tree with serrate, narrowly oblong, leathery leaves about 6 inches long and ovoid-globose acorns an inch and a half in diameter.

61243 and 61244. *FRAGARIA* spp. *Rosaceæ*.
Strawberry.

From The Hague, Netherlands. Plants presented by the American vice consul, The Hague. Received September 12, 1924.

Dutch strawberry varieties introduced for testing by horticulturists.

61243. *FRAGARIA* sp.*Breadasche*.61244. *FRAGARIA* sp.

"*Deutsch Evern*. A prolific variety with very large, delicious berries." (*J. Abbing & Sons, Zeist, Netherlands, 1922-1923 catalog.*)

61245 to 61252.

From Cape Town, Union of South Africa. Bulbs purchased from W. S. Duke & Co., Cape Town, through H. L. Shantz, Bureau of Plant Industry. Received September 18, 1924.

61245. *BRUNSVIGIA JOSEPHINAE* (Red.)
Ker. *Amaryllidaceæ*.

No. 467. A South African bulbous plant 2 to 3 feet high with eight or ten thick, closely ribbed, strap-shaped leaves and large, brick-red flowers.

61246. *BUPHANE CILIARIS* (L.) Herbert.
Amaryllidaceæ.

No. 470. The flower stalks of this remarkable South African amaryllidaceous plant appear before the leaves and bear 50 to 100 dull-purple flowers. The thick, strap-shaped leaves appear later.

61247. *GLADIOLUS* sp. *Iridaceæ*.

A South African variety.

61245 to 61252—Continued.

61248. *HAEMANTHUS KATHERINAE* Baker.
Amaryllidaceæ. Blood lily.

An attractive bulbous plant, native to South Africa, with three to five oblong, pointed leaves borne on a separate stem which appears with the flowers. The bright-red flowers are produced at the summit of an upright peduncle which grows from the base of the leaf stem.

61249. *ORNITHOGALUM NATALENSE* Baker.
Liliaceæ.

A white-flowered bulbous plant from the Cape of Good Hope, where several members of this genus are known as "chinnerchees." The dried flower clusters are prized there as "everlastings."

61250. *TRITONIA* sp. (*Montbretia* sp.).
Iridaceæ.

The *Tritonias* are South African plants, related to the *ireses*, with narrow leaves and numerous flowers of various colors. In the trade, *Tritonias* are often known as *Montbretias*.

61251. *WATSONIA ROSEA* Ker. *Iridaceæ*.
Bugle lily.

A robust pink-flowered species, 4 to 6 feet high, with strap-shaped narrow leaves. The flowers are in dense or lax spikes, the terminal spikes measuring 6 inches to a foot in length. Native to South America.

61252. *WATSONIA* sp. *Iridaceæ*.
Bugle lily.

The *Watsonias* are South African ornamental plants closely related to the *gladiolus*.

61253. *CANARIUM OVATUM* Engl. *Balsameaceæ*.
Pili nut.

From Manila, Philippine Islands. Nuts presented by H. T. Edwards, Bureau of Plant Industry. Received July 29, 1924.

Pili nuts as grown in the Philippines are quite variable in quality, and these now sent in by Mr. Edwards are from particularly choice strains. The tree which is rarely cultivated, is tall, at times reaching 130 feet in height, with dark-green, pinnate leaves over a foot long. According to P. J. Wester (Food Plants of the Philippines), the triangular, pointed nut, inclosed in a black, shining shell, is excellent when eaten raw or roasted and is of high food value.

For previous introduction see S. P. I. No. 54434.

61254 to 61257.

From Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924. Notes by Mr. Westover.

61254. *PANICUM MILIOIDES* Nees. *Poaceæ*.
Grass.

April, 1924. Collected near Sucre, Buenos Aires.

61255 to 61257. *PASPALUM DILATATUM*
Poir. *Poaceæ*. *Dallis grass*.

61255. March 28, 1924. Collected near Mercedes, Buenos Aires.

61254 to 61257—Continued.

61256. April 5, 1924. Collected near Sucre, Buenos Aires, Argentina. This is one of the most abundant grasses in this locality.

61257. March 30, 1924. Collected near Lupan de Cuyo, Mendoza, Argentina.

61258 to 61267. *SOJA MAX* (L.) Piper
(*Glycine hispida* Maxim.). Fabaceae.
Soy bean.

From Marugame, Sanuki Province, Japan. Seeds presented by J. Woodrow Hassell. Received August 6, 1924.

Introduced for testing by agronomists engaged in soy-bean experiments.

61258. No. 1.	61263. No. 6.
61259. No. 2.	61264. No. 7.
61260. No. 3.	61265. No. 8.
61261. No. 4.	61266. No. 9.
61262. No. 5.	61267. No. 10.

61268. *CLITANDRA ELASTICA* Cheval.
Apocynaceae.

From Nigeria, Africa. Seeds presented by the senior conservator of forests, Oloke-mej, Southern Provinces. Received July 29, 1924.

A black rubber of good quality is obtained from this plant by the natives of Nigeria, where it grows wild. It is described by Holland (*Useful Plants of Nigeria*) as a climbing plant up to 60 feet in height, with elliptic, dark-green leaves, paler below, and spherical fruits the size of a mandarin orange. It is one of the principal sources of vine rubber on the Ivory Coast. When cut to the ground the vine shoots up again from the base. It is introduced for department rubber specialists.

61269 and 61270.

From Summit, Canal Zone. Seeds presented by Holger Johansen, Agronomist, Plant Introduction Garden. Received August 11, 1924.

61269. *ARTOCARPUS COMMUNIS* Forst.
Moraceae. Breadfruit.

The jackfruit (*Artocarpus integra*) has been grown successfully in southern Florida. The closely allied breadfruit, however, has not yet received an adequate trial in that State, and the department is now attempting to establish this tree in that region. Although it is not anticipated that the breadfruit tree will ever become of economic importance in the continental United States, it is thought that it may prove an interesting addition to the list of tropical economic plants which can be grown in the gardens of southern Florida.

For previous introduction see S. P. I. No. 57771.

61270. *RHEEDIA* sp. Clusiaceae.

Seeds of a native *Rheedia*. (Johansen.)

Some of the members of this genus of tropical trees have edible fruits. The mangosteen (*Garcinia mangostana*) belongs to this family.

61271. *HIBISCUS* sp. Malvaceae.

From Koro Levu, via Nadroga, Fiji. Seeds presented by E. M. Bucknell. Received August 1, 1924.

A very handsome hibiscus with single flowers; these are deep, rich red. The plant is straggly in habit, being almost a vine. Propagation is easily effected by seeds. (Bucknell.)

61272. *AVENA ABYSSINICA* Hochst. Poaceae.
Oats.

From Asmara, Eritrea, Africa. Seeds presented by the Direttore dell' Ufficio Agrario Sperimentale. Received August 1, 1924.

In the upper part of the middle, or sub-tropical zone, of Abyssinia, where the altitude is approximately 8,000 feet, and also at still higher altitudes in some places, this species of oats is cultivated both as a cereal and for forage, according to Chiorenda (Osservazioni Botaniche nell' Etiopia). Besides the typical form, a number of local strains have been reported.

61273. *CORYLOPSIS GOTOANA* Makino.
Hamamelidaceae.

From Jamaica Plain, Mass. Cuttings presented by Prof. C. S. Sargent, Arnold Arboretum. Received August 12, 1924.

This is the hardiest member of the genus *Corylopsis*, according to E. H. Wilson, of the Arnold Arboretum, where the plant has never suffered winter injury. It is a wide-spreading, twiggy shrub with delicately fragrant, lemon-yellow flowers in slender, pendent racemes and is one of the first shrubs to bloom in the spring. The individual flowers, three-eighths of an inch across, are rich in nectar. This species is native to the rugged mountains of central Japan.

61274 to 61278.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, Regius Keeper, Royal Botanic Garden. Received June 16, 1924. Notes by Mr. Smith.

Local Tibetan strains of crop plants secured for testing by agronomists.

61274. *HORDEUM VULGARE COELESTE* L.
Poaceae. Six-rowed barley.

No. 1. From Tuna, at an altitude of about 14,500 feet.

61275. *HORDEUM VULGARE COELESTE* L.
Poaceae. Six-rowed barley.

No. 2. From Dochen, at an altitude of about 14,000 feet.

61276. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 3. From Khangma, at an altitude of about 13,500 feet.

61277 and 61278. *PISUM SATIVUM* L., Fabaceae. Pea.

61277. No. 4. From Khangma, at an altitude of about 13,500 feet.

61278. No. 5. From Grantse, at an altitude of about 13,000 feet.

61279 to 61298. *ORYZA SATIVA* L. Poaceae.
Rice.

From Canton, China. Seeds presented by Edward Shim, Department of Agriculture, Canton Christian College. Received July 15, 1924.

61279. *Bak Hok Lau*.

61279 to 61298—Continued.

61280. *Fah Loh Check*.
 61281. *Goi Leong Tung Koon Bak*.
 61282. *Ho Kau Guk*.
 61283. *Siu Goo Sun*.
 61284. *Ka Ying Zao*.
 61285. *Kong Sai Zao*.
 61286. *Lok Yip Chim*.
 61287. *Ngung Chim*.
 61288. *Siu Goo Sun*.
 61289. *So She Bak*.
 61290. *Sui Sun Guk*.
 61291. *Su Lo Bak*.
 61292. *Szechuan Chim*.
 61293. *Tai Yip Chim*.
 61294. *Tung Koon Bak*.
 61295. *Vung Ying Chim*.
 61296. *Vung Ying Chun Chim*.
 61297. *Yuen Zui Hung*.
 61298. *Zau Kau Lau*.

61299 and 61300. *SOJA MAX (L.) Piper*
(Glycine hispida Maxim.). Fabaceæ.
 Soy bean.

From Fukuoka, Japan. Seeds presented by Dr. Tyozaburo Tanaka, in charge, Horticultural Institute, Department of Agriculture, Kyushu Imperial University. Received July 24, 1924. Notes by Doctor Tanaka.

61299. *Shiro Aki Daidzu* (white autumn bean). From the Saga Prefectural Agricultural Experiment Station.

61300. *Kuro Aki Daidzu* (black autumn bean). From the Saga Prefectural Agricultural Experiment Station.

61301. *GARCINIA MANGOSTANA L.* Clusiaceæ.
 Mangosteen.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received August 18, 1924.

Mangosteen seeds, originally from Asia; introduced for testing in the tropical dependencies of the United States.

For previous introduction see S. P. I. No. 58027.

61302. *AMYGDALUS PERSICA* × *PERSICA*
NECTARINA. Amygdalaceæ.

Hybrid peach.

A hybrid originated at the Plant Introduction Garden, Chico, Calif., and now numbered, July 1924, for convenience in distribution.

This variety was produced by J. E. Morrow, superintendent of the Chico Garden, by crossing the Bolivian Cling (S. P. I. No. 36126) and the Quetta nectarine (S. P. I. No. 34684). A description of the fruit follows:

Fruit nearly round, 2 inches in diameter; cavity medium sized, mid-abrupt; suture mostly distinct, shallow; apex with very small point; skin light greenish yellow, overlain with red at stem end and side, slightly tough, separating readily

from the flesh, with heavy tomentum; flesh white, little fiber, juicy, firm, pleasing peachy flavor, clinging to pit; pit large for size of fruit, $1\frac{1}{4}$ inches by 1 inch. A good fruit for home use.

61303. *LYCOPERSICON ESCULENTUM* Mill.
 Solanaceæ. Tomato.

From Nancagua, Chile. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

May 7, 1924. This is said to be the wild tomato, but probably it is the cultivated form which has escaped. (Westover.)

61304 to 61309. *AVENA* spp. Poaceæ.

From Melbourne, Victoria, Australia. Seeds presented by A. E. V. Richardson, Superintendent of Agriculture. Received August 6, 1924. Quoted notes from the Australian Institute of Science and Industry, Bulletin No. 23.

61304 and 61305. *AVENA STERILIS L.* Oats.

61304. "Algerian. A very good general-purpose oat, giving excellent yields in all districts except those where a very early variety is necessary. Occasionally reported as having a tendency to shatter and lodge, but on the whole does neither. Season medium; stooling medium to abundant. The panicle is equilateral, spreading, erect, and rather short." (P. 27.)

61305. "Calcutta. Straw weaker than Algerian [S. P. I. No. 61304], and more inclined to lodge. This variety is reported to be early in most districts, but it is sometimes considered as midseason. The panicle is equilateral, spreading, and erect. (P. 26.)

61306 to 61308. *AVENA SATIVA L.* Oats.

61306. "Dun. A general-purpose variety for the colder districts. Season late; stooling abundant; the panicle equilateral and erect." (P. 21.)

61307. "Quandong. Medium stouter as compared with Ruakura [S. P. I. No. 61308], but has slightly taller, stronger straw. Good variety for dry districts. Season early; panicle equilateral, spreading, erect, and rigid." (P. 22.)

61308. "Ruakura. Good general-purpose oat. Season early; stooling abundant; panicle equilateral, spreading, erect, rigid, lateral branches rigid." (P. 25.)

61309. *AVENA SATIVA* × *STERILIS*.

Hybrid oats.

"Yarran. Season early; stooling medium, panicle equilateral, erect, long, branches erect, number of lateral branches seven to twelve." (P. 24.)

61310 and 61311. *ZEA MAYS L.* Poaceæ.
 Corn.

From Peru, South America. Seeds collected by Fred D. Richey, of the Bureau of Plant Industry, and Prof. R. A. Emerson, of Cornell University. Received July 31, 1924.

Introduced for agronomists experimenting with corn varieties.

61310. *Laurel*.

61311. *Granada*.

61312. CITRUS AURANTIFOLIA (Christm.)

Swingle, Rutaceae. Lime.

From Panama. Seeds collected by David Fairchild, Bureau of Plant Industry. Received August 23, 1924.

August 2, 1924. A wild lime growing in dense shade on the new Lathrop Trail just opened up across Barro Colorado Island. The fruits were of medium size, with few seeds, and of excellent quality. (Fairchild.)

61313. MARTINEZIA EROSA Linden. Phœnicaceae. Palm.

From Santiago de las Vegas, Cuba. Seeds presented by Gonzalo Fortun, Director, Estación Experimental Agronómica, through David Fairchild, Bureau of Plant Industry. Received July 25, 1924.

A small ornamental feather-leaved palm from tropical America which is covered throughout with long, needlelike spines. A related species (*M. caryotaefolia*) is grown to some extent in lower Florida.

For previous introduction see S. P. I. No. 51724.

61314. HORDEUM DISTICHON PALMELLA Harlan. Poaceae. Two-rowed barley.

From Czechoslovakia. Seeds presented by Scheuker & Co., Bron. Received August 12, 1924.

To be grown for comparison and cultural tests.

61315 and 61316. URCEOLA ESCULENTA (A. DC.) Benth. Apocynaceae.

From Maymyo, India. Seeds presented by Charles T. Bogg, Superintendent, Government Botanic Garden. Received July 14, 1924.

A vigorous climber from eastern India, which, according to Watt (Dictionary of the Economic Products of India), has received some consideration in that country as a source of rubber. In Burma the plant is cultivated to some extent for the edible fruit, which is about the size of an orange and popular with the natives. It is now introduced for department specialists experimenting with rubber-yielding plants.

61315. From the Conservator of Forests, Tavoy. (Bogg.)

61316. From the Extra Assistant Conservator of Forests, Mergui. (Bogg.)

61317 to 61321.

From Japan. Seeds presented by K. Matsu-shima, through W. S. Field, San Francisco, Calif. Received July 15, 1924.

A collection of seeds sent in without notes; to be grown and tested for value as forage.

61317. AGROPYRON SEMICOSTATUM Nees. Poaceae. Grass.

A perennial, fibrous-rooted grass, with erect stems and narrowly linear leaves. Native to Afghanistan.

61318. AGROPYRON sp. Poaceae. Grass.**61319. HORDEUM NODOSUM L. (H. secalinum Schreb.). Poaceae. Grass.**

A perennial, European grass, of upright habit, about a foot in height.

61317 to 61321—Continued.**61320. MELILOTUS SUAVEOLENS Ledeb. Fabaceae. Sweet clover.**

A Siberian sweet clover introduced for cultural and comparison tests.

61321. VICIA AMOENA Fisch. Fabaceae. Vetch.

A perennial Siberian vetch, with stems up to 4 feet in length and purplish flowers.

61322. MELILOTUS INDICA (L.) All. Fabaceae. Sweet clover.

From Simla, India. Seeds presented by H. E. J. Peake, Khaltoo Fruit Orchards, Solan brewery. Received July 17, 1924.

A local strain of annual yellow melilot, collected near the Solan brewery; introduced for testing by agronomists.

61323. HETEROSPATHE ELATA Scheff. Phœnicaceae. Palm.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, Director, Bureau of Agriculture, at the request of P. J. Wester, Manila. Received July 18, 1924.

A tall, unarmed palm, with a slender, straight stem and long pinnate leaves, growing in protected situations and where the rainfall is evenly distributed. It is one of the most attractive and graceful palms that I have seen, and from my experience with it at Lamao it will make a good plant for the conservatory and possibly a good house palm. (Wester.)

For previous introduction see S. P. I. No. 46340.

61324 to 61328.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received July 5, 1924.

61324. ANOPTERUS GLANDULOSUS Labill. Escalloniaceae.

A handsome evergreen shrub, abundant in Tasmanian forests, with leathery, toothed leaves and rather large flowers, white with a rosy tint, produced in erect, terminal racemes.

61325 and 61326. BILLARDIERA LONGIFLORA Labill. Pittosporaceae.

A twining shrub, sometimes several feet in length, with leaves varying from oval to linear in shape and from half an inch to 2 inches in length. The flowers are pendulous on solitary stems an inch long. This plant grows wild along watercourses in Australia and Tasmania.

For previous introduction see S. P. I. No. 56562.

61325. Pink flowers.**61326. Blue flowers.****61327. DRIMYS LANCEOLATA (Poir.) Baill. (D. aromatica F. Muell.). Magnoliaceae.**

The bark of this Tasmanian shrub or small tree, like that of its Chilean relative (*Drimys winteri*), possesses aromatic properties, and the round drupes, about the size of a pea, are used as a condiment.

61324 to 61328—Continued.

61328. *RICHEA DRACOPHYLLA* R. Br. Euphorbiaceae.

A stout Tasmanian shrub or small tree, described by Bentham (*Flora Australiensis*) as having long, narrow leaves crowded at the ends of the branches, and white or pink flowers, nearly half an inch long, in dense terminal clusters.

61329. *EUPHORBIA ABYSSINICA* Gmel. Euphorbiaceae.

From Asmara, Eritrea, Africa. Seeds presented by the Direttore dell' Ufficio Agrario Sperimentale. Received August 1, 1924.

E. O. Fenzl, of Tripoli, Libia, states (under S. P. I. 61366) that this plant may prove of special interest, since it grows in the poorest and driest soil, attains a height of 30 to 40 feet, and yields a large quantity of latex containing about 5 per cent of first-class rubber.

61330. (Undetermined.)

From Balavaini, Marovo Lagoon, Solomon Islands. Tubers presented by H. Trevor Fairbrother. Received August 6, 1924.

The tubers of this plant are small, about the size, shape, and flavor of Morton's tinned new potatoes. The plant bears in about two months from planting, and the "potatoes" are not borne underground, but on the vine, which bears from 300 to 2,000 tubers of varying size. This is an ideal substitute for the potato. (*Fairbrother.*)

61331. *CRATAEGUS ORIENTALIS* Pall. Malaceae. Hawthorn.

From Kew, England. Seeds presented by Dr. Arthur W. Hill, Director, Royal Botanic Gardens. Received November 10, 1923. Numbered July, 1924.

A shrub or small tree, native to dry, stony places in Asia Minor and southeastern Europe. According to the late Frank N. Meyer (in his note under S. P. I. 26765), it is able to withstand much heat and drought. The flowers are in dense corymbs, and the fruits are dark red.

For previous introduction see S. P. I. No. 26765.

61332 and 61333. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Edinburgh, Scotland. Seeds presented by John Donaldson & Co. through G. C. Edler, Bureau of Agricultural Economics. Received August 15, 1924.

Local clover strains from two localities in England, introduced for testing by clover specialists.

61332. No. 1.

61333. No. 2.

61334 to 61352.

From Sapporo, Japan. Seeds presented by J. Minami, College of Agriculture, Sapporo, through C. R. Ball, Bureau of Plant Industry. Received August 15, 1924.

Introduced for specialists engaged in experimenting with various types of cereals.

61334 to 61338. *HORDEUM DISTICHON* PALMELLA Harlan. Poaceae.

Two-rowed barley.

61334 to 61352—Continued.

61334. *Chevalier* (spring).

61335. *Golden melon* (spring).

61336. *Hanna* (spring).

61337. *Hokudai No. 1* (spring).

61338. *Date No. II* × *Hokudai No. I* (winter).

61339 to 61342. *HORDEUM VULGARE* PALLIDUM Seringe. Poaceae.

Six-rowed barley.

61339. *Erhardt Frederiksens* (spring).

61340. *Imperial* (spring).

61341. *Date No. II* (winter).

61342. *Date No. II* × *Hokudai No. I* (winter).

61343 to 61350. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

61343. *Green Mountain* (spring).

61344. *Sapporo* (spring).

61345. *White fife* (spring).

61346. *Akakawa aka* (red grain, winter).

61347. *Red genealogical* (winter).

61348. *Sandmilka* (winter).

61349. *Shirokawa shiro* (white grain, winter).

61350. *White Champion* (winter).

61351 and 61352. *TRITICUM DURUM* Desf. Poaceae. Durum wheat.

61351. *Medea* (spring).

61352. *Roumania* (spring).

61353 to 61355. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Lemberg, Poland. Seeds received August 28, 1924. Introduced for testing by clover breeders.

61353. (No. 1.)

61355. (No. 3.)

61354. (No. 2.)

61356 to 61365. *CICER ARIETINUM* L. Fabaceae. Chick-pea.

From Poona, Bombay, India. Seeds presented by Dr. William Burns, Economic Botanist, College of Agriculture. Received August 20, 1924. Notes by Doctor Burns.

Introduced for trial as stock feed in the southwestern United States.

61356. No. 1. White variety from Poona.

61357. No. 2. Yellow variety from Poona.

61358. No. 3. Small, yellow variety from Dohad.

61359. No. 4. Small, white variety from Dohad.

61360. No. 5. Small, red variety from Dohad.

61361. No. 6. Small variety from Ahmednagar.

61362. No. 7. Yellow variety from Belgam.

61363. No. 8. From Belgam.

61356 to 61365—Continued.

61364. No. 9. Karachi from Mandalay.

61365. No. 10. Burmese from Mandalay.

61366 and 61367.

From Tripoli, Libia, North Africa. Seeds presented by Dr. E. O. Fenzi. Received August 20, 1924.

61366. *EUPHORBIA ABYSSINICA* Gmel. Euphorbiaceae.

This may prove of special interest, since it grows in the poorest and driest soil, attaining a height of 30 to 40 feet, and yields a large quantity of latex containing 5 per cent of first-class rubber. (Fenzi.)

For previous introduction see S. P. I. No. 61329.

61367. *SALVADORA PERSICA* L. Salvadoraceae.

A shrub or small tree which grows commonly in dense clumps on the shores of Lake Chad, Africa. The seeds contain about 45 per cent of fat, according to Holland (Useful Plants of Nigeria); this is suitable for making candles. The pungent shoots and leaves are eaten as salad and also given to stock as fodder.

For previous introduction see S. P. I. No. 53845.

61368 to 61372. *PHASEOLUS CALCARATUS* Roxb. Fabaceae. Rice bean.

From Mandalay, Burma. Seeds presented by M. McGibbon, Economic Botanist, Mandalay, through C. V. Piper, Bureau of Plant Industry. Received August 20, 1924.

Five varieties of rice beans obtained for testing by forage-crop specialists.

61368. *Be or Pe yin*.61369. *Bete or Chinpè*.61370. *Betè Be or Chinpè* (large).61371. *Betè Be or Chinpè* (small).61372. *Kachin-pè*.61373. *BAMBOS POLYMORPHA* Munro. Poaceae. Bamboo.

From Dehra Dun, United Provinces, India. Seeds presented by P. C. Kanjilal, Forest Botanist, Forest Research Institute and College. Received August 13, 1924.

A tropical species found in Bengal and Burma. The plants grow in tufts or clumps, often reaching a height of 60 to 80 feet. The leaves are small, 3 to 7 inches long, and from one-fourth to one-half an inch wide. Suitable only for extreme southern Florida and our tropical insular regions; should thrive in the Canal Zone. The plant is not abundant in the Indian forests but is often met with in tropical botanical gardens such as the one at Calcutta, India.

61374 to 61377. *COLOCASIA* spp. Araceae. Taro.

From Papeete, Tahiti. Tubers presented by C. C. Campbell. Received August 25, 1924. Notes by Mr. Campbell.

61374. *COLOCASIA* sp.

Black variety; a dry-land taro from my plantation on the island of Moorea, at an altitude of about 300 feet.

61374 to 61377—Continued.

61375. *COLOCASIA* sp.

This is called "Chinese taro" here; I bought it in the market at Papeete.

61376. *COLOCASIA* sp.

Red variety, from the same locality as the black variety [S. P. I. No. 61374].

61377. *COLOCASIA* sp.

This is called "tarua" here; it is a very good dry-land plant and was grown on my plantation on Tahiti, at an altitude of 50 feet.

61378 to 61384. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Czechoslovakia. Seeds presented by Dr. Rudolf Kuraz, Czechoslovakian Legation, Washington, D. C. Received August 25, 1924.

Local strains of red clover introduced from Czechoslovakia for breeding tests.

61378. No. 1-B. 61382. No. 5-B.

61379. No. 2-B. 61383. No. 6-B.

61380. No. 3-B. 61384. [No notes.]

61381. No. 4-B.

61385. *ACROCOMIA SCLEROCARPA* Mart. Phœnicaceae. Macauba palm.

From Vera Cruz, Mexico. Seeds presented by Dr. C. A. Purpus, Zacuapam. Received August 26, 1924.

A graceful, spiny, tropical American palm, 30 to 45 feet high, with a terminal cluster of narrow, pinnate leaves. When matured, the inside of the trunk furnishes excellent starch equal in quality to that of the cassava plant. The leaves yield strong fiber, utilized by the natives of Paraguay for making hammocks. From the yellowish fruits, about an inch in diameter, an excellent edible oil is expressed.

For previous introduction see S. P. I. No. 53487.

61386 and 61387.

From La Providencia, Chiapas, Mexico. Presented by Dr. C. A. Purpus. Received August 20, 1924.

61386. *CHAMAEDOREA TEPEJILOTE* Liebm. Phœnicaceae. Palm.

Seeds of a relative of the pacayito (*Chamaedorea elegans*); this is a slightly larger palm, becoming about 10 feet high, with leaves 4 feet long. Doctor Purpus says that the undeveloped flowers make an excellent vegetable and are eaten throughout the State of Vera Cruz, Mexico. It grows best in shady places.

61387. *XANTHOSOMA VIOLACEUM* Schott. Araceae. Yautia.

Corms of a very handsome Mexican plant, related to the elephant-ear. The leaves are dark bluish green with very dark stems.

61388 to 61392.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

61388. *AELUROPUS LITTORALIS* (Gouan) Parl. Poaceae. Grass.

A hardy grass which thrives in sandy places and is said to yield hay of high quality.

61388 to 61392—Continued.

61389 to 61391. *AGROPYRON* spp. Poaceæ.
Grass.

61389. *AGROPYRON ORIENTALE* (L.) Roem. and Schult.

An annual, much-branched grass, of prostrate-ascending habit, native to sandy places in Asia Minor and Turkestan.

61390. *AGROPYRON SIBIRICUM* (Willd.) Beauv.

A perennial, cespitose grass, native to Siberia, with erect or ascending stems about 15 inches high.

For previous introduction see S. P. I. No. 57222.

61391. *AGROPYRON TRITICEUM* Gaertn.

An annual Siberian grass, much branched at the base, with stems 8 inches or less in length.

61392. *ALHAGI PSEUDALHAGI* (Bieb.) Desv. (*A. camelorum* Fisch.). Fabaceæ.
Camel's thorn.

The camel's thorn is a very prickly, herbaceous, perennial plant, native to central Asia. It grows on very dry lands, often strongly alkaline, but is likely to become a serious weed if allowed to get beyond control. The pinkish brown flowers appear to be rich in nectar. Introduced for forage-crop specialists.

61393. *ACACIA CAVENIA* (Molina) Bertero. Mimosaceæ. Cavan.

From Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

A much-branched, spiny shrub about 20 feet high, native to Chile. The large, globular flower heads are deep yellow and very fragrant. A good hedge plant.

61394 to 61401.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

61394. *AMMODENDRON KARBLINI* Fisch. and Mey. Fabaceæ.

A yellow-flowered shrub, native to the shores of the Caspian Sea.

61395. *ARTEMISIA SONGARICA* Schrenk. Asteraceæ. Wormwood.

A low, shrubby plant, closely related to the wormwoods.

61396 to 61398. *ASTRAGALUS* spp. Fabaceæ.

61396. *ASTRAGALUS CONTORTUPLICATUS* L.

An annual plant, with erect or ascending stems 4 to 15 inches long, native to southern Europe.

61397. *ASTRAGALUS TESTICULATUS* Pall.

A perennial, cespitose, densely hairy astragalus from the desert regions of southern Siberia.

61398. *ASTRAGALUS VULPINUS* Willd.

A perennial astragalus from the desert regions of southeastern Siberia.

61399. *AVENA SATIVA* L. Poaceæ. Oats.

A local strain introduced for cultural tests.

61394 to 61401—Continued.

61400. *BROMUS DANTHONIAE* Trin. Poaceæ.
Grass.

An annual grass, usually upright or ascending in habit, native to southern Europe and central Asia.

61401. *BROMUS JAPONICUS* Thunb. Poaceæ.
Grass.

A biennial, upright or ascending grass of wide distribution in Europe and Asia. It commonly becomes 1 to 2 feet high.

61402. *MEDICAGO SATIVA* L. Fabaceæ.
Alfalfa.

From Chile. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

June 10, 1924. These seeds were procured through Williamson & Co., and are said to come from the Huasco Valley. (Westover.)

61403. *CAPPARIS SPINOSA* L. Cappari-
daceæ. Capér.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

A trailing shrub armed with stipular spines, with leathery roundish leaves and large, white flowers. The buds are pickled as "capers." Native to the Mediterranean region.

61404 to 61406. *PROSOPIS* spp. Mimosaceæ.

From South America. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924. Notes by Mr. Westover.

61404. *PROSOPIS* sp.

Lampa, Chile. May 13, 1924. Trees very large, with trunk sometimes attaining a diameter of 1½ feet or more.

61405. *PROSOPIS* sp.

Paso de los Andes, Mendoza, Argentina. March 31, 1924.

61406. *PROSOPIS* sp.

Alto del Carmen, Chile. June 1, 1924.

61407. *CICER ARIETINUM* L. Fabaceæ.
Chick-pea.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

Introduced for testing as forage.

61408 to 61410. *PASPALUM DISTICHUM* L. Poaceæ.
Grass.

From Chile. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924. Notes by Mr. Westover.

61408. Cunaco. May 7, 1924.

61409. June 5, 1924. From the estate of Señor Izquierdo, Santa Ines.

61410. May 7, 1924. Collected near Nancagua. Forms the main pasture grass in this region and grows as a weed in the cultivated fields.

61411 and 61412.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

61411. *CRYSIS ACULEATA* (L.) Ait. Poaceae. Grass.

A spreading annual grass, native to the Mediterranean region.

61412. *DELPHINIUM RUGULOSUM* Boiss. Ranunculaceae. Larkspur.

An annual plant, described by Boissier (*Flora Orientalis*) as being 4 to 5 inches high, often with several stems, and with grayish blue flowers.

61413 and 61414. *PASPALUM DISTICHUM* L. Poaceae. Grass.

From Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

61413. March 31, 1924. This grass, similar to carpet grass, is found around irrigating ditches and roadways and in vineyards near Mendoza. (*Westover*.)

61414. April 5, 1924. Collected at Sucre. This grass, highly relished for pasture, is common along the roads and in closely grazed pastures. (*Westover*.)

61415 to 61419.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

61415. *ECHINOCHLOA CRUSGALLI* (L.) Beauv. Poaceae. Barnyard grass.

Introduced for testing by forage-plant specialists.

61416. *ELYMUS ARALENSIS* Regel. Poaceae. Grass.

A tall, erect, perennial grass, native to Siberia.

61417. *ELYMUS GIGANTEUS* Vahl. Poaceae. Grass.

A tall, erect, perennial grass, native to Siberia.

61418. *EPHEDRA DISTACHYA* L. Gnetales.

A low, decumbent shrub with pale or bluish green stems and scarlet, berrylike fruits. Native to southern Europe and western Asia.

61419. *ERAGROSTIS MINOR* Host. Poaceae. Grass.

An annual, much-branched grass, with jointed, ascending stems up to a foot and a half long. Widely distributed throughout the North Temperate Zone.

61420. *PASPALUM DISTICHUM* L. Poaceae. Grass.

From Chile. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

June 7, 1924. Seeds presented by Enrique Matte, Buin. (*Westover*.)

61421. *EVERSMANNIA SUBSPINOSA* (Fisch.) B. Fedtsch. Fabaceae.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

A shrubby, slightly spiny plant, native to arid regions in southeastern Russia.

61422. *PHALARIS BULBOSA* Jusl. Poaceae.

From Buenos Aires, Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

April 8, 1924. Obtained from the Bridger brothers. (*Westover*.)

61423 to 61427.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

61423. *FRITILLARIA KARELINI* (Fisch.) Baker. Liliaceae.

A dwarf, compact species, which, according to Boissier (*Flora Orientalis*), has lilac flowers produced in 3 to 12 flowered racemes.

61424 to 61427. *GLYCYRRHIZA* spp. Fabaceae. Licorice.

61424. *GLYCYRRHIZA ASPERA* Pall.

A perennial plant with ascending stems and purplish flowers; found native in semiarid regions of southern Siberia.

61425. *GLYCYRRHIZA GLABRA* L.

A perennial, somewhat woody plant, with thick, subterranean runners and stout, upright stems sometimes 3 feet high. Native to southern Europe and Turkistan.

61426. *GLYCYRRHIZA TRIPHYLLA* Fisch. and Mey.

An erect, perennial plant, 1 to 2 feet high, with pinkish white flowers. Native to Siberia.

61427. *GLYCYRRHIZA URALENSIS* Fisch.

An erect perennial plant with hairy stems; native to the Ural Mountains, Siberia. Introduced for testing as forage.

61428. *POLYPOGON CRINITUS* Trin. Poaceae. Grass.

From Chile. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

Boros. May 24, 1924. (*Westover*.)

61429. *HELEOCHLOA SCHOENOIDES* (L.) Host. Poaceae. Grass.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

A low, perennial, spreading grass with dense, spike-like panicles. Native to the Mediterranean region.

61430 to 61432. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

From Chile. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

These wheats, procured from a seedsman in Chile, are said to be the three varieties most commonly grown. (*Westover*.)

61430. *Blanco* wheat.

61431. *Egypto* wheat.

61432. *Florence* wheat.

61433. LIMONIUM OTOLEPIS (Schrenk)
Kuntze (*Statice otolepis* Schrenk).
Plumbaginaceae. Sea lavender.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

A perennial plant, native to Turkestan, with small, narrowly ovate leaves and short spikes of white flowers.

61434 and 61435.

From South America. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924. Notes by Mr. Westover.

61434. SOLANUM MURICATUM Ait. Solanaceae. **Pepino.**

Ovalle, Chile. June 1, 1924. One sees large acreages of this plant in the small irrigated valleys of northern Chile. The fruits, highly prized among the natives, are very sweet and juicy and rather palatable. They are sold everywhere in the markets, and the natives even flock around all the trains in an effort to sell them.

61435. SORGHASTRUM sp. Poaceae. **Grass.**

April 8, 1924. These seeds, said to have come originally from Brazil, were purchased in a store in Buenos Aires under the name of Yarogua. They are especially suited to wet lands.

61436 to 61438.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

61436. MEDICAGO SATIVA L. Fabaceae. **Alfalfa.**

Introduced for cultural and comparison tests.

61437. MELILOTUS ALBA Desr. Fabaceae. **White sweet clover.**

Introduced for testing by forage-crop specialists.

61438. PEGANUM HARMALA L. Zygophyllaceae.

An erect, strong-scented, shrubby plant, 2 to 3 feet high, with irregularly cut leaves and terminal, white flowers. Native to the Mediterranean region.

61439 and 61440.

From Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

61439. SPOROBOLUS SUBINCLUSUS Phil. Poaceae. **Grass.**

March 30, 1924. This grass is abundant in the pastures around Lupan de Cuyo, Mendoza, but is apparently not relished by cattle. (Westover.)

61440. STENOTAPHRUM SECUNDATUM (Walt.) Kuntze. Poaceae. **Grass.**

April 8, 1924. Collected southeast of Buenos Aires, where it is highly esteemed as a pasture grass. (Westover.)

61441. POLYPOGON MARITIMUS Willd. Poaceae. **Grass.**

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

A low, annual grass, with laxly ascending stems not over a foot in length. Native to the Mediterranean region.

61442 and 61443.

From South America. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924. Notes by Mr. Westover.

61442. STIPA PAPPOSA Nees. Poaceae. **Grass.**

April 5, 1924. Collected near Sucre, Argentina. This grass is apparently not relished by cattle so long as other grasses are available.

61443. VICIA sp. Fabaceae. **Vetch.**

Placilla, Chile. May 24, 1924.

61444. SPHAEROPHYSA SALSULA (Pall.) DC. Fabaceae.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

A perennial herbaceous plant, native to Turkestan, with erect stems and racemes of purplish flowers.

61445. ZEA MAYS L. Poaceae. **Corn.**

From Chile. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received July 14, 1924.

Hacienda El Tambo, Mallao. May, 1924. (Westover.)

61446 and 61447.

From Omsk, Russia. Seeds presented by Prof. K. Murashinsky, Siberian Agricultural Academy. Received June 24, 1924.

61446. TRIGONELLA ARCUATA Meyer. Fabaceae.

An annual leguminous plant found native in dry situations in Asia Minor.

61447. TULIPA BORSZCZOWI Regel. Liliaceae. **Tulip.**

A Russian tulip with stems 12 to 18 inches high, bluish green, narrowly ovate leaves up to 6 inches in length, and red flowers with black blotches at the base of the petals.

61448 to 61477. HOLCUS SORGHUM L. (*Sorghum vulgare* Pers.). Poaceae. **Sorghum.**

From Khartum, Anglo-Egyptian Sudan. Seeds presented by the Government Experiment Farm, through H. V. Harlan, Bureau of Plant Industry. Received August 25, 1924.

61448. Abu Carakish.

61449. Abu Khimmer.

61450. Abu Shanab No. 9.

61451. Ahamar No. 21.

61452. Beid-el-Chor.

61453. Dura Abiad No. 1.

61454. Dwarf Feterita No. 811.

61455. Dwarf Hegari.

61456. Dwarf Milo No. 1933.

61457. El Hacherag.

61458. Feterita.

61459. Feterita No. 25.

61460. Gassabi.

61461. Hegeiri.

61448 to 61477—Continued.

61462. *Hemesi*.
 61463. *Higiri* No. 6.
 61464. *Kalm Ahmer*.
 61465. *Khamis Wad Gah*.
 61466. *Korgi* No. 1.
 61467. *Milo kaoliang* (hybrid) No. 1473.
 61468. *Mogd Wad Fadl*.
 61469. *Mugeed*.
 61470. *Neili Neili* No. 7.
 61471. *Safra Bahr-el-Abiad*.
 61472. *Safra el Dahara*.
 61473. *Shal Shalih* No. 4.
 61474. *Shallouft el Naga*.
 61475. *Shikori* No. 2.
 61476. *Um Gorirrat*.
 61477. *Waga*.

61478 to 61505.

From Amani, Tanganyika Territory, Africa. Seeds presented by Alleyne Leechman, Director, Biological and Agricultural Institute. Received August 27, 1924.

61478. *ADENANTHERA MICROSPERMA* Teijsm. and Binn. Mimosaceæ.

No. 12. An East Indian tree, resembling the mimosas in general appearance; it is occasionally planted in eastern Java as a shade tree, according to C. A. Backer (*Schoolflora voor Java*).

- 61479 to 61481. *ALBIZZIA* spp. Mimosaceæ.

61479. *ALBIZZIA ADIANTHIFOLIA* (Schum.) W. F. Wight (*A. fastigiata* E. Mey.).

No. 16. This tropical African species, like many others of the genus, is a large, handsome tree of spreading habit, which is suitable as a shade tree in tropical or perhaps subtropical regions.

For previous introduction see S. P. I. No. 49288.

61480. *ALBIZZIA CHINENSIS* (Osbeck) Merr. (*A. stipulata* Boiv.).

No. 20. A large, rapid-growing tree, native to the subtropical regions of eastern India. It is said by Watt (*Dictionary of Economic Products of India*) to have been found very satisfactory in Assam as a shade tree for tea. The roots do not penetrate the soil deeply, and the foliage does not make a dense shade.

For previous introduction see S. P. I. No. 51143.

61481. *CASSIA SIAMEA* Lam. Cæsalpinaceæ.

No. 19. The kassod tree is described by J. F. Rock (*Ornamental Trees of Hawaii*, p. 99) as being rather low, with twiggy branches and bluish leaves up to a foot in length. In the late summer and early fall, when all other showy leguminous trees have ceased to bloom, this tree bears axillary and terminal panicles of attractive bright-yellow flowers. In Honolulu it has been planted more or less extensively in private grounds. The native home of the kassod tree is southern India and Malaysia.

For previous introduction see S. P. I. No. 54924.

61478 to 61505—Continued.

61482. *BERRIA AMMONILLA* Roxb. *Thiaceæ*.

No. 47. "Trincomalli wood" is the name under which the very hard, durable, dark-red wood of this Indian tree is exported, according to Watt (*Dictionary of the Economic Products of India*). The wood is used for making agricultural implements and for other purposes where toughness and hardness are desired. The tree is large, with long-stemmed, heart-shaped leaves and dense racemes of small, white flowers. Its distribution includes the Malay Archipelago and the Philippines.

61483. *CASTILLA ELASTICA* Cerv. *Moraceæ*. Rubber tree.

No. 75. Seeds of this tropical American rubber tree have been obtained for the use of department rubber specialists.

For previous introduction see S. P. I. No. 42363.

61484. *CASUARINA DISTYLA* Vent. *Casuarinaceæ*.

No. 76. Unlike many of the better-known casuarinas, this species is usually a small shrub 2 to 3 feet high. It is common in Tasmania and in parts of southern Australia.

61485. *COFFEA BUKOBENSIS* Zimmerm. *Rubiaceæ*. Coffee.

No. 104. The coffee grown in the vicinity of Bukoba, Tanganyika Territory, was formerly supposed to be a variety of *Coffea arabica*, but Zimmermann (*Der Pflanzer*, vol. 4) maintains that it is a separate species and has named it *C. bukobensis*. The differences are in the venation of the leaves and flower structure, and culturally this species is very similar to *C. arabica*.

61486. *COFFEA QUILLOU* P. J. S. Cramer. *Rubiaceæ*. Coffee.

No. 108. Introduced for cultural and comparison tests in tropical America.

Introduced into the East Indies from Libreville, French Congo; in 1901 this was found to be distinct from *Coffea robusta*. The leaves are narrower and brighter green and the young trees are pyramidal in habit. The berries are bright red, not dark crimson, and oblong. The crop matures later than *C. robusta* and under favorable circumstances is larger than that of any other coffee. Under less favorable conditions *C. robusta* is more productive. (Note taken from *Tea and Coffee Trade Journal*, vol. 35, p. 477.)

- 61487 and 61488. *CRYPTOMERIA JAPONICA* (L. f.) D. Don. *Pinaceæ*.

61487. No. 119. Var. *araucarioides*. "A variety of pyramidal habit resembling *Araucaria excelsa*." (Alfred Rehder, *Arnold Arboretum*.)

61488. No. 120. Var. *glabra*. A glabrous variety.

61489. *CUPRESSUS FUNEBRIS* Endl. *Pinaceæ*. Mourning cypress.

No. 123. Var. *glauca*. A glaucous variety of the mourning cypress (*Cupressus funebris*); the typical form is a wide-spreading, pendulous, Chinese species.

61478 to 61505—Continued.

61490. *FICUS CHLAMYDODORA* Warb. Moraceae.

No. 171. A stately tree grown largely as a shade tree in parts of tropical Africa because of the handsome foliage and brick-red branches. According to Holland (Useful Plants of Nigeria), twice a year it bears abundant crops of peach-colored figs, which are fairly sweet and juicy.

61491. *FUNTUMIA ELASTICA* (Preuss) Stapf. Apocynaceae. Lagos rubber tree.

No. 177. A large forest tree which is very widely distributed throughout central Africa and is the source of Lagos rubber, which is of excellent quality. It is being introduced with a view of including it in the collection of rubber plants now being brought together in southern Florida for investigational purposes.

For previous introduction see S. P. I. No. 58963.

61492. *LANDOLPHIA KIRKII* Dyer. Apocynaceae.

No. 205. A number of native climbing plants are used in East Africa as sources of native rubber, and this shrubby vine is one of the most important, according to Thiselton-Dyer (Flora of Tropical Africa). It has thin, tough leaves, loose clusters of whitish flowers, and roundish fruits 1 to 3 inches in diameter.

For previous introduction see S. P. I. No. 52583.

61493. *LANDOLPHIA STOLZII* Busse. Apocynaceae.

No. 206. A number of *Landolphia*s are being introduced from tropical Africa for testing by department rubber specialists. This one is described by Thiselton-Dyer (Flora of Tropical Africa) as a climbing shrub with small, oval leaves, dense clusters of white, sweet-scented flowers, and fruits resembling small oranges.

61494. *LILIUM REGALE* Wilson. Liliaceae.
Royal lily.

No. 210. Seeds of the royal lily as grown in Africa, introduced for the use of lily breeders.

61495. *LINOMA ALBA* (Bory) O. F. Cook. Phenicaceae.

No. 8. A slender, spineless, pinnate-leaved palm resembling *Areca* in habit, 30 feet or more in height, and native to tropical Asia. The leaves of the mature plant are 8 to 12 feet long. When young this makes a very desirable house palm.

For previous introduction see S. P. I. No. 43583.

61496 and 61497. *MANIHOT GLAZIOVII* Muell. Arg. Euphorbiaceae.

Ceara rubber.

Ceara rubber, obtained from this tree, is one of the important rubbers of commerce. These seeds are introduced for testing by rubber specialists.

For previous introduction see S. P. I. No. 46809.

61496. No. 217.

61497. No. 216. Received as *Manihot dichotoma*, but the seeds are not of that species.

61478 to 61505—Continued.

61498. *MASCARENHASIA ELASTICA* Schum. Apocynaceae.

No. 220. A shrubby tropical African tree, 20 to 30 feet high, which furnishes rubber said to be of about the same quality as that from *Landolphia kirkii*. Introduced for testing by rubber specialists.

61499. *MONODORA MYRISTICA* (Gaertn.) Dunal. Annonaceae. Calabash nutmeg.

No. 225. The calabash nutmeg is described in Curtis's Botanical Magazine (pl. 3059) as a large, spreading, tropical African tree, with shining, pale-green leaves, and fragrant flowers. The latter, borne singly in the leaf axils, are about 6 inches across, with six petals; three of these are spreading and yellow, the other three are erect and creamy white, and all are dotted with red. The fruit, 4 to 6 inches in diameter, contains a number of cylindric seeds about an inch long; these have a flavor resembling closely that of the common nutmeg.

For previous introduction see S. P. I. No. 47500.

61500. *MUSA TEXTILIS* Nee. Musaceae.
Abaca.

No. 227. Abaca seeds introduced for testing by fiber-plant specialists.

For previous introduction see S. P. I. No. 57696.

61501. *PTYCHOSPERMA* sp. Phœnicaceae.
Palm.

No. 34. Palms of this genus have smooth, ringed trunks, crowned at the summit by a dense cluster of pinnate leaves.

61502. *SCHIZOLOBIUM PARAHYBUM* (Vell.) Blake (*S. excelsum* Vog.). Cæsalpiniaceae.
Bacarabú.

No. 275. A tall leguminous tree, sometimes 120 feet high in Brazil, its native country, with large, handsome, fernlike leaves and large panicles of yellow flowers. It is of possible value as a shade and ornamental tree for the warmest parts of Florida.

For previous introduction see S. P. I. No. 45621.

61503. *SYZYGIIUM OWARIENSE* (Beauv.) Benth. (*Eugenia owariensis* Beauv.). Myrtaceae.

No. 169. A tropical African tree, 30 to 40 feet high, closely related to the jambolan (*Syzygium jambolana*). The small fruits are eaten by the natives of Nigeria, according to Holland (Useful Plants of Nigeria), and the tree is good for timber.

61504. *TELFAIREA PEDATA* (J. E. Smith) Hook. Cucurbitaceae.

No. 288. In the eastern sections of tropical Africa the roundish seeds produced by this clinging shrub are boiled and eaten by the natives. The perennial stems become 50 to 100 feet long; the flowers are pale purple, and the oblong fruits, 2 to 3 feet long, contain many seeds. These seeds also yield an abundance of oil which is said to be equal in quality to olive oil, according to an analysis made at the Imperial Institute, London.

For previous introduction see S. P. I. No. 55504.

61478 to 61505—Continued.

61505. *TERMINALIA BELLERICA* (Gaertn.) Roxb. Combretaceae.

No. 291. The small, round fruits of this handsome tropical Indian tree have been exported from India for tanning purposes under the name of myrobalans. The yellowish gray wood is used for general construction. The tree also has merit as a shade tree for avenues, with its huge buttressed trunk and long horizontal branches.

For previous introduction see S. P. I. No. 59686.

61506 to 61592. *HORDEUM* spp. Poaceae.

From Leningrad, Russia. Seeds presented by Prof. N. I. Vavilov, Director, Bureau of Applied Botany and Plant Breeding. Received July 11, 1924. Notes by Professor Vavilov.

61506. *HORDEUM DISTICHON NUDEM* L. Two-rowed barley. No. 3773.

61507 to 61510. *HORDEUM DISTICHON PALMELLA* Harlan. Two-rowed barley. Pure-line varieties.

61507. No. 0114. Province of Tiflis.

61508. No. 0149. Province of Kutais.

61509. No. 0110. Province of Erivan.

61510. No. 0624. Province of Erivan.

61511 to 61568. *HORDEUM VULGARE COELESTE* L. Six-rowed barley.

From Mongolia.

61511. No. 3878. 61520. No. 3927.

61512. No. 3880. 61521. No. 3929.

61583. No. 4063. 61591. No. 4088.

61592. Subvariety *rikotense*.

No. 0621. Province of Elizabetpol.

61593 and 61594.

From Darjiling, India. Seeds presented by G. H. Cave, Curator, Lloyd Botanic Garden. Received September 4, 1924.

61593. *ACACIA CATECHU* (L. f.) Willd. Mimosaceae.

The pale-yellow gum obtained from this acacia has very strong adhesive powers and is considered a better substitute for gum arabic than that from *Acacia arabica*, according to Watt (Dictionary of the Economic Products of India). The tree is found wild in parts of India and Burma, where it sometimes becomes 70 feet high, though usually smaller. The leaves are very finely pinnate, and the white or pale-yellow flowers are in spikes.

For previous introduction see S. P. I. No. 55420.

61594. *ALBIZZIA PROCERA* (Roxb.) Benth. Mimosaceae.

A tall, handsome, tropical tree, often 60 to 80 feet high, with yellowish or greenish white bark, large compound leaves, and terminal panicles of yellowish white flowers. In Burma, Bengal, and southern India, where the tree is native, the brown heartwood is used for making agricultural implements.

For previous introduction see S. P. I. No. 47892.

61595. XANTHOSOMA VIOLACEUM Schott. Araceae. **Yautia.**

From La Providencia, Chiapas, Mexico. Corms presented by Dr. C. A. Purpus. Received September 12, 1924.

A very handsome Mexican plant, related to the elephant-ear. The leaves are dark bluish green with very dark stems.

For previous introduction see S. P. I. No. 61387.

61596 to 61625.

From Darjiling, India. Seeds presented by G. H. Cave, Curator, Lloyd Botanic Garden. Received September 4, 1924.

61596. BISCHOFIA TRIFOLIATA (Roxb.) Hook. (*B. javanica* Blume). Euphorbiaceae.

A tropical, deciduous tree which is sometimes called "red cedar" in northeastern India, because of the reddish color of the wood, which is used for general construction. The dense, oval crown and deep-green foliage make the tree very handsome.

For previous introduction see S. P. I. No. 51194.

61597. BOEHMERIA MACROPHYLLA D. Don. Urticaceae.

According to Watt (Dictionary of the Economic Products of India) this is a broad-leaved shrub, native to northeastern India at an altitude of about 4,000 feet. The bark yields a fiber much prized by the natives of India for making fish nets.

61598. BUCKLANDIA POPULNEA R. Br. Hamamelidaceae.

J. F. Rock, Agricultural Explorer of the Bureau of Plant Industry, who has collected this species in southwestern Yunnan, not far from the border of India, describes it as a tall, straight tree, 60 to 80 feet high, of handsome appearance, and growing in that region at an altitude of 6,000 feet. The broadly triangular leaves are dark green, and the yellow male flowers are in globose heads.

For previous introduction see S. P. I. No. 56637.

61599. CHONEMORPHA MACROPHYLLA (Roxb.) Don. Apocynaceae.

A large climber, native to Bengal and Burma, with milky sap from which a kind of caoutchouc is obtained.

For previous introduction see S. P. I. No. 57886.

61600. CLERODENDRUM COLEBROOKIANUM Walp. Verbenaceae.

A low shrub, 4 to 8 feet high, which, according to Hooker (Flora of British India), has rosy purple or whitish flowers about an inch long, and small blue fruits about a third of an inch in diameter. It is native to Sikkim and Assam, India, at rather low altitudes, and will therefore probably not endure much cold.

61601. DALBERGIA SERICEA G. Don. Fabaceae.

The branches and leaves of this small leguminous tree are covered with reddish brown hairs, and the young leaflets are clothed with silky down. The pale-lilac flowers are in short, compact, axillary clusters.

61596 to 61625—Continued.**61602. DUABANGA SONNERATIOIDES** Buch-Ham. Lythraceae.

A tall, deciduous tree from subtropical regions in northeastern India; the light-brown bark peels off in thin flakes. The gray, soft, yellow-streaked wood, according to Watt (Dictionary of the Economic Products of India), is used extensively in Bengal and Assam for making tea boxes, as it seasons well, takes a good polish, and does not warp.

61603. ELAEOCARPUS SIKKIMENSIS Masters. Elaeocarpaceae.

A handsome, evergreen tree, native to Sikkim, India, with erect racemes of small, white flowers. The sharp-pointed, serrate leaves are about 8 inches long.

61604. ENGELHARDTIA SPICATA Leschen. Juglandaceae.

This Himalayan relative of the walnut is a large, handsome tree, with thick brown bark which contains a large percentage of tannin. The wood shows a beautiful grain and is said not to warp.

61605. GYNOCARDIA ODORATA R. Br. Flacourtiaceae.

This tree, one of the most common in the Chittagong Hills, was long considered to be the true source of chaulmoogra oil, which is now known to be *Taraktogenos kurzii*. The seeds of the former species contain neither chaulmoogric nor hydrocarpic acids, according to J. F. Rock (Bulletin 1057, United States Department of Agriculture). The tree is tall and handsome, with dark-green foliage and pendent branches, and may prove of value as a shade tree for the warmest parts of the United States.

For previous introduction see S. P. I. No. 53121.

61606. HIPTAGE BENGHALENSIS (L.) Kurz (*H. madablota* Guertn.). Malpighiaceae.

A tall, shrubby climber which is found wild throughout India in ravines and moist places. The thick, smooth leaves are 4 to 6 inches long, and the showy, fragrant flowers, with silky white, fringed petals, are in axillary racemes.

61607. HOLARRHENA ANTIDYSENTERICA (Roth) Wall. Apocynaceae.

An attractive, white-flowered little tree found native throughout India. The soft, white wood is largely used, in India, for carved furniture, and the astringent bark is employed medicinally as an antidiysenteric and anthelmintic, according to Watt (Dictionary of the Economic Products of India).

For previous introduction see S. P. I. No. 53579.

61608. LAGERSTROEMIA PARVIFLORA Roxb. Lythraceae.

A tropical timber tree, native to India, closely related to the well-known crape myrtle (*L. indica*). According to Brandis (Forest Flora of India) the white fragrant flowers, half an inch across, are in terminal or axillary panicles, and the wood is tough, elastic, and durable.

For previous introduction see S. P. I. No. 53582.

61596 to 61625—Continued.

61609. *LEUCOSCEPTRUM CANUM* J. E. Smith. Menthaceæ.

A stout-branched, densely hairy tree, commonly about 30 feet high, with large narrowly ovate leaves, silvery hairy beneath and at times a foot long. The small white or pinkish flowers are in spikes. Native to temperate regions of the Himalayas.

For previous introduction see S. P. I. No. 57888.

61610. *LEYCESTERIA BELLIANA* W. W. Smith. Caprifoliaceæ.

A small, graceful shrub with opposite, membranous, lance-shaped leaves, and sessile, 2 to 4 flowered spikes of rosy white flowers. It is native in the Sikkim Himalayas near the Nepal border at an altitude of 10,000 feet.

For previous introduction see S. P. I. No. 55686.

61611. *LEYCESTERIA GLAUCOPHYLLA* (Hook. f. and Thoms.) C. B. Clarke. Caprifoliaceæ.

A slender plant, closely allied to the honeysuckle, with pale-green leaves and bearing, in the early winter, a profusion of pink flowers, in short axillary spikes. It is native to the subtropical Himalayas at an altitude of 5,000 feet.

For previous introduction see S. P. I. No. 55907.

61612. *MEIBOMIA CEPHALOTES* (Roxb.) Kuntze (*Desmodium cephalotes* Wall.). Fabaceæ.

A tall shrub, with densely silky, acutely angled, zigzag branches and dense umbels of deep-red flowers. It is native to the eastern Himalayas. Cattle and goats are said to be fond of the leaves, according to Watt (Dictionary of the Economic Products of India).

61613. *MEIBOMIA GYROIDES* (DC.) Kuntze (*Desmodium gyroides* DC.). Fabaceæ.

A shrubby leguminous plant, 8 to 10 feet high, from the warmer parts of the central and eastern Himalayas. It has hairy leaves and terminal clusters of red flowers.

61614. *MORUS LAEVI GAGA* Wall. Moraceæ.
Mulberry.

An Indian mulberry which occurs wild and cultivated, though not common, in the lower Himalayas, where, according to Atkinson (Notes on the Economic Products of the Northwest Provinces), it forms a medium-sized tree with oval leaves up to 7 inches in length. In early spring the long-cylindrical, yellowish white or pale-purple fruits appear; these are edible, although of a rather insipid-sweet flavor.

For previous introduction see S. P. I. No. 55692.

61615. *MUCUNA MACROCARPA* Wall. Fabaceæ.

A woody climber, native to northeastern India, which is described by Hooker (Flora of British India) as having purple flowers and torulose pods over a foot in length.

61596 to 61625—Continued.

61616. *PICEA MORINDOIDES* Rehder. Pinaceæ.
Spruce.

A Himalayan spruce of spreading habit, with slender pendulous branchlets. It becomes over 200 feet tall. The young cones are purple, turning to a pale brown when mature.

For previous introduction see S. P. I. No. 58912.

61617. *PIPER ATTENUATUM* Buch.-Ham. Piperaceæ.

A woody, rambling, tropical plant, native to the warmer parts of the eastern Himalayas. According to Hooker (Flora of British India) the female spikes are very slender, lengthening in fruit to about 9 inches. The long-stemmed leaves are roundish, with hairy lower surfaces.

61618. *PORANA RACEMOSA* Roxb. Convolvulaceæ.
Snow creeper.

One of the most beautiful of the Himalayan plants, described by Watt (Dictionary of the Economic Products of India) as occurring in dense masses, climbing over other plants in the jungle, with the dazzling white flowers resembling patches of snow.

61619. *PRUNUS CERASOIDES* D. Don. (*P. puddum* Roxb.). Amygdalaceæ.

The pendulous flowers are campanulate and deep rosy red. They are said to appear before the foliage, which is a bright, glossy green. The tree, native to the highlands of Burma, is said to endure some frost in its native country. (*Coolingwood* Ingram, Benenden, Kent, England, in note under S. P. I. No. 57680.)

61620. *PYGMEUM ACUMINATUM* Colebr. Amygdalaceæ.

A tropical relative of the peach, native to Bengal, and described by Hooker as an evergreen tree with narrow oblong leaves, racemes of yellow-green flowers, and dark-purple fruits about an inch in diameter.

For previous introduction see S. P. I. No. 50721.

61621. *QUERCUS INCANA* Roxb. Fagaceæ.
Oak.

A large, evergreen oak from the mountains of eastern India, with bark rich in tannin and acorns which are eaten by the wild animals of the Himalayas.

For previous introduction see S. P. I. No. 50722.

61622. *RUBUS NIVEUS* Thunb. Rosaceæ.

A subtropical *Rubus*, distributed throughout the temperate Himalayas, Burma, Ceylon, and Java. The berries, which vary in color from red and orange to bluish, are very palatable and are commonly sold to Europeans in the bazaars of British India. Introduced for horticulturists experimenting with small fruits.

61623. *SENECIO SCANDENS* Buch.-Ham. Asteraceæ.
Climbing groundsel.

An attractive, autumn-flowering composite from the Himalayas, with a woody stem and climbing habit. The yellow flowers are in few-flowered loose panicle-like clusters. Because of its rustic beauty and its habit of flowering in October, this plant is a very desirable ornamental.

61596 to 61625—Continued.

61624. *TERMINALIA TOMENTOSA* (Roxb.) Wight and Arn. Combretaceæ.

The tropical almond (*Terminalia catappa*) is one of the most popular trees in southern Florida, where it is extensively planted as an ornamental shade tree. This closely related Asiatic species, found in many parts of India, is described by Brandis (Forest Flora of India) as a large tree, 80 to 100 feet tall, with hard, leathery leaves 5 to 9 inches long and erect, terminal racemes of dull-yellow flowers. The tree appears to thrive best in India in heavy, binding soils. The dark-brown wood is valued in India for general construction purposes.

For previous introduction see S. P. I. No. 53589.

61625. *THYSANOLAENA MAXIMA* (Roxb.) Kuntze. Poaceæ.

An ornamental, tropical grass, 8 to 10 feet high, which grows wild in the mountainous regions of northern India. The great masses of steel-gray inflorescences give the huge clumps a handsome appearance during about four months of the year.

61626 to 61632.

From Panama. Seeds collected by David Fairchild, Bureau of Plant Industry. Received August 23, 1924.

61626. *CHAMAEDOREA* sp. Phœnicaceæ. Palm.

Several of the palms of this genus are attractive ornamentals. This one is said by Doctor Fairchild to be slender and of graceful habit.

61627. *ELAEIS MELANOCOCCA* Gaertn. Phœnicaceæ. Palm.

A wide-spreading, low palm which grows in damp situations. It is closely related to the African oil palm (*Elaeis guineensis*), and a clear oil is extracted from the kernels in small quantities by the natives, who prize it highly for cooking.

For previous introduction see S. P. I. No. 57801.

61628. *INGA RUFESCENS* Benth. Mimosa-cææ.

A tropical tree with acacialike foliage and small heads of white flowers with showy red stamens. Native to Panama.

61629. *MANICARIA SACCIFERA* Gaertn. Phœnicaceæ. Palm.

Unlike most palms, this Brazilian species has entire leaves, which become about 30 feet in length and 5 feet in width. The trunk is erect, ringed, and unarmed, and 15 to 20 feet high. The natives of Brazil use the immense leaves of this palm for thatching their huts and also for making a coarse cloth.

For previous introduction see S. P. I. No. 45087.

61630. *PRIORIA COPAIFERA* Griseb. Cæsal-piniaceæ.

A large, handsome tree, native to central and northern South America, which yields a resin known commercially as balsam of copaiba, according to Pittier (Plantas Usuales de Costa Rica).

For previous introduction see S. P. I. No. 47998.

61626 to 61632—Continued.

61631. *RHEEDIA LATERIFLORA* L. Clusiaceæ.

The "hatstand tree" is a small tree, about 10 feet high, common in the woods of the island of Trinidad. It is noted for the regularity of its branching, and is frequently cut, fastened in a heavy base, and used as a hatstand.

For previous introduction see S. P. I. No. 45604.

61632. *STERCULIA* sp. Sterculiaceæ.

A number of sterculias are attractive shade trees, adapted for growing in the warmer parts of the United States. This one, sent in from Panama, will be grown for its possible ornamental value.

61633. *ORYZA SATIVA* L. Poaceæ. Rice.

From Manila, Philippine Islands. Seeds presented by H. E. Fernandez. Received September 15, 1924.

Introduced for rice-breeding experiments.

61634 to 61695.

From Union of South Africa. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received August, 1924. Notes by Doctor Shantz.

61634. *AESCHYNOMENE ELAPHROXYLON* (Guill. and Perr.) Taub. (*Hermimiera elaphroxylon* Guill. and Perr.). Fabaceæ. Ambash.

No. 240a. Lake Nyasa. April 22, 1924. Ambash forms the principal tree in the marshy lands and papyrus swamps about the central African lakes and is abundant in the upper Nile region. The plant has light foliage similar to that of the ordinary acacia, but differs in having very large pealike, orange-yellow flowers. It forms at times a trunk 10 inches in diameter, and the wood is exceedingly light, a log 10 feet long weighing only a few pounds. Along the upper Nile it is used extensively in making rafts and huts, and should be valuable in a great many ways.

61635. *ALOE ZEBRINA* Baker. Lillaceæ.

No. 416. Near Nyamandslova, Southern Rhodesia. June 12, 1924. An aloe, grown on swamp land, which blooms during the drought period. The very showy flower spike rises from a relatively small rosette.

61636. *ANTHOSCHMIDTIA* sp. Poaceæ. Grass.

No. 245. April 23, 1924. Mixed grass seed from Monkey Bay, Nyasaland. All are sand grasses, grown in a relatively arid country.

61637. *ARISTIDA* sp. Poaceæ. Grass.

No. 381. Bembezi, Southern Rhodesia. June 10, 1924. Native grass used for hay.

61638. *ASPARAGUS* sp. Convallariaceæ.

No. 344. Blantyre. May 21, 1924. An ornamental asparagus.

61639. *BABIANA* sp. Iridaceæ.

No. 442. Bathoen, Bechuanaland. June 16, 1924. From semiarid grasslands. Attractive iridaceous flowers. The corms are eaten by baboons.

61634 to 61695—Continued.

61640. *CITRULLUS VULGARIS* Schrad. Cucurbitaceæ.
Watermelon.

No. 409. Tjolotjo, Southern Rhodesia. June 12, 1924. Tsama melon, found growing under native conditions, furnishes water for travelers and wild game in the Kalahari Desert. It maintains itself in a wild state. Every effort should be made to establish this plant in the Southwest, where it would increase the value of the native range. It might also do well at the edge of the large sand-dune areas in California, Arizona, and New Mexico.

61641. *CLEMATIS* sp. Ranunculaceæ.

No. 334. Portuguese East Africa, between M'Khoma and Zomba. May 12, 1924. An herbaceous clematis, with greenish white flowers and white fruit clusters, which grows about 3 feet high, probably from a perennial root. Abundant in grasslands which are burned over each year at the end of the dry season.

61642. *COMBRETUM PRIMIGENUM* Marloth. Combretaceæ.

No. 406. Tjolotjo, Southern Rhodesia. June 11, 1924. A fine ornamental tree for a semiarid country. The wood is also valuable.

61643. *COPAIVA COLEOSPERMA* (Benth.) Kuntze (*Copaifera coleosperma* Benth.). Casalpiniaceæ.

No. 417. Victoria Falls, Southern Rhodesia. June 13, 1924. A beautiful, evergreen tree of excellent form and foliage, reaching a height of 60 feet. The wood is especially valuable and is known as bastard teak or occasionally known as Rhodesia teak. The native names are *um-tshibi* and *m'sibi* (or *m'zoule*).

For previous introduction see S. P. I. No. 49233.

61644. *COPAIVA MOPANE* (Kirk) Kuntze. Casalpiniaceæ.

No. 414. Tjolotjo, Southern Rhodesia. June 12, 1924. One of the most valuable timber trees, because of the resistance of the wood to attacks of termites. It grows in a semiarid country, where water may stand over the soil after heavy rains. The leaves are heavily lacquered and deep shiny green. The seeds look very much like the leaves. Native names are *mopani*, *ili pani*, *muwanga*, or *mu scani*.

61645. *CRACCA* sp. Fabaceæ.

No. 341. Between Zomba and Nyasaland. May 13, 1924. A small-podded legume, abundant in the lowlands.

61646. *CROTALARIA* sp. Fabaceæ.

No. 343. Blantyre, Nyasaland. May 21, 1924. A large-podded *Crotalaria*.

61647 and 61648. *FLACOURTIA INDICA* (Burm. f.) Merr. (*F. ramontchi* L'Herit.). Flacourtiaceæ. Ramontchi.

61647. No. 199. April 12, 1924. Fruits small like red-fleshed plums but with several seeds. This sample was found in the market at Dar es Salaam.

61648. No. 390. Tjolotjo, Southern Rhodesia. June 11, 1924. A small plum-like fruit, with several seeds. The fruit is very good when eaten out of hand and excellent for making jelly. The tree is very attractive and would make a good ornamental in the semiarid South and West. It could also be used as a hedge plant.

61634 to 61695—Continued.

61649. *GLADIOLUS* sp. Iridaceæ.

No. 328. Near Didza, Nyasaland. May 12, 1924. A large red mottled variety.

61650. *GLADIOLUS* sp. Iridaceæ.

No. 347. M'Khoma, Nyasaland. May 12, 1924. This is one of the best native types. The plant is tall, and the reddish flowers are of good size.

61651. *GREWIA* sp. Tiliaceæ.

No. 425. Mochudi, Bechuanaland. June 15, 1924. The so-called "Somali" fruit. It is a small bush growing in a semiarid country.

61652. *GREWIA* sp. Tiliaceæ.

No. 426. Mochudi, Bechuanaland. June 15, 1924. A small, one-seeded fruit from a semiarid desert tree.

61653 to 61673. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceæ.
Sorghum.

61653 to 61656. Nos. 235 to 238. Between Blantyre, Nyasaland, and the Zambezi. April 22, 1924. Here the natives grow a very tall form of sorghum with large spreading open heads. It is remarkably uniform in height and shape of inflorescence, but there are differences in color. These four heads represent range in type.

61653. No. 235. 61655. No. 237.

61654. No. 236. 61656. No. 238.

61657 to 61667. Nos. 348 to 358. May 13, 1924. The sorghum grown by the natives in this section is a very tall, open-headed type. I have seen none of the closed-head types in Nyasaland. The following numbers, although similar in size of plant and shape of head, differ in color of seed and hull. They may be accepted as typical of the sorghums grown in this section of Africa.

61657. No. 348. Zomba. Light-red, white-grained type.

61658. No. 349. White hull and seed.

61659. No. 350. Dull-red hull and tan seed.

61660. No. 351. Pink hull and white seed.

61661. No. 352. Deep-red hull and white seed.

61662. No. 353. Similar to No. 352 [S. P. I. No. 61661].

61663. No. 354. This type has a darker hull than that of No. 352 [S. P. I. No. 61661].

61664. No. 355.

61665. No. 356. Very much like No. 352 [S. P. I. No. 61661].

61666. No. 357. Very much like No. 354 [S. P. I. No. 61663].

61667. No. 358. Magenta hull and light seed.

61668 to 61672. Nos. 420 to 424. June, 1924. Types of sorghum grown by the Bakagathala tribe in the semiarid region of Bechuanaland. Sorghum constitutes their principal food.

61634 to 61695—Continued.

61668. No. 420. Mochudi, Bechuanaland. June 15, 1924. Similar to 421 [S. P. I. No. 61669], but known as *Sefoke*.
61669. No. 421. Known as *Noanya-anthana*, a good late variety.
61670. No. 422. Typical Mabele, known as *Sekamfokane*.
61671. No. 423. One of the best types, known as *Segaolane*.
61672. No. 424.
61673. No. 460. June, 1924. A sample of the Kafir corn.
61674. *HOLCUS SORGHUM VERTICILLIFLORUS* (Steud.) Hitchc. Poaceæ. **Tabucki grass.**
- No. 306. May 8, 1924. Wild sorghum variety, very abundant on lowlands above southern end of Nyasaland, Domira Bay.
61675. *HYPERICOPHYLLUM* sp. Asteraceæ.
- No. 262. Livingstonia. April 23, 1924. A beautiful composite with deep, rich-red flowers.
61676. *MANISURIS* sp. Poaceæ. **Grass.**
- No. 307. Domira Bay, May 8, 1924. A very tall rank grass abundant on the lowlands about Lake Nyasa, especially on the black cotton soils, where it grows from 6 to 8 feet high and produces a heavy crop of seed.
61677. *ORYZA SATIVA* L. Poaceæ. **Rice.**
- No. 201. Beira, Portuguese East Africa. April 20, 1924. A very low-growing, small-seeded variety. Grown at Beira on drier land. It has a peculiar odor and may be valuable.
61678. *PANICUM MADAGASCARIENSE* Spreng. Poaceæ. **Grass.**
- No. 202. Beira, Portuguese East Africa. April 20, 1924. A small grass, very attractive and valuable as an ornamental.
61679. *PANICUM* sp. Poaceæ. **Grass.**
- No. 388. Tjolotjo. June 11, 1924. One of the grasses which is most successful in the semiarid agriculture of the eastern Kalahari.
61680. *POGONARTHRIA* sp. Poaceæ. **Grass.**
- No. 418. Tjolotjo, Southern Rhodesia. June 11, 1924. Mixed grass seed of the type which forms the grass cover on the eastern edge of the Kalahari Desert.
61681. *SESAMUM ANGOLENSE* Welw. Pedaliaceæ.
- No. 386. Tjolotjo, Southern Rhodesia. June 11, 1924. This appears to be a small flowered type of wild sesame than is found in Central Africa.
61682. *SOLANUM TUBEROSUM* L. Solanaceæ. **Potato.**
- No. 293. Livingstonia. April 30, 1924. Brought from Scotland some years ago and grown on the highlands above Nyasaland.
- 61683 and 61684. *SORGHUM VERSICOLOR* Anderss. Poaceæ. **Black Sudan grass.**
61683. No. 239. April 23, 1924. A rather small plant about 3 to 6 feet high, abundant along the road south of Fort Johnston, Nyasaland.

61634 to 61695—Continued.

61684. No. 340. May 13, 1924. A dark-seeded plant resembling Sudan grass, abundant along roadways at the southern end of Lake Nyasa. The heads are dark, drooping gracefully, and the seeds shatter easily.
61685. *SPOROBOLUS* sp. Poaceæ. **Grass.**
- No. 208. Beira, April 22, 1924. The golf course at Beira is made up of this grass. When closely clipped it makes a good turf. Most of the golf course is near tidalwater level.
61686. *STERCULIA* sp. Sterculiaceæ.
- No. 240. Fort Johnston. April 22, 1924. A large white-barked tree with very soft wood. The leaves are somewhat like those of the cotton plant. The pods are large, resembling those of *Asclepias*, but with stinging hairs around the aril, which is bright red. It is sometimes called the "fever" tree and is locally known as N'goza. The seeds are said to be picked to form a powder used as snuff.
61687. *TERMINALIA SERICEA* Burchell. Combretaceæ.
- No. 407. Tjolotjo, Southern Rhodesia. June 11, 1924. A well-shaped ornamental tree, suitable for a semiarid country; the yellow wood is of excellent quality and the most valued of any in the region. Bark cloth of poor quality is made from the bark. The tree is known under the native names of *Uhangwe*, *M'Susu*, *M'Tarataka*, etc.
61688. *THEMEDA* sp. Poaceæ. **Grass.**
- No. 443. Ramanthlava, Bechuanaland. June 16, 1924. Mixed grass seed from the acacia-tall-grass belt, which is probably the most successful grazing region of Africa.
61689. *TRADESCANTIA* sp. Commelinaceæ.
- No. 263. Livingstonia. April 27, 1924. A very delicate variety with showy flowers; it should be of value as an ornamental.
- 61690 to 61692. *TRICHOLAENA ROSEA* Nees. Poaceæ. **Natal grass.**
61690. No. 295. April 30, 1924. Mixed grass seed from the hills above Livingstonia.
61691. No. 305. Koto Koto, Nyasaland. May 7, 1924. A rather large type, abundant west of Lake Nyasa on the lowlands.
61692. No. 319. M'Khoma, Nyasaland. May 12, 1924. A grass grown in native sod.
61693. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceæ. **Common wheat.**
- No. 294. Livingstonia. April 30, 1924. Wheat grown on the highlands above Nyasaland. It yields fairly well here. Much of the flour used here is produced on the highlands.
- 61694 and 61695. *VIGNA SINENSIS* (Turner) Savi. Fabaceæ. **Cowpea.**
- Nos. 389 and 419-b. Tjolotjo, Southern Rhodesia. June 12, 1924. An important crop at the edge of the desert. There are many types grown in the same field. An effort was made to include all types in the sample.
61694. No. 389. 61695. No. 419-b.

61696 to 61725.

From Leningrad, Russia. Seeds presented by Prof. N. I. Vavilov, Director of the Bureau of Applied Botany and Plant Breeding. Received September 24, 1924. Notes by Professor Vavilov.

61696 to 61714. *GOSSYPIMUM* spp. Malva-
ceæ. Cotton.

61715 and 61716. *HORDEUM VULGARE PAL-
LIDUM* Seringe. Poaceæ.

Six-rowed barley.

61715. No. 62.

61716. No. 63.

61717 to 61719. *ORYZA SATIVA* L. Poaceæ.
Rice.

61717. No. 10. *Bokhara.*

61718. 16755-1922. Turkestan Repub-
lic. *Shala.*

61719. 170-F. Turkestan. *Shala.*

61696 to 61725—Continued.

61720. *SECALE CEREALE* L. Poaceæ. Rye.
Abkhaz Republic.

61721. *TRIFOLIUM PRATENSE* L. Fabaceæ.
Red clover.

360. 1174. No. 22.

61722 to 61724. *TRITICUM AESTIVUM* L. (*T.
vulgare* Vill.). Poaceæ. Common wheat.

61722. No. 50.

61723. [No notes.]

61724. From Abkhaz.

61725. *ZEA MAYS* L. Poaceæ. Corn.
From Abkhaz.

61726 to 61737. *MEDICAGO SATIVA* L. Fa-
baceæ. Alfalfa.

From South America. Seeds collected by
H. L. Westover, Bureau of Plant Indus-
try. Received July 14, 1924. Notes by
Mr. Westover.

61726. Near Lampa, Chile. May 13,
1924. Provenance alfalfa, produced on
the estate of Señor Marticorena, who
is a very large producer of this seed.
He procured the seed from France a
few years ago and has made every ef-
fort to keep it pure.

61727. Santa Ines, Chile. June 5, 1924.
Seeds from an unusually vigorous plant
found on the estate of Salvador Izqui-
erdo.

61728. June 1, 1924. From the Huasco
Valley, about 12 miles from Alta del
Carmen. Seed coming from this dis-
trict, which is very warm, is regarded
very highly.

61729. April 7, 1924. Procured from
Bridger Bros., Buenos Aires, and said
to have been produced in the northern
part of Argentina, where the climate is
very mild.

61730. March 31, 1924. Seeds collected
from a plant near Lupan de Cuyo,
Mendoza, Argentina.

61731. May 31, 1924. From near Mendoza,
Argentina.

61732. May, 1924. Pao F. C. Oeste,
Pampa, Argentina.

61733. March 26, 1924. Seeds produced
on the estate of the Chapman brothers,
near Enrique Lavalle, in the western
part of the Province of Buenos Aires.

61734. April 7, 1924. From Colonia
Alvear, Mendoza, Argentina, a region
comparatively free from frost.

61735. June 7, 1924. Seeds obtained from
Williamson & Co., Santiago, Chile.
This seed is said to have been grown
in the Huasco Valley, and many of
the alfalfa growers in Chile use seed
only from this source, as they claim
that it produces more and better hay
than seed from other parts of Chile.

61736. June 20, 1924. Purchased from
the seed store at Mollendo, Peru.
This seed, which should be similar to
our Smooth Peruvian, is said to have
been produced at Candarava, about 30
leagues from Mollendo, at a high alti-
tude.

61737. Pisco, Peru. June 21, 1924. Pur-
chased from the market. Probably
grown near the coast and should be
very similar to Hairy Peruvian.

Introductory statement-----	1
Inventory-----	3
Index of common and scientific names-----	27

INTRODUCTORY STATEMENT

In July, 1924, P. H. Dorsett, of the Office of Foreign Plant Introduction, and his son, J. H. Dorsett, were detailed for agricultural exploration work in northern China. Shipments of plant material which they collected began to arrive in Washington in October, 1924, the greater part coming from the vicinity of Peking, in the Province of Chihli. The lists of the Dorsetts' collections in northern China take up a conspicuous part of this inventory and include both seeds and scions of a large number of fruits, such as peaches, pears, apples, persimmons, apricots, grapes, and quinces, also walnuts, chestnuts, hazelnuts, various vegetables, and a number of woody and herbaceous ornamentals.

The collection of varieties of *Diospyros kaki* (Nos. 61837 to 61842) obtained by Mr. Dorsett in the vicinity of Peking, China, may include valuable additions to the list of excellent varieties previously introduced and now in the trade in this country, such as the nonastringent Fuyu (S. P. I. No. 26491) and the Tamopan (S. P. I. No. 16921), an excellent keeper.

While on his way to carry on agricultural explorations in the East Indies, David Fairchild of this office spent several days at the Royal Botanic Gardens, Kew, England, and also at Aldenham House, the estate of Hon. Vicary Gibbs, at Elstree, Herts, England. At the Royal Botanic Gardens Doctor Fairchild procured seeds of the dove tree (*Davidia involucrata vilmoriniana*, No. 62022). This is a handsome Chinese relative of the dogwood, and only one specimen is known to be in cultivation in this country. At Aldenham House there has been gathered together a remarkable collection of hardy rare trees and shrubs, mostly from eastern Asia, and seeds of a number of these were obtained by Doctor Fairchild (Nos. 61972 to 61996).

In the preceding inventory (No. 80) mention was made of the agricultural explorations being conducted in Argentina and Chile by H. L. Westover, of the Office of Forage Crops. During this period Mr. Westover was still abroad, and he sent in not only a number of local strains of alfalfa but also seeds of a number of native forage plants and grasses (Nos. 62060 to 62073, 62075 to 62092).

Of similar interest to Mr. Westover's shipments is a large collection of grasses, mostly native to southern South America, presented by the Federación Rural, Montevideo. Uruguay (Nos. 62031 to 62059). These grasses will

undoubtedly be of great interest to agronomists attempting to develop strains of forage plants suitable for parts of the Southern States.

Among the shipments sent from northern China by Mr. Dorsett, whose work is mentioned above, were tubers of *Stachys sieboldi* (No. 61897). This species has been introduced a number of times previously and has been grown with satisfactory results. However, its tubers are small, and for this reason it does not have the appeal to growers that it might otherwise. It resembles closely our native *Stachys floridana* of the South, and should be given serious attention by plant breeders along with the latter species.

Seeds of *Arachis nambyquarae* (No. 62099), introduced in 1924, have since been grown at several of our southern experiment stations, where the plants have proved to be well adapted for growing in their new environment. The large seeds of this Brazilian relative of our common peanut make it of special interest for general experimental work.

Actinidia venosa (No. 61803) may be of value only as an ornamental, but it is a welcome addition to the Actinidias now grown in this country. These include *A. arguta*, which is hardy as far north as Massachusetts and which bears an edible fruit about an inch long, and *A. chinensis*, which bears a much larger edible fruit but which is adapted for growing only in the southern half of the United States.

The present popularity of the Japanese flowering cherries in this country is due in large measure to the fact that this office has been introducing, for several years, promising varieties from the Orient. Capt. Collingwood Ingram, of Benenden, Kent, England, who has a large private collection of flowering cherries, has presented plants of a variety which he has called Kojima (*Prunus serrulata*, No. 62101). This variety, which originated in his garden, has very large, semidouble, pure white flowers borne in drooping corymbs, and should prove a real addition to our present collection.

Specialists in the United States working with strawberries and potatoes will be interested in a collection of wild strawberry plants (*Fragaria* sp., No. 61885) and types of wild potatoes (*Solanum* spp., Nos. 61886 to 61892) made by Elbert E. Reed, of the Instituto Agrícola Bunster, on the island of Chiloe, off the coast of Chile. Many of the cultivated strawberries of the American trade are derived in part from the Chiloe strawberry (*Fragaria chiloensis*), which is native to this region.

The botanical determinations of seeds introduced have been made and the nomenclature determined by H. C. Skeels, and the descriptive notes have been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,

Washington, D. C., September 17, 1926

INVENTORY¹

61738 and 61739.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December, 1924.

61738. AMPELOPSIS ACONITIFOLIA Bunge. Vitaceæ.

No. 904. Near Laochun. October 10, 1924. The bright-blue fruits make this vine a good ornamental. (Dorsett.)

61739. AMYGDALUS PERSICA L. (*Prunus persica* Stokes). Amygdalaceæ. Peach.

No. 761. Peking. October 6, 1924. Seeds of a domesticated peach. (Dorsett.)

61740. PERSEA AMERICANA Mill. (*P. gratissima* Gaertn. f.). Lauraceæ. Avocado.

Fruits from the Plant Introduction Garden, Miami, Fla. Received at Washington, November 20, 1924.

A cross between the Collinson and Trapp avocados, made at the Plant Introduction Garden, Miami, February, 1921, by Edward Simmonds. Fruited first time this year [1924].

Fruits about 4 inches long and 3½ inches wide, roundish obovate, slightly oblique; stem short, thick, inserted at a slight angle; cavity small, shallow, wrinkled; apex obliquely flattened, slightly depressed at stigmatic point; surface smooth, light green; dots numerous, yellowish, conspicuous; skin of medium thickness, adhering rather closely to the flesh; flesh creamy yellow, greenish near skin, smooth, buttery, with rich, nutty flavor and no fiber; seed large, tight in the cavity, free from seed coats.

61741. CAMPANULA sp. Campanulaceæ. Bellflower.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 8, 1924.

No. 712. October 10, 1924. Seeds of a plant with very pretty purple, bell-shaped flowers, collected along the trail from the Ming tombs to Silver Mountain. (Dorsett.)

61742 to 61746.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received December 24, 1924.

61742. ACER OSMASTONI Gamble. Aceraceæ. Maple.

A large Himalayan maple, described (Kew, Bulletin of Miscellaneous Information, 1908, p. 446) as a tree up to 100 feet tall, growing wild in Sikkim, India, at an altitude of about 7,000 feet. The leaves, 1 to 3 lobed, are papery and about 5 inches long.

61743. ACER STACHYOPHYLLUM Hiern. Aceraceæ. Maple.

A small maple, native to Sikkim, India, at an altitude of 10,000 feet.

61744. ALANGIUM ALPINUM (C. B. Clarke) Smith and Cave. Cornaceæ.

A deciduous tree, about 40 feet high, native to the eastern Himalayas and related to the dogwood. The white flowers are in lax 3-flowered, axillary clusters, and are succeeded by black fruits.

61745. DECAISNEA INSIGNIS (Griffith) Hook. f. and Thoms. Lardizabalaceæ.

An upright, sparingly branched shrub, much resembling a large-leaved sumac, found in the eastern Himalayas. The leaves, often 3 feet long, are made up of 13 to 25 elliptic, acuminate leaflets, bright green above and slightly glaucous beneath. The racemes of pendulous, greenish flowers resemble those of a yucca, but are smaller. These are followed by edible, yellow fruits, 3 to 4 inches long and about 2 inches thick, filled with a whitish pulp and black seeds.

61746. GAULTHERIA FRAGRANTISSIMA Wall. Ericaceæ.

A very fragrant evergreen shrub or small tree found in the mountains of India from Nepal eastward to Bhutan. In summer it is loaded with white or pinkish flowers, which are followed by beautiful racemes of blue-purple fruits.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature. It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the specific identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

61747 and 61748. *LILIUM* spp. *Lilia-*
ceæ. **Lily.**

From Goring by Sea, Sussex, England. Bulbs presented by Maj. F. C. Stern. Received December 30, 1924.

61747. *LILIUM FARRERI* Turritt.

From a packet of mixed seeds collected in China by the well-known botanical explorer, Reginald Farrer, there was grown this handsome lily, described in Curtis's Botanical Magazine (pl. 8847) as having erect stems, nearly 3 feet in height, and numerous narrow leaves scattered along the entire stem. The relatively small but fragrant flowers, white with purple spots, are terminal and either solitary or in loose 6-flowered umbels. This lily has proved hardy in the mild-wintered region of southeastern England.

61748. *LILIUM CENTIFOLIUM* Stapf. **Lily.**

This Chinese lily was originally discovered by Reginald Farrer, according to the Botanical Magazine (pl. 8960); Mr. Farrer found it growing in a little garden at Siku, Kansu, in 1914. The stem, densely leafy and somewhat glaucous, is up to 7 or 8 feet in height, arising from a slightly depressed bulb about 3 inches in diameter. The numerous leaves are dark green above and paler below, linear or linear-lanceolate, and up to 18 inches long. The sweet-scented flowers, 6 to 18 in number, are arranged in a short, almost umbellike raceme. The individual flowers are 6 inches long and about 4 inches across the mouth. Within, the perianth is pure white, blending into lemon yellow in the throat; the outer segments are richly flushed with dark purple, while the broader inner segments are greenish with deep, brownish-purple midribs. The anthers are rusty red.

61749 to 61760.

From Kaifeng, Honan, China. Seeds purchased from R. M. Lewis, St. Andrew's School. Received December 20, 1924. Notes by Mr. Lewis.

Collection of seed from the largest grain store in Kaifeng.

61749 and 61750. *PHASEOLUS AUREUS* Roxb. Fabaceæ. **Mung bean.**

Two varieties of average quality, planted around the 5th of May, and maturing early, or later if dry.

61749. No. 8. *Lü Hui tou* (green gray).

61750. No. 7. *Ming Lü tou* (shiny green).

61751 and 61752. *PISUM SATIVUM* L. Fabaceæ. **Pea.**

61751. No. 11. *Hua wan* and *huang wan* (mottled and yellow). A variety of average quality, planted during September and maturing in May.

61752. No. 12. *Huang wan* (yellow). One of the best varieties; planted in September and maturing in May.

61753 to 61758. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. **Soy bean.**

61753. No. 1. *Hei* (black). A variety of average quality, planted about May 5 and maturing in September.

61754. No. 2. *Hsiao hei* (small). A variety a little better than the average, planted around May 5 and maturing during September.

61749 to 61760—Continued.

61755. No. 3. *Huang* (yellow). A soy bean of average quality, planted about May 5 and maturing during September.

61756. No. 4. *Huang* (yellow). A variety of the best quality, planted about May 5 and maturing during September.

61757. No. 5. *Ching* (green, literally "clear"). Of good quality, planted about May 5 and maturing late.

61758. No. 6. *Ching* ("clear"). A variety of average quality, planted about May 5 and maturing late.

61759 and 61760. *VIGNA SINENSIS* (Torrner) Savi. Fabaceæ. **Cowpea.**

Varieties of average quality, planted about May 5 and maturing during September.

61759. No. 9. *Pai Chiang* (white kidney).

61760. No. 10. *Hung Chiang* (red kidney).

61761. *CANARIUM ALBUM* (Lour.) DC. Balsameaceæ.

From Peking, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 6, 1924.

No. 759. October 1, 1924. *Ching Kuo* (green nut). An olive-green and olivelike fruit shipped in to the market from the south. This may be made into a good candied fruit something like citron. (Dorsett.)

61762 to 61766.

From Simla, India. Plants presented by H. E. J. Peake, Khaltoo Fruit Orchards. Solan brewery, through Walter T. Swingle, Bureau of Plant Industry. Received October 2, 1924.

61762. *BELOU MARMELOS* (L.) Lyons (*Aegle marmelos* Correa). Rutaceæ. **Bel.**

The bel is a small, handsome tree, closely related to the genus *Citrus*; it is native to northern India, but is widely cultivated throughout India, Siam, and Indo-China. It is often spiny and has deciduous, trifoliate leaves. The greenish, globular fruit, usually about 4 inches in diameter, has a hard shell which incloses greenish, aromatic pulp of sweetish flavor. Sherbets are made from the mashed pulp, and also a beverage. In northern India the bel is said to endure a temperature of 20° F. without injury.

61763. *CITRUS* sp. Rutaceæ.

This is native to the Simla Hills. (Peake.)

61764. *CITRUS* sp. Rutaceæ.

61765. *HESPERETHUSA CRENULATA* (Roxb.) Roemer. Rutaceæ.

This is a shrub or small tree growing in dry situations in India, sometimes at a height of 4,000 feet. The fruits are very small, but occasionally used as a condiment by the natives. The wood is hard and suitable for parts of machinery where great strength and toughness are required. This plant belongs to the orange family and is introduced primarily in connection with experiments now in progress in the breeding of new types of citrus fruits and stocks for the same.

61762 to 61766—Continued.

61766. *TOONA CILIATA* Roemer (*Cedrela toona* Roxb.). Meliaceae. Toon tree.

A large Himalayan tree, 50 to 80 feet high, with nearly evergreen foliage and white, honey-scented flowers. The wood, which is used for furniture, carvings, and for making cigar boxes, is very durable and is not attacked by termites.

61767. *CORDEAUXIA EDULIS* Hemsl. Cæsalpiniaceae. Yeheb nut.

From Kew, Surrey, England. Plants presented by Dr. Arthur W. Hill, director, Royal Botanic Gardens. Received October 3, 1924.

The Yeheb nut is a leguminous shrub or small tree which grows wild in the great semiarid region of Italian Somaliland, known as the "Haud," where its highly nutritious nuts are a staple food of the Somali tribes who inhabit the region, and are offered in the markets on the Somali coast. The thick, evergreen leaves of this shrub are about 4 inches long, with usually four pairs of leaflets, and the crisp, leathery pod is slightly over 2 inches long. In composition the Yeheb nut closely resembles the chestnut and is comparable to it in food value. The region where the shrub is found indicates that while it should prove very drought resistant it is not likely that it will stand frost, although tests are necessary to determine this point.

61768. *MEDICAGO SATIVA* L. Fabaceae. Alfalfa.

From Cuenca, Ecuador. Seeds presented by E. Malo A., British vice consulate. Received October 7, 1924.

This is a sample of the alfalfa we grow in this district; we have known single plants to become over 3 feet high. We believe this may be Peruvian alfalfa. (*Malo.*)

61769. *PSIDIUM GUAJAVA* L. Myrtaceae. Guava.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received October 7, 1924.

A very fine large guava with golden-green skin and yellow pulp. The flavor is so sweet that the addition of sugar is unnecessary. The plant is vigorous and prolific. (*Towns.*)

61770. *ECHINOCHLOA HOLCIFORMIS* (H. B. K.) Chase. Poaceae. Grass.

From the city of Mexico, Mexico. Seeds presented by Arthur Stockdale. Received October 7, 1924.

An erect perennial grass, 6 feet or more high, from humid, mountainous regions of Mexico. Introduced for testing as forage.

61771. *MAGNOLIA CAMPBELLII* Hook. f. and Thoms. Magnoliaceae.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received October 7, 1924.

According to Curtis's Botanical Magazine (pl. 6793), this is a beautiful, deciduous magnolia from the Himalayas, where it ascends to 8,000 feet above sea level. It reaches a height of 80 feet, has very dark bark, large elliptical dark-green leaves, and white to purple flowers 10 inches in diameter. This magnolia has flowered freely in southern France and Italy.

For previous introduction see S. P. I. No. 55688.

61772. *ARACHIS HYPOGAEA* L. Fabaceae. Peanut.

From Potchefstroom, Union of South Africa. Seeds presented by F. C. Fellschop, School of Agriculture, Potchefstroom, through J. H. Beattie, Bureau of Plant Industry. Received October 9, 1924.

Locally grown seeds introduced for cultural tests and comparison with American-grown varieties.

61773. *SOLANUM OPACUM* A. Br. and Bouche. Solanaceae.

From Sydney, New South Wales. Seeds presented by George Valder, undersecretary and director, Department of Agriculture. Received October 9, 1924.

An annual Australian Solanum which is closely related to the nightshade (*S. nigrum*) and appears to have shown some value as a fodder plant, according to the Agricultural Gazette of New South Wales for October 31, 1921. No harmful effects on stock were observed after numerous feeding tests.

61774. *AFZELIA BREIYI* Wildem. Cæsalpiniaceae.

From Brussels, Belgium. Seeds presented by Dr. Esmond Leplae, Director General of Agriculture. Received October 1, 1924.

Among the recent additions to the flora of the Belgian Congo is a leguminous tree whose seeds contain an oil promising both as an edible oil and for illumination. The tree is described (Bulletin Agricole du Congo Belge, March, 1923) as having an ultimate height of 100 feet, with finely cracked bark and handsome, bluish-green pinnate foliage. The kidney-shaped pods, about 8 inches long and 5 inches wide, contain reddish-brown seeds $1\frac{1}{2}$ inches long. The oil obtained from these seeds is light brownish yellow, with a sweet, agreeable flavor resembling that of some types of olive oil.

61775. *CORNUS CONTROVERSA* Hemsl. Cornaceae. Giant dogwood.

From Jamaica Plain, Mass. Seeds collected by B. Y. Morrison, Bureau of Plant Industry. Received October 17, 1924.

This Chinese dogwood is one of the most striking of the genus; in its native home it sometimes becomes a tree 60 feet in height with a trunk 7 feet in girth. The numerous long branches extend at right angles to the trunk, with the lowest sometimes touching the ground. The white or slightly yellowish flowers are in flat clusters 6 or 7 inches in diameter, appearing from late May to early June. The black shining fruits which follow are eaten by the birds as fast as they ripen.

61776 and 61777.

From Nairobi, Kenya Colony, Africa. Seeds presented by S. Battiscombe, conservator of forests, Forest Department. Received October 17, 1924.

61776. *BRACHYLAENA HUTCHINSII* Hutchinson. Asteraceae.

The hard, white timber of this tall East African tree is durable, easily worked, and not subject to attack by termites. In height the tree reaches 90 to 100 feet; the branches are upright and are confined to the upper fourth of the trunk.

61776 and 61777—Continued.

61777. *OLEA CHRYSOPHYLLA* Lam. Oleaceae.

A small East African relative of the cultivated olive: its chief ornamental value lies in the golden color of the under surfaces of the leaves.

61778. *AGATI GRANDIFLORA* (L.) Desv. (*Sesbania grandiflora* Poir.). Fabaceae.

From Summit. Canal Zone. Seeds presented by Holger Johansen, Plant Introduction Garden. Received October 17, 1924.

A small, rapid-growing, soft-wooded tree, 15 to 20 feet in height, with pinnate leaves and large pendulous white flowers, followed by long, sickle-shaped pods. The fleshy petals are used in curries and soups in the Indian Archipelago, where this tree is native. The leaves and young shoots are sometimes used as fodder.

For previous introduction see S. P. I. No. 57079.

61779. *RUBUS* sp. Rosaceae.

Blackberry.

From Kew, England. Seeds presented by Dr. J. Burtt Davy, Royal Botanic Gardens. Received November 5, 1924.

Selected Dartmoor (Devonshire) blackberries. The berries are large, full, and of exceptionally good flavor. Found growing wild in a hedge at Bag Tor, Ilstington, South Devon, at 800 feet altitude. (Burt Davy.)

61780 and 61781. *SOLANUM* spp. Solanaceae.

From Wolverhampton, England. Tubers presented by F. W. Keay. Received October 24, 1924.

Of possible value for breeding purposes.

61780. *SOLANUM* sp.

A seedling of unknown parentage.

61781. *SOLANUM DEMISSUM* × *TUBEROSUM*. Potato.

61782 to 61785.

From Argentina. Seeds presented by A. K. Bulley, Ness, Neston, England. Received October 1, 1924.

These seeds were sent to Mr. Bulley by W. T. Goethe, who collected them while in Argentina.

61782 to 61784. *BERBERIS* spp. Berberidaceae.

61782. *BERBERIS* sp.

No. 191. A yellow-flowered evergreen shrub. (Goethe.)

61783. *BERBERIS* sp.

No. 242.

61784. *BERBERIS* sp.

No. 271. Large fruits, of good color. (Goethe.)

61785. *NOTHOFAGUS BETULOIDES* (Mirb.) Oerst. Fagaceae.

No. 62. One of the principal trees which make up the dense, dark forests of Tierra del Fuego is this evergreen species, according to the Gardeners' Chronicle (ser. 3, vol. 33). In favorable localities it becomes very large. It is closely related to the beech (*Fagus* spp.), but has small evergreen leaves.

61786 to 61793.

From Ness, Neston, England. Seeds presented by A. K. Bulley. Received October 1, 1924.

61786. × *GEUM BORISII* Kellerer. Rosaceae.

According to a note in the Allgemeine Botanische Zeitschrift (vol. 12, p. 91) this interesting hybrid is the result of a cross between *Geum reptans* L. and *G. bulgaricum* Panc. It was discovered by J. Kellerer on Mount Rilo, Bulgaria, and has pendent, yellow flowers.

61787. *MECONOPSIS PSEUDOINTEGRIFOLIA* Prain. Papaveraceae.

A stemless hairy plant from southwestern Tibet, China, with narrow leaves and one-flowered scapes; the flowers are bright yellow and up to 3 inches in diameter.

For previous introduction see S. P. I. No. 55302.

61788. *MECONOPSIS SINUATA* Prain. Papaveraceae.

Var. *latifolia*. A horticultural form which is generally similar to *Meconopsis aculeata*, but the leaves are less lobed, and the stigma is deep pink or orange rather than green. The plant is 1 to 4 feet high, with spreading prickles, oblong leaves about 6 inches long, and blue flowers. Native to the Himalayas.

61789 to 61792. *PRIMULA* spp. Primulaceae.

61789. *PRIMULA CHIONANTHA* Balf. and Forr. Primrose.

Many interesting and attractive primroses have been found in Yunnan, China; the one here considered was found in that province by G. Forrest, who collected it on the Chungtien Plateau at an altitude of 13,000 feet. It is described in Curtis's Botanical Magazine (pl. 8816) as a stout herbaceous plant 1 to 2 feet high, with blunt, narrowly oval leaves, sulphur mealy beneath, and clusters of white flowers borne in a many-flowered umbel at the apex of a stout scape. It appears to thrive best in rich, moist soil and has proved perfectly hardy at Kew, England.

61790. *PRIMULA COCKBURNIANA* Hemsl. Primrose.

A glabrous primrose from western China, with membranous, oblong leaves and yellow flowers borne on a slender scape a foot or more in height.

61791. *PRIMULA INVOLUCRATA* Wall. Primrose.

A Himalayan primrose with leathery, oval leaves and a long, slender scape bearing many-flowered umbels of white flowers.

61792. *PRIMULA* sp. Primrose.

Red Hugh. A hybrid of *Primula beesiana*. (Bulley.)

61793. *ROSCOEIA CAUTLEOIDES* Gagn. Ziniberaceae.

A perennial herbaceous, gingerlike plant, 9 to 12 inches high, native to China, with thick, fleshy roots, irislike leaves, and primrose-yellow flowers borne on many-flowered scapes.

61794. RIBES sp. Grossulariaceae.

Gooseberry.

From Vineland Station, Ontario, Canada. Plants presented by James A. Neilson, Horticultural Experiment Station. Received November 7, 1924.

Clark. This variety was found in the garden of Jabez Clark, of Burlington, Ontario. It is believed to be a chance hybrid between the American and European species. This variety has been growing at the Horticultural Experiment Station since 1911 and is the only variety that survived on our very heavy clay soil. The bush is a vigorous grower and retains its foliage late in the season. It yields heavily and bears large fruits of good quality and appearance. The plants appear to be drought resistant. We consider this variety one of the best for commercial culture in this district. (*G. H. Dikson, Vineland Station.*)

61795 and 61796.

From Dar es Salaam, Tanganyika Territory, Africa. Seeds presented by the director, Department of Agriculture. Received October 21, 1924.

61795. CRYPTOSTEGIA GRANDIFLORA R. Br. Asclepiadaceae. Palay rubber.

An erect, woody climber of unknown nativity but now cultivated in many places in the Tropics of both hemispheres as an ornamental, and occasionally growing as an escape from cultivation. The flowers, reddish purple becoming pale pink, are about 2 inches across and are produced in short spreading cymes. In India the plant is called palay; it is cultivated for the rubber obtained from the juice.

For previous introduction see S. P. I. No. 58851.

61796. FICUS VOLKENSHI Warb. Moraceae.

This tropical African representative of the genus is a shrub or small tree with narrow, papery leaves.

61797 and 61798. ACACIA spp. Mimosaceae. Hybrid acacia.

From Mandelieu, near Cannes, Alpes Maritimes, France. Seeds presented by A. Richon. Received October 23, 1924. Notes by Mr. Richon.

61797. ACACIA BAILEYANA × DEALBATA.

The hybrids of these species bear very long spikes of well-colored flowers. They resemble *Acacia dealbata* in being hardy, but, unlike that species, the leaflets do not fold up in the evening. Some develop root suckers; others do not.

61798. ACACIA sp.

Bon Accueil. This is a chance hybrid, perhaps between *Acacia decurrens* and *A. dealbata*. I consider it one of the most beautiful acacias grown on the Riviera. The flower clusters have up to 40 heads, larger than the best varieties of *A. dealbata*; they are beautifully grouped at the ends of the branches. The leaves are bright green with long, very fine leaflets. The tree is vigorous and about 20 feet high, but a little less hardy than *A. dealbata*.

61799 and 61800.

From Africa. Seeds collected by H. L. Shantz, Bureau of Plant Industry. Received October 24, 1924. Notes by Doctor Shantz.

61799. HYPERICOPHYLLUM sp. Asteraceae.

No. 217. Above Inhamica, Tanganyika Territory. April 21, 1924. A bright, reddish orange composite.

61800. PAHUDIA QUANZENSIS (Welw.) Prain. (*Afzelia quanzensis* Welw.). Cæsalpiniaceae.

No. 483. Beira, Portuguese East Africa. May 24, 1924. A broad, spreading tree, with very rich pinnate foliage, regarded as one of the most beautiful trees for street planting and for parks. It produces beautiful wood, mahoganylike, but of much coarser grain.

For previous introduction see S. P. I. No. 49310.

61801. OXALIS INCARNATA L. Oxalidaceae.

From Algiers, Algeria. Bulbs presented by Dr. L. Trabut. Received October 25, 1924.

A very attractive, low, bulbous plant, with reddish-purple leaves, dotted beneath, and bell-shaped flesh-colored flowers. Native to South Africa.

61802. PRUNUS sp. Amygdalaceae.

From Siberia. Plants collected by Prof. N. E. Hansen, South Dakota State College, Brookings, S. Dak. Received October 25, 1924.

Of possible value as a stock.

61803. ACTINIDIA VENOSA Rehder. Dilleniaceae.

From Elstree, Herts, England. Cuttings presented by Vicary Gibbs, Aldenham House, through David Fairchild, Bureau of Plant Industry. Received November 1, 1924.

A climbing shrubby plant from the mountains of western Szechwan, China, which may prove an interesting ornamental. It is described (*Plantae Wilsonianae*, vol. 2) as being up to 25 feet in height, with oval, membranous leaves, short clusters of buff-yellow flowers, and small, russet berries.

61804. PRUNUS CERASUS L. Amygdalaceae. Morello cherry.

From Dropmore, Manitoba, Canada. Seeds presented by F. L. Skinner. Received November 8, 1924.

From seedlings of the hardy Koslov-Morello cherry.

61805 to 61809. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

From Shaoling, Chekiang, China. Seeds presented by Rev. A. F. Ufford, American Baptist Foreign Mission Society. Received October 25, 1924.

61805. Black variety, A.

61806. Black variety, B.

61807. Green variety, A.

61808. Green variety, B.

61809. Two white varieties, mixed.

61810. DIOSPYROS SABIENSIS Hiern. **Diospyraceae.** **Persimmon.**

From Mount Silinda, Southern Rhodesia. Seeds presented by Dr. W. L. Thompson. American Board Mission. Received November 10, 1924.

A wild persimmon from this region; the tree grows to a large size, 100 feet or more in height, and the fruit, which is very sweet and popular with the natives, is too small and full of seeds to be of much value. I have not yet tried this species as a stock for the larger fruited forms. (Thompson.)

61811 to 61832.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November, 1924. Notes by Mr. Dorsett.

61811 to 61817. AMYGDALUS spp. **Amygdalaceae.**

61811 to 61816. AMYGDALUS PERSICA L. (*Prunus persica* Stokes). **Peach.**

61811. No. 440. August 30, 1924.

61812. No. 474. September 2, 1924.

61813. No. 481. September 2, 1924.

61814. No. 497. September 4, 1924.

61815. No. 50. September 4, 1924.

61816. No. 514. September 6, 1924.

61817. AMYGDALUS PERSICA PLATYCARPA (Decaisne) Ricker. **Flat peach.**

No. 439. August 30, 1924. These are reported to have come from Tsinan, Shantung Province.

61818. ARACHIS HYPOGAEA L. **Fabaceae.** **Peanut.**

No. 754½. Peking. September 29, 1924. Purchased in the market; said to have come from the South; mostly two seeded.

61819 to 61826. MALUS spp. **Malaceae.** **Apple.**

Seeds of domesticated apples; obtained in the Peking market.

61819. MALUS sp.

No. 443. August 30, 1924.

61820. MALUS sp.

No. 444. August 30, 1924.

61821. MALUS sp.

No. 445. August 30, 1924.

61822. MALUS sp.

No. 475. September 2, 1924.

61823. MALUS sp.

No. 479. September 2, 1924.

61824. MALUS sp.

No. 480. September 2, 1924.

61825. MALUS sp.

No. 498. September 4, 1924.

61826. MALUS sp.

No. 502. September 4, 1924.

61827. PRUNUS sp. **Amygdalaceae.** **Plum.**

No. 477. Peking. September 2, 1924. From fruits purchased in the market; may be useful as stock.

61811 to 61832—Continued.

61828 to 61832. PYRUS spp. **Malaceae.** **Pear.**

61828. PYRUS sp.

No. 496. September 4, 1924. Seeds from fruit taken from a tree in Mr. Strong's garden at the village of Mao-Chiotu, about 4 miles east of the east gate of the Peking wall. As an ornamental, with its abundance of small, bright-red fruits, it is very handsome.

61829. PYRUS sp.

No. 703. September 19, 1924. Collected near the village of Liangchakou. This tree, which was loaded with small, bright-red fruits, may prove useful as an ornamental or for stock.

61830 to 61832. Peking. September 29, 1924. From the market. Small, wild pears said to be used in the western hills for stock. They are much larger than the wild Chinese pears we have seen.

61830. PYRUS sp.

No. 752.

61831. PYRUS sp.

No. 753.

61832. PYRUS sp.

No. 754.

61833. EUCALYPTUS PAUCIFLORA Siebr. **Myrtaceae.** **White gum.**

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received November 11, 1924.

The white gum, as this eucalypt is called in Australia, attains there a height of 100 feet and a diameter of about 4 feet. It grows well in swampy lowlands, and the timber is used for general building purposes.

61834 to 61852.

From China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 21, 1924. Notes by Mr. Dorsett.

61834. CASTANEA sp. **Fagaceae.** **Chestnut.**

No. 790. Fa Hua Ssu temple, Taitzu, Chihli. October 12, 1924. Seeds secured from trees growing on terraced, decomposed granite soil. These chestnuts are the largest and finest looking we have seen.

61835. CASTANEA sp. **Fagaceae.** **Chestnut.**

No. 791. Fa Hua Ssu temple, Taitzu, Chihli. October 12, 1924. Seeds. These chestnuts are the ordinary run of the crop and are of average size.

61836. CORYLUS sp. **Betulaceae.** **Hazel.**

No. 775. Shalingtang, Chihli. October 10, 1924. Plants and scions.

61837 to 61842. DIOSPYROS KAKI L. f. **Diospyraceae.** **Kaki.**

61837. No. 771. Tailuangyuan. October 8, 1924. Scions obtained from a tree, the best we have yet seen, growing in an orchard belonging to Sun Yu. In most cases this variety bears small crops.

61838. No. 772. Tailuangyuan. October 8, 1924. Scions. This fruit, the quality of which is very good, is not more than one-half the size of the large Chinese persimmon.

61834 to 61852—Continued.

61839. No. 782. Lungtzuting Valley. October 12, 1924. Scions from a tree growing in a large orchard of mixed fruits. Though a comparatively young tree, perhaps 8 or 10 years old, this tree was full of fruit.

61840. No. 783. Lungtzuting Valley. October 12, 1924. Scions from a tree in a large orchard, the fruits of which are small and slender, reminding us very much of large acorns.

61841. No. 784. Lungtzuting Valley. October 12, 1924. Scions from young trees of what is supposed to be the "lantern" persimmon.

61842. No. 785. Lungtzuting Valley. October 12, 1924. Scions from a persimmon tree, the fruits of which are small and quite slender.

61843. IRIS sp. Iridaceæ. Iris. No. 773. October 8, 1924. Plants of a wild iris collected along a rocky terrace across the river from the Yung Lo [Ming] tomb.

61844. IRIS sp. Iridaceæ. Iris. No. 774. October 8, 1924. Plants collected on the grounds around the Yung Lo [Ming] tomb.

61845. POPULUS TOMENTOSA Carr. Salicaceæ. Poplar.

No. 786. October 12, 1924. Scions of a graceful poplar, the trunk of which is gray; collected along the river bank between Hungmentsun and Hsiachuang.

61846. PRUNUS sp. Amygdalaceæ. Cherry.

No. 781. Fa Hua Ssu temple, near the village of Haitzu, Chihli. October 11, 1924. Scions of a cherry having the appearance and habit of *Prunus pseudocerasus*.

61847 to 61850. PYRUS spp. Malaceæ. Pear.

Fa Hua Ssu temple, near Haitzu, Chihli. October 11, 1924. Scions introduced for trial as stock plants on which to graft cultivated varieties and for use in breeding types resistant to fire blight.

61847. PYRUS sp.

No. 777. Called the "sugar pear" by the priest. A good-sized, russet pear covered with many small brown dots, containing a fair amount of juice, which is like sweetened water and is of poor flavor. The white flesh is crisp and gritty. This pear is reported to be one of the best keepers.

61848. PYRUS sp.

No. 778. A fragrant pear, small and greenish yellow, covered with numerous small brown dots. The juice is like sweetened water and the white flesh is crisp, a little gritty, and slightly woody. The quality of this pear is poor, though better than the sugar pear [S. P. I. No. 61847].

61849. PYRUS sp.

No. 779. A small to medium-sized pear, fragrant and dull greenish yellow, covered with many small brown dots. Flesh white, crisp, and gritty; juice watery and sweet.

61834 to 61852—Continued.

61850. PYRUS sp.

No. 780. Known as "Golden Hand-le." This pear is small to medium sized, creamy white, and covered with many small brown dots. The white flesh is gritty and coarse, and the sweet juice is only of fair quality. One of the most attractive of the five pears we photographed here, and we think this is the best pear seen here.

61851. RUBUS sp. Rosaceæ.

No. 776. Wanpochuan, Chihli. October 10, 1924. Plants.

61852. SALIX sp. Salicaceæ. Willow.

No. 787. October 12, 1924. Cuttings of a quite common, upright growing willow, collected along a river between Hungmentsun and Hsiachuang.

61853. ROSA ROULETTII CORREYON. Rosa-ceæ. Rose.

From Chenebourg, near Geneva, Switzerland. Plants purchased from H. Correyon, Floraire Nursery. Received November 15, 1924.

A dwarf shrubby rose of the general type of *Rosa lawrenciana*, but even smaller than the latter. As grown in my garden it does not become more than 4 inches in height, and the very numerous red flowers are produced continuously from May to January if the plant is sheltered. (Correyon.)

61854. LILIUM sp. Liliaceæ. Lily.

From Peking, China. Bulbs collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 24, 1924.

No. 789. October 15, 1924. Procured in the market. (Dorsett.)

61855. JUGLANS REGIA L. Juglandaceæ. Walnut.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received November 13, 1924.

* These walnuts, which come from Aures, are of excellent quality. The trees are very vigorous, and this strain has been propagated from seeds by the natives for centuries. (Trabut.)

61856. PYRUS sp. Malaceæ. Pear.

From Dropmore, Manitoba, Canada. Plants presented by F. L. Skinner. Received November 4, 1924.

Tait's No. 1. Introduced for pear-breeding experiments.

61857 to 61860. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceæ.

Common wheat.

From Maison Carree, Algeria. Seeds presented by the governor general, institute of agriculture. Received November 20, 1924.

61857. No. 1. Soudan.

61858. No. 6. Soudan.

61859. No. 11. Djeghloul.

61860. No. 87. Bahatane.

61861 to 61879. TRITICUM DURUM Desf.
Poaceæ. Durum wheat.

From Rabat, Morocco. Seeds presented by the Station de Sélection et D'Essai de Semences, Rabat, through J. H. Martin, Bureau of Plant Industry. Received November 20, 1924.

61861. No. 6.	61871. No. 120.
61862. No. 8.	61872. No. 140.
61863. No. 14.	61873. No. 156.
61864. No. 16.	61874. No. 181.
61865. No. 20.	61875. No. 182.
61866. No. 22.	61876. No. 184.
61867. No. 24.	61877. No. 185.
61868. No. 46.	61878. No. 196.
61869. No. 88.	61879. No. 198.
61870. No. 110.	

61880. ACACIA sp. Mimosaceæ.

From Old Umtali, Rhodesia, Africa. Seeds presented by E. H. Greeley. Received November 21, 1924.

A flowering tree, 20 feet high, with handsome foliage, and clusters of long, white, sweet-scented flowers. (Greeley.)

61881. QUERCUS sp. Fagaceæ. Oak.

From Chihli Province, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 24, 1924.

No. 788. October 8, 1924. Acorns from a broad-leaved oak growing near the Yung Lo [Ming] tomb. (Dorsett.)

61882. ERIOBOTRYA JAPONICA (Thunb.) Lindl. Malaceæ. Loquat.

From Babson Park, Fla. Plants presented by W. D. Carrier, Polk County Avocado Nurseries. Received November 28, 1924.

A seedling loquat, of excellent quality, from a fine old tree grown in Putnam County, Fla. This tree has survived freezes since 1894, and produces large quantities of excellent fruits. (Carrier.)

61883 and 61884.

From Peking, China. Tubers collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 26, 1924. Notes by Mr. Dorsett.

61883. COLOCASIA sp. Araceæ. Taro.

No. 794. October 17, 1924. The small dasheen tubers we have ever seen offered for sale, obtained from the Morrison Street Market.

61884. SAGITTARIA SAGITTIFOLIA L. Alismaceæ. Arrowhead.

No. 795. October 17, 1924. Chinese name Tzu Ku. Obtained from the market. These are very good cooked and served with a sweet sauce.

61885 to 61892.

From the island of Chiloe, Chile. Collected by Elbert E. Reed, Instituto Agrícola Bunster. Received November 19, 1924.

The island of Chiloe, which lies off the coast of Chile in latitude 42° S., is a region little known horticulturally. It is reputed to be the home of wild forms of

the true potato, as well as of *Fragaria chilensis*, the frutilla or Chilean strawberry, which is cultivated in several parts of the Andean region. This berry, which was carried to Europe from Concepcion, Chile, in 1712, has played an important part in the development, through crossing, of the cultivated strawberries of the present day.

In order to procure from Chiloe material for the use of North American plant breeders, actively engaged in the improvement of potatoes and strawberries, the Department of Agriculture arranged with Elbert Reed, horticulturist of the Instituto Agrícola Bunster at Angol, Chile, to visit the island. Mr. Reed has sent in the following collection together with his notes:

61885. FRAGARIA sp. Rosaceæ. Strawberry.

Plants of a wild strawberry from sand banks more or less 100 feet high, near Quilán.

61886 to 61892. SOLANUM spp. Solanaceæ. Wild potato.

61886 and 61887. Tubers raised from wild potato seeds by Señor Vera, of Quilán, near Cucao.

61886. SOLANUM sp.

A hybrid between the wild and Quilán varieties.

61887. SOLANUM sp.

A wild variety.

61888. SOLANUM sp.

From a patch of ground adjoining the beach at Alpua, about 15 miles south of Cucao.

61889. SOLANUM sp.

Presented by Sr. Everardo Werner, of Puntura. Señor Werner discovered these wild potato plants in the region called Cucao, on the west coast of Chiloe, about six years ago, while searching with a large party for the passengers of a wrecked ship. He has cultivated these plants ever since.

61890 to 61892. Progeny of the wild potato, brought from Cucao by Señor Werner, showing a very distinct variation in the seedlings from the wild pistillate parent, both in the tuber and in the plants. It here loses all semblance to the wild type and appears like the ordinary cultivated potato. Señor Werner says that all three colors—red, white, and yellow—came from the seeds of one plant.

61890. SOLANUM sp.

White strain.

61891. SOLANUM sp.

Yellow strain.

61892. SOLANUM sp.

Red strain.

61893. GOSSYPIUM sp. Malvaceæ. Cotton.

From Constantza, Rumania. Seeds presented by Kevorik Boyadjian, through Richard B. Haven, American vice consul. Received December 1, 1924.

Turkish cotton which matured at Dobrodja, Rumania, where the growing season is 100 to 150 days long and usually very warm. (Haven.)

61894 and 61895. DIOSPYROS KAKI L. f.
Diospyraceæ. Kaki.

From Hananho, Chihli, China. Scions collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 29, 1924. Notes by Mr. Dorsett.

61894. No. 797. October 21, 1924. Scions obtained from a young tree known here as the "Lantern persimmon." This tree was found growing in the same orchard from which the large Chinese persimmon, Nos. 771 and 798 [S. P. I. Nos. 61837 and 61895] was obtained. If girdled, this tree produces very good and sometimes heavy crops, otherwise it appears to be shy in fruiting. Though small, the fruits are attractive.

61895. No. 798. October 21, 1924. A large Chinese persimmon from one of the best trees in the orchard. The land on which this orchard is located is composed of sandy loam and is of very good texture.

61896 to 61898.

From Peking, China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 8, 1924. Notes by Mr. Dorsett.

61896. HELIANTHUS TUBEROSUS L. Asteraceæ.
Jerusalem artichoke.

No. 1046. October 26, 1924. Tubers. The Chinese name is *Ti Kua*, meaning "ground gourd." These small tubers are mostly used in making pickles or are eaten raw.

61897. STACHYS SIEBOLDI Miquel. Menthaceæ.
Chorogi.

No. 1047. October 26, 1924. Tubers. The Chinese name is *Wai Kuo Chiang*, meaning "foreign ginger." The tubers are of average size.

61898. ZINZIBER OFFICINALE Roscoe. Zinziberaceæ.
Ginger.

No. 1050. October 27, 1924. Ginger roots purchased in the market. These had been shipped in from Fu Chen. It is reported that this is the best type of Chinese ginger.

61899. LANSIUM DOMESTICUM Jack.
Meliaceæ. Langsat.

From Manila, Philippine Islands. Seeds presented by Adn. Hernandez, director, Bureau of Agriculture. Received December 8, 1924.

The langsat or lanzon is reckoned one of the best fruits of the Malayan region.

The tree reaches 40 feet in height and has pinnate leaves composed of five to seven elliptic leaflets each 4 to 8 inches long. The fruit varies in form and character, but is generally oval or round, 1 to 2 inches in diameter, velvety and straw colored, with a thick leathery skin inclosing five segments of white, translucent, juicy, aromatic flesh, and one to three large seeds.

Two distinct kinds are known, one termed langsat and the other duku or doedoe. Choice seedling forms occur in both, and should be propagated by some vegetative means.

For previous introduction see S. P. I. No. 58382.

61900 to 61902.

From Kobe, Japan. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 8, 1924. Notes by Mr. Dorsett.

61900. CITRULLUS VULGARIS Schrad. Cucurbitaceæ.
Watermelon.

No. 214. August 9, 1924. A watermelon of average size obtained from the market. The red flesh is of very good quality.

61901 and 61902. CUCUMIS MELO L. Cucurbitaceæ.
Melon.

61901. No. 212. August 9, 1924. A greenish yellow melon about 3 inches in diameter and 6 inches in length. The flesh, which is white and not very thick, is of fair quality.

61902. No. 213. August 9, 1924. A small, lemon-yellow melon, which is very fragrant; purchased in the market. The flesh is white, crisp, and of very good quality.

61903 to 61914.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November, 1924. Notes by Mr. Dorsett.

61903. ARISTOLOCHIA sp. Aristolochiaceæ.

No. 716. Tanchientzu. September 21, 1924. Collected along the trail.

61904. BEGONIA EVANSIANA Andrews. Begoniaceæ.

No. 651. Heichunghuan. September 17, 1924. A wild begonia with pink flowers; collected on the river bank.

61905. BENINCASA HISPIDA (Thunb.) Cogn. Cucurbitaceæ.
Wax gourd.

No. 319. Shanghai. August 16, 1924. A large gourd used in Shanghai as a vegetable and sold in the market in large quantities.

61906. BERBERIS POIRETI C. Schneid. Berberidaceæ.
Barberry.

No. 705. Liangshalou. September 19, 1924. This barberry has small leaves and small, bright-red berries.

61907 and 61908. CAPSICUM ANNUUM L. Solanaceæ.
Red pepper.

61907. No. 495. September 3, 1924. Collected at Loutzuchang, about 4 or 5 miles east of Peking.

61908. No. 499. Peking. September 4, 1924. Purchased in the market. These bright-red peppers are of good size and much corrugated. They are used for seasoning.

61909 to 61913. CITRULLUS VULGARIS Schrad. Cucurbitaceæ.
Watermelon.

61909. No. 471. Peking. August 30, 1924. A very dark-green watermelon, weighing 22 pounds, with yellow flesh, which is sweet and of good flavor.

61910. No. 472. Peking. August 30, 1924. Purchased in the market. A watermelon striped light and dark green, weighing 14 pounds. The flesh is yellow, juicy, and sweet.

61903 to 61914—Continued.

61911. No. 473. Peking. September 1, 1924. Brought from the market by Peter Lin. This watermelon, weighing 1½ pounds, has a light-green rind and white juicy sweet flesh of good quality.

61912. No. 507. Peking. September 4, 1924. A long light-green watermelon, 15 pounds in weight with light-yellow flesh of fair quality.

61913. No. 508. Peking. September 4, 1924. A small, oval watermelon, weighing 11 pounds, with a light-green rind and bright-red flesh.

61914 *CUCUMIS MELO* L. Cucurbitaceæ. Melon.

No. 601. Shihmen, Chihli. September 11, 1924. A small green melon with white flesh which is crisp and of fair flavor.

61915. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceæ. Cushaw.

From Kobe, Japan. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 8, 1924.

No. 215. August 9, 1924. From the market. A good-looking squash, the outside being a deep russet brown and the flesh a deep golden yellow. (Dorsett.)

61916 to 61971.

From China. Seeds and tubers collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November, 1924. Notes by Mr. Dorsett.

61916 and 61917. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceæ. Cushaw.

61916. No. 320. Shanghai. August 16, 1924. A russet-brown, long-necked squash with thick, deep-orange flesh.

61917. No. 322. Shanghai. August 16, 1924. A large, crook-necked squash from the market. The rind is smooth and of terra-cotta color; the flesh is deep orange.

61918. *CUCURBITA PEPO* L. Cucurbitaceæ. Pumpkin.

No. 321. Shanghai. August 16, 1924. This rather small, oval fruit, obtained in the market, is 6 to 9 inches long and has a creamy yellow rind and yellow flesh.

61919 and 61920. *DELPHINIUM GRANDIFLORUM* L. Ranunculaceæ. Larkspur.

61919. No. 696. September 19, 1924. Seeds of a very attractive, deep-blue larkspur, collected at the Temple of the Three Saints, located on one of the ranges of the Western Hills, between Chianglou and Liangchakou.

61920. No. 704. September 19, 1924. A hardy larkspur with large heads of deep-purple flowers borne on spikes sometimes 12 inches or more in length, found quite abundantly on the eastern slope of the range of mountains near the village of Liangchakou.

61921. *DIOSCOREA* sp. Dioscoreaceæ. Yam.

No. 492. September 3, 1924. From Loutzuchang, which is 4 or 5 miles east of Peking. These aerial tubers were obtained from vines about 15 feet in length.

61916 to 61971—Continued.

61922. *GLEDITSIA HETEROPHYLLA* Bunge. Cæsalpiniaceæ. Honey locust.

No. 653. Tungchuangtzu. September 17, 1924. This shrubby plant, 6 to 15 feet in height, was found on a gravelly river bank. The leaves are small, and the broad seed pods, when ripe, and the rather large, flat seeds are mahogany brown.

61923. *IRIS DICHOTOMA* Pall. Iridaceæ. Iris.

No. 650. Heilungkuan. September 17, 1924. A wild iris from rocky cliffs on the north side of the mountain about a day's journey from Toli.

61924. *LONICERA* sp. Caprifoliaceæ. Honeysuckle.

No. 701. September 19, 1924. This shrub, bearing small, round, bright-red berries, was found on the east slope of the mountain near Liangchakou.

61925. *MALUS* sp. Malaceæ. Apple.

No. 478. Peking. September 2, 1924. These fruits, resembling crab apples, were purchased in the market; they are rather seedy, small, round, and creamy white; the flesh is pure white, crisp, and juicy, containing just enough acid to be pleasant. May prove of value to apple breeders.

61926 to 61936. *PHASEOLUS* spp. Fabaceæ.

61926 to 62929. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Adzuki bean.

61926. No. 603. Shihmen, Chihli. September 11, 1924. A small, black and gray bean, with a distinct white eye, from a field near the railway station.

61927. No. 672. September 18, 1924. From Precious Spring or Water Mountain, about half a day's journey from Hungmeichang. The plants are fairly vigorous, growing 18 to 24 inches high, and the seeds are a dirty creamy white.

61928. No. 702. September 19, 1924. Collected near the village of Chianglou, en route to Liangchakou; creamy white beans from the steep mountain side.

61929. No. 707. Liangchakou. September 19, 1924. This small red bean appears to be planted wherever we have been.

61930 to 61934. *PHASEOLUS AUREUS* Roxb. Mung bean.

61930. No. 605. Shihmen, Chihli. September 11, 1924. A small, green bean, collected in a field near the railway station. Used commonly as a green vegetable and for sprouting. It appears to do well in any kind of soil.

61931. No. 616. September 16, 1924. Small, brown beans growing in sandy loam just across the river from Toli, Chihli. The plants are about 2 feet in height and are quite vigorous.

61932. No. 617. September 16, 1924. Yellow beans collected across the river from Toli, Chihli. The plants are about 18 inches high and fairly vigorous.

61916 to 61971—Continued.

61933. No. 618. September 16, 1924. Green beans collected across the river from Toli, Chihli.
61934. No. 619. September 16, 1924. Black beans collected across the river from Toli, Chihli.
- 61935 and 61936. *PHASEOLUS VULGARIS* L. Common bean.
61935. No. 710. Liangchakou, Chihli. September 19, 1924. Red beans.
61936. No. 711. Liangchakou, Chihli. September 19, 1924. White beans.
61937. *PHYSALIS* sp. Solanaceæ. Ground cherry.
- No. 699. September 19, 1924. Pinkish yellow husk tomato collected near the village of Taanshan. May prove of value to plant breeders.
61938. *PTEROCARYA STENOPTERA* DC. Juglandaceæ. Chinese wingnut.
- No. 295½. Shanghai, August 15, 1924. Collected from the Bubbling Well cemetery, a short distance from the grave of Frank N. Meyer. The long, pendulous catkins make this tree quite attractive.
61939. *RHAMNUS GLOBOSA* Bunge. Rhamnaceæ. Buckthorn.
- No. 697. September 19, 1924. From the west side of one of the ranges of the Western Hills, opposite the village of Chianglou. This shrubby, thorny plant, which may be ornamental and may also prove to be a good hedge plant, was found growing in very exposed places.
- 61940 to 61952. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.
- 61940 to 61943. Peking. September 4, 1924. From plants growing in the Peking Botanical Garden.
61940. No. 503. Originally from Chelin. The plants are 2 feet or more high and quite vigorous.
61941. No. 504. Large, green soy beans from vines about 3 feet in height.
61942. No. 505. Originally from Shansi. Large, green soy beans from vines about 3 feet in height.
61943. No. 506. Originally from Japan. These soy beans are large and green; the vines are about 3 feet high.
61944. No. 568. September 9, 1924. An almost round, creamy yellow soy bean collected between Anshan and Kepo, Chihli, 75 to 100 miles east of Peking.
61945. No. 569. September 9, 1924. Collected between Anshan and Kepo, Chihli. A creamy soy bean somewhat larger than No. 568 [S. P. I. No. 61944].
61946. No. 570. September 9, 1924. Brown soy beans mottled with black, collected between Kepo and Wankuankechuan. Not nearly so common as the creamy yellow type, No. 568 [S. P. I. No. 61944].
61947. No. 586. September 10, 1924. An almost round, creamy yellow soy bean, with a brown eye, collected between Kepo and Toukoankehuan.

61916 to 61971—Continued.

61948. No. 587. September 10, 1924. Brown and black striped soy beans, collected between Toukoankehuan and Kepo, Chihli.
61949. No. 604. Shihmen, Chihli. September 11, 1924. This black-seeded soy bean, from a field near the railway station, is only seen occasionally.
61950. No. 606. Shihmen, Chihli. September 11, 1924. This soy bean, mottled black and brown, is from a field near the railway station.
61951. No. 708. Liangchakou, Chihli. September 19, 1924. Seeds of a soy bean, rather small, oval, and creamy white, from strong, vigorous vines.
61952. No. 718. Mentoukou. September 21, 1924. From a very rocky area.
61953. *SOLANUM MELONGENA* L. Solanaceæ. Eggplant.
- No. 509. Peking. September 4, 1924. An attractive eggplant 5 inches in diameter and 4 inches in length.
61954. *SPIRAEA DASYANTHA* Bunge. Rosaceæ. Spirea.
- No. 670. September 19, 1924. A very free-flowering, rather dwarf plant found growing on Precious Spring or Water Mountain, Chihli.
61955. *VIBURNUM* sp. Caprifoliaceæ.
- No. 700. September 19, 1924. A shrub growing on the mountain side, near Liangchakou. The seed berries or fruits occur two or three in a cluster and are at first red, changing to black when ripe.
- 61956 to 61958. *VIGNA SESQUIPEDALIS* (L.) Fruwirth. Fabaceæ. Yard Long bean.
- Liangchakou, Chihli. September 21, 1924. Collected in a field.
61956. No. 728. Light buff.
61957. No. 728 a. Black.
61958. No. 728 b. Reddish brown.
- 61959 to 61965. *VIGNA SINENSIS* (Toner) Savi. Fabaceæ. Cowpea.
61959. No. 588. Near Kepo, Chihli. September 10, 1924. A creamy white cowpea with a purple eye.
61960. No. 591. Toukoankehuan, Chihli. September 10, 1924. Cowpeas tinged with greenish pink.
61961. No. 602. Shihmen, Chihli. September 11, 1924. A red-seeded cowpea collected in a field near the railway station.
61962. No. 607. Shihmen, Chihli. September 11, 1924. Cowpeas speckled dirty gray and reddish brown, collected near the railway station.
61963. No. 620. September 16, 1924. Purple-eyed, white cowpeas collected in a river bottom field between Toli and Koutoutsun, Chihli.
61964. No. 621. September 16, 1924. Red cowpeas from a river bottom field between Toli and Koutoutsun, Chihli.
61965. No. 622. Toli, Chihli. September 16, 1924. Pink or brick-red cowpeas from a gravelly clay hill.

61916 to 61971—Continued.

61966 to 61970. *ZEA MAYS* L. Poaceae.
Corn.

61966. No. 571. September 9, 1924. Obtained from the fields between Anshan and Kepo, Chihli. One of the representatives of the average corn of this section.

61967. No. 589. Talitientzu, September 10, 1924. Collected in a field. One of the representatives of the average corn of this section.

61968. No. 675. September 18, 1924. Collected near the village of Taan-shan.

61969. No. 676. September 18, 1924. Collected near Hungmeichang. This corn is the yellow flint and has one ear to the stalk. It is evident that corn is one of the most important crops in this mountain country.

61970. No. 709. Liangchakou, Chihli. September 19, 1924. One of the representatives of the average corn of this section.

61971. *ZINNIA MULTIFLORA* L. Asteraceae.

No. 654. September 17, 1924. Collected between Shatsui and Kanho. This rather attractive plant, with terra cotta-colored flowers, appears to be indigenous. May prove of value to plant breeders.

61972 to 61996.

From Elstree, Herts, England. Seeds presented by Hon. Vicary Gibbs, Aldenham House, through David Fairchild, Bureau of Plant Industry. Received November 12, 1924. Notes by Doctor Fairchild.

61972. *ARONIA ARBUTIFOLIA* (L.) Pers. (*Pyrus arbutifolia* L. f.). Malacae.
Red chokeberry.

No. 12. Var. *grandiflora*. A large-flowered form with delicate pink, almost translucent fruits.

61973. *BERBERIS BRACHYPODA* Maxim. Berberidaceae.
Barberry.

Nos. 1 and 2. An attractive shrub from western China, 4 to 7 feet high with ovate, serrate leaves, long slender panicles of yellow flowers, and scarlet fruits often half an inch long.

For previous introduction see S. P. I. No. 58097.

61974. *BERBERIS GAGNEPAINI* C. Schneid. Berberidaceae.
Barberry.

No. 3. An evergreen Chinese shrub 3 to 6 feet high, with leathery leaves, spiny on the margins, and delicate yellow flowers on red pedicels. The ellipsoid berries are dark purple.

For previous introduction see S. P. I. No. 58138.

61975. *CORIARIA TERMINALIS* Hemsl. Coriariaceae.

No. 4. A handsome shrub of very graceful habit, with translucent golden yellow fruits which hang in long racemes from the twigs.

61976. *COTONEASTER FRIGIDA* Wall. Malacae.

No. 6. Var. *vicarii*. A variety named after Mr. Gibbs, with small, very brilliant red fruits; one of the handsomest of the genus.

For previous introduction see S. P. I. No. 56450.

61972 to 61996—Continued.

61977. *COTONEASTER SALICIFOLIA RUGOSA* (E. Pritz.) Rehd. and Wils. Malacae.

No. 5. A willow-leaved cotoneaster of very distinctive appearance with bright-scarlet fruits of small size and delicate appearance.

For previous introduction see S. P. I. No. 58610.

61978. *CRATAEGUS OXYACANTHA* L. Malacae.
English hawthorn.

No. 7. Var. *gireoudi*. A remarkable variegated variety which Mr. Gibbs has proved will come true to seed.

61979. *DIPTERONIA SINENSIS* Oliver. Aceraceae.

No. 8. A monotypic genus from China closely related to the maples. An attractive tree with conspicuous papery winged fruits borne in the autumn. It reminds one somewhat of the bladder-nut tree (*Ptelea trifoliata*).

61980 to 61982. *EUONYMUS* spp. Celastraceae.

61980. *EUONYMUS EUROPAEUS* L.
Spindle tree.

No. 9. Var. *aldenhamensis*. A beautiful variety selected by Mr. Gibbs and named in honor of his estate. The delicate pink color of its fruit is particularly attractive.

61981. *EUONYMUS HAMILTONIANUS* Wall.

No. 11. A large Himalayan shrub which under favorable circumstances becomes a moderate-sized tree, 30 to 35 feet high, with a short, straight trunk 4 to 5 feet in girth. The clusters of 15 to 20 greenish-white flowers are followed by yellow capsules, the seeds of which are entirely surrounded by a scarlet aril. The fruit ripens from August onward. The leaves are brilliantly colored in autumn.

For previous introduction see S. P. I. No. 57281.

61982. *EUONYMUS YEDOENSIS* Koehne.
Yeddo euonymus.

No. 10. A particularly attractive species from Japan with more than usually beautiful pink fruits.

For previous introduction see S. P. I. No. 53702.

61983. *MALUS THEIFERA* Rehder. Malacae.
Tree crab.

No. 19. A small, stiff-branched tree, native to China, which bears fragrant white flowers and globose, yellow fruits with red cheeks.

For previous introduction see S. P. I. No. 54091.

61984. *PSEDERA HIMALAYANA* (Royle) C. Schneid. Vitaceae.

No. 27. Var. *rubrifolia*. A semiwoody, Himalayan climber, with handsome trifoliate leaves which become brilliant red in autumn.

61985. *PYRUS SALICIFOLIA* Pall. Malacae.
Pear.

No. 15. Var. *pendula*. An ornamental, pendulous variety of the willow-leaved pear, which is a small, often spiny tree, native to Asia Minor, with corymbs of white flowers and round, yellowish green fruits.

61972 to 61996—Continued.

61986. *ROSA DAVIDI* Crepin. Rosaceae.

Rose.

No. 20. A pink-flowered, orange-fruited rose 3 to 18 feet high, native to western Szechwan, China, at altitudes of 4,000 to 9,000 feet. It is the nearest Chinese relative of *Rosa macrophylla* of the western Himalayas.

For previous introduction see S. P. I. No. 58617.

61987 to 61992. *SORBUS* spp. Malaceae.61987. *SORBUS ARIA* × *AUCUPARIA*.

No. 14. A hybrid bearing unusually large and attractive bright-red fruits.

61988 and 61989. *SORBUS AUCUPARIA* L. (*Pyrus aucuparia* Ehrh.)

European mountain ash.

61988. Var. *conradinae*.

No. 13. One of the Chinese forms which may prove unusually hardy. The berries are small but very bright red.

61989. Var. *subarachnoidea*.

No. 28. A variety with waxy white berries which stand out in striking contrast to the green leaves; this is rare even in England.

61990. *SORBUS FOLGNERI* (C. Schneid.) Rehd. (*Pyrus folgneri* Léveillé).

No. 16. A handsome Chinese tree, with gracefully spreading branches and oval leaves, dark green above and white-hairy beneath. The ovoid, red berries are about half an inch long.

61991. *SORBUS SCALARIS* Koehne.

No. 17. A large shrub, one of E. H. Wilson's introductions from China. The tiny red fruits on long delicate peduncles are very attractive.

61992. *SORBUS VILMORINI* C. Schneid.

No. 18. A handsome shrub from Yunnan, China. The graceful, finely cut foliage, white or somewhat pinkish flowers, and bright, translucent, rosy-red fruits make an attractive ornamental.

61993. *STRANVAESIA DAVIDIANA* UNDULATA (Decaisne) Rehd. and Wils. Malaceae.

No. 22. A low, spreading, evergreen shrub, or occasionally a small tree, native to western China. The leathery, narrowly oval leaves are glossy green and 1 to 3 inches long, and the white flowers, about half an inch across, appear in terminal clusters. Its greatest charm as an ornamental is the abundant crop of bright-red fruits.

For previous introduction see S. P. I. No. 58621.

61994. *STYRAX DASYANTHUM* Perkins. Stracaceae. Snowbell.

No. 23. A deciduous shrub or small tree, native to central China, with broadly oval or obovate, pointed leaves 2 to 4 inches in length, and white flowers, one-half to three-fourths of an inch long, produced during July in slender terminal racemes. It has proved hardy in the vicinity of London, England.

61995. *VIBURNUM OVATIFOLIUM* Rehd. Caprifoliaceae.

No. 25. A very attractive viburnum from the mountainous districts of western Hupeh, China. The ovoid berries are bright red.

For previous introduction see S. P. I. No. 53749.

61972 to 61996—Continued.

61996. *VITIS* sp. Vitaceae.

Grape.

No. 26. This is called "Bellair's vine," from the name of the man on whose place Mr. Gibbs found it. It has small bunches of grapes like those of the fox grape, and the foliage becomes bright colored in the autumn.

61997. *VIGNA SINENSIS* (Torner) Savi. Fabaceae. Cowpea.

From Heilungkuan, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 7, 1924.

No. 673. September 18, 1924. A red variety of cowpea from a terraced area. (Dorsett.)

61998. *ORYZA SATIVA* L. Poaceae. Rice.

From Changchiasihmen, Chihli, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 8, 1924.

No. 593. September 11, 1924. A well-seeded, upland rice 18 inches to 2 feet high. (Dorsett.)

61999. *AVENA SATIVA* L. Poaceae. Oats.

From Rieti, Italy. Seeds presented by N. Strampelli, director, R. Stazione Sperimentale di Granicoltura. Received November 11, 1924.

A strain grown locally at Rieti.

62000. *ZEA MAYS* L. Poaceae. Corn.

From Sydney, New South Wales. Seeds presented by E. M. Lawton, American consul general. Received November 14, 1924.

Coodra Vale. This seed corn has been supplied by an important ranch in New South Wales; according to press reports this variety has produced as high as 142 bushels to the acre. (Lawton.)

62001. *DAUCUS CAROTA* L. Apiaceae. Carrot.

From Auckland, New Zealand. Seeds presented by O'Leary Bros. & Downs, at the request of H. R. Wright. Received November 19, 1924.

Yates Improved White. A field carrot extensively grown in New Zealand for stock. This variety is a heavy yielder; about two-thirds of the root grows above the surface, making it easy to lift. (Wright.)

62002. *TRITICUM DURUM* Desf. Poaceae. Durum wheat.

From Potchefstroom, Union of South Africa. Seeds presented by the School of Agriculture. Received November 25, 1924.

Var. *Great Scott*.

62003 and 62004.

From Suifu, Szechwan, China. Seeds presented by David C. Graham, Suifu, through W. deC. Ravenel, United States National Museum. Received November 26, 1924.

Samples of cereals which accompanied a consignment of specimens sent to the United States National Museum. (Ravenel.)

62003. *HORDEUM VULGARE COELESTE*. Poaceae. Six-rowed barley.62004. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

62005. DIOSPYROS sp. Diospyraceae.

Persimmon.

From Salisbury, Rhodesia, Africa. Seeds presented by Dr. F. Eyles, botanist and mycologist, Rhodesian Department of Agriculture. Received November 13, 1924.

The ripe fruit of the "Rhodesian persimmon" is round, about $1\frac{1}{4}$ inches in diameter, brown, soft, and of pleasant flavor, and usually contains four seeds. The tree, which grows in southern Rhodesia at an altitude of 3,500 feet or less, is gnarled, with blackish bark, and becomes only 25 to 35 feet in height. The native name is *M'chenje*. According to the natives it fruits only in alternate years. (Eyles.)

62006. BYRSONIMA SPICATA (Cav.) DC. Malpighiaceae.

From Dominica, British West Indies. Seeds presented by Joseph Jones, curator, Botanic Gardens. Received November 24, 1924.

A tropical tree 30 to 40 feet high, known in Dominica as *Bois Tan*. The narrow leaves are shining green above and rusty brown beneath, and the yellow flowers, followed by acid, edible fruits of the same color, make the tree a showy ornamental. The tough, light wood is useful for general construction, and the bark is a source of tannin.

For previous introduction see S. P. I. No. 58370.

62007. DAVIDIA INVOLUCRATA Baill. Cornaceae. Dove tree.

From Paris, France. Seeds presented by A. Gerard. Received November 18, 1924.

The dove tree, as this is sometimes called, is a native of the mountainous forests of central and western China, and was first introduced into western cultivation by E. H. Wilson of the Arnold Arboretum, who gives an account of his search for this plant in the Country Gentleman for August, 1926. After a number of disappointments Mr. Wilson finally discovered a number of trees in the neighborhood of Ichang, Hupeh, China, and collected a quantity of seeds.

In its native home this tree becomes 75 feet high, with a shapely pyramidal crown. When in bloom the tree is unusually striking because of the two or three large, snow-white bracts which subtend each flower. These bracts are unequal in size, the largest being 4 to 8 inches long and 2 to 4 inches wide. The bright-green, oval, sharply toothed leaves are 3 to 6 inches long.

62008. EUCRYPHIA PINNATIFOLIA Gay. Eucryphiaceae.

From Kew, Surrey, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received November 24, 1924.

An evergreen shrub from 3 to 10 feet high, which is particularly attractive because of its large, white flowers, $2\frac{1}{2}$ to 3 inches across, not unlike a large, single rose with a tuft of stamens in the center. It does best in a rather moist situation protected from the strongest rays of the sun.

For previous introduction see S. P. I. No. 49271.

62009 and 62010.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received November 26, 1924.

62009 to 62010—Continued.

62009. ARTOCARPUS sp. Moraceae.

No. 1. October 1, 1924. *Hung Kwai Muk*. Collected by G. W. Groff from a tree on the campus of the Canton Christian College. A very ornamental tree, 5 meters (approximately 16 feet) high, with a spreading habit and glossy foliage. The tree bears abundantly, round, greenish yellow-brown fruits about the size of a large plum, with a pleasant acid flavor. The fruits can be made into a jam which resembles cherry preserves in color and flavor. Due to a certain roughness of the skin, which is not evident to the eye, the fruit is unfortunately a little difficult to eat out of hand. (McClure.)

62010. GORDONIA AXILLARIS (Roxb.) Szyszyl. Theaceae.

No. 2. October 9, 1924. Collected on Hongkong Island in a wooded ravine at 300 meters (approximately 1,000 feet) altitude in decomposed granite soil. A beautiful shrub, 2 to 4 meters (approximately 7 to 14 feet) in height, with thick, glossy foliage and delicate, ephemeral, white flowers 3 to 4 centimeters (approximately 1 to 2 inches) in diameter. (McClure.)

62011. AMYGDALUS COMMUNIS L. (*Prunus amygdalus* Stokes). Amygdalaceae. Bitter almond.

From Serai, Bagdad, Mesopotamia. Seeds presented by G. S. Cameron, officiating director of agriculture. Received December 1, 1924.

Seeds of the bitter almond, introduced for comparison and cultural tests.

62012. DEUTZIA LONGIFOLIA Franch. Hydrangeaceae.

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received December 1, 1924.

Among the many attractive species of *Deutzia*, this is considered to be one of the handsomest, according to the *Gardeners' Chronicle* (ser. 3, vol. 51). It comes from western China and is a shrub about 6 feet high, with narrow leaves, whitish below, and rosy flowers, about an inch across, produced in rounded clusters 2 to 3 inches in diameter.

62013. CHAMAEDOREA ELEGANS Mart. Phœnicaceae. Pacayito.

From Zacuapam, Huatusco, Vera Cruz, Mexico. Seeds presented by Dr. C. A. Purpus. Received December 4, 1924.

The pacayito, a handsome dwarf palm native to Mexico and Central America, is an excellent ornamental house plant, and will tolerate shade to a greater extent than many other plants. It often comes into flower when not over a foot high, and the deep-green, finely pinnate, graceful leaves are very attractive. Excessive atmospheric aridity, such as frequently prevails in artificially heated rooms, is likely to prove unfavorable to this palm.

62014. RUBUS GLAUCUS Benth. Rosaceae. Andean raspberry.

From Ibarra, Ecuador. Seeds presented by Sr. José Felix Tamayo. Received December 3, 1924.

The Andean raspberry is half climbing in habit and a vigorous grower. It covers arbors and fences or can be trained into bush form, making a clump about 10 feet broad and high. The stems are round and cov-

ered with a thick whitish bloom; the leaves are trifoliate, with the leaflets ovate-lanceolate, long-acuminate, serrate, about 3 inches in length, light green above and whitish below. The flowers are produced in terminal racemes sometimes a foot in length; they are white and about an inch in diameter. The fruits are oblong-oval, often an inch long, and composed of a large number of drupelets crowded closely together. The seeds are not so large as to be troublesome in the mouth, nor are they hard; the flavor resembles that of certain northern raspberries, being rich, aromatic, and very pleasant. Although excellent when eaten with sugar and cream, the fruit is more commonly used in Ecuador to prepare a sweet conserve or the sirup made in Otavalo called *jarone de mora*, from which an excellent refresco is made.

The plant grows in soils of various types, from clay to light sandy loam. It will probably require intelligent pruning to make it fruit abundantly. I believe it possesses great possibilities when cultivated in the southern and southwestern United States, since its fruits are larger than any of the raspberries we now grow and are of excellent quality. (Wilson Popenoe, Bureau of Plant Industry.)

For previous introduction see S. P. I. No. 52717.

62015 and 62016. PIROCYDONIA spp. Malaceæ.

From Ille et Vilaine, France. Plants presented by Lucien Daniel. Received December 11, 1924. Notes by Mr. Daniel.

Graft hybrids between the pear and quince.

62015. PIROCYDONIA DANIELI Winkler.

A small shrub, resembling the quince in general habit, cultivated in the gardens of the Faculté des Sciences, at Rennes, France. This graft hybrid arose from an old pear grafted on quince stock. These seedlings are grafted on pear stock.

62016. PIROCYDONIA WINKLERI Daniel.

One of the pear grafts on the old quinces in the garden of St. Vincent College gave rise to a sucker of distinct character; this was called *Pirocydonia winkleri* by Mr. Daniel. The shoots and leaves are pubescent, unlike those of the pear. The leaves are short stemmed like the quince, but are lanceolate like the pear. A very peculiar thing about this hybrid is that it had its origin below the point of union of the graft and stock.

62017 and 62018. CASUARINA spp. Casuarinaceæ.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department, through C. V. Piper, Bureau of Plant Industry. Received December 2, 1924.

62017. CASUARINA STRICTA Ait.

This tree, commonly cultivated in California, but more rare in Florida, is a fairly hardy species making a low, often shrubby, growth. It is conspicuous on account of its very thick, often pendulous branches and very big cones. In appearance it is not so elegant as some of the other casuarina, but it is very striking and is also of some economic value. The branchlets are said to be a favorite forage of Australian cattle. The wood is especially valuable for shingles and posts.

62017 and 62018—Continued.

62018. CASUARINA SUBEROSA Otto and Dietr.

A tree 30 to 40 feet tall, quite similar to *Casuarina equisetifolia*, with smooth, slender branchlets. It is considered a valuable fodder tree in the interior districts of Australia which are subject to drought. The wood is of great beauty for cabinetwork, but should be used only in veneers, as it is apt to split in drying.

For previous introduction see S. P. I. No. 56564.

62019. TROPÆOLUM SPECIOSUM Poepp. and Endl. Tropæolaceæ.

Vermilion nasturtium.

From Elstree, Herts, England. Seeds presented by Hon. Vicary Gibbs, Aldenham House, through David Fairchild, Bureau of Plant Industry. Received November 12, 1924.

No. 24. This is the most attractive little vine which I have seen in Great Britain. Its brilliant scarlet blooms and delicate foliage make it a unique ornamental. (Fairchild.)

62020 and 62021. JASMINUM spp. Oleaceæ.

From Nogent sur Marne, Seine, France. Presented by the Directeur de l'Institut National d'Agronomie Coloniale. Received December 16, 1924.

62020. JASMINUM FRUTICANS L. Jasmine.

A half-evergreen, shrubby jasmine from the Mediterranean region, with a dense mass of slender, erect stems 3 to 5 feet high, and smooth, deep-green leaflets. The fragrant yellow flowers are produced in early summer, usually in threes or fives at the ends of short twigs, and the round, shining-black fruits are the size of peas.

62021. JASMINUM PRIMULINUM Hemsl. Primrose jasmine.

An evergreen, rambling shrub, 6 to 10 feet high, native to western China. The dark, glossy green leaflets forming a background for the fragrant bright-yellow flowers make the shrub very handsome in spring and early summer.

62022 to 62025.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens, through David Fairchild, Bureau of Plant Industry. Received December 12, 1924.

62022. DAVIDIA INVOLUCRATA VILMORINIANA (Dode) Hemsl. Cornaceæ. Dove tree.

A handsome tree from western China which, according to Horticulture (vol. 10, p. 433), becomes 60 to 70 feet in height; in habit and foliage it resembles a linden. The bright-green, oval leaves 3 to 6 inches long are sharply toothed and slender stalked, and the globular beads of small flowers, borne on slender nodding stalks about 2 inches long, appear in May and are made unusually striking by the two or three large bracts. These bracts are of unequal size, the largest being from 4 to 7 inches long and 2 to 4 inches broad.

For previous introduction see S. P. I. No. 55913.

62022 to 62025—Continued.

62023. *ERICA ARBOREA ALPINA* Dieck.
Ericaceae. Heath.

An evergreen bushy heath which is native in the mountainous region of Cuenca, Spain, and has proved hardy at the Royal Botanic Gardens, Kew, England. The dull-white flowers are produced in stiff, pyramidal clusters, but the chief beauty of the plant lies in the rich, cheerful green color of the foliage, which, in England, lasts throughout the winter.

62024. *PLATANUS ACERIFOLIA* Willd. Platanaceae. Plane tree.

The London plane, of garden origin, is a tree up to 100 feet in height and is supposed to be a hybrid between *Platanus orientalis* and *P. occidentalis*. In characters it is intermediate between the two. It resembles the American plane in foliage and is of more pyramidal habit than the European species.

62025. \times *QUERCUS LUCOMBEANA* Sweet. Fagaceae. Oak.

A handsome, sturdy oak, a hybrid between *Quercus suber* and *Q. cerris*. It produces fertile acorns, from which have been raised numerous seedling forms of widely varying characters.

62026. *MALUS SIKKIMENSIS* (Hook. f.) Koehne (*Pyrus sikkimensis* Hook. f.). Malaceae. Sikkim crab.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens, through David Fairchild, Bureau of Plant Industry. Received December 12, 1924.

The Sikkim crab is a small tree which grows wild in the interior of Sikkim, India, at altitudes up to 10,000 feet. The narrowly oval leaves are very woolly beneath, and the white flowers, rosy in the bud, are about an inch across and are borne very freely in 4 to 8 flowered clusters. The pear-shaped fruits are dark red with paler dots and are about half an inch wide.

For previous introduction see S. P. I. No. 58491.

62027 to 62029.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, regius keeper, Royal Botanic Garden. Received November 17, 1924.

62027 and 62028. *BOMAREA* spp. Amaryllidaceae.

62027. *BOMAREA CALDASII* (H. B. K.) Herbert.

A twining plant of the amaryllis family, native to the Andes of Peru. The thin, spreading leaves are 3 to 6 inches long, and the flowers, orange-yellow with crimson spots, are about an inch long and borne in many-flowered pendulous clusters.

62028. *BOMAREA CARDEBI* Masters.

This Colombian species is the most beautiful of the entire genus, according to J. N. Rose, of the United States National Museum. The broadly oblong leaves are 4 to 6 inches long, and the pale-pink flowers, spotted with brown near the top of the perianth, are in large clusters about a foot long.

62029. *PASSIFLORA HERBERTIANA* Ker. Passifloraceae.

Many of the passion flowers are charming ornaments. This Australian species is a tall climber with 3-lobed, heart-shaped leaves and white flowers.

62030. *DAVIDIA INVOLUCRATA VILMORINIANA* (Dode) Hemsl. Cornaceae.

Dove tree.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received November 10, 1923. Numbered October, 1924.

A handsome, hardy Chinese tree of pyramidal habit, differing from the typical form in leaf characters, and perhaps less winter hardy. The white floral bracts make a striking contrast with the bright-green foliage.

62031 to 62059.

From Montevideo, Uruguay. Seeds presented by Juan R. Piñeyro, secretary, Consejo Directivo Federación Rural. Received November 24, 1924.

62031. *AGROSTIS MONTEVIDENSIS* Spreng. Poaceae. Grass.

A caespitose, perennial Uruguayan grass, with slender leaves up to a foot in length.

62032. *ANDROPOGON LATERALIS INCANUS* (Hack.) Henr. Poaceae. Grass.

An erect perennial grass, up to 7 feet in height, with thick, fibrous rhizomes and hard, narrow leaves. Native to Uruguay.

62033. *ANDROPOGON SACCHAROIDES* Swartz. Poaceae. Grass.

An erect, or ascending perennial grass, with cylindrical canes and narrow, flat leaves prolonged to a fine point. It is very variable in character and is distributed throughout tropical and subtropical America.

62034. *BOUPELLOU MEGAPOTAMICA* (Spreng.) Kuntze. Poaceae. Grass.

An erect, caespitose perennial grass, with narrow, spikelike panicles.

62035. *BROMUS WILLDENOWII* Kunth. Poaceae. Grass.

An annual or biennial grass, 1 to 2 feet high, said to be good for forage.

62036. *CALAMAGROSTIS MONTEVIDENSIS* Nees. Poaceae. Grass.

A perennial erect grass, with woody rhizomes and straight, unbranched canes, 1 to 2 feet high. The handsome, reddish violet panicles are 6 to 8 inches long. Native to Uruguay.

62037. *CAPRIOLA DACTYLON* (L.) Kuntze (*Cynodon dactylon* Pers.). Poaceae.

Bermuda grass.

Introduced for special comparison tests.

62038. *CHAETOCLOA ONURUS* (Griseb.) Scribn. and Merr. (*Setaria onurus* Griseb.). Poaceae. Grass.

A slender-stemmed grass, 1 to 4 feet high, with a creeping root and linear leaves. Native to tropical America.

62039 to 62042. *CHLORIS* spp. Poaceae. Grass.

62039. *CHLORIS CANTERAI* Arech.

An erect perennial, Uruguayan grass, with somewhat bulbous rhizomes, erect canes 2 to 3 feet high, and narrow leaves.

62040. *CHLORIS CARABAEA* Spreng.

An annual, erect, leafy grass, native to the West Indies, with linear, flat leaves about a foot high.

62031 to 62059—Continued.

62041. *CHLORIS CILIATA* Swartz.

A perennial grass with erect stems 10 to 20 inches high. Native to Uruguay.

62042. *CHLORIS ULIGINOSA* Hack.

An erect, probably annual, grass about a foot high, with rigid linear leaves. Native to Uruguay.

62043. *ERIOCHLOA PUNCTATA* (L.) Hamilt. Poaceæ. Grass.

A perennial grass with erect stems, about 4 feet high; distributed throughout tropical and subtropical America. Grows usually in damp places and is said to be good forage.

62044. *MANISURIS SELLOANA* (Hack.) Kuntze. Poaceæ. Grass.

A caespitose suberect grass, common in Uruguay. The slender canes are about a foot high.

62045. *PANICUM BERGI* Arech. Poaceæ. Grass.

A rather densely caespitose grass, 1 to 2 feet high, with a bulbous rhizome and very narrow leaves. Native to Uruguay.

62046 to 62052. *PASPALUM* spp. Poaceæ. Grass.62046. *PASPALUM BARBIGERUM* Kunth.

A smooth, caespitose grass, native to South America, with stiff, erect culms 20 to 40 inches high.

62047. *PASPALUM DILATATUM* Poir.

This grass has long been introduced in the Southern States, where it is widely distributed. It is a valuable grass for pasturage, particularly on rich land, and not infrequently is cut for hay. It goes very commonly under the name of Dallis grass but is sometimes called water grass and not infrequently simply paspalum. The grass is a native of Argentina, but is now extensively cultivated in Australia, New Zealand, South Africa, and in general throughout the Tropics. (C. V. Piper, Bureau of Plant Industry.)

62048. *PASPALUM LARRANAGAI* Arech.

A hardy grass, 5 or 6 feet in height, much relished by stock; good for growing in moist land.

62049. *PASPALUM NOTATUM* Fluegge.

A perennial grass which has shown promise as a pasture grass in the southern United States; now introduced for further testing in that region.

62050. *PASPALUM Plicatulum* Michx.

An upright, caespitose, perennial Uruguayan grass, about 3 feet high.

62051. *PASPALUM PROLIFERUM* Arech.

A stoloniferous, caespitose, perennial grass with numerous, slender culms and very narrow leaves. Native to Uruguay, and grows in sandy places.

62052. *PASPALUM* sp.62053. *SPOROBOLUS BERTEROANUS* (Trin.) Hitchc. and Chase. Poaceæ. Grass.

An annual, erect, bunch grass, with long, slender, spikelike panicles.

62031 to 62059—Continued.

62054. *STENOTAPHRUM SECUNDATUM* (Walt.) Kuntze. Poaceæ. Grass.

A broad-leaved grass, extensively employed in Rio de Janeiro as a lawn grass.

62055 to 62058. *STIPA* spp. Poaceæ. Grass.62055. *STIPA CHARRUANA* Arech.

A perennial, slender-stemmed, Uruguayan grass with woody rhizomes and erect culms, about 2 feet high.

62056. *STIPA HYALINA* Nees.

The somewhat bulbous rhizomes of this South American perennial grass send up rather woody culms about 2 feet high with very narrow leaves.

62057. *STIPA PAPPOSA* Nees.

A perennial Uruguayan grass of caespitose habit, with a fibrous rhizome, and slender culms about 20 inches high.

62058. *STIPA SETIGERA* Presl.

A perennial subcaespitose grass, about 20 inches high. Native to southern South America.

62059. *TRIODIA BRASILIENSIS* (Nees) Lindm. Poaceæ. Grass.

An erect, tufted perennial grass, native to Brazil, with flat leaves.

62060 to 62073.

From Argentina. Seeds collected by H. L. Westover, Bureau of Plant Industry. Received November 25, 1924.

62060. *ANDROPOGON CONSANGUINEUS* Kunth. Poaceæ. Grass.

No. 18. Near Teniente Origone. A slender-stemmed grass, 6 to 20 inches in height, native to southern South America.

62061. *ANDROPOGON SACCHAROIDES* Swartz. Poaceæ. Grass.

No. 20. Teniente Origone. A rather coarse, perennial grass, native to tropical America, with stems 1 to 3 feet high and attractive dense, silvery panicles.

62062. *ARISTIDA* sp. Poaceæ. Grass.

No. 11. Near Choele Choele.

62063. *ARISTIDA* sp. Poaceæ. Grass.

Near Teniente Origone.

62064. *BROMUS UNIOLOIDES* (Willd.) H. B. K. Poaceæ. Rescue grass.

No. 7. Puerto Madryn. An annual or biennial grass, 1 to 2 feet high, native to South America; it has been cultivated occasionally in the Southern States for winter forage.

62065. *BROMUS* sp. Poaceæ. Grass.

Near Teniente Origone.

62066. *CHLORIS ARGENTINA* (Hack.) Lillo and Parodi. Poaceæ. Grass.

No. 19. Teniente Origone. An erect, perennial grass, 1 to 3 feet high, native to sandy places in Argentina.

62067. *HORDEUM MURINUM* L. Poaceæ. Grass.

No. 10. Near Puerto Madryn. An annual European grass, a foot or more in height, with numerous rhizomes, and flat leaves about 6 inches long.

62060 to 62073—Continued.

62068. *POA LANUGINOSA* Poir. Poaceæ.
Grass.

No. 13. Near Puerto Madryn. A perennial grass, 1 to 2 feet in height, with very narrow leaves and erect spikes about 4 inches long. Native to southern South America.

62069. *SPOROBOLUS RIGENS* (Trin.) E. Desv. Poaceæ.
Grass.

No. 8. Puerto Madryn. A perennial grass, with stiff upright, leathery leaves, and large whitish panicles. Native to Chile.

62070 to 62073. *STIPA* spp. Poaceæ.
Grass.

62070. *STIPA CHUBUTENSIS* Speg.

No. 2. Puerto Madryn. A perennial, cespitose grass which, according to Spegazzini (Anales del Museo Nacional de Montevideo, vol. 4) grows in rocky fields in Chubut, Argentina, attaining a height of about 8 inches.

62071. *STIPA HUMILIS* Brot.

No. 4. Puerto Madryn; No. 5. Near Puerto Madryn; No. 12. Near Chubut; No. 13. Near Choele Choele.

According to Spegazzini (Anales del Museo Nacional de Montevideo, vol. 4) this is a perennial grass of densely cespitose habit, with rigid leaves up to a foot high. Native to rocky situations in southern Argentina.

62072. *STIPA HYPOGONA* Hack.

No. 1. Puerto Madryn. A perennial grass, with erect, terete culms about a foot high. Native to Argentina.

62073. *STIPA NEAEI* Nees.

Nos. 6 and 9. Puerto Madryn. A perennial grass, native to arid, stony places in southern Argentina, which is described (Spegazzini, Anales del Museo Nacional de Montevideo, vol. 4) as erect or ascending, with culms up to 4 feet in height, rigid, sedgelike leaves, and purplish glumes.

62074. *PYRACANTHA CRENULATA* (Don) Roemer. Malaceæ. Firethorn.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received November 10, 1923. Numbered October, 1924.

Var. *rogersiana*. A rapid-growing Hima-layan shrub which produces an abundance of white flowers in early summer; these are succeeded by a profusion of bright-red berries. Probably this shrub is suited best for mild-wintered sections of the United States.

62075 to 62083.

From Argentina. Seeds secured by H. L. Westover, Bureau of Plant Industry. Received December 1, 1924.

62075. *GOURLIEA SPINOSA* (Molina) Skeels. Fabaceæ. Chañal.

Collected along the Rio Negro. A small, ornamental tree 12 to 15 feet high, with long, thick branches terminating in spines. The flowers, orange streaked with red, are in loose racemes, and the fruits, about an inch in diameter, have a pulp resembling the jujube in flavor.

62076. *MEDICAGO LUPULINA* L. Fabaceæ. Black medic.

From Trelew Plaza, Chubut.

62075 to 62083—Continued.

62077 to 62079. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

62077. Chilean alfalfa grown from seeds originally brought from San Jose de Maipo, Rio Claro, Brazil.

62078. Peruvian alfalfa grown from seeds originally brought from the high mountains near Arequipa, Peru.

62079. *Provence* alfalfa grown from seeds originally brought from Provence, France.

62080. *PROSOPIS STROMBULIFERA* (Lam.) Benth. Mimosaceæ.

"Screw bean." From a valley near Rio Negro, Choele Choele. This grows commonly in the Mendoza Desert and is a low shrub not over 12 inches high. Its peculiar screw-shaped pods look like bright-yellow spikes of flowers a short distance away. The pods hang on long after the leaves have fallen.

For previous introduction see S. P. I. No. 43386.

62081. *PROSOPIS* sp. Mimosaceæ.

Collected between the Rio Chubut and Rio Negro.

62082. *TRIFOLIUM REPENS* L. Fabaceæ. White clover.

From Trelew, Chubut.

62083. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceæ. Common wheat. Barletta. From the Chubut Mercantile Co., Trelew, Chubut.

62084 to 62088. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

From Chubut Province, Argentina. Seeds presented through H. L. Westover, Bureau of Plant Industry. Received December 1, 1924. Notes by Mr. Westover.

62084. Presented by William H. Williams; from near Gaiman. Chubut, Argentina.

62085. Presented by William D. Owen, from near Trelew.

62086. Presented by Mrs. R. L. Owen, Saltland, from near Dolabon.

62087. From Chacre, Dolabon.

62088. Presented by J. H. Rowlands, from near Gaiman.

62089 to 62092. *MEDICAGO SATIVA* L. Fabaceæ. Alfalfa.

From Chile. Seeds obtained through H. L. Westover, Bureau of Plant Industry. Received December 1, 1924. Notes by Mr. Westover.

62089. Hacienda of Sproa, Salane y Miriel.

62090. Serena, Coquimbo.

62091. Ovalle, Coquimbo.

62092. Hurtado, Coquimbo.

62093 to 62098.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received November 17, 1924.

62093. *ACANTHOSABAL CAESPITOSA* Proschowsky. Phenicaceæ. Palm.

A spiny-stemmed palm.

62093 to 62098—Continued.

62094. BESCHORNERIA BIGELOWII Hort. Anaryllidaceæ.

A very drought-resistant, ornamental succulent plant, hardy at Nice. (*Proschowsky*.)

62095. MIMOSA ACULEATICARPA Ortega (*M. acanthocarpa* Poir.). Mimosaceæ.

Very drought resistant; the best hedge plant I know, absolutely impenetrable. (*Proschowsky*.)

62096. PINUS CANARIENSIS C. Smith. Pinaceæ. Canary pine.

Rapid-growing timber tree. (*Proschowsky*.)

A pine, native to the Canary Islands, which thrives in warm temperate climates. It is suited to nearly all soils and has a straight trunk even when it grows in an isolated position. The wood of this pine, known in the Canary Islands as "tea," is very hard, very difficult to work, but unequalled for duration and building purposes because it does not rot.

62097. RAPHIOLEPIS UMBELLATA (Thunb.) C. Schneid. (*R. japonica* Sieb. and Zucc.). Malaceæ.

Fresh seeds of a beautiful evergreen, very hardy bush which will, I think, thrive in the southeastern parts of the United States, at least as far as North Carolina. (*Proschowsky*.)

62098. VIBURNUM sp. Caprifoliaceæ.

To be grown to ascertain its horticultural value.

62099. ARACHIS NAMBYQUARAE Hoehne. Fabaceæ. Peanut.

From Rio de Janeiro, Brazil. Seeds presented by F. W. Hoehne, Comissão de Linhas Telegraficas Estrategis de Matto Grosso ao Amazonas. Received December 10, 1924.

A Brazilian relative of the peanut, which, according to Hoehne (*Historia Natural Botânica, Matto Grosso, Brazil, Part XII*) is a much-branched, prostrate or ascending plant. The pod is 2 to 3 inches long, usually having two seeds which are edible and very oily.

62100. CICER ARIETINUM L. Fabaceæ. Chick-pea.

From Bengal, India. Seeds presented by D. Dutta, second economic botanist. Received December 10, 1924.

Introduced for trial as stock feed in the southwestern United States.

62101 and 62102.

From Benenden, Kent, England. Plants presented by Capt. Collingwood Ingram. Received December 20, 1924.

62101. PRUNUS SERRULATA Lindl. Amygdalaceæ. Flowering cherry.

Var. *kojima*. A variety of Japanese flowering cherry which has very large, pure-white flowers which are somewhat campanulate and semidouble; these are produced in a long-stemmed, drooping corymb, and are slightly fragrant. The tree is quick growing and very vigorous. (*Ingram*.)

62102. VIOLA sp. Violaceæ. Violet. A pink-flowered violet.

62103 to 62108.

From Little River, Fla. Seeds presented by Charles T. Simpson. Received December 17, 1924.

These seeds were sent to Mr. Simpson by Dr. B. E. Dahlgren, Field Museum of Natural History, Chicago, Ill.

62103. RHYTIDOCOS AMARA (Jacq.) Baccari (*Cocos amara* Jacq.). Phœnicaceæ. Palm.

A tall, feather-leaved palm, 50 to 100 feet in height, with a winged trunk. It is native to Martinique, French West Indies, and is closely related to the coconut.

62104. LICUALA SPINOSA Thunb. Phœnicaceæ. Palm.

A dwarf, fan-leaved, West Indian palm, 10 to 12 feet high, with roundish leaves 3 feet or more in diameter and 3-angled stems armed with brownish hooked spines. It requires abundant moisture and heat.

62105. INODES BLACKBURNIANA (Glazeb.) O. F. Cook (*Sabal blackburniana* Glazeb.). Phœnicaceæ. Palm.

The trunk of this West Indian palm is spineless, about 40 feet high, and thickened in the middle, and the rather rigid leaf blade is round, with about 40 sword-shaped segments. The pear-shaped fruits are an inch and a half long.

62106. SABAL MAURITIAEFORMIS (Karst.) Griseb. and Wendl. Phœnicaceæ. Palm.

A handsome West Indian palm with a trunk 60 to 80 feet in height and over a foot in diameter, and large, roundish leaves multifold to the middle, up to 12 feet in diameter. The black fruits are about the size of peas.

62107. SIMAROUBA AMARA Aubl. Simaroubaceæ.

A tall, evergreen, tropical American tree with alternate, leathery, pinnate leaves and yellowish white flowers with spreading petals. It yields a drug known as simaruba bark.

62108. TABEBUIA SERRATIFOLIA (Vahl) Nicholson. Bignoniaceæ.

A West Indian relative of the trumpet creeper of the northern United States (*Tecoma radicans*); it is a handsome evergreen tree, with digitate leaves and terminal panicles of yellow flowers.

62109. RODGERSSIA PURDOMII Hort. Saxifragaceæ.

From Langley Slough, England. Plants purchased from J. C. Allgrove, Middle Green. Received December 22, 1924.

A very attractive, hardy Chinese perennial with large, feathery panicles of creamy white flowers. It is said to thrive best in a somewhat moist, peaty soil.

62110 to 62115.

From Kew, England. Cuttings presented by Dr. A. W. Hill, director, Royal Botanic Gardens, through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received December 31, 1924.

62110. × POPULUS EUGENEI Simon-Louis. Salicaceæ. Poplar

An unusually large and vigorous poplar, which is described by Bean (*Trees and Shrubs Hardy in the British Isles*)

as a probable hybrid between the Lombardy poplar and *Populus marilandica* or *P. regenerata*, but its origin is not definitely known. The tree originated at the nursery of Simon & Louis, near Metz, Lorraine, about 1832, as a seedling, and was still standing in 1904, when it measured 150 feet in height, with a trunk 38 feet in circumference at the base.

62111. × *POPULUS GENEROSA* A. Henry. Salicaceæ. Poplar.

This hybrid poplar is, according to its originator, Augustine Henry, intermediate in characters between its parents, *Populus angulata* and *P. trichocarpa*. The leaves are coarsely serrate and pale gray beneath. The tree is a rapid grower and unusually vigorous.

For previous introduction see S. P. I. No. 58646.

62112. *AMYGDALUS COMMUNIS* L. (*Prunus amygdalus* Stokes). Amygdalaceæ. Almond.

Var. *macrocarpa*. A large-fruited variety which is also excellent as an ornamental.

62113. *PRUNUS MAACKII* Rupr. Amygdalaceæ. Amur cherry.

A Manchurian bird cherry, 40 feet or more in height, with very smooth brownish yellow bark which peels off like that of a birch. The leaves are pointed and very finely toothed, and the white flowers are in short racemes borne on the previous season's wood.

For previous introduction see S. P. I. No. 57310.

62114. *RUBUS THIBETANUS* Franch. Rosaceæ.

The bluish purple stems and handsome pinnate foliage make this shrub one of the most attractive of the Chinese species of *Rubus*, according to W. J. Bean (Trees and Shrubs Hardy in the British Isles). In habit it is erect, becoming about 6 feet high, and the dark-green leaves are white felted below. The purple flowers, half an inch across, are succeeded by bluish-black berries.

For previous introduction see S. P. I. No. 53538.

62115. *SALIX MATSUDANA* Koidz. Salicaceæ. Willow.

An eastern Asiatic willow about 40 feet in height, with ascending or pendulous, greenish branches, and narrowly lanceolate leaves 2 to 4 inches long. Observations made in northeastern China by Frank N. Meyer indicate that this willow thrives in regions having a scanty rainfall.

62116 to 62123. *PISUM SATIVUM* L. Fabaceæ. Pea.

From Cambridge, England. Seeds presented by F. T. Engledow, School of Agriculture. Received December 19, 1924.

62116 to 62119. From Bohemia.

62116. P. 63. 62118. P. 65.

62117. P. 64. 62119. P. 66.

62120 to 62123. From Tibet.

62120. (a). 62122. (c).

62121. (b). 62123. (d).

62124 to 62126. *SACCHARUM OFFICINARUM* L. Poaceæ. Sugar cane.

From Santiago de las Vegas, Cuba. Cuttings presented by Gonzalo Fortun, director, Estación Experimental Agronómica. Received December 20, 1924.

62124. Cuba 35. **62125.** C. H. 64/21.

62126. Cuba del Cubana.

62127 and 62128.

From Glasnevin, Dublin, Ireland. Seeds presented by the director, Royal Botanic Gardens. Received December 30, 1924.

62127. *DELPHINIUM PYLZOWI* Maxim. Ranunculaceæ. Larkspur.

A Chinese larkspur originally collected in Kansu by Przewalski, and described (Bulletin de l'Académie Impériale, St. Petersburg, vol. 23, p. 307) as having a leafy stem, 5-parted leaves, and attractive flowers with violet sepals and blackish petals.

62128. *MAGNOLIA WILSONII* (Finet and Gagn.) Rehd. Magnoliaceæ.

In habit this Chinese magnolia is a large shrub; it was first discovered in western Szechwan by E. H. Wilson, and appears to be a valuable horticultural addition to this already popular genus. The flowers, which are pure white and delicately fragrant, are produced freely during late May and early June.

62129. *CASTANEA MOLLISSIMA* Blume. Fagaceæ. Hairy chestnut.

From Nanking, China. Seeds presented by Dr. J. H. Reiser, University of Nanking. Received November 14, 1924.

A hardy, blight-resistant chestnut from northern China, producing nuts of good quality, closely resembling our native chestnut in size, shape, and color.

62130. *VIGNA SINENSIS* (Torner) Savi. Fabaceæ. Cowpea.

From Taillungyuan, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 8, 1924.

No. 809. October 7, 1924. Red and white seeded cowpea from one of the village farmers. This is one of the two chief varieties grown around here. (Dorsett.)

62131. *CANNA* sp. Cannaceæ. Canna.

From Summit, Canal Zone. Seeds presented by Holger Johansen, agronomist, Plant Introduction Gardens. Received December 30, 1924.

A dark-red canna, quite common here and of ornamental value. (Johansen.)

62132 to 62140.

From China. Bulbs and tubers collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 20, 1924. Notes by Mr. Dorsett.

62132. *ALLIUM* sp. Liliaceæ. Onion.

No. 1095. Peking. October 31, 1924. Bulbs of Chinese "garlic." The Chinese use garlic in many forms and especially in their cooking.

62132 to 62140—Continued.

62133 and 62134. *Dioscorea* sp. Dioscoreaceae. Yam.

62133. No. 1058. Peking. October 31, 1924. Tubers of a Chinese variety *Shan Yoo* (mountain medicine).

62134. No. 1094. Peking. October 31, 1924. Aerial tubers purchased in the market. These tubers are said to be from the same vine which produce the long ground tubers, No. 1058 [S. P. I. No. 62133].

62135 to 62140. *Solanum tuberosum* L. Solanaceae. Potato.

62135. No. 1096. Peking. October 31, 1924. Tubers of a good-looking potato purchased in the market. It is said that these potatoes are also shipped in from Tientsin.

62136. No. 1097. Peking. October 31, 1924. Tubers of an oblong, medium-sized potato shipped in to the market from Tientsin.

62137 and 62138. October 31, 1924. Tubers purchased in the Peking market.

62137. No. 1098. Tubers of a rather small, oblong, purplish potato shipped in to the market from Kalgan.

62138. No. 1099.

62139. No. 1312. Huangan, Chihli. November 8, 1924. These tubers are white or tinged with a delicate shade of pink, and though not so very large they are of fair appearance.

62140. No. 1313. Huangan, Chihli. November 8, 1924. Tubers of a rather small, purple-skinned potato. The Chinese say that this variety is dug in the fall.

62141. *Calophyllum calaba* L. Clusiaceae.

From Summit, Canal Zone. Seeds presented by Holger Johansen, Plant Introduction Garden. Received November 18, 1924.

A West Indian relative of the mango-steen (*Garcinia mangostana*) which is known as the Calaba tree; it becomes 60 feet high, with dark-green, glossy foliage and axillary clusters of white flowers. The wood is used for building purposes, and the oil pressed from the seeds is sometimes used, in Porto Rico, in lamps.

62142 to 62158.

From China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December, 1924. Notes by Mr. Dorsett.

62142. *Corylus* sp. Betulaceae. Hazel.

No. 1297. November 8, 1924. Scions collected between Shihchiaying and Huangan. This hazel is reported to bear flattened nuts in place of the conical nuts like those sent in under No. 799 [S. P. I. No. 62170].

62143. *Diospyros kaki* L. f. Diospyraceae. Kaki.

No. 1229. November 6, 1924. Scions from a large orchard near Hielungkuan. The fruits are 4 inches or more in diameter.

62144 to 62146. *Juglans regia* L. Juglandaceae. Walnut. Scions.

62142 to 62158—Continued.

62144. No. 1285. November 8, 1924.

From a good-looking young tree growing in a canyon between Shihchiaying and Huangan.

62145. No. 1314½. November 9, 1924.

From a good-looking tree growing in a terraced orchard a short distance above Taho, Chihli.

62146. No. 1315½. November 9, 1924.

From a large good-looking tree growing in a terraced orchard just above Taho, Chihli.

62147. *Populus* sp. Salicaceae. Poplar.

No. 1296. November 8, 1914. Cuttings obtained from small suckers and plants growing between Shihchiaying and Huangan.

62148 to 62151. *Prunus armeniaca* L. Amygdalaceae. Apricot. Scions.

62148. No. 1403. November 11, 1924.

From an old tree measuring 56 inches in circumference, growing in an old Chinese cemetery near Yenchia, Chihli. This tree is said to bear large, long fruits with golden-yellow flesh which separates easily from the stone.

62149. No. 1404. November 11, 1924.

A large, red-fruited apricot with dark-yellow flesh, from a terraced mountain side between Yenchia and Menloukou, Chihli.

62150. No. 1405. Honantai, Chihli.

November 11, 1924. A reddish-green apricot having large fruit; from an orchard located on a terraced mountain side.

62151. No. 1406. Honantai, Chihli.

November 11, 1924. An apricot known here as the *Kan Ke Lo*. This is said to be a good-sized apricot having yellow flesh which separates easily from the stone.

62152. *Rosa* sp. Rosaceae. Rose.

No. 1290. November 8, 1924. Cuttings collected near an old Chinese temple between Shihchiaying and Huangan, Chihli. The hips are bright red and slender, and the stems are dull red and quite thorny.

62153. *Rubus* sp. Rosaceae.

No. 1291. November 8, 1924. Plants collected between Shihchiaying and Huangan.

62154. *Salix* sp. Salicaceae. Willow.

No. 1295. November 8, 1924. Cuttings of a willow found growing quite abundantly between Shihchiaying and Huangan.

62155 to 62157. *Vitis vinifera* L. Vitaceae. Grape.

62155. No. 1156. Between Peking and Toli. November 3, 1924. Scions of the so-called rose grape, secured from Mr. Tsui.

62156. No. 1173. Menshuiho, Chihli. November 4, 1924. Cuttings of a rose or pink grape procured from Mr. Wang. These plants were growing in sandy loam.

62157. No. 1174. Menshuiho, Chihli. November 4, 1924. Cuttings of a long, white grape, known as "milk grape," procured from Mr. Wang.

62142 to 62158—Continued.

62158. *VITIS* sp. Vitaceæ. Grape.

No. 1292. November 8, 1924. Scions collected between Shihchiaying and Huangnan. This grape may prove useful as an ornamental.

62159 and 62160.

From China. Tubers collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November, 1924. Notes by Mr. Dorsett.

62159. *DIOSCOREA* sp. Dioscoreaceæ. Yam.

No. 789. October 9, 1924. Aerial tubers from a vine growing on the hill just back of the Yung Lo [Ming] tomb, Changling, Chihli.

62160. *IPOMOEA BATATAS* (L.) Poir. Convolvulaceæ. Sweet potato.

No. 796. Nananho. Chihli. October 21, 1924. The flesh of these good-sized sweet potatoes is creamy white with a slight tinge of pink near the skin.

62161 to 62184.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December, 1924. Notes by Mr. Dorsett.

62161 and 62162. *ANDROPOGON ISCHAEMUM* Poaceæ. Grass.

62161. No. 800. October 7, 1924. A grass, called by the Chinese "brush grass," secured in a river bottom area between Tuili and Mentoukou.

62162. No. 801. October 7, 1924. Near Nankow, on the road to the Ming tombs, we found this grass forming a thick mat; the stems and panicles have a reddish cast. It grows on very dry, gravelly soil.

62163 and 62164. *ARACHIS HYPOGAEA* L. Fabaceæ. Peanut.

62163. No. 962. Hsingshon. Chihli. October 12, 1924. From plants growing in river-bottom soil.

62164. No. 1029. Peking. October 22, 1924. Sent in to the market from Taotingfu where considerable quantities of these small peanuts are grown. The Chinese steam these, hulls and all, in a strong salt solution, then dry and shell the nuts. These nuts are chiefly used as salted peanuts.

62165. *CANNABIS SATIVA* L. Moraceæ. Hemp.

No. 931. October 11, 1924. From the Fa Hua Ssu temple grounds, near Haitzu, Chihli.

62166. *CAPSICUM ANNUUM* L. Solanaceæ. Red pepper.

No. 994. Peking. October 17, 1924. A long smooth-skinned, red pepper, procured in the market.

62167. *CARAGANA* sp. Fabaceæ.

No. 905. October 10, 1924. Collected from plants growing on a mountain side near Laochun.

62168. *CELTIS BUNGEANA* Blume. Ulmaceæ. Hackberry.

No. 1014. October 21, 1924. A tree with small, deep-green leaves, and black fruits the size of small peas, growing in the Black Dragon temple grounds.

62161 to 62184—Continued.

62169. *CHAENOMELES* sp. Malaceæ. Chinese quince.

No. 1012. October 20, 1924. Shipped in to the Peking market from Kansu. These fruits have a pleasant fragrance. The flesh is yellow, hard, gritty, and quite acid.

62170. *CORYLUS* sp. Betulaceæ. Hazel.

No. 799. Peking. October 21, 1924. Procured in the market. These hazelnuts, reported to be native Chinese hazel, are the smallest we have ever seen. They may have value for growing as stock plants on which to graft other and larger sorts.

62171. *DOLICHOS LABLAB* L. Fabaceæ. Hyacinth bean.

No. 792. Peking. October 15, 1924. This bean, obtained in the market, is called "French bean" by the Chinese, who use it dried as a vegetable.

62172 to 62174. *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench). Polygonaceæ. Buckwheat.

62172. No. 864. Chunglang, Chihli. October 9, 1924. Sample of buckwheat obtained from a farmer.

62173. No. 935. Fa Hua Ssu temple, near Taitzu, Chihli. From a mountain valley.

62174. 963. Tangshan (Hot Springs). October 12, 1924. Growing on sandy loam.

62175. *FALCATA EDGEWORTHII* (Benth.) Kuntze. Fabaceæ.

No. 860. Yung Lo [Ming] tomb, Changling, Chihli. October 9, 1924. The seeds are greenish yellow and blotched with black. May prove useful as a ground cover.

62176. *GLEDITSIA SINENSIS* Lam. Cæsalpinaceæ.

No. 1019. Wenchueng, Chihli, October 21, 1924. A good-sized, round-headed tree with compound leaves. The Chinese use the pods in the manufacture of soap.

62177 and 62178. *IRIS DICHOTOMA* Pall. Iridaceæ. Iris.

62177. No. 773. October 9, 1924. Collected across the river from the Yung Lo [Ming] tomb. The flowers are said to be yellow.

62178. No. 774. October 9, 1924. From plants growing in the grounds of the Yung Lo [Ming] tomb.

62179. *LATHYRUS* sp. Fabaceæ.

No. 906. Shalingliang, Chihli. October 10, 1924. Pods collected from a bundle of wild grass brought down from the mountain.

62180. *LESPEDEZA* sp. Fabaceæ.

No. 810. October 7, 1924. Collected between Lunghutai and the Ming tombs.

62181. *LESPEDEZA* sp. Fabaceæ.

No. 866. Nung Lo tomb, near Changling, Chihli. October 9, 1924. Said to be good for goats.

62182. *LESPEDEZA VIRGATA* (Thunb.) DC. Fabaceæ.

No. 925. Fa Hua Ssu temple, near Haitzu. October 11, 1924. A shrubby legume.

62161 to 62184—Continued.

62183. *MELOTHRIA* sp. Cucurbitaceæ.

No. 1027. Peking. October 22, 1924. *Chih Pao* (red parcel). The sweet, melon-like fruits with smooth, red skin are small but quite attractive.

62184. *MENISPERMUM DAURICUM* DC. Menispermaceæ. Asiatic moonseed.

No. 959. Near Hssachunk. October 12, 1924. A vine having ivylike leaves and berries about as large as good-sized peas.

62185. *INDIGOFERA MACROSTACHYA* Vent. Fabaceæ. Indigo.

From Shalingliang, Chihli, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 6, 1924.

No. 908. October 10, 1924. A shrubby plant with hairy leaflets and pink flowers in dense racemes which are longer than the leaves, found growing along the trail near Shalingliang on very poor soil.

62186 to 62229.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December, 1924. Notes by Mr. Dorsett.

62186. *ORYZA SATIVA* L. Poaceæ. Rice.

No. 981. Tatangshan (the Large Hot Spring Mountain), Chihli. October 13, 1924. Seeds obtained from a rice farmer.

62187. *PERILLA FRUTESCENS* (L.) Britton (*P. ocymoides* L.). Menthaceæ. Perilla.

No. 930. Fa Hua Ssu temple, near Haitzu, Chihli. October 11, 1924. The small, gray seeds of this perilla are used for the oil contained in them.

62188 to 62190. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Fabaceæ. Adzuki bean.

62188. No. 828. Tailungyuan. October 8, 1924. A mottled black and gray bean; from vines growing in a large persimmon orchard.

62189. No. 857. Lung Lo tomb, Changling, Chihli. October 9, 1924. A pink bean obtained from a farmer.

62190. No. 969. Tangshan (Hot Springs), Chihli. October 12, 1924. A small, dark-blue and gray mottled bean.

62191 and 62192. *PHASEOLUS AUREUS* Roxb. Fabaceæ. Mung bean.

62191. No. 808. Tailungyuan. October 7, 1924. A green mung bean obtained from a farmer.

62192. No. 929. Fa Hua Ssu temple, near Haiszu, Chihli. October 11, 1924. A green mung bean.

62193. *PHASEOLUS CALCARATUS* Roxb. Fabaceæ. Rice bean.

No. 858. Lung Lo tomb, Changling, Chihli. October 9, 1924. A small, creamy-white bean obtained from a farmer.

62194. *PINUS* sp. Pinaceæ. Pine.

No. 868. Nung Lo tomb, near Changling, Chihli. October 9, 1924. This is a low, flat-headed, scraggly pine of a rather peculiar appearance.

62186 to 62229—Continued.

62195. *PYRUS BETULAEFOLIA* Bunge. Malaceæ. Pear.

No. 865. Nung Lo tomb, near Changling, Chihli. October 9, 1924. This tree, 20 or more feet in height, does not show any signs of blight.

62196. *PYRUS* sp. Malaceæ. Pear.

No. 766. October 6, 1924. Seeds of a domesticated Chinese sugar pear found in the district of the Ming tombs, north-east of Peking.

62197. *RICINUS COMMUNIS* L. Euphorbiaceæ. Castor bean.

No. 907. Wanpaochuan, Chihli. October 10, 1924. From the edge of a cultivated field.

62198 to 62208. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceæ. Soy bean.

62198. No. 804. Lunghutai. October 7, 1924. This black soy bean is the commonest type grown in this section.

62199. No. 811. Tailungyuan. October 7, 1924. This is the leading variety grown here.

62200. No. 856. Yung Lo tomb, Changling, Chihli. October 9, 1924. A yellow variety.

62201. No. 933. Fa Hua Ssu temple, near Haitzu, Chihli. October 11, 1924. A black variety.

62202. No. 936. October 12, 1924. A yellow variety, mottled with brown, obtained from the priest of the Fa Hua Ssu temple, near Haitzu, Chihli.

62203. No. 937. October 12, 1924. A very dark-brown variety obtained from the priest of the Fa Hua Ssu temple, near Haitzu, Chihli.

62204. No. 964. Tangshan (Hot Springs). October 12, 1924. A creamy yellow variety.

62205. No. 966. Tangshan (Hot Springs). October 12, 1924. A black variety; one of the most important types grown in this sandy loam river-bottom soil.

62206. No. 1013. Chouchiahsiang, Chihli. October 21, 1924. A yellow or creamy yellow variety commonly grown in this section.

62207. No. 1015. Chouchiahsiang, Chihli. October 21, 1924. A black variety commonly grown in this level valley section.

62208. No. 1030. Peking. October 22, 1924. A brown variety streaked with black, called by the Chinese *Hu p't tou* (tiger skin). These soy beans taste very good after being roasted.

62209 to 62211. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceæ. Common wheat.

62209. No. 863. Nung Lo tomb, Changling. October 9, 1924. This winter wheat has the smallest grain we have ever seen, and it appears very soft.

62210. No. 970. Tangshan (Hot Springs). October 12, 1924. Ordinary winter wheat with very small grains.

62186 to 62229—Continued.

62211. No. 1016. Chouchiahhsiang, Chihli. October 21, 1924. A winter wheat growing in a broad flat valley.

62212 and 62213. *Vicia faba* L. Fabaceæ.
Broad bean.

Peking. Beans known here as *Tsan fou* (silkworm bean). These are roasted and are also cooked and used as a vegetable.

62212. No. 783. October 15, 1924. A large, broad, brownish green variety.

62213. No. 1031. October 22, 1924. A pinkish buff variety.

62214. *Vigna sesquipedalis* (L.) Frurith. Fabaceæ. Yard Long bean.

No. 802. Between Nankou and Lung-hutai. October 7, 1924. The base of this bean is terra-cotta colored and is blotched or streaked with a deeper shade of red.

62215 to 62224. *Vigna sinensis* (Torner) Savi. Fabaceæ. Cowpea.

62215. 803. Between Nankou and Lung-hutai. October 7, 1924. A cowpea with a pinkish or purple eye, growing in a very dry situation.

62216. No. 809. Tailungyuan. October 7, 1924. A pink or brown eyed cowpea.

62217. No. 855. Yung Lo tomb, Changling, Chihli. October 9, 1924. A pink cowpea.

62218. No. 932. Fa Hua Ssu temple, near Haitzu, Chihli. October 11, 1924. A cowpea mottled brown and white.

62219. No. 934. Fa Hua Ssu temple, near Haitzu, Chihli. October 11, 1924. A pink or brown eyed cowpea.

62220. No. 965. Tangshan (Hot Springs). October 12, 1924. This brown-eyed cowpea is one of the leading types grown on this sandy loam river-bottom soil.

62221. No. 968. Tangshan (Hot Springs). October 12, 1924. Cowpea mottled pink and white.

62222. No. 1017. Chouchiahhsiang, Chihli. October 21, 1924. A brown-eyed cowpea.

62186 to 62229—Continued.

62223. No. 1018. Chouchiahhsiang, Chihli. October 21, 1924. A pink cowpea.

62224. No. 1045. Peking. October 25, 1924. A mottled reddish brown and creamy yellow cowpea purchased in the market and reported to have come from the region south of Peking.

62225. *Zanthoxylum* sp. Rutaceæ.
Prickly ash.

No. 903. Yung Lo [Ming] tomb, Changling, Chihli. October 10, 1924. This plant is fully as broad as it is high, and the dark-green leaves have a pleasant, spicy odor. It may prove to be a good ornamental and possibly a good hedge plant.

62226 and 62227. *Zea mays* L. Poaceæ.
Corn.

62226. No. 806. Lung-hutai. October 7, 1924. Small ears of flint corn purchased in the temple. The keeper reported that this corn is harvested within 100 days after planting.

62227. No. 926. Fa Hua Ssu temple, near Haitzu, Chihli. October 11, 1924. Yellow flint corn grown here on the mountain.

62228. *Ziziphus jujuba* Mill. (*Z. sativa* Gaertn.). Rhamnaceæ. Jujube.

No. 758. Peking. October 1, 1924. These fruits, obtained in the market, are quite acid and of good quality.

62229. *Grewia parviflora* Bunge.

No. 829. Nung Lo tomb, near Changling, Chihli. October 9, 1924. Collected from a small shrub which resembled a *Celtis*.

62230. *Rhamnus davurica* Pall. Rhamnaceæ. Dahurian buckthorn.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 6, 1924.

No. 967. October 12, 1924. A shrub having rather small, deep-green leaves and numerous small, purple or black, one-seeded fruits; found at Neutang, a short distance from Tangshan (Hot Springs). (Dorsett.)

Introductory statement-----	1
Inventory-----	3
Index of common and scientific names-----	55

INTRODUCTORY STATEMENT

MORE THAN 1,200 lots of plant material were received during the three months represented by this inventory, a total well above the average maintained for the last few years. Much of this material was sent in by the four agricultural explorers who were pursuing their activities in eastern Asia, northern Africa, and western South America.

The Province of Chihli, China, and especially the vicinity of Peking, has continued to be a very fertile field for agricultural explorations, and from this region P. H. Dorsett has sent in a steady stream of promising plant immigrants. Of special interest are scions of a number of large-fruited varieties of the Chinese jujube (*Ziziphus jujuba*, Nos. 62352-62354, 62562, 63322, 63323, 63476), because of the increasing demand for this fruit among the growers in the South-western States and California. The jujube has shown itself to be adapted for growing in semiarid regions having long, hot summers and mild winters. As a candied fruit, processed in sugar sirup and dried, its popularity is steadily increasing.

Other fruits represented in Mr. Dorsett's collections are peaches, apricots, plums, cherries, pears, and persimmons. There are also included many locally developed strains of cereals and vegetables and a number of herbaceous and woody ornamentals.

From Ecuador a number of interesting lots of plant material were sent in by Wilson Popenoe. These include scions of a peach (*Amygdalus persica*, No. 62551), a medium-sized freestone which may prove adapted to subtropical climates, and scions of the capulin cherry (*Prunus serotina*, No. 62553) from the old Gonzales tree at Catiglata. This tree, famous throughout the Ecuadorian highlands, bears cherries of unusually large size. The capulin cherry is very closely related to the wild black cherry of the eastern United States and may prove suitable for growing in the Southeastern States, where other cherries do not thrive.

In southeastern China F. A. McClure continued his investigations of the economic flora of that region and sent in an interesting collection of scions of the Japanese apricot (*Prunus mume*, Nos. 62311-62318). Our previous experience with the ornamental forms of *Prunus mume* has been that a few of the double-flowering and large-flowered sorts may be of special value because of their habit of blooming in the spring even before the forsythias, but as they are doubtfully hardy as far north as Washington, D. C., it may be necessary to confine their cultivation to the southern United States. Mr. McClure's collection includes some very promising large-flowered forms.

While traveling through Europe, David Fairchild, in charge of this office, visited some of the leading nurseries and arboreta in France and England. As a result of his visits there has been sent in propagating material of a large number of rare and promising trees and shrubs, mostly from the cooler parts of eastern Asia. Doctor Fairchild also visited Algeria, sending in from that country, among other things, seeds of the argan (*Argania spinosa*, No. 62660), a large drought-resistant evergreen tree of western Morocco which grows in very rocky soil and bears an abundance of light-yellow plumlike fruits eaten by stock. The seeds yield an oil which can be used for cooking.

A firlike tree from western China (*Keteleeria davidiana*, No. 62254) should be of interest. It is a tree of pyramidal habit which sometimes becomes 100 feet tall, and it has glossy green foliage. Two excellent evergreens previously introduced from this region which have found a place in American horticulture are the Chinese juniper (*Juniperus chinensis*) and the white-barked pine (*Pinus bungeana*). Mention should also be made, in this connection, of the East African juniper (*Juniperus procera*, No. 62395), which Doctor Sargent, director of the Arnold Arboretum, Jamaica Plain, Mass., considers the handsomest juniper in the world. It may be sufficiently hardy to grow in Florida and southern California.

Gladiolus breeders will be especially interested in the introduction of a number of indigenous species from South Africa (*Gladiolus* spp., Nos. 62653, 62857-62860). The rapidly increasing interest in this group of ornamentals should stimulate attempts to create new varieties by crossbreeding.

A remarkable collection of rice varieties (*Oryza sativa*, Nos. 62523-62550) was presented by H. Ando, Director of the Imperial Agricultural Experiment Station at Nishigahara, Tokyo, Japan. These varieties, purebred through selection, had been grown at the station for several years and include both early and late maturing forms. Another rice collection consisting of nearly 200 varieties (*Oryza sativa*, Nos. 62962-63148), mostly crossbred, was presented by Yoshinori Takesaki, of the Imperial University at Kyoto, Japan.

The botanical determinations of these introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., November 22, 1926.

INVENTORY

62231. *LYCOPERSICON ESCULENTUM* Mill. Solanaceae. Tomato.

From Lima, Peru. Seeds presented by Dr. A. Weberbauer. Received January 31, 1925.

Seeds of wild-grown tomatoes, collected during December between Lima and Ancon on the coastal plain on stony saline soil, in an almost rainless district. (Weberbauer.)

62232. *ECDEIOCOLEA MONOSTACHYA* F. Muell. Baloskionaceae.

From Perth, Western Australia. Seeds presented by W. M. Carne, botanist and plant pathologist, Department of Agriculture. Received January 31, 1925.

Collected at Wongan Hills, Western Australia, December, 1924, by C. A. Gardner. (Carne.)

A perennial, rushlike, herbaceous plant, introduced for testing as a possible source for paper-making material.

62233. *ELAEOCARPUS OBLONGUS* Gaertn. Elaeocarpaceae.

From Guntur, Madras Presidency, India. Seeds presented by William Bembower. Received February 3, 1925.

The "Nilghiri mock olive" is a tree of domelike habit, with a white, well-branched trunk. The elliptic leaves are shining green, and the white flowers appear in slender, axillary racemes 2 to 6 inches long. The crimson color of the autumn foliage is very attractive, resembling that of the Virginia creeper. The tree appears to be a satisfactory ornamental for subtropical regions. (Bembower.)

62234. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Santiago de las Vegas, Cuba. Cuttings presented by the agricultural experiment station, through E. W. Brandes, Bureau of Plant Industry. Received March 25, 1925.

Hawaii 109.

62235. *OLEARIA FORSTERI* Hook. f. Asteraceae.

From Dublin, Ireland. Plants and cuttings presented by J. W. Besant, Glasnevin Botanic Garden, at the request of Dr. Augustine Henry, College of Science. Received February 7, 1925.

A handsome, evergreen, New Zealand shrub, about 7 feet in height, which belongs to a group closely allied to the shrubby asters. The oblong leaves have wavy margins and are whitish below, and the insignificant but fragrant flowers appear late in the fall. While this plant is said to be able to endure rather low temperatures, it also requires a cool, moist summer.

62236 to 62238. *VIOLA ODORATA* L. Violaceae. Violet.

From Killaloe, County Clare, Ireland. Plants purchased from Mrs. Stanistreet. Received February 7, 1925. Notes by Mrs. Stanistreet.

62236. *Lady Hume Campbell*. A variety with very large, long-stemmed flowers, which are a soft lavender-blue and very fragrant. Blooms freely and is valuable for its long flowering season.

62237. *Mrs. David Lloyd George*. The highly perfumed flowers, borne on long stems, are purple, with center petals shaded lavender, rose, and white.

62238. *Souvenir de ma Fille*. A new variety with enormous dark-violet, highly perfumed flowers, borne on long stems. Good for frames or open air.

62239. *CISSUS STRIATA* Ruiz and Pav. (*Vitis striata* Miq.). Vitaceae.

From Paris, France. Plants purchased from Vilmorin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 19, 1925.

A low, shrubby, evergreen vine, native to southern South America. The leaves are small, with three to five leaflets; the yellowish flowers are in rather dense clusters. Probably tender except in the Southern States.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction, and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all, and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no samples of herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

62240. ZIZIPHUS JUJUBA Mill. (*Z. sativa* Gaertn.). Rhamnaceae. Jujube.

From Chihli, China. Suckers collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 14, 1925.

No. 1545. *Lou Tzu Chuang* and *Ta Shan Tzu*. December 1, 1924. Known as the "tooth jujube." (*Dorsett*.)

62241 to 62243.

From St. Quentin, Somme, France. Seeds presented by René Bourgeois. Received February 3, 1925. Notes by Mr. Bourgeois.

62241. BENINCASA HISPIDA (Thunb.) Cogn. Cucurbitaceae. Wax gourd.

A variety having a very long fruiting season, cultivated by the natives of Tonking for making sweetmeats.

62242. BRASSICA NAPIFORMIS (Paill. and Bois.) Bailey. Brassicaceae.

A tuberous mustard from China, the seeds of which are sown during July. The tubers are eaten during the winter season in the same manner as turnips.

62243. PHASEOLUS sp. Fabaceae.

A variety with edible seeds, cultivated in Tonking and remarkable for its vigorous growth.

62244. CISTUS ALBIDUS L. Cistaceae. Rockrose.

From London, England. Seeds presented by O. E. Warburg. Received February 4, 1925.

The typical form of this low European shrub bears lilac or rosy flowers; this horticultural variety is said to produce flowers which are white.

62245 to 62247. PASPALUM spp. Poaceae. Grass.

From Guayaquil, Ecuador. Presented by J. A. Cleveland. Received February 5, 1925.

62245. PASPALUM CONJUGATUM Berg.

Seeds of a creeping perennial grass with the flowering stems sometimes 3 feet tall. This species, originally from Dutch Guiana, is found in moist places in the Tropics of both hemispheres and forms extensive and close mats.

For previous introduction, see S. P. I. No. 55693.

62246. PASPALUM sp.

No. 1. Plants.

62247. PASPALUM sp.

No. 2. Plants.

62248. CUCUMIS MELO L. Cucurbitaceae. Melon.

From Gien, Loiret, France. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received February 6, 1925.

I found strings of these melons on sale in Paris, and on sampling them I discovered that they were perfectly delicious in flavor. They seemed to be uniformly sweet and

were so juicy that they simply melted in our mouths. The melon is a rather small and typically melon-shaped one with grooves or furrows. Each fruit is tied up in a kind of basket made of straws, hung up and allowed to ripen. (*Fairchild*.)

62249. PYRUS sp. Malaceae. Pear.

From Peking, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received February 6, 1925.

Nos. 1666 and 1695. December 20, 1924. Seeds of a domesticated peach secured in the market; may prove of value as stocks. (*Dorsett*.)

62250 to 62252.

From Avondale, Auckland, New Zealand. Seeds presented by H. R. Wright. Received January 21, 1925.

62250. ALECTRYON EXCELSUM Gaertn. Sapindaceae. Titoki.

A handsome evergreen tree, 30 to 60 feet high, native to New Zealand. The bark is almost black, and the young branches, under surfaces of the compound leaves, and inflorescences are covered with a very fine, silky pubescence, according to Cheeseman (*Manual of the New Zealand Flora*). The shining-black, oily seeds are half imbedded in a scarlet, fleshy, cup-shaped aril. The tough, elastic wood is used for tool handles.

62251. CUCURBITA MAXIMA Duchesne. Cucurbitaceae. Squash.

A small, gray variety, which keeps the year round; of good quality. (*Wright*.)

62252. ZEA MAYS L. Poaceae. Corn.

A variety especially recommended for green feed; stools well and is high in saccharine. Grown here as stock feed. (*Wright*.)

62253 and 62254.

From Ichang, China. Seeds purchased from Albert S. Cooper, American Church Mission. Received January 26, 1925.

62253. DIOSPIROS KAKI L. f. Diospyraceae. Kaki.

Seeds of wild kakis, from the vicinity of Ichang. (*Cooper*.)

62254. KETELEERIA DAVIDIANA (Bertrand) Beissner. Pinaceae.

A coniferous tree from western China which is closely allied to the firs. It sometimes becomes 100 feet tall, is of pyramidal habit, and has handsome, glossy green, firlike foliage. The tree is said to be somewhat tender to frost, and therefore probably adapted for growing only in the southern half of the United States.

62255 and 62256. COTONEASTER spp. Malaceae.

From Orleans, France. Seeds presented by Leon Chenault, through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received January 27, 1925.

62255. COTONEASTER DAMMERI C. Schneid.

A prostrate, evergreen shrub, native to central China, with pure-white, solitary flowers and coral-red fruits one-fourth of an inch wide.

62255 and 62256—Continued.

62256. COTONEASTER SALICIFOLIA FLOCCOSA
Rehd. and Wils.

A graceful shrub about 12 feet high, which bears dense corymbs of white flowers and roundish, light-red fruits. Native to western China at altitudes of 7,500 to 9,800 feet.

62257 to 62262.

From China. Scions presented through P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received February 4, 1925. Notes by Mr. Dorsett.

A collection of scions presented by the priest, Chueh Ming, from the Fa Hua Ssu temple, Silver Mountain, Changpinghsien, Chihli.

62257. CASTANEA sp. Fagaceae.

Chestnut.

No. 1677. December 23, 1924. *Hu-chao-li Tzu* (tiger-paw chestnut). Seeds of this same chestnut were sent in under No. 790 [S. P. I. No. 61834].

62258. CASTANEA sp. Fagaceae.

Chestnut.

No. 1678. December 23, 1924. *Li Tzu*. From a tree of the ordinary chestnut. Seeds were sent in under No. 791 [S. P. I. No. 61835].

62259 to 62262. PYRUS spp. Malaceae.

Pear.

62259. PYRUS sp.

No. 1679. December 23, 1924. *Pai Li* (white pear), also known as "cold pear." Scions were sent in under No. 778 [S. P. I. No. 61848].

62260. PYRUS sp.

No. 1680. December 23, 1924. *Chin Pa Li* (golden handle pear). Scions were sent in under No. 780 [S. P. I. No. 61850].

62261. PYRUS sp.

No. 1681. December 23, 1924. *T'ang Li* (sugar pear). Scions sent in under No. 777 [S. P. I. No. 61847].

62262. PYRUS sp.

No. 1682. December 23, 1924. *Ya Li* (duck pear). This is a popular pear in the Peking market.

62263 to 62265. OLEA EUROPAEA L.

Oleaceae. Olive.

From Seville, Spain. Scions purchased through William C. Burdett, American consul. Received February 4, 1925.

According to W. V. Cruess, College of Agriculture, Berkeley, Calif., the following varieties are of possible value for ripe pickling in California and will be tested there for that purpose.

62263. *Cordovi*.

62265. *Rapasayo*.

62264. *Madrileño*.

62266 to 62270.

From Peking, Chihli, China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 24, 1925. Notes by Mr. Dorsett.

62266. CATALPA OVATA Don. Bignoniaceae. **Japanese catalpa.**

62266 to 62270—Continued.

No. 1584. December 12, 1924. Seeds of a variety called by the forestry station *Ch'iu Shu* (autumn tree) and said to bear pink flowers.

62267. JUNIPERUS sp. Pinaceae.

Juniper.

No. 1583. Forestry station at the Temple of Heaven. December 12, 1924. Seeds.

62268. PYRUS sp. Malaceae.

Pear.

No. 1577. December 4, 1924. Said to have come from the pear-growing region northwest of Peking, in the vicinity of Hsuhochuang. Seeds of a domesticated pear.

62269. ULMUS PUMILA L. Ulmaceae.

Chinese elm.

No. 1582. December 12, 1924. Seeds of a variety of the Chinese elm from the forestry station at the Temple of Heaven, Yiishu.

62270. ZIZANIA LATIFOLIA (Griseb.) Stapf. Poaceae. **Wild rice.**

No. 1579. December 11, 1924. *Chiao-pai Goba*. These roots were secured from Tungchen, near Nanhshimen. The Chinese make this variety grow by removing all but the strongest shoots in June. The crop is harvested in October.

62271. PINUS MERKUSII Jungh. and De Vr. Pinaceae. Pine.

From Medan, Sumatra. Seeds presented by Sydney B. Redecker, American vice consul. Received February 5, 1925.

This tree, which is the only pine found south of the Equator, attains a height of 100 feet and forms a flat, umbrellalike crown. It is found in Burma, Borneo, Sumatra, and the Philippine Islands, chiefly at altitudes of 3,000 to 4,000 feet. The wood is very resinous, and the trunks are used for masts and spars.

62272. ORNITHOPUS SATIVUS Brot. Fabaceae. Serradella.

From Hamburg, Germany. Seeds purchased from Ernst & Von Spreckelsen. Received February 10, 1925.

German-grown seeds.

62273. ASTREBLA LAPPACEA (Lindl.) Domin. Poaceae. Mitchell grass.

From Kew, England. Seeds presented by Dr. Arthur W. Hill, director, Royal Botanic Gardens, through C. V. Piper, Bureau of Plant Industry. Received February 9, 1925.

The accompanying memorandum is from notes forwarded by F. Turner, of New South Wales, who supplied the seed to Doctor Hill.

"*Mitchell grass*." This grass, which is of perennial duration, generally grows in tussocks from 2 to 3 feet high and occurs in the interior of New South Wales, Queensland, and Western Australia, and in many parts fairly plentifully. Its thick, wiry roots penetrating the earth to a great depth enable the grass to withstand an ordinary drought with impunity. When growing on fertile plain country it will, in ordinary seasons, yield a great amount of rich, succulent herbage on which stock thrive and fatten. Stock will travel farther and keep in better condition when fed solely on Mitchell grass than on any other

grasses that grow in the interior of Australia. When allowed to remain undisturbed for a time this grass produces an abundance of seeds, which usually ripen in summer and autumn. Although its natural habitat is in the arid interior, I have successfully cultivated it in the warmer districts on the eastern side of the Dividing Range. When cut just as the flower spikes appear it makes capital hay.

As you purpose distributing them in the hotter and drier tropical colonies of the British Empire, I should perhaps mention that under natural conditions seeds of the Mitchell grass germinate readily during summer and early autumn after thunderstorms or heavy rains. If sown under similar natural conditions in other parts of the world, the seeds should germinate readily. Failing that, artificial watering at the time of sowing will facilitate germination. Once the grass is established it luxuriates in deep, rich land during very dry and hot weather.

62274. PEROVSKIA ATRIPLICIFOLIA Benth.
Menthaceae.

From Chester, England. Plants purchased from the Dickson Nurseries. Received February 12, 1925.

A handsome, shrubby plant, allied to the sages (*Salvia* spp.) which is indigenous to the mountainous regions of Afghanistan. It is of erect habit, about 5 feet high, and emits an aromatic sagelike odor when bruised. Its chief ornamental value lies in the terminal panicles of blue flowers which appear in early autumn, forming a pleasing contrast with the silvery gray stems.

62275 and 62276. PISUM SATIVUM L.
Fabaceae. Pea.

From Trier, Germany. Seeds purchased from J. Lambert & Son. Received February 10, 1925.

Tall, medium late, round-seeded varieties. Pods very long, slender, slightly curved. Both, prolific varieties, classed as field peas by American users, but are used in Germany as green shelling peas. (D. N. Shoemaker, Bureau of Plant Industry.)

62275. *Grosser Victoria*. Larger than the following [S. P. I. No. 62276], otherwise very similar.

62276. *Grünefolger*.

62277. CITRUS sp. Rutaceae.

From Johannesburg, Transvaal. Fruits presented by Col. A. J. Bester. Received February 7, 1925.

When I visited the great Symbabian ruins in central Africa in 1911 I discovered a new citrus fruit; I collected seeds and brought them back, and now the variety is distributed all over the Transvaal. The smooth-skinned fruits are much like a big lime in shape, and the abundant, fine-flavored juice is very sweet. (Bester.)

For previous introduction, see S. P. I. No. 55624.

62278. AVENA SATIVA L. Poaceae.

Oats.

From Edinburgh, Scotland. Seeds presented by Thomas Young, Edinburgh and East of Scotland College of Agriculture. Received February 12, 1925.

This is a black oat which has done very well in Scotland as a winter oat. (Young.)

62279 and 62280.

From Verrieres le Buisson, Seine et Oise, France. Plants presented by A. Meunissier. Received February 17, 1925.

62279. CRYPTOMERIA JAPONICA (L. f.) D.
Don. Pinaceae.

Var. *Vilmoriniana*. A horticultural variety of the well-known Japanese conifer which is described (The Garden, vol. 88, p. 310) as a dwarf form of compact, bushy habit. It was discovered in 1923 in the Vilmorin nursery at Verrieres le Buisson, near Paris, France, where it makes a striking appearance in the rock garden.

62280. SCHIZOPHRAGMA INTEGRIFOLIA Oil-
ver. Hydrangeaceae.

A climbing shrub, closely related to the hydrangeas, which is native to rocky places in central China. It reaches about 15 feet in height, and has broadly oval, bright-green leaves about 5 inches long. The inflorescence consists of loose terminal clusters of small, white flowers, with large and showy sterile flowers at the margins of these clusters. This shrub is hardy as far north as southern Massachusetts.

62281. HIBISCUS SABDARIFFA L. Malva-
ceae. Roselle.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received February 16, 1925.

Rizel. A new variety that has originated on the hacienda of R. M. McCrory, Novales, Riza Province, and which I have named after the province in which it originated. This new variety is apparently a spontaneous hybrid between either the Rico or Victor and the Archer. The calyces are white at the base, the claws of the epicalyx green, and the remainder of the calyx is tinged with pink to light red, giving the "fruit" a waxy pink appearance somewhat like the fruit of the makpoo, *Eugenia javanica*. Jelly made from the fruit probably would be pink in color. Because of the pretty coloring of the fruit, the plants of the Rizal make a more attractive ornamental than the ordinary kinds, and it ought to become popular, especially with hunters of novelties. (Wester.)

62282. CITRUS sp. Rutaceae.

From Fukuoka, Japan. Seeds presented by Dr. Tyoaburo Tanaka, in charge, Horticultural Institute, Department of Agriculture, Kyushu Imperial University. Received February 18, 1925.

Sweequisasa. A species of Citrus native to Nuchu Island. It is closely related to our *Koji* variety, but differs in its greater amount of pectin and in the puffiness and deep color of the rind. It is possibly a good citrus stock. Provisionally I have named it *Citrus pectinifera*, but I shall make further observations of the flowers before describing the species. (Tanaka.)

62283 to 62285.

From Orleans, France. Plants presented by Leon Chenault, through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received February 21, 1925.

62283. BUDDLEIA ALTERNIFOLIA Maxim.
Loganiaceae. Butterfly bush.

62283 to 62285—Continued.

According to Maximowicz (Bulletin de l'Académie Impériale, St. Petersburg, vol. 26, p. 494) this ornamental shrub is native to the valley of the Hwang River in Kansu, China. The narrow, very short leaves are alternate, and the violet flowers are in dense, nearly sessile clusters.

62284. *FORSYTHIA OVATA* Nakai. Oleaceae.

A new and distinct species native to Korea. It is a vigorous shrub, with cylindrical boughs and oval, green leaves. The numerous flowers, which are brilliant canary yellow, appear [in Orleans] during the first fine days of February. (Chenault.)

62285. *MAGNOLIA WILSONII* (Finet and Gagn.) Rehder. Magnoliaceae.
Wilson magnolia.

In habit this Chinese magnolia is a large shrub; it was first discovered in western Szechwan by E. H. Wilson, and appears to be a valuable horticultural addition to this already popular genus. The flowers, which are pure white, are deliciously fragrant and are produced freely during late May and early June.

62286 and 62287.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received February 17, 1925.

62286. *PERNETTYA MUCRONATA* (L. f.) Gaud. Ericaceae.

According to W. J. Bean (Trees and Shrubs Hardy in the British Isles, vol. 2, p. 127) this is one of the finest ornamental shrubs, native to South America about the Straits of Magellan. It is one of the hardiest from that continent, and is rarely injured by frost in the neighborhood of London. The shrub is an evergreen, 2 to 5 feet high, and spreads freely by suckers, forming ultimately a dense, low thicket. The white, nodding flowers, one-fourth of an inch long, are produced singly in the axils of the leaves at the ends of the shoots. The round berries, up to half an inch in diameter, vary in color from white to pink, lilac, crimson, purple, or almost black and remain on the branches through the winter and following spring. At Kew the berries are untouched by birds.

62287. *STYRAX WILSONII* Rehder. Styracaceae.
Chinese snowbell.

A very attractive, compact little shrub 6 feet or less in height, which starts to bear its small clusters of white flowers when about 2 years old. The oval leaves are white tomentose beneath. The shrub is native to the mountains of western China, and is hardy as far north as the Arnold Arboretum, Jamaica Plain, Mass.

62288 and 62289.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, regius keeper, Royal Botanic Garden. Received February 17, 1925.

62288. *OPHIPOGON JABURAN* (Siebold) Lodd. Liliaceae.
Jaburan.

A perennial, stemless, Japanese plant, belonging to the lily family, with a stoloniferous rhizome and erect, narrowly linear leaves about 2 feet high. The flowers, varying in color from white to lilac, are in racemes 3 to 6 inches long,

62288 and 62289—Continued.

borne on a scape up to 2 feet in height. It is likely to prove tender for outside growing in the northern United States.

62289. *SCHIZOPHRAGMA INTEGRIFOLIA* Oliver. Hydrangeaceae.

For previous introduction and description see S. P. I. No. 62280.

62290. *CASSIA DIDYMOBOTRYA* Fres. Caesalpinaceae.

From Beverly Hills, Calif. Seeds presented by A. Stephen Vavra. Received February 21, 1925.

This plant is a native of British East Africa; it blooms within nine months from seeds, and the orange-yellow flowers are in spikes over a foot in length. (Vavra.)

62291 to 62294.

From Maison Carree, Algeria. Seeds presented by L. Duccellier, Algerian Agricultural School, through H. V. Harlan, Bureau of Plant Industry. Received February 21, 1925.

62291 to 62293. *NICOTIANA TABACUM* L. Solanaceae. Tobacco.

62291. *Arbi.*

62292. *Cabot de Bone.*

62293. *Colon.*

62294. *ZEA MAYS* L. Poaceae. Corn.

Navajo × *Maïs du Languedoc.*

62295. *ALEURITES CORDATA* (Thunb.)

Muell. Arg. Euphorbiaceae.

Japanese tung-oil tree.

From Yokohama, Japan. Seeds purchased from the Yokohama Nursery Co. Received February 24, 1925.

The Kiri-oil tree is a close relative of the tung-oil tree (*Aleurites fordii*) and, like the latter, is cultivated, especially in Japan, for the sake of the oil obtained from the seeds. The tree grows to a height of about 25 feet, and the broadly ovate leaves are three to five lobed. The seeds are about the size and shape of large castor beans. The oil, which differs from tung oil in several important features, is used in Japan chiefly as an illuminant. This introduction is made for the purpose of testing this Japanese species in southern Florida, where the cultivation of the tung-oil tree has become of commercial importance.

62296 and 62297. *HELIANTHUS TUBEROSUS* L. Asteraceae.

Jerusalem artichoke.

From Edinburgh, Scotland. Tubers purchased from Peter Lawson & Son. Received March 9, 1925.

62296. Purple variety.

62297. White variety.

62298. *PRUNUS BRIGANTINA* Vill. Amygdalaceae.

Alpine plum.

From Paris, France. Budwood presented by Vilmorin-Andrieux & Co. Received January 16, 1925.

The Alpine plum is a shrub or small, spineless tree, native to the French Alps; the small, smooth subacid fruits are about the size of a small Green Gage plum.

62299. PRUNUS COCOMILIA Ten. Amygdalaceae. Italian plum.

From Paris, France. Scions presented by Vilmorin-Andrieux & Co. Received January 24, 1925.

The Italian plum, allied to the cherry plum (*Prunus cerasifera*), is a bush or small tree with thorny branches, oval sharply-toothed leaves, and small, globular fruits which are fairly good for eating.

62300 to 62306.

From Alnarp, Akarp, Sweden. Plants presented by Carl G. Dahl, superintendent, Förståndare för Alnarps Trädgårdsskola. Received January 7, 1925.

62300 to 62303. FRAGARIA spp. Rosaceae. Strawberry.**62300. FRAGARIA sp.**

Abundance. An old French variety. (Dahl.)

62301. FRAGARIA sp.

Elsa von Hochberg.

62302. FRAGARIA sp.

Frau Direktor Echtermeyer.

62303. FRAGARIA sp.

Grüss aus Dahlem.

62304 to 62306. RUBUS spp. Rosaceae. Blackberry.

These varieties are much hardier than the American or English types of blackberries introduced into this country. Last summer these fruited when all other (foreign) varieties gave only canes, the old growth being killed in the winter. The berries are sweet and well flavored, but are not so large as the American types. (Dahl.)

62304. RUBUS sp.

Torekov.

62305. RUBUS sp.

Ostra Karup.

62306. RUBUS sp.

Sunne.

62307. ANANAS SATIVUS Schult. f. Bromeliaceae. Pineapple.

From Monrovia, Liberia, West Africa. Offshoots presented by George F. Cope, Muhlenberg Mission. Received January 8, 1925.

These grow in a semiwild condition near the mission. I have been told that, when cultivated, they become as large as the cultivated varieties. (Cope.)

62308. PYRUS CALLERYANA Decaisne. Malaceae. Pear.

From Nanking, China. Seeds purchased from Dr. John H. Reisner, College of Agriculture and Forestry, University of Nanking. Received February 5, 1925.

Introduced for testing as a stock for cultivated apple and pear varieties.

62309 and 62310. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Scheemda, Netherlands. Seeds purchased from the Hommo Ten Have's Seed Co. Received January 2, 1925.

Two local strains.

62309. Remontant. 62310. Roosendaal.**62311 to 62318. PRUNUS MUME Sieb. and Zucc. Amygdalaceae.**

Japanese apricot.

From Canton, China. Scions collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 10, 1925. Notes by Mr. McClure.

62311 to 62316. Scions from trees in an orchard of Chung Hoh Ching, near Fohtsuen, Kwangtung.

62311. No. 10. December 5, 1924.

Tai Mui. From a tree 3 to 4 meters high, with a wide-spreading habit, branching out from a point about half a meter above the ground. The fruits of this subvariety are said to be characterized by their large size.

62312. No. 11. December 5, 1924.

Tai Mui and Teng Tai Mui (the biggest mui). From a tree 3 meters high, with a low-spreading habit. The fruits are especially large. This variety is one of the *Tsing Mui* group.

62313. No. 13. December 5, 1924.

Tai Wat Tsing Mui (large-seeded green mui). From a tree 4 meters in height, and spreading from a point half a meter above the ground. In appearance this particular individual resembles a peach tree as to habit and color of bark. This tree is said to flower a little earlier than the other trees in this region.

62314. No. 14. December 5, 1924.

Wang Wat Mui (transverse seeded mui). From a tree 3 to 4 meters in height and spreading in habit. This variety is said to have especially large flowers.

62315. No. 15. December 5, 1924.

Hung Mui (red mui). From a tree 4 meters high. This variety is distinguished by a reddish bark, more slender branches, pink flowers, and red fruits. Its habit of growth is very much like that of the *Tsing Muis*.

62316. No. 16. December 5, 1924.

Hang Mui. From a tree 4½ meters in height; distinctly more upright in habit than either *Tsing Mui* or *Hung Mui*.

62317. No. 17. December 6, 1924. Sheung Tok Mui (double-flowered mui).

From the only double-flowered mui to be found in the neighborhood of Fohtsuen. This specimen was found growing under difficult conditions of shading, etc., on the ground of Chung Chi Chan. The place is called Sheunglinglailau. The tree was 5 to 6 meters in height. Its upright habit and unusual growth in height are probably due to the fact that it is shaded too much. This tree is said by the natives to belong to the *Tsing Mui* group. It is said to have been grafted, but I was not able to find out the source of the scion.

62318. No. 20. December 11, 1924. Sheung Tok Tsing Mui and Sheung Paan Mui.

Secured from a tree at the Canton Christian College, originally from Wongkonghang, Kwangtung. The tree has a tendency to a more upright habit than most of the *Tsing Muis*.

62319 and 62320. SPENCERIA RAMALANA
Trimen. Rosaceae.

From Edinburgh, Scotland. Presented by Dr. William Wright Smith, regius keeper, Royal Botanic Garden. Received January 3, 1925.

A free-flowering and attractive rosaceous plant native to the dry upland pastures of western Szechwan and Yunnan, China. It is described (Curtis's Botanical Magazine, pl. 9007) as a perennial herbaceous plant about a foot high, with erect or ascending stems, which are covered with silvery hairs. The stem leaves are reduced to one or two pairs of narrowly oval leaflets, and the golden or reddish yellow flowers are in stiff, open racemes. In England tests made with this plant appear to show that it requires well-drained, calcareous soil for the best results.

62319. Seeds.

62320. Plants.

62321. COTONEASTER SEROTINA Hutchin-
son. Malaceae.

From Flax Bourton, England. Seeds presented by G. H. Wollaston. Received January 3, 1925.

A small-sized tree, originally discovered in western China by the well-known collector, George Forrest, and described (Curtis's Botanical Magazine, pl. 8854) as having elliptic, papery leaves, small, white flowers, borne in many-flowered corymbose clusters, and attractive, bright-red berries which persist throughout most of the winter. It appears to be perfectly hardy in southeastern England, and thrives best in a sunny position.

62322 and 62323. RUBUS spp. Rosa-
ceae.

From Yenfangwan, Hupeh, China. Seeds presented by Rev. A. S. Cooper, American Church Mission. Received January 5, 1925.

"Corn berries" from Hupeh; collected at an altitude of about 3,500 feet. They mature in the fall. (Cooper.)

62322. RUBUS sp.

62323. RUBUS sp.

Red variety.

Yellow variety.

62324. ECHINOCHLOA CRUSGALLI EDULIS
Hitche. Poaceae. Barnyard millet.

From Nanking, China. Seeds presented by George E. Ritchey, College of Agriculture and Forestry, University of Nanking. Received January 5, 1925.

Locally grown seeds.

62325. TRIFOLIUM REPENS L. Faba-
ceae. White clover.

From Scheemda, Netherlands. Seeds presented by the Hommo Ten Have's Seed Co. Received January 6, 1925.

A local strain, growing wild at Scheemda.

62326. DIOSCOREA MACROURA Harms.
Dioscoreaceae. Yam.

From Edinburgh, Scotland. Tubers presented by Dr. William Wright Smith, regius keeper, Royal Botanic Garden. Received January 7, 1925.

A tropical African vine with simple, heart-shaped leaves about a foot in width and inconspicuous flowers in large racemes 2 feet long. Introduced for specialists investigating nitrogen-fixing bacteria.

62327 and 62328. LESPEDEZA spp. Fa-
baceae.

From Fukuoka, Japan. Seeds presented by Mitsunaga Fujioka, Kyushu Imperial University. Received January 7, 1925.

62327. LESPEDEZA JUNCEA Pers.

Medohagi. From the crop of 1924. (Fujioka.)

A Siberian bushclover which is semi-shrubby in habit, with slender branches and bright-yellow flowers marked with violet.

62328. LESPEDEZA STRIATA (Thunb.) Hook.
and Arn.

Yahazuso. From the crop of 1924. (Fujioka.)

62329 to 62338. Cicer ARIETINUM L.
Fabaceae. Chick-pea.

From Dacca, Bengal, India. Seeds presented by D. Dutta, second economic botanist. Received January 8, 1925.

Introduced for trial as stock feed in the southwestern United States.

62329. No. 1.

62334. No. 6.

62330. No. 2.

62335. No. 7.

62331. No. 3.

62336. No. 8.

62332. No. 4.

62337. No. 9.

62333. No. 5.

62338. No. 10.

62339. ACTINIDIA PURPUREA Rehder.
Dilleniaceae.

From Nancy, France. Plants purchased from Victor Lemoine & Son. Received January 13, 1925.

A woody vine, native to western China, described by Rehder (Plantae Wilsonianae, vol. 2, p. 378) as 10 to 25 feet in height, with papery, elliptic leaves about 4 inches long, axillary clusters of small, white flowers, and edible ovoid purple berries about an inch long.

62340. ATTALEA sp. Phoenicaceae.
Palm.

From Palmira, Valle, Colombia. Seeds purchased from the director, Compañia Agrícola Caucana. Received January 9, 1925.

Corozo de puerco palm. This palm thrives abundantly in the Cauca Valley, especially in the neighborhood of Roldanillo, on the left bank of the Cauca River and about 7 miles north of Cali. (Director.)

62341. (Undetermined.)

From Nanking, China. Seeds presented by Dr. J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received January 16, 1925.

Seed of *Ku Tsao* which, translated, means "bitter grass." This is a legume grown in the northern part of this Province, Kiangsu, on land that is too alkaline to grow anything else. This crop is used for fuel, and after it has been grown on the land for several years the farmers plow it up and plant it to a regular crop. (Reisner.)

62342. ATRIPLEX PAMPARUM Griseb.
Chenopodiaceae. Saltbush.

From Cordoba, Argentina. Seeds presented by E. Tanago, Director General, Cordoba Department of Agriculture. Received February 3, 1925.

A much-branched bushy plant, which, according to Grisebach (*Plantae Lorentzianae*) forms a prominent feature of the vegetation in the saline desert areas of Santiago del Estero, Argentina. The plant is said to be useful as forage.

62343. PRUNUS MUME Sieb. and Zucc.
Amygdalaceae. Japanese apricot.

From Canton, China. Scions collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 13, 1925.

No. 12. December 5, 1924. *Tai Wat Tsing Mui* (large-seeded, green mui). From a tree in one of the orchards of Chung Hoh Ching, near the village of Foh-tsuen, Kwangtung. This tree was 4 meters in height, with a wide spreading habit. (McClure.)

62344 and 62345.

From Taihoku, Japan. Seeds presented by Dr. R. Kanehira, director, Government Forest Experiment Station. Received January 16, 1925.

62344. DIOSPYROS MORRISIANA Hance.
Diospyraceae. Persimmon.

A relative of the Japanese persimmon (*Diospyros kaki*) which is described by Dr. Alfred Rehder (Arnold Arboretum, Jamaica Plain, Mass.) as an evergreen shrub or small tree, with oval leaves 3 inches long, whitish flowers, and roundish, yellow, edible fruits about three-fourths of an inch in diameter and ripening in December. Native to Taiwan and Hongkong.

62345. KOELREUTERIA FORMOSANA Hayata.
Sapindaceae.

One member of this genus (*Koelreuteria paniculata*) is widely grown as a hardy shade and ornamental tree in many parts of the United States. This species, native to Taiwan, is also a large handsome tree, with attractive, compound leaves and large terminal panicles of yellow flowers. It is likely, however, to prove tender to much frost and is therefore best suited for growing in the Southern States.

For previous introduction, see S. P. I. No. 43947.

62346 and 62347. PRUNUS MUME Sieb. and Zucc.
Amygdalaceae. Japanese apricot.

From Canton, China. Scions collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 13, 1925.

62346. No. 18. December 11, 1924. *Hung Mui*. Secured from a tree at the Canton Christian College, originally from Wongkonghang, Kwangtung. This tree was 2½ meters high, with a spreading habit. (McClure.)

62347. No. 19. December 11, 1924. *Hung Mui*. From a tree at the Canton Christian College, originally from Wongkonghang, Kwangtung. Tree 3 meters high, with upright habit, branching from a point near the ground. (McClure.)

62348. AVENA SATIVA L. Poaceae. Oats.

From Svalof, Sweden. Seeds presented by A. Akerman, Sveriges Utsädesför. Received January 23, 1925.

Engelbrekt. According to the Sveriges Utsädesför. Tidskrift (vol. 34, p. 4) this is a new, high-yielding black variety originated at Svalof and adapted to southern and central Sweden.

62349 and 62350. CITRUS spp. Rutaceae.

From Nanking, China. Seeds presented by J. Lossing Buck, College of Agriculture and Forestry, University of Nanking. Received January 14, 1925.

62349. CITRUS ICHANGENSIS Swingle.
Ichang lemon.

A spiny shrub or small tree, 5 to 15 feet high, native to central and southwestern China. It differs from other members of the genus chiefly in its very large, thick seeds and its slender leaves, which are four to six times longer than broad. It is also one of the hardiest species of citrus known.

For previous introduction, see S. P. I. No. 58480.

62350. CITRUS sp. Orange.
A wild orange. (Buck.)

62351 to 62354.

From China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 14, 1925. Notes by Mr. Dorsett.

62351. VITIS VINIFERA L. Vitaceae.
European grape.

No. 1546. Loutzchuang. December 1, 1924. Cuttings of what the Chinese call *Hung Pu Tao* (red grape).

62352 to 62354. ZIZIPHUS JUJUBA Mill.
(*Z. sativa* Gaertn.). Rhamnaceae.

62352. No. 447. Chenchiafen, Chihli. December 1, 1924. Scions of the "Apple jujube" from Mr. Lee's place.

62353. No. 1543. Loutzchuang, Chihli. December 1, 1924. Scions of the "Tooth jujube" from Mr. Fan's place. The mahogany-brown fruits are large at the base, and from about the center they taper rather abruptly to the apex. The flesh is firm, crisp, and quite sweet.

For previous introduction, see S. P. I. No. 62240.

62354. No. 1544. Loutzchuang, Chihli. December 1, 1924. Scions of the "Tooth jujube" from Mr. Fan's place.

For previous introduction, see S. P. I. No. 62353.

62355. TRIFOLIUM JOHNSTONI Oliver.
Fabaceae. Clover.

From Nairobi, Kenya Colony, Africa. Seeds presented by the Director, Kenya Colony Department of Agriculture. Received February 16, 1925.

This clover grows on the slopes of Mount Kenya at an altitude of 4,500 feet, where there is no frost and where the annual rainfall is about 40 inches. (*The Director*.)

A smooth perennial clover with the habit of white clover (*Trifolium repens*), found

at high altitudes in eastern Africa. The leaves are long stemmed, with membranous leaflets and globose flower heads about an inch in diameter.

62356 and 62357. GOSSYPIUM SPP.
Malvaceae. Cotton.

From Fuerte Olimpo, Paraguay. Seeds presented by C. Francisco Mead. Received January 8, 1925.

These were sent in response to a request for a shrubby cotton said to grow spontaneously west of the Paraguay River, Paraguay, where the fiber was spun and woven by wild tribes in prehistoric times.

62356. GOSSYPIUM SP.

Red form.

62357. GOSSYPIUM SP.

White form.

62358 to 62375.

From Caracas, Venezuela. Seeds presented by H. Pittier, director, Museo Comercial. Received January 8, 1925.

**62358 and 62359. HORDEUM VULGARE PAL-
LIDUM Seringe. Poaceae.**

Six-rowed barley.

From Tachira.

62358. No. 1.

62359. No. 2.

62360 and 62361. NICOTIANA TABACUM L.
Solanaceae. Tobacco.

From Barinas.

62360. Special. Used only in the manufacture of chimo or tobacco juice. (Pittier.)

62361. Varinas. Cultivated to-day on a small scale, but once celebrated in Europe under the name of *Kanister*. (Pittier.)

62362 to 62368. TRITICUM AESTIVUM L.
(T. vulgare Vill.). Poaceae.

Common wheat.

From Tachira.

62362. No. 3. Grande del Morte.

62363. No. 5. La clase.

62364. No. 6. Lebarata.

62365. No. 4.

62366. No. 5.

62367. No. 4. Pequeño.

62368. No. 1.

62369 to 62375. ZEA MAYS L. Poaceae.
Corn.

From Tachira.

62369. No. 4. Bayuelo amarillo.

62370. No. 5. Bojo.

62371. No. 2. Chiquito amarillo.

62372. No. 6. Matizado.

62373. No. 7. Mazorcas.

62374. No. 1. Mortiño.

62375. No. 3. Piedrita blanco.

62376. PERSEA AMERICANA Mill. (P.
gratissima Gaertn. f.). Lauraceae.
Avocado.

Fruits from a seedling of S. P. I. No. 19080, Collins, located 15 feet south-east of Gottfried tree, S. P. I. No. 46337,

62376—Continued.

at the Plant Introduction Garden, Miami, Fla. Received at Washington, D. C., January 8, 1925.

The original seeds from the old Collins tree were planted in the spring of 1916.

Form roundish oblate, oblique; stem short, thick, cavity small, very shallow, wrinkled; apex obliquely flattened, stigmatic point slightly raised; surface roughened by deeply set dots, dark brownish purple; dots rather numerous, large, light brown, mostly elongated, deeply set in the skin; skin quite thin, granular on inside, but separating readily from flesh; flesh deep yellow, green near skin, smooth but-tery, no fiber, pleasant, rich flavor.

A good medium-sized fruit with a thin skin that peels readily from the flesh, which is of good texture and flavor, though not quite so rich as that of some other varieties.

The tree is tall and spreading.

62377. HORDEUM DISTICHON PALMELLA
Harlan. Poaceae. Two-rowed barley.

From Caracas, Venezuela. Seeds presented by H. Pittier. Received January 8, 1925.

No. 3. From Tachira.

**62378. LOTUS ULIGINOSUS Schkuhr. Fa-
baceae.**

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received January 12, 1925.

A pasture plant of considerable importance in New Zealand, where it grows in wet, swampy ground. It is introduced for introduction in similar situations in this country.

62379. ABIES MARIESII KAWAKAMII
Hayata. Pinaceae.

From Taihoku, Japan. Seeds presented by Dr. R. Kanehira, director, Government Forest Experiment Station. Received January 12, 1925.

This is one of the rarest of the silver firs, according to Bean (Trees and Shrubs Hardy in the British Isles); it is a tree usually about 40, but sometimes 80, feet in height. The leaves are dark shining green, and the egg-shaped cones, 4 inches or more in length, are purple when young.

62380 to 62384.

From Meguro, Tokyo, Japan. Seeds presented by Motoo Ohsako, Central Forest Experiment Station, at the request of Mitsunaga Fujioka, Kyushu Imperial University, Fukuoka. Received January 12, 1925.

62380. CASSIA MIMOSOIDES DIMIDIATA
(Buch.-Ham.) Baker. Caesalpiniaceae.

A shrubby leguminous plant from the Himalayas, described (Hooker, Flora of British India, vol. 2) as a low, much-branched plant with very narrow, stiff leaflets and yellow flowers borne singly or in twos in the leaf axils.

62381. INDIGOFERA PSEUDOTINCTORIA Mats.
Fabaceae. Indigo.

A shrubby, red-flowered plant, native to Japan.

62380 to 62384—Continued.

62382. *LESPEDEZA BICOLOR* Turcz. Fabaceae.

A bushy, herbaceous Japanese perennial which flowers in early autumn, bearing a profusion of rosy purple flowers which practically cover its drooping branches. These branches sometimes become 6 feet in length.

62383. *LESPEDEZA STRIATA* (Thunb.) Hook. and Arn. Fabaceae.

A local strain.

62384. *VICIA UNIJUGA* A. Br. Fabaceae. Vetch.

A perennial vetch, native to Siberia, with an upright or ascending stem 8 to 16 inches long and rather large, purplish flowers. It is sometimes cultivated in European gardens as an ornamental.

62385. *STRANVAESIA DAVIDIANA* Decaisne. Malaceae.

From Kells, County Meath, Ireland. Seeds presented by Lord Headfort. Received January 13, 1925.

The handsome evergreen foliage, loose clusters of white flowers, and scarlet berries of this hardy Chinese shrub make it an attractive ornamental.

62386 to 62388.

From Maidstone, England. Plants presented by George Bunyard & Co. Received January 22, 1925. Notes taken from Bunyard's Catalogue of Fruit Trees, 1924-25.

62386. *PYRUS* sp. Malaceae. Pear.

Laxton's Superb, raised by Laxton Bros., from *Beurre Superfin* × *Williams*. A large pear with very tender and deliciously flavored flesh, ripens early, and is a good cropper.

62387 and 62388. *RUBUS* spp. Rosaceae. Raspberry.

62387. *RUBUS* sp.

Lloyd George. This variety is quite perpetual in habit and keeps a supply of fruit from the earliest season till late autumn. It is vigorous and productive and is in all respects a sterling novelty.

62388. *RUBUS* sp.

Royal. The enormous fruits, conical in shape, are solid and of good flavor, and are borne on short trusses. The canes are very stout and vigorous.

62389 to 62392.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Garden. Received January 15, 1925.

62389. *CRATAEGUS WATTIANA* Hemsl. and Lace. Malaceae. Hawthorn.

According to Curtis's Botanical Magazine (pl. 8818) this attractive hawthorn was originally discovered by J. H. Lace, in the Urak Gorge, Baluchistan, at an altitude of about 7,000 feet. It is a rather small tree, unarmed, laxly spreading, with brownish purple young twigs. The white flowers are in many-flowered terminal clusters, and the globular fruits, half an inch in diameter, are translucent yellow and become ripe in August.

62389 to 62392—Continued.

62390. *DEUTZIA COMPACTA* Craib. Hydrangeaceae.

It is not known from just which part of China this handsome shrub originated, according to Curtis's Botanical Magazine (pl. 8795). It is described in that place as a bushy shrub about 6 feet high, with dull-green leaves and terminal clusters of flowers which are white fringed with pink when young.

62391. *LONICERA CHAETOCARPA* Rehder. Caprifoliaceae. Honeysuckle.

Lonicera chaetocarpa was collected in Kansu, western China, by E. H. Wilson. It is described (Curtis's Botanical Magazine, pl. 8804) as a shrub of compact habit and about 5 feet in height. The oblong leaves are bright green and more or less hairy, and the flowers, an inch or more in length, open early in June and are a pleasing primrose yellow.

62392. *STRANVAESIA SALICIFOLIA* Hutchins. Malaceae.

A rosaceous, evergreen shrub, closely related to *Stranvaesia undulata*, from which, according to Curtis's Botanical Magazine (pl. 8862), it differs in its narrower, willowlike leaves and its fruits, which are red, and not orange like those of *S. undulata*. The small, white flowers are in terminal clusters. It comes from western China and is perfectly hardy in southeastern England.

62393. *CASTANEA MOLLISSIMA* Blume. Fagaceae. Hairy chestnut.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 24, 1925.

No. 23. December 5, 1924. *Fung Lut*. Seeds secured from Chung Hung, a villager from Lungtin, Kwangtung. He gave the following information: Chestnuts are grown to a considerable extent in this region, the soil being sandy. The trees are grown only from seeds, and just one variety is cultivated. They begin to bear at 7 or 8 years of age and live to become 30 to 40 years old. The harvest is during September and October. The average crop is about 50 or 60 pounds husked fruits per tree, but crops of 150 to 250 pounds are not uncommon. Seeds for planting are stored in the husks in a cool dry place and planted during December or January in sand or sandy soil. (McClure.)

62394. *POPULUS* sp. Salicaceae. Poplar.

From Peking, Chihli, China. Cuttings collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 24, 1925.

No. 1581. December 12, 1924. *Hsiao Yih Yang* (small-leaved poplar). Secured from young trees at the forestry station at the Temple of Heaven. (Dorsett.)

62395 and 62396.

From Tripoli, Libia, Africa. Seeds presented by Miss Ernestina Fenzi. Received January 21, 1925.

62395. *JUNIPERUS PROCERA* Hochst. Pinaceae. East African juniper.

This is probably the largest and hand-somest juniper in the world. It is native to the high mountains of eastern tropical Africa, and should prove an

62395 and 62396—Continued.

extremely valuable tree in the mountains of the West Indies; it may grow in the southern United States. (*C. S. Sargent, Arnold Arboretum, Jamaica Plain, Mass., in note under S. P. I. No. 55484.*)

62396. PHOENIX DACTYLIFERA L. Phoenixaceae. **Date palm.**

From Nalut.

62397 to 62509.

From China. Seeds and corms collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 5, 1925. Notes by Mr. Dorsett.

62397. ARISAEMA sp. Araceae.

No. 1283. Eastern slope of One Hundred Flower Mountain, while en route from Shihchiaying to Huangan. November 8, 1924. Our cook found this spike of small, bright-red, closely clustered fruits resembling an Indian turnip.

62398 and 62399. AVENA NUDA Hoefer. Poaceae. **Naked oats.**

62398. No. 1299. Huangan. November 8, 1924. A variety known here as "oil wheat" and said to be commonly grown 100 miles north of Peking, in Kalgan.

62399. No. 1477. November 25, 1924. "Oil wheat" secured from the Yu Mao Hao shop in Peking. It is said that this variety should be planted in the spring.

62400. BENINCASA HISPIDA (Thunb.) Cogn. Cucurbitaceae. **Wax gourd.**

No. 1444. Peking. November 20, 1924. A dark-green Chinese gourd about 10 inches in diameter and 24 inches or more long, having snow-white flesh. After peeling and cutting into pieces it is boiled with meat.

62401 to 62403. CANNABIS SATIVA L. Moraceae. **Hemp.**

62401. No. 1302. Huangan. November 8, 1924.

62402. No. 1360. Hsiamaling. November 10, 1924.

62403. No. 1498. Peking. November 26, 1924. This variety, which is used chiefly for bird seed, was secured in the market.

62404. CAPSICUM ANNUM L. Solanaceae. **Red pepper.**

No. 1051. October 27, 1924. *Yang Chiao Chin Chiao* (goat-horn pepper). These long, slender, bright-red peppers were grown in the vicinity of Peking.

62405. CHAENOMELES sp. Malaceae. **Chinese quince.**

No. 1438. Peking. November 19, 1924. A small to medium-sized, bright-yellow quince with a delightful fragrance; secured in the market.

62406 and 62407. CHAETOCHLOA ITALICA (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. **Millet.**

62406. No. 1464. Peking. November 25, 1924. A small white-grained millet secured from Yung Ho Hseu.

62407. No. 1465. Peking. November 25, 1924. Red-seeded millet secured from Yung Ho Hseu.

62397 to 62509—Continued.

62408. CHRYSANTHEMUM MORIFOLIUM (Ramat.) Hemsl. Asteraceae.

No. 694. October 10, 1924. A pink-flowered chrysanthemum growing wild in the Western Hills between the Ming tombs and the Fa Hua Ssu temple.

62409. COLOCASIA sp. Araceae.

No. 1452. Peking. November 24, 1924. These corms, secured in the market and reported to be grown locally about Peking, are small compared with the ones produced in the United States.

62410 to 62413. CUCURBITA MOSCHATA Duchesne. Cucurbitaceae. **Cushaw.**

62410. No. 1092. Peking. October 31, 1924. A rather long-necked, winter squash, secured in the market; striped with terra cotta and green, and having a golden yellow flesh.

62411. No. 1093. Peking. October 31, 1924. A small, rather thin though attractive terra-cotta colored pumpkin purchased in the market.

62412. No. 1230. Neptune temple, Hlungkuau. November 6, 1924. A good-sized, flat, yellow pumpkin with golden yellow flesh of fair thickness, growing on a terraced mountain side.

62413. No. 1309. Huangan. November 8, 1924. A black-seeded winter squash.

62414. CUCURBITA PEPO L. Cucurbitaceae. **Gourd.**

No. 1450. Peking. November 21, 1924. This gourd is a peculiar shape and color, the color being scarlet with stripes of creamy white and blotched with grayish olive green. The flesh is yellow, and the seeds are medium large and white.

62415. DAUCUS CAROTA L. Apiaceae. **Carrot.**

No. 1069. Peking. October 30, 1924. A reddish carrot of good quality.

62416. DEUTZIA sp. Hydrangeaceae.

No. 1287. En route from Shihchiaying to Huangan. November 8, 1924. A flowering shrub growing on the east slope of One Hundred Flower Mountain.

62417. DIOSPYROS LOTUS L. Diospyraceae. **Persimmon.**

No. 1440. Peking. November 20, 1924. Secured in the market. The so-called black date, the wild persimmon, universally used in this region as a stock upon which to graft the large Chinese varieties.

62418. EUNYMUS BUNGEANUS Maxim. Celastraceae.

No. 1134. Peking. November 1, 1924. A fine-looking specimen of Eunymus growing out of a stone wall of a canal about one of the buildings in the Temple of Heaven grounds. The yellowish green leaves with pink stems and bright-red berries with yellowish arils make a remarkably fine showing.

62419. FAGOPYRUM TATARICUM (L.) Gaertn. Polygonaceae. **Kangra buckwheat.**

No. 1300. Huangan. November 8, 1924. Seeds of a variety known here as "sweet buckwheat."

62397 to 62509—Continued.

62420 to 62425. *FAGOPYRUM VULGARE* Hill
(*F. esculentum* Moench). Polygonaceae.
Buckwheat.

62420. No. 1181. Fzuchiawu. November 4, 1924. Secured from the priest at the Neptune temple.

62421. No. 1236. Chihyukou. November 6, 1924. A representative of the type grown on the rather heavy clay soil, at an altitude of probably 3,000 to 4,000 feet.

62422. No. 1267. November 7, 1924. Secured in Shihchihiyung, located on the eastern slope of One Hundred Flower Mountain, in the Western Hills.

62423. No. 1301. Huangnan. November 8, 1924. "Bitter buckwheat."

62424. No. 1365. Hsiamaling. November 10, 1924.

62425. No. 1475. Peking. November 25, 1924. Secured from the Hengsheng tea shop.

62426 and 62427. *HELIANTHUS ANNUUS* L.
Asteraceae. **Sunflower.**

62426. No. 1499. Peking. November 27, 1924. Large seeds sent in to the market from Kalgan.

62427. No. 1500. Peking. November 27, 1924. Smaller seeds than No. 1499 [S. P. I. No. 62426]. These were also shipped in from Kalgan.

62428. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. **Sorghum.**

No. 1467. Peking. November 25, 1924. Red kaoliang secured from Yung-hohseu.

62429. *HORDEUM VULGARE COELESTE* L.
Poaceae. **Six-rowed barley.**

No. 1476. Peking. November 25, 1924. A broad-grained, hull-less barley from the Xu Mao Hao shop.

62430. *HORDEUM VULGARE PALLIUM* Seringe. Poaceae. **Six-rowed barley.**

No. 1473. Peking. November 25, 1924. A variety called "King barley" by the Chinese, secured from the Hengsheng tea shop.

62431. *JUNIPERUS CHINENSIS* L. Pinaceae. **Chinese juniper.**

No. 1401. Yenchia. November 11, 1924. Secured from trees growing in an old Chinese cemetery.

62432. *LACTUCA SATIVA* L. Cichoriaceae. **Lettuce.**

No. 1068. Peking. October 30, 1924. The stalk, after being peeled and cut into small pieces, is boiled with meat.

62433. *MALUS* sp. Malaceae. **Apple.**

No. 1099. Peking. October 31, 1924. These creamy yellow fruits with an occasional pink blush were purchased in the market.

62434. *PANICUM MILIACEUM* L. Poaceae. **Proso.**

No. 1235. Chihyukou. November 6, 1924. This millet is commonly grown in this region in rather heavy clay, at an altitude of 3,000 to 4,000 feet.

62397 to 62509—Continued.

62435. *PERILLA FRUTESCENS* (L.) Britton
(*P. ocyroides* L.). Menthaceae. **Perilla.**

No. 1466. Peking. November 25, 1924. Used for bird feed and for the oil contained in the seeds.

62436 to 62469. *PHASEOLUS* spp. Fabaceae.

62436 to 62440. *PHASEOLUS AUREUS* Roxb. **Mung bean.**

62436. No. 1182. Fzuchiawu. November 4, 1924. A yellow bean secured from the priest of the Neptune temple.

62437. No. 1185. Fzuchiawu. November 4, 1924. A green bean secured from the priest of the Neptune temple.

62438. No. 1237. Chihyukou. November 6, 1924. A brown bean growing in heavy clay soil in a mountainous region, at an altitude of 3,000 to 4,000 feet.

62439. No. 1367. Hsiamaling. November 10, 1924. A green bean growing on a terraced mountain side several hundred feet above the Hon River.

62440. No. 1461. Peking. November 25, 1924. A green bean secured from the shop of Yung Ho Hseu. Used extensively in the manufacture of vermicelli and for bean sprouts.

62441 and 62442. *PHASEOLUS CALCARATUS* Roxb. **Rice bean.**

62441. No. 1238. Chihyukou. November 6, 1924. A long, slender, white bean growing in rather heavy clay, at an altitude of 3,000 to 4,000 feet.

62442. No. 1362. November 10, 1924. Secured from Hsiamaling where it was growing on a terraced mountain side in a friable loam, several hundred feet above the Hon River. This variety is known here as "small southern bean" and in other places as "rice bean."

62443 to 62469. *PHASEOLUS VULGARIS* L. Fabaceae. **Common bean.**

62443. No. 1100. Peking. October 31, 1924. A large, red bean with a white hilum, secured in the market.

62444 to 62455. Chihyukou. November 6 and 7, 1924. These varieties of beans are large.

62444. No. 1240. Red.

62445. No. 1240a. White.

62446. No. 1240b. Creamy pink.

62447. No. 1240c. Black.

62448. No. 1240d. White with purple marking.

62449. No. 1240e. Purple.

62450. No. 1240f. Mottled pink and purple.

62451. No. 1240g. Creamy yellow.

62452. No. 1268. Red or pink.

62453. No. 1268a. Creamy pink.

62397 to 62509—Continued.

62454. No. 1268b. Creamy white with purplish cast and deep-purple blotches.

62455. No. 1268c. White.

62456 to 62463. Huangan. November 8, 1924.

62456. No. 1308a. White.

62457. No. 1308b. Red.

62458. No. 1308c. Creamy pink.

62459. No. 1308d. Creamy pink mottled with a darker pink.

62460. No. 1308e. Mottled with dark purple and purplish pink.

62461. No. 1308f. Brown.

62462. No. 1308g. Black.

62463. No. 1308h. Mottled black and brown.

62464 to 62466. Hsiamalung. November 10, 1924. Large, climbing beans secured several hundred feet above the Hon River.

62464. No. 1364. Red.

62465. No. 1364a. Brown and light pink.

62466. No. 1364b. Blotched grayish purple and brown.

62467. No. 1456. Peking. November 25, 1924. A large red garden bean secured from Yung Ho Hseu.

62468. No. 1457. Peking. November 25, 1924. A large white garden bean secured from Yung Ho Hseu.

62469. No. 1471. Peking. November 25, 1924. A yellow, garden bean, tinged with pink, secured in the Hengsheng tea shop.

62470. *PINUS BUNGEANA* Zucc. Pinaceae. Lacebark pine.

No. 1176. Tomb of Chuang Wang, near the village of Fzuchiawu. November 4, 1924. A white-barked pine.

62471 and 62472. *PINUS SINENSIS* Lambert. Pinaceae. Chinese pine.

62471. No. 1421. November 12, 1924. From Hsi Fen Shang, at the Su Chen Wang temple, located on the Hon River, a few miles above Meuloukou.

62472. No. 1175. Tomb of Chuang Wang, near the village of Fzuchiawu. November 4, 1924. A peculiarly flat-topped, yellow pine quite common about Peking.

62473. *PISUM SATIVUM* L. Fabaceae. Pea.

No. 1463. Peking. November 25, 1924. A round, creamy white, field pea, used chiefly for sprouts. Presented by Yung Ho Hseu.

62474. *ROSA* sp. Rosaceae. Rose.

No. 1290. November 8, 1924. Collected on Flower Mountain, which is said to have an altitude of 10,000 feet, while en route from Shihchiaying to Huangan. The hips are bright red, slender, and long, and the bark is light red.

62397 to 62509—Continued.

62475 to 62490. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

62475. No. 1135. Peking. November 1, 1924. Yellow soy beans from the Temple of Heaven.

62476. No. 1178. Fzuchiawu. November 4, 1924. Black soy beans secured from the Neptune temple. This is a common variety grown in this section.

62477. No. 1179. Neptune temple, Fzuchiawu. November 4, 1924. A small, yellow soy bean.

62478. No. 1261. Shihchiaying. November 7, 1924. A yellow or creamy white soy bean grown in rather heavy gravelly soil, on a terraced mountain side.

62479. No. 1262. Shihchiaying. November 7, 1924. A black soy bean grown in rather heavy gravelly mountain soil.

62480. No. 1303. Huangan. November 8, 1924. A greenish soy bean grown in sandy or moderately light loam.

62481. No. 1306. Huangan. November 8, 1924. A yellow soy bean grown in gravelly friable loam.

62482. No. 1307. Huangan. November 8, 1924. A black soy bean which appears to be a different type from any we have yet secured.

62483. No. 1320. Chaitang, about 20 miles from Huangan. November 9, 1924. A yellow soy bean.

62484. No. 1321. Chaitang, about 20 miles from Huangan. November 9, 1924. A black soy bean.

62485. No. 1363. Hsiamalung. November 10, 1924. A yellow soy bean growing in friable loam.

62486. No. 1366. Hsiamalung. November 10, 1924. A black soy bean growing in friable loam.

62487. No. 1453. Peking. November 25, 1924. A black soy bean, white within, secured from Yung Ho Hseu.

62488. No. 1454. Peking. November 25, 1924. A rather rich-looking yellow soy bean secured from Yung Ho Hseu.

62489. No. 1455. Peking. November 25, 1924. A green soy bean secured from Yung Ho Hseu.

62490. No. 1474. Peking. November 25, 1924. A black soy bean, green within, secured from the Hengsheng tea shop.

62491. *SPIRAEA* sp. Rosaceae. Spirea.

No. 1289. November 8, 1924. Collected on the top of One Hundred Flower Mountain, while en route from Shihchiaying to Huangan. These seeds are from strong plants several feet in height, which appeared to be very free flowering.

62492. *SYRINGA* sp. Oleaceae. Lilac.

No. 1288. En route from Shihchiaying to Huangan. November 8, 1924. A flowering shrub, about 8 feet in height, growing on One Hundred Flower Mountain.

62397 to 62509—Continued.

62493 to 62495. *TRITICUM AESTIVUM* L.
(*T. vulgare* Vill.). Poaceae.

Common wheat.

62493. No. 1177. Fzuchiawu. November 4, 1924. A winter wheat secured from the temple of Neptune.

62494. No. 1469. Peking. November 25, 1924. A winter wheat secured from Yung Ho Hseu.

62495. No. 1470. Peking. November 25, 1924. A spring wheat secured from Yung Ho Hseu.

62496 to 62504. *VIGNA SINENSIS* (Toner) Savi. Fabaceae. Cowpea.

62496. No. 1180. Fzuchiawu. November 4, 1924. A red or pink cowpea secured from the Neptune temple.

62497. No. 1239. Chihyukou. November 6, 1924. A red or pink cowpea growing at an altitude of 3,000 to 4,000 feet in rather heavy clay.

62498. No. 1263. Shihchiang. November 7, 1924. A brown-eyed cowpea growing in rather heavy gravelly loam.

62499. No. 1298. Huangang. November 8, 1924. A brown-eyed cowpea.

62500. No. 1305. Huangang. November 8, 1924. This cowpea is mottled a light pink.

62501. No. 1368. Hsiamaling. November 10, 1924. A purple-eyed cowpea growing in friable soil.

62502. No. 1369. Hsiamaling. November 10, 1924. A pink cowpea growing in friable loam.

62503. No. 1459. Peking. November 25, 1924. A pink and white blotched cowpea secured from Yung Ho Hseu.

62504. No. 1462. Peking. November 25, 1924. A creamy brown cowpea mottled a darker brown.

62505 to 62509. *ZEA MAYS* L. Poaceae. Corn.

62505. No. 1183. Fzuchiawu. November 4, 1924. A small, white flint corn showing a few grains of yellow; growing in a rather stiff clay loam.

62506. No. 1231. Chihyukou. November 6, 1924. A white flint corn growing in a rather heavy clay, at an altitude of 3,000 to 4,000 feet.

62507. No. 1232. Chihyukou. November 6, 1924. A heavy flint corn growing in a rather heavy clay, at an altitude of 3,000 to 4,000 feet.

62508. No. 1310. Huangang. November 8, 1924. A yellow flint corn growing in a friable loam.

62509. No. 1311. Huangang. November 8, 1924. A red flint corn. Three types, yellow, red, and white, are grown in this village.

62510 to 62512.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 13, 1925. Notes by Mr. McClure.

62510. *ALEURITES MONTANA* (Lour.) Wilson. Euphorbiaceae. Mu-oil tree.

No. 3. October 25, 1924. *Tung Yau Shue* and *Muk Yau Shue*. Seeds col-

62510 to 62512—Continued.

lected from a tree growing in a public burying ground (Kung Yik Shan Chong), about $1\frac{1}{2}$ miles from Wuchow, Kwangsi. There is said to be only one species of wood-oil tree grown in this region. The fruits of this species are obovate in form, with usually three ridges extending from the base, gaining in prominence as they approach the apex, where they join in a sharp point. The fruits are usually gathered in November and, after being husked and dried, are crushed in a crude ox-power grinder, consisting of a deep, circular stone gutter in which an iron wheel runs. The crushed nuts are then placed in a press, crudely fashioned from a log, and the oil expressed by means of wedges driven into place with a battering ram. The tree seems to grow equally well on all soils, from limestone to red sandy soil.

62511. *PIRIS* sp. Malaceae. Pear.

No. 21. Wuchow, Kwangsi. October 25, 1924. *Ka Sha Lei*, *Tong Lei Tsz*, and *Shan Cha Tsz*. Seeds from fruits brought to the market by natives who collected them in the wild. These rusty brown fruits, about the shape of a round apple and up to 3 centimeters in diameter, are pickled or eaten whole by the natives.

62512. *THEA OLEIFERA* (Abel) Rehd. and Wils. Theaceae.

No. 22. Tungon, Kwangtung. November 15, 1924. *Cha Tsai* and *Yau Cha*. Seeds secured by the assistance of Chan Hung On, who gives the following information: A tree 3 to 4 meters high, growing in the wild, sometimes semicultivated in the hills. It bears flowers and fruits all the year round, fruiting most abundantly in August. The flowers are white and fragrant. The oil, expressed from the seeds by the same process used to express the wood oil [see S. P. I. No. 62510], is used in cooking and by the women as a hair dressing, in which case perfume is often added.

62513 to 62518. *ALEURITES MONTANA* (Lour.) Wilson. Euphorbiaceae.

Mu-oil tree.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 24, 1925. Notes by Mr. McClure.

62513. No. 4. October 25, 1924. *Tung Yau Shue* and *Muk Yau Shue*. Seeds from a tree found growing in a public burying ground (Kung Yik Shan Chong) about $1\frac{1}{2}$ miles from Wuchow, Kwangsi. The same as No. 3 [S. P. I. No. 62510] in every respect except that the fruits were uniformly more pointed at the apex and the three ridges were sharper.

62514. No. 5. October 25, 1924. *Tung Yau Shue* and *Muk Yau Shue*. Seeds collected from a tree growing in a public burying ground (Kung Yik Shan Chong) about $1\frac{1}{2}$ miles from Wuchow, Kwangsi. This tree was young, perhaps 4 years old, but was bearing very prolifically.

62515. No. 6. October 25, 1924. *Tung Yau Shue* and *Muk Yau Shue*. Seeds from a tree growing in the Christian Missionary Alliance compound across the river from Wuchow, Kwangsi. No record has ever been kept of the yield, but an estimate of 4 to 5 piculs (133 pounds) seems conservative.

62513 to 62518—Continued.

62516. No. 7. October 25, 1924. *Tung Yau Shue* and *Muk Yau Shue*. Seeds collected from a large tree in the Christian Missionary Alliance compound across the river from Wuchow, Kwangsi. This tree is said by the Chinese to occasionally bear staminate flowers.

62517. No. 8. October 25, 1924. *Tung Yau Shue* and *Muk Yau Shue*. Seeds from a large and prolific tree in the Baptist Mission compound at Wuchow, Kwangsi. These trees differ from the foregoing numbers of this species in having the leaves more uniformly three lobed and in greater prolificity of fruits, which are borne in clusters of 8 to 11.

62518. No. 9. October, 1924. *Tung Yau Shue* and *Muk Yau Shue*. Seeds secured through the Hongkong Botanic Gardens from Shihing, in Kwangtung Province.

62519 to 62521. FRAGARIA spp. Rosa-ceae. Strawberry.

From Orleans, France. Plants presented by Edmond Versin, St. Jean le Blanc. Received February 3, 1925. Notes by Mr. Versin.

62519. FRAGARIA sp.

Nomblot-bruneau. An early variety with enormous sweet-flavored fruits.

62520. FRAGARIA sp.

Géante rouge. A new, large-yielding variety, with very large rounded fruits; five or six fruits sometimes weigh a pound.

62521. FRAGARIA sp.

L'Indispensable. An everbearing, very prolific variety, quite hardy; the plant does not disappear in winter. The fruits are larger than those of *Docteur Morère*, juicy, sweet, with firm red flesh of fine quality, and stand shipping well. It bears from June until frost.

62522. RUBUS sp. Rosaceae.

From Bedford, England. Plants purchased from Laxton Bros. Received February 5, 1925.

The *Laxtonberry*. A hybrid between the raspberry and loganberry, but being rather self-sterile should be planted near other berries. (*Laxton Bros. catalogue*.)

62523 to 62550. ORYZA SATIVA L. Poa-ceae. Rice.

From Nishigahara, Tokyo, Japan. Seeds presented by H. Ando, director, Imperial Agricultural Experiment Station. Received February 17, 1925. Notes by Mr. Ando.

These varieties have been grown at our station and purebred through several years.

62523 to 62535. Early-maturing varieties.

62523. No. 1. *Nigôhan*.

62524. No. 2. *Homura*.

62525. No. 3. *Akage*.

62526. No. 4. *Mesibu*.

62527. No. 5. *Ôba*.

62528. No. 6. *Kamenoo*.

62523 to 62550—Continued.

62529. No. 7. *Turugi*.

62530. No. 8. *Fuji-wase*.

62531. No. 9. *Jyôsyû*.

62532. No. 10. *Sinagawa*.

62533. No. 11. *Sinsyû*.

62534. No. 12. *Sen'iti*.

62535. No. 13. *Yamatodikara*.

62536 to 62547. Medium-maturing varieties.

62536. No. 14. *Jôhô*.

62537. No. 15. *Aikoku*.

62538. No. 16. *Nakajima-bôju*.

62539. No. 17. *Kairyô-funkuyama*.

62540. No. 18. *Ômi*.

62541. No. 19. *Isihiro*.

62542. No. 20. *Kunitomi*.

62543. No. 21. *Tamanisiki*.

62544. No. 22. *Wasesinriki*.

62545. No. 23. *Sekitori*.

62546. No. 24. *Hozoroi*.

62547. No. 25. *Araki*.

62548 to 62550. Late-maturing varieties.

62548. No. 26. *Takenari*.

62549. No. 27. *Sugaippon*.

62550. No. 28. *Siragihiei*.

62551 to 62557.

From Ambato, Ecuador. Presented by Prof. Augusto Martinez, through Wilson Popenoe, agricultural explorer, Bureau of Plant Industry. Received February 28, 1925. Notes by Doctor Popenoe.

62551. AMYGDALUS PERSICA L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

No. 703. Scions. Peaches have been grown for several centuries in the Ecuadorian highlands, particularly in the region of Ambato. Since propagation has been almost entirely by seed, there are as many varieties as there are trees in this region. The majority of them produce fruit of inferior quality, judged by our standard, but an occasional one is really good. Professor Martinez has searched for the best and has propagated them by budding. A few trees of selected varieties have thus been established at the Quinta Normal in Ambato.

The one represented by this number has been named *Juan Leon Mera* by Professor Martinez, honoring the well-known Ecuadorian poet and writer, in whose garden in Ambato the variety originated. This is a white freestone, of medium size and excellent flavor. It is interesting to us, principally because it may prove adapted to subtropical climates.

62552. CARICA PENTAGONA Heilborn. Pa-payaceae.

No. 700. Plants. This will stand several more degrees of frost than the papaya, while its fruits, nearly a foot in length, are excellent when stewed or preserved. This plant is fully described in my bulletin, *Economic Fruit-Bearing Plants of Ecuador*, Contributions from the United States National Herbarium, vol. 24, pt. 5, 1924.

62551 to 62557—Continued.

62553 and 62554. *PRUNUS SEROTINA* Ehrh.
Amygdalaceae. Capulin cherry.

62553. No. 701. Scions. It is worthy to note that the old Gonzales tree at Catiglatá, famous throughout the Ecuadorian highlands, is dying. Professor Martinez, however, has established young budded trees at the Quinta Normal and at his own quinta in Catiglatá, so the variety will not be lost. This variety is described and illustrated in the Journal of Heredity, February, 1922, and is also described in a previous inventory under S. P. I. No. 52720.

62554. No. 702. Scions. An excellent variety which originated in the quinta of Professor Martinez at Catiglatá, near Ambato. It may even be superior to the Gonzales; the fruit is of practically the same size and appearance, and the only difference is in the flavor, which seems a bit sweeter than that of the Gonzales.

62555. *PYRUS COMMUNIS* L. Malaceae. Pear.

No. 710. Plants. The so-called *pera nacional*, or native pear, brought here by the Spanish in early colonial days. It is propagated by suckers, for the fruits rarely contain seeds. The fruits are small and of fair quality.

62556. *RUBUS GLAUCUS* Benth. Rosaceae. Andes raspberry.

No. 711. Plants of the typical form of the Andes raspberry from the Quinta "La Lira" of Professor Martinez. The Andes berry, introduced by this office several years ago, promises to prove valuable for cultivation in the warmest parts of the United States and in other subtropical regions.

For previous introduction, see S. P. I. No. 52717.

62557. *VITIS* sp. Vitaceae. Grape.

No. 712. Cuttings. From the garden of Professor Martinez, a species which he believes was brought from Santo Domingo de los Colorados, in the hot, moist lowlands on the western slopes of the Andes. Professor Martinez says this grape does not fruit in the climate of Ambato, though it vegetates vigorously and blossoms freely. He knows nothing regarding the quality of its fruit, but believes the latter to be edible and of fair size.

62558 and 62559. *VITIS VINIFERA* L. Vitaceae. European grape.

From Key West, Fla. Cuttings presented by George E. Murrell, horticulturist of the Southern Railway. Received March 2, 1925.

Cuttings of the so-called "Key" grape, commonly grown in the Florida Keys.

62558. No. 1. 62559. No. 2.

62560 to 62562.

From Chihli, China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 2, 1925. Notes by Mr. Dorsett.

62560. *POPULUS* sp. Salicaceae. Poplar.

No. 1915. Tsaochiaio, near Fungtai, January 27, 1925. Cuttings of what is known here as the Chinese large-leaf poplar.

62560 to 62562—Continued.

62561. *ROSA* sp. Rosaceae. Rose.

No. 1913. Village of Kechiatsum, near Fungtai. January 27, 1925. Plant and cuttings of a small-leaved rose known as *Mu Hsiang*.

62562. *ZIZIPHUS JUJUBA* Mill. (*Z. sativa* Gaertn.). Rhamnaceae. Jujube.

No. 1916. Kechiatsum, near Fungtai, January 27, 1925. Scions of what is reported to be a large "apple" jujube. *Ping Kuo Tsao*, secured by Mr. Li.

62563 and 62564. *SOLANUM TUBEROSUM* L. Solanaceae. Potato.

From Wolverhampton, England. Tubers presented by E. W. Keay. Received March 2, 1925.

62563. *Paterson Victoria* × *Magnum Bonum*. Hybrid seedling No. 373.

62564. *Catriona*. A second early variety grown to some extent in Great Britain and on the Continent. The tubers are supposed to be kidney-shaped, with blue sprouts and colored skin. (William Stuart, Bureau of Plant Industry.)

62565. *HYPHAENE* sp. Phoenicaceae. Palm.

From Dar es Salaam, Tanganyika Territory, Africa. Seeds presented by the director, Department of Agriculture. Received March 18, 1925.

The palms of this genus are all indigenous to Africa and are remarkable in having branched stems, a character not common among palms. Each branch terminates in a tuft of large, fan-shaped leaves. One species (*Hyphaene thebaica*) bears fruits with fibrous husks which are eaten in Upper Egypt.

Received as *H. macrocarpa* Gaertn., for which a place of publication has not been found.

62566 to 62590.

From Elstree, Herts, England. Seeds presented by Vicary Gibbs, Aldenham House Gardens. Received February 20, 1925.

62566. *CARAGANA BOISI* C. Schneid. Fabaceae.

A handsome bush 10 to 12 feet high, with long, arching branches, native to Szechwan and eastern Tibet, China. In May the light-green foliage and numerous yellow flowers make this an especially attractive ornamental.

For previous introduction, see S. P. I. No. 56808.

62567. *CEANOTHUS THYRSIFLORUS* Eschw. Rhamnaceae.

Var. *Griseus*. An English horticultural form of a native American shrub.

62568 to 62584. *COTONEASTER* spp. Malaceae.

62568. *COTONEASTER DIELSIANA* ELEGANS Rehd. and Wils.

A variety differing from the typical form in having thinner and more persistent leaves and smaller, pendulous, coral-red fruits. The shrub is 6 feet or less in height, with slender, arching branches. Native to western China.

62569. *COTONEASTER LACTEA* Hort.

Forrest No. 10419.

62566 to 62590—Continued.

62570. COTONEASTER MOUPINENSIS Franch.

A cotoneaster commonly found in the thickets and margins of woods throughout western Szechwan at altitudes of 4,000 to 7,000 feet. According to E. H. Wilson (Sargent, *Plantae Wilsonianae*, vol. 1, p. 163) it is 6 to 15 feet high, with white flowers and jet-black fruits.

For previous introduction, see S. P. I. No. 55081.

62571. COTONEASTER NEWRYENSIS Hort.

62572. COTONEASTER SALICIFOLIA Franch.

A half-evergreen shrub, sometimes 15 feet in height, with white flowers produced in dense corymbs about 2 inches across and roundish, bright-red fruits, which, ripening in October, make the shrub particularly ornamental. Native to western China.

62573. COTONEASTER sp.

Farrer No. 403.

62574. COTONEASTER sp.

Farrer No. 404.

62575. COTONEASTER sp.

Farrer No. 405b.

62576. COTONEASTER sp.

Forrest No. 14948.

62577. COTONEASTER sp.

Forrest No. 14960.

62578. COTONEASTER sp.

Forrest No. 14976.

62579. COTONEASTER sp.

Forrest No. 15376.

62580 to 62584. These numbers were affixed by the Royal Horticultural Society and are not Forrest's own numbers.

62580. COTONEASTER sp.

No. 273.

62581. COTONEASTER sp.

No. 402.

62582. COTONEASTER sp.

No. 488.

62583. COTONEASTER sp.

No. 489.

62584. COTONEASTER sp.

No. 562.

62585. LEPTOSPERMUM PUBESCENS Lam. Myrtaceae.

The chief attractions of this evergreen Australian shrub lie in the small, myrtle-like foliage and the copiously produced white flowers which cover the shrub in the spring.

62586. SORBUS DOMESTICA L. (*Pyrus sorbus* Gaertn.). Malaceae. Service tree.

A round-headed tree, 30 to 60 feet high, which is often confounded with the European mountain ash (*Sorbus aucuparia*) from which it is distinguished by having larger flowers and fruits. The

62566 to 62590—Continued.

leaflets are sharply and rather coarsely serrate, and the white flowers, half an inch wide, are in terminal, broadly pyramidal clusters. The fruits, roundish or pear shaped, vary in size from half an inch to an inch and a half. The service tree is distributed throughout southern Europe, northern Africa, and western Asia.

62587. VERONICA CUPRESSOIDES Hook. f. Scrophulariaceae. Speedwell.

The veronicas, of which there are more than one hundred known species, constitute an important feature of the New Zealand flora, and many of them are popular ornamentals. This species belongs to a group known as the "whipcord" veronicas; the mature leaves are reduced to scales, usually pressed close to the branch and completely hiding it. It is described by Cockayne (*Cultivation of New Zealand Plants*, p. 70) as a tall, erect, cypresslike bush, 3 feet or more high, with dense, dark-green foliage and abundant purple flowers appearing in summer. In New Zealand this plant is sufficiently hardy to withstand a few degrees of frost.

62588. VIBURNUM HUPEHENSE Rehder. Caprifoliaceae. Hupeh viburnum.

A fairly hardy deciduous shrub, allied to *Viburnum wrightii*, with coarsely toothed, long-pointed, dark-green leaves, white flowers and ovoid, dark-red fruits. Native to central China.

For previous introduction, see S. P. I. No. 59401.

62589. VIBURNUM VEITCHI C. H. Wright. Caprifoliaceae. Veitch viburnum.

One of the most ornamental of the Lantana group, about 5 feet high, with young branches, leafstalks, and under surfaces of the leaves densely clothed with starlike down; the white flowers are in cymes 4 to 5 inches across, and the red fruits later become black. Native to central China.

For previous introduction, see S. P. I. No. 53752.

62590. XANTHOCERAS SORBIFOLIA Bunge. Sapindaceae.

A shrub, occasionally growing into a small-sized tree, found in loose soil. The shiny pinnate foliage reminds one of an ash, but the drooping racemes of white flowers, with yellow stamens, produced in great masses in early summer, give the shrub quite a distinct appearance. The Chinese eat the kernels of the fruits and call the plant "Mu kua hua," meaning "quince flower," because the large fruits resemble those of the Japanese quince (*Chaenomeles lagenaria*). This shrub, closely related to the horse-chestnut, is decidedly ornamental and of special value as a garden shrub for the semiarid sections of the United States where the winters are not too severe. (Frank N. Meyer, in note under S. P. I. No. 39431.)

62591 to 62598. GOSSYPIUM spp. Malvaceae. Cotton.

From Paris, France. Seeds presented by Prof. A. Chevalier, Laboratoire d'Agronomie Coloniale. Received February 26, 1925.

62591. GOSSYPIUM ANOMALUM Wawra.

This wild African cotton is described by Oliver (*Flora of Tropical Africa*, vol. 1, p. 211) as a shrub 5 to 10 feet in

62591 to 62598—Continued.

height, with rough branches, reddish flowers, and oval capsules about an inch in length.

For previous introduction, see S. P. I. No. 55410.

62592 to 62594. *GOSSYPIUM HERBACEUM* L.

62592. A brown variety.

62593. A white variety.

62594. A form with partly indehiscent capsules.

62595. *GOSSYPIUM NANKING* Meyen.

The "Chinese" cotton of commerce is, according to Watt (Wild and Cultivated Cottons of the World), an annual or perennial bush, with delicate, sparsely branched stems and imperfectly cordate leaves. The irregular-shaped seeds are densely coated with rufous velvet and bear a silky fiber, which, in all the better varieties, is white, but often shows a tendency to become reddish or khaki. This cotton is cultivated throughout tropical Asia.

62596. *GOSSYPIUM OBTUSIFOLIUM AFRICANUM* Watt.

From French Equatorial Africa.

An African variety which, according to Watt (Wild and Cultivated Cottons of the World), differs chiefly from the typical Indian species in having more copious and finer fiber.

62597. *GOSSYPIUM PUNCTATUM* Schum. and Thonn.

A wild cotton, found in tropical America and also in central and western Africa. It is described (Watt, Wild and Cultivated Cottons of the World) as a shrub with hairy, 3-lobed leaves, and yellow flowers spotted with purple. The fiber is pure white and silky.

62598. *GOSSYPIUM PUNCTATUM* × *BARBADENSE*.

Cultivated by the natives, but perhaps of recent introduction.

62599 to 62647.

From China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received February, 1925. Notes by Mr. Dorsett.

62599. *AMYGDALUS DAVIDIANA* (Carr.) Zabel (*Prunus davidiana* Franch.). Amygdalaceae. Chinese wild peach.

No. 1733. Fa Hua Ssu temple, near Haitzu. December 31, 1924. Seeds of *Shan Mao T'ao* (wild mountain peach) which is used by the Chinese as stock for their peaches and plums.

62600 to 62602. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

December 31, 1924. Scions from the Fa Hua Ssu temple.

62600. No. 1723. *Ma Nao Hung T'ao* (red agate peach). The freestone fruits, 3 to 4 inches in diameter, are red outside and white within, ripening during the early part of August. They are grafted on the wild peach.

62601. No. 1739. *Pai Tien T'ao* (white sweet peach). The fruits, 2 to 3 inches in diameter, are clingstones and ripen in early August. The wild peach is used as stock.

62599 to 62647—Continued.

62602. No. 1773. *Pi T'ao* (flowering peach). The twigs of blossoms, which fade from pink to white and then turn red, are sold here. The fruits, about 1½ inches in diameter and resembling apricots in shape, are freestone and ripen in September, becoming pink.

62603 and 62604. *CHAETOCHELOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.

62603. No. 1597. *Lou Tai*. Seeds of a white millet collected in a large valley between Peking and Tientsin. December 16, 1924.

62604. No. 1737. Fa Hua Ssu temple. December 31, 1924. Seeds of the *Fo Shou Nien Ku* (Buddha's finger millet). A millet having yellow seeds.

62605. *CRATAEGUS PINNATIFIDA* Bunge. Malaceae. Chinese hawthorn.

No. 1746. Fa Hua Ssu temple. December 31, 1924. Scions of what is reported to be a large, red hawthorn, about 1 inch in diameter, and which ripens during the middle of October. It was growing on mountain sides and in narrow valleys at an altitude of 6,000 to 12,000 feet.

62606. *ECHINOCHLOA CRUSGALLI EDULIS* Hitchc. Poaceae. Barnyard millet.

No. 1600. Loutai. December 16, 1924. Seeds of the *Pai Tzu* (tare). When other foods are scarce this variety is ground into flour and used.

62607. *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench.). Polygonaceae. Buckwheat.

No. 1590. Loutai. December 16, 1924.

62608 to 62610. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

Loutai. December 16, 1924.

62608. No. 1591. *Nien Kaoliang* (sticky kaoliang).

62609. No. 1592. *Hung Kaoliang* (red kaoliang). Said to have long flower and seed stalks.

62610. No. 1593. *Pai Kaoliang* (white kaoliang).62611. *JUGLANS MANDSHURICA* Maxim. Juglandaceae.

No. 1735. Fa Hua Ssu temple. December 31, 1924. *Shan Ho T'ao* (wild mountain walnut). Used for stock here when the walnut is grafted.

62612 to 62615. *JUGLANS REGIA* L. Juglandaceae. Persian walnut.

Fa Hua Ssu temple.

62612. No. 1736. December 31, 1924. Seeds of *Shan Ma Ho T'ao* (wild mountain walnut). The nuts are broader than long and have a heavy keel and are quite rough. Used for stock here.

62613. No. 1766. January 5, 1925. Scions of *Ying Pi Ho T'ao* (thick-shelled walnut) from a 10-year-old tree that has been bearing for three years.

62599 to 62647—Continued.

62614. No. 1767. January 5, 1925. Scions of *Pao P'i Ho T'ao* (thin-shelled walnut) from a tree 50 or 60 years old which ripens in early September. It is said that if these walnuts are allowed to fall from the trees they will break.

62615. No. 1778. January 5, 1925. Scions of *Pao P'i Hsiao Ho T'ao* (thin-shelled small walnut) about an inch in diameter. The fairly smooth nuts ripen in early September.

62616 to 62624. *MALUS* spp. Malaceae. Apple.

Fa Hua Ssu temple.

62616. *MALUS* sp.

No. 1719. December 31, 1924. Seeds of *Shan Ting Tzu* (wild mountain crab apple) which may prove useful as a dwarfing stock. The fruits are very small and yellowish.

62617. *MALUS* sp.

No. 1720. December 31, 1924. *Hung Sha Kuo* (red crab apple). A sweet, sand crab apple, about 1 to 1½ inches in diameter, and which is a little longer than broad. Ripens about the middle of August.

62618. *MALUS* sp.

No. 1734. December 30, 1924. Offshoots of *Shan Ting Tzu* (wild mountain crab apple). Seeds were sent in under No. 1719 [S. P. I. No. 62616].

62619. *MALUS* sp.

No. 1741. December 3, 1924. Scions of *Hung Sha Kuo* (red crab apple) 1 to 1½ inches in diameter, which ripens the middle of August. It is grafted on the wild crab apple.

62620. *MALUS* sp.

No. 1745. December 31, 1924. Scions of *Pai Hai T'ang* (small white crab apple) which ripens in September. This crab apple was growing on terraced mountain sides and in narrow valleys at altitudes of 6,000 to 12,000 feet.

62621. *MALUS* sp.

No. 1750. December, 1924. Scions of *Sha Kuo* (sand crab apple). A red crab apple, 1 inch in diameter, which ripens in early August.

62622. *MALUS* sp.

No. 1762. December 30, 1924. Scions of a large apple, 2½ to 4½ inches in diameter, which ripens between the middle of July and the middle of August, becoming green with a pink or red blush. Grafted on the wild mountain crab apple.

62623. *MALUS* sp.

No. 1763. December 30, 1924. Scions of a very sweet, fragrant apple, 2½ to 3 inches in diameter, which is green with a red blush. Grafted on the wild crab apple.

62624. *MALUS* sp.

No. 1777. January 5, 1925. Scions of *Suan Pin Tzu* (sour purple crab apple). A white-fleshed crab apple, 1½ to 2 inches in diameter, which ripens in early September. Grafted on the wild crab apple.

62599 to 62647—Continued.

62625 to 62627. *PANICUM MILIAECUM* L. Poaceae. Proso.

Loutai. December 16, 1924. Said to be used both for human food and for stock.

62625. No. 1596. A sticky, white-seeded variety.

62626. No. 1598. A dark-brown variety.

62627. No. 1599. A variety having light-colored seeds.

62628 to 62632. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

Fa Hua Ssu temple.

62628. No. 1725. December 31, 1924. Scions of *Ta Huang Hsing* (large yellow apricot), the kernel of which is sweet; ripens about the end of June, becoming yellow with a red blush. Grafted on the wild peach and apricot.

62629. No. 1732. December 31, 1924. Scions of *Hung Lao Yieh Lien Hsing* (red-faced apricot). A freestone variety, 1 to 1½ inches in diameter, which ripens the last of June. The flesh is white and the kernel is sweet.

62630. No. 1740. December 3, 1924. Scions of the same variety as No. 1732 [S. P. I. No. 62629], but from a different tree.

62631. No. 1742. December 31, 1924. Scions of *Pien Tzu Hsing* (flat apricot). The broad fruits, which are sold only for the kernels, ripen at the end of June.

62632. No. 1764. January 5, 1925. Seeds of *Shan Mao Hsing* (wild mountain apricot), the trees of which grow to a good size. Used as stock upon which to work the commercial varieties, both fruiting and the sweet kernel. It is claimed that when this wild apricot is used as stock there is less trouble from worms in the fruits.

62633 to 62638. *PRUNUS* spp. Amygdalaceae.

Scions from the Fa Hua Ssu temple.

62633. *PRUNUS* sp. Plum.

No. 1712. December 30, 1924. *Shui Hung Li Tzu* (water red plum). The round fruits, 1 to 1½ inches in diameter, ripen the beginning of July. Grafted on the wild peach.

62634. *PRUNUS* sp. Plum.

No. 1744. December 31, 1924. *Tien Li Tzu* (sweet plum). A variety which ripens at the end of July, becoming purple and red. The fruits are round, about an inch in diameter.

62635. *PRUNUS* sp. Plum.

No. 1748. December 31, 1924. *Hsing Li Tzu* (red plum), 1½ to 2 inches in diameter, which ripens at the end of July. The flesh is yellow.

62636. *PRUNUS* sp. Cherry.

No. 1769. January 5, 1925. *Hung Shan Tou Tzu* (mountain bean red cherry). The trees are about 10 feet in height and 3 to 4 inches in diameter. The small fruits ripen during the middle of May. Grafted on the wild peach.

62599 to 62647—Continued.

62637. *PRUNUS* sp. Cherry.

No. 1770. January 5, 1925. *Pai Shan Tou Tzu Ying Tao* (mountain bean white cherry). The trees grow to a height of 10 or 12 feet and 3 to 4 inches in diameter. The small fruits ripen during the middle of May. Grafted on the wild peach.

62638. *PRUNUS* sp. Cherry.

No. 1772. January 5, 1925. *Nau Ying Tao* (southern sweet cherry). This particular tree was 30 years old. The fruits are of average size and ripen in May, becoming pink.

62639 to 62647. *PYRUS* spp. Malaceae. Pear.

Scions from the Fa Hua Ssu temple.

62639. *PYRUS* sp.

No. 1713. December 31, 1924. *Sha Kuo Li* (crab-apple pear). The fruits of this summer pear are about 1½ to 2 inches in diameter, and ripen at the end of August, becoming light yellow blushed with red.

62640. *PYRUS* sp.

No. 1726. December 31, 1924. *Chin Chin Pa Li* (autumn golden handle pear). The fruits, 2 to 3 inches in diameter, ripen about the middle of September, becoming yellow. Grafted on the wild mountain pear.

62641. *PYRUS* sp.

No. 1749. December 31, 1924. *Shih Ping Tang Li* (dry persimmon sugar pear). The yellow fruits, 3 or more inches in diameter, ripen during the middle of October.

62642. *PYRUS* sp.

No. 1751. December 31, 1924. *Ta Tzu Hsiang Li* (fragrant pear). A yellow pear, 2 to 3 inches in diameter, with a small core. Ripens late in August.

62643. *PYRUS* sp.

No. 1765. January 5, 1925. *Hung Hsai Li* (red sour pear). The fruits, 2 to 3 inches in diameter, ripen in September, becoming yellow with a red or pink blush.

62644. *PYRUS* sp.

No. 1768. January 5, 1925. *Chin Chin Li* (golden handle pear).

62645. *PYRUS* sp.

No. 1774. January 5, 1925. *Ping Kuo Li* (apple pear). The white-fleshed fruits, the size of large apples, are white with a pink blush. Ripens at the end of September.

62646. *PYRUS* sp.

No. 1775. January 5, 1925. *Ta Tzu Hsiang Li* (fragrant pear). A yellow pear, about 2 inches in diameter, which ripens at the end of September.

62647. *PYRUS* sp.

No. 1776. January 5, 1925. *Pan Chin Su Li* (half-catty brittle pear). The yellow fruits ripen during the early part of October. This is said to be the largest of the pears, being 2 to 3 inches or more in diameter.

62648. *ARTEMISIA* sp. Asteraceae. Wormwood.

From Peking, Chibli, China. Roots collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received February 25, 1925.

No. 1816. January 12, 1925. The small, fragrant, aromatic roots, after being cleaned, are chopped into small pieces, dipped in hot water, and eaten fresh with soy-bean sauce, vinegar, a little pepper and salt, sesame oil, and a little sugar. (Dorsett.)

62649 and 62650. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Faba-ceae. Soy bean.

From Buitenzorg, Java. Seeds presented by L. Koch, chief, Plant Breeding Station. Received February 14, 1925.

These varieties have given good results here during the past few years. (Koch.)

62649. *Swarte Kedelee* No. 3.62650. *Witte Kedelee* No. 17.62651. *DENDROCALAMUS MACROCULMIS* Hort. Poaceae. Bamboo.

From Algiers, Algeria. Cuttings collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 19, 1925.

One of the giant bamboos which was introduced from Cochinchina by the Jardin des Plantes in Paris and sent here for trial. There is now a splendid avenue of it in the Jardin d'Essais, at Algiers. This is a clump species, very distinct and valuable. (Fairchild.)

62652. *DIOSCOREA* sp. Dioscoreaceae. Yam.

From Chibli, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 5, 1925.

No. 1283. November 8, 1924. Collected on the eastern side of One Hundred Flower Mountain, en route from Shihchiayang to Huanggan, at an altitude of 10,000 feet. (Dorsett.)

62653. *GLADIOLUS HIRSUTUS* Jacq. Iridaceae.

From Kirstenbosch, Cape Province, South Africa. Bulbs presented by Prof. R. H. Compton, National Botanic Gardens. Received March 27, 1925.

About a foot in height, this species has bright-red flowers borne in a very lax, few-flowered, secund spike. The sword-shaped leaves are strongly ribbed.

According to Dr. Rudolph Marloth, Cape Town, South Africa, this plant grows in sandy stretches which are moist only during the winter.

62654 to 62656. *PISUM SATIVUM* L. Fabaceae. Pea.

From Stirling, Scotland. Seeds purchased from W. Drummond & Sons, through D. N. Shoemaker, Bureau of Plant Industry. Received March 27, 1925.

Introduced for horticulturists testing pea varieties.

62654. *Drummond's Early Multiple*.62655. *New Main Crop Chancellor*.62656. *The Bell*.

62657. HELIANTHUS TUBEROSUS L. Asteraceae. Jerusalem artichoke.

From Saonara, Padova, Italy. Tubers purchased from Fratelli Sgaravatti. Received March 29, 1925.

Locally grown tubers.

62658. CITRUS WEBBERII Wester. Rutaceae. Alsem.

From Manila, Philippine Islands. Seeds presented by P. J. Wester. Received March 30, 1925.

A small, handsome tree, 15 to 30 feet high, which is particularly abundant in the mountain Province, Nueva Viscaya, and southern Luzon. The better forms have oblate, very juicy, acid fruits somewhat like the mandarin in appearance and up to 2½ inches in diameter; these may be used like the lemon. The species is very variable and appears promising as a citrus stock. (Wester.)

62659. VIOLA ODORATA L. Violaceae. Violet.

From Killalow, County Clare, Ireland. Plants purchased from Mrs. Stanistreet. Received February 7, 1925.

King of the Belgians (synonym, Kaiser Wilhelm). The large, rich, deep-purple flowers, very highly perfumed, are borne on long firm stems. This is a magnificent violet, probably the best single variety, and it is very rare. (Stanistreet.)

62660 to 62674.

From Algeria. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 21, 1925. Notes by Doctor Fairchild.

62660. ARGANIA SPINOSA (L.) Skeels (A. sideroxylon Roem. and Schult.). Sapotaceae. Argan.

The argan tree of western Morocco is very limited in its range, occurring only in that part of the African continent. It grows to a large size and bears an abundance of light-yellow fruits somewhat resembling in shape small plums. Cattle and goats are said to feed upon these fruits, which contain a large amount of nourishment, although the fruits are exceedingly acrid to the taste. The seeds are very thick walled and go through the intestines of the animals undigested. These seeds are also used for the oil contained in them. Apparently the tree is not injured by frost, and it may thrive wherever hardy citrus grows.

62661. ATROPA BAETICA Willk. Solanaceae.

A species related to belladonna and of possible interest to drug-plant specialists. Presented by Professor Maire, of the University of Algiers.

62662. CAPPARIS SPINOSA L. Capparidaceae. Caper.

Var. *inermis*. A spineless form of the caper of commerce, presented by the Botanic Gardens, University of Algiers.

62663. CASUARINA SUBEROSA Otto and Dietr. Casuarinaceae.

A species with very large fruits (4 centimeters) and long, coarse, pendent branchlets, very distinct from *Casuarina equisetifolia*. This species is evidently hardier, for the trees from which these

62660 to 62674—Continued.

seeds were gathered have stood temperatures of 26° F. Presented by Doctor Trabut from his Jardin d'Essais at Maison Carree, Algeria.

62664. CASUARINA SP. Casuarinaceae.

Probably *Casuarina suberosa* × *C. cunninghamiana*. A form which appeared at the Jardin d'Essais of Maison Carree, Algeria. By judicious clipping it has produced a beautiful hedge which resembles closely those produced in Florida with *C. equisetifolia*. This form is apparently hardier, for Maison Carree has been visited by temperatures below 26° F., and it has never been injured.

62665. CORDIA OBLIQUA Willd. Boraginaceae.

A handsome shade tree from Cochinchina which has proved hardy in the Botanic Gardens of Mustapha, where the temperature sometimes goes below freezing. Because of its handsome foliage and good habit of growth, this may be worth considering as an avenue tree. Presented by Prof. R. Maire, director of the botanic gardens, University of Algiers.

62666. × EUCALYPTUS ALGERIENSIS Trabut. Myrtaceae.

A hybrid between *Eucalyptus rostrata* and *E. rudis* which has become naturalized in North Africa and now covers considerable areas of the hills around Algeria. It differs from *E. rudis* by its smooth trunk, its small flowers with the hemispherical operculum not beaked, and from *E. rostrata* by its buds, which are white like those of *E. rudis*. *Eucalyptus rudis* flowers in the month of December, *E. algeriensis* flowers in the spring, while *E. rostrata* flowers in July and August. Presented by Professor Maire, of the University of Algiers.

62667. HYOSCYAMUS FALEZLEZ Cos. Solanaceae.

This is known to the Touaregs as "Afahehlé." It is common in the southern part of the Sahara, where its toxic properties are well known to the natives. It can be eaten by camels, goats, and sheep, but is very poisonous to horses and donkeys. It is believed that Afahehlé fattens ruminants and also women, corpulency among the latter being considered a mark of beauty. (L. Trabut, in note under S. P. I. No. 60257.)

62668. LENTILLA LENS (L.) W. F. Wight (Lens esculenta Moench.). Fabaceae. Lentil.

Var. *nigricans*. A very delicate variety of this genus which furnishes the lentil of commerce.

62669. LYCOPERSICON ESCULENTUM Mill. Solanaceae. Tomato.

An early variety of tomato called *Précoces Côtelées* (early ribbed) which is being grown along the seacoast of North Africa under the protection of windbreaks made of the canes of *Arundo mauritanica* and which may prove unusually early when grown in southern Florida. The plants are trained to a single stem and pinched back.

62670. ONOPORDON DISSECTUM Murbeck. Asteraceae. Cotton thistle.

Var. *costatum*. A composite which may prove as attractive for borders as the Arabian species, *Onopordon arabicum*. This variety, occurring in the sandy clearings in the forests of Mamora,

62660 to 62674—Continued.

at Kenitra, and between Sale and Tifet, Morocco, was presented by its discoverer, Professor Maire, of the University of Algiers, Mustapha.

62671. PAEONIA CORIACEA Boiss. Ranunculaceae. **Peony.**

A Spanish peony, allied to *Paecnia albiiflora*, with nearly unbranched, reddish stems and leathery leaves. The flowers are bright crimson.

62672. PILOCARPUS PENNATIFOLIUS Lem. Rutaceae.

A handsome Brazilian tree with beautiful foliage and striking pendent spikes of pinkish red flowers. It is interesting in that the terminal flowers in the spike open before the basal ones, quite the opposite to the habit of ordinary flower spikes in which the first-formed flower buds on the spike open first. The leaves of this poisonous tree furnish the pilocarpin of the pharmacopoeia.

62673. SCHINUS TEREBINTHIFOLIUS Raddi. Anacardiaceae. **Brazilian pepper tree.**

A particularly handsome tree growing beside the road to Ain Taiya, Algeria. I think it is quite possible that this form, grown as a shade tree in Algiers, is different from the bushlike form which is being used so extensively in southern Florida.

62674. STYRAX OFFICINALE L. Styracaceae. **Snowbell.**

A small, handsome tree, suitable for parks, with attractive white flowers, presented by Professor Maire, of the University of Algiers.

62675. ARECASTRUM sp. **Phoenicaceae.**
Palm.

From South America. Seeds collected by Wilson Popenoe, agricultural explorer, Bureau of Plant Industry. Received February 28, 1925.

No. 714. Cumbi. A common ornamental palm in towns and villages of the Ecuadorian highlands. It has a slender trunk, attaining to 25 or 30 feet in height, surmounted by a crown of pinnate, strongly arcuate, grayish green leaves. As it grows at altitudes of 8,000 to 9,000 feet in Ecuador, I would expect it to be sufficiently frost resistant for cultivation in parts of California and Florida. So far as I have learned, it has little economic value; the leaves may be used for thatch, but the oval, dry fruits, each about 2 inches long, are not used for food. As a new ornamental palm for the warmest portions of the United States it is of more than passing interest. (*Popenoe*.)

62676. AXONOPUS SCOPARIUS (Fluegge) Hitchc. Poaceae. **Grass.**

From Guayaquil, Ecuador. Plants presented by J. A. Cleveland, through Wilson Popenoe, agricultural explorer, Bureau of Plant Industry. Received February 28, 1925.

No. 713. When Dr. A. S. Hitchcock was in Ecuador last year he secured seeds of a promising forage grass from the Hacienda La Teresita, near Bucay. His notes on this plant, which was called *Paspalum scoparium* at that time, are given under S. P. I. No. 58966. The seeds failed to grow, and at Doctor Hitchcock's request I have secured from La Teresita, through Mr. Cleveland, the owner of the hacienda, live plants of this grass, which will be tested in Florida and other subtropical regions. (*Popenoe*.)

62677 to 62691.

From South America. Collected by Wilson Popenoe, agricultural explorer, Bureau of Plant Industry. Received February 28, 1925. Notes by Doctor Popenoe.

62677 and 62678. DELOSTOMA ROSEUM (Karst. and Tr.) Schum. Bignoniaceae.

Ambato, Ecuador. *Cholán*. Seeds of a small tree, native to certain regions of Ecuador, and occasionally cultivated in parks and gardens. It is rather susceptible to frost, but will probably withstand the winters of southern Florida. Its lilac flowers resemble those of the catalpa in form and size.

62677. No. 704. A variety with pale-lilac flowers.

62678. No. 705. A variety with deep-lilac flowers.

62679. FRAGARIA CHILOENSIS (L.) Duchesne. Rosaceae. **Chiloe strawberry.**

No. 707. Ambato, Ecuador. Plants of the *frutilla*, or Chilean strawberry, which is cultivated extensively at Guachi, near Ambato. The character of this fruit and its culture in Ecuador is described under S. P. I. No. 52731, and more fully in the Journal of Heredity for December, 1921.

62680. GOSSYPIUM sp. Malvaceae. **Cotton.**

No. 693. Chota Valley, Ecuador. In recent years the cultivation of cotton has assumed considerable importance in northern Ecuador. The Chota Valley in particular has proved well suited to this crop. Though a few introduced varieties have been tested, the only one successfully grown at present is the so-called native cotton, presumably the same type as that cultivated in Peru. These seeds were obtained from the Hacienda San Rafael.

62681. LYCOPERSICON ESCULENTUM Mill. Solanaceae. **Tomato.**

Seeds presented by Prof. Julio Gaudron, Jardín Botánico de la Escuela Nacional de Agricultura, Lima, Peru. This is a primitive form of the tomato which grows wild in the vicinity of Lima. The plant is of vigorous habit and produces an abundance of tiny tomatoes, each about the size of a Concord grape.

62682. ONOSERIS HYSSOPIFOLIA H. B. K. Asteraceae.
